119	119.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration – Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
119	119.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
120	120.0001	Private - Pampas Private	Stakeholder engagement		Proponent has not engaged with the Pampas Progress Association and listed their concerns	Withdraw the EIS and start consultation process again	ARTC has had many conversations with the committee of the Pampas Progress Association regarding the potential impacts the Project may have on the hall. In May 2021, ARTC ran community engagement on the proposed road network changes for Pampas. During this consultation a number of hall committee members were engaged and their concerns captured. The revised draft EIS notes the Pampas Hall as a sensitive receptor. Additional engagement is planned in mid 2023 when updated noise modelling will give a clearer understanding of potential noise impacts to discuss how mitigation will be managed. ARTC are committed to engaging with the Pampas Hall committee as the Project progresses through detailed design and impacts are more clearly understood. Consultation for the Project is outlined in Appendix E Consultation Report.	Appendix E: Consultation Report
120	120.0002	Private - Pampas Private	Traffic and Transport		Revisit decisions around rail and bridge design in the village of Pampas	Withdraw EIS, ensure all items under the ToR are included in the EIS	<p>Regarding level crossings, ARTC recognises the complex decision-making process surrounding public road rail interfaces. The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The Harris Road level crossing in Pampas for the draft EIS was developed in consultation with the local community. In July 2019 the Pampas community asked to keep the level crossing as close to its current location as possible to minimise impacts to Pampas Hall, residents and enable continued movement of farming equipment with minimised highway interference. The Project team worked to accommodate these aspects in consultation with road authorities, however further development of the draft EIS reference design found that the Gore Highway required additional turning lanes which resulted in potential road safety and access issues, such as the Caltex service station and properties on the northern side of Gore Highway.</p> <p>The Project team proceeded to develop an alternate solution that offers a simpler, safer and less impactful design to landowners, the community and road users. In May 2021 the Project team presented both options to the community;</p> <ul style="list-style-type: none"> Draft EIS reference design including road network updates Alternate solution that reduces extent of works on the Gore Highway A letterbox drop followed the information session and additional community feedback was captured. Feedback from the community indicated a preference for the alternate solution. <p>Reference design outcomes included changes to Fysh Road, Harris Road, and the Gore Highway intersection, which involved road realignments and more optimal location of the proposed level crossing. For more detail, refer to Section 5.9 of Appendix AA: Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Appendix BT</p>
121	121.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
121	121.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
121	121.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration – Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
121	121.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<p>Community consultation process to be undertaken again with independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
122	122.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be redone.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
122	122.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the community of Pampas cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
122	122.0003	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
122	122.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Pampas will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Pampas community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Pampas has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration, and results discussed in Section 16.6 of Chapter 16: Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10, and Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic, Section 7. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers in Pampas. The noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. Concept noise barrier mitigation at Pampas are more modelled and discussed in Section 17.4. There will be engineering, further acoustic assessment (including noise modelling) and community engagement undertaken during the detailed design and construction stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic</p> <p>Section 7</p> <p>W: Noise and Vibration - Railway Operations Section 4</p> <p>Section 11</p> <p>Section 17</p> <p>Section 17.4</p>
123	123.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Pampas will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). 123	123.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
124	124.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	<p>The SIA Survey should be redone.</p>	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
124	124.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the community of Pampas cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
124	124.0003	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
124	124.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Pampas will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Pampas community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Pampas has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration, and results discussed in Section 16.6 of Chapter 16: Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10, and Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic, Section 7. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers in Pampas. The noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. Concept noise barrier mitigation at Pampas are more modelled and discussed in Section 17.4. There will be engineering, further acoustic assessment (including noise modelling) and community engagement undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic</p> <p>Section 7</p> <p>W: Noise and Vibration - Railway Operations Section 4</p> <p>Section 11</p> <p>Section 17</p> <p>Section 17.4</p>
125	125.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Pampas will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). 125	125.0005	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be redone.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
125	125.0006	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the community of Pampas cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
126	126.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
126	126.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
126	126.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, further acoustic assessment (including noise modelling) and community engagement undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers in Pampas. The draft revised EIS discusses a range of reasonable and practicable mitigation measures to reduce noise where predictions exceed the relevant noise level criteria.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic</p> <p>Section 7</p> <p>W: Noise and Vibration - Railway Operations</p> <p>Section 4</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
126	126.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
127	127.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
128	128.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be redone.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
128	128.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the community of Pampas cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
128	128.0003	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
128	128.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Pampas will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Pampas community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Pampas has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	The draft EIS submitted by the proponent should be rejected on the grounds that: <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration, and results discussed in Section 16.6 of Chapter 16: Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10, and Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic, Section 7. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers in Pampas. The noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. Concept noise barrier mitigation at Pampas are more modelled and discussed in Section 17.4. There will be engineering, further acoustic assessment (including noise modelling) and community engagement undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations.</p>	Chapter 16: Noise and Vibration Section 16.6 Section 16.8 Section 16.10 Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic Section 6.2 W: Noise and Vibration - Railway Operations Section 4 Section 10.6 Section 17 Section 17.4
129	129.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
129	129.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
129	129.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4
129	129.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 130	130.0001	Private	Cultural Heritage	Non-Indigenous cultural heritage	A grave site with a headstone is present on Mr Neil Owens property where the railway will be going through.	Seeking another solution to avoid damaging the grave and headstone.	Section 19.4 of Chapter 19: Cultural Heritage has been updated to note that a site visit by a heritage specialist and assessment of the grave site was undertaken and Section 19.6 of Chapter 19: Cultural Heritage was updated with recommend mitigations. These include further archaeological survey and the relocation of the Tibbs grave and a reported adjacent unmarked grave to Pittsworth cemetery. Inland Rail has met with the submitter regarding the grave and will continue to work with History Pittsworth and the landowner throughout this process.	Chapter 19: Cultural Heritage Section 19.4 Section 19.6
131	131.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
131	131.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
131	131.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>
131	131.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
132	132.0001	Private	Project alignment	Directly impacted landowner	Millmerran Power Station Coal reserves impacted by route of Inland Rail B2G.	Commercial discussion regarding compensation for impacted resources within MDL 299 and MDL 300. Alternate route selection.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps).</p> <p>The preferred location for the proposed rail corridor (as presented in Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs The outcomes of the multi-criteria analysis (MCA). <p>If extinguishment of part of a mining lease or other resource tenement occurs, this gives the holder a right to claim compensation. Compensation will be assessed in accordance with the Acquisition of Land Act 1967 (Qld) and is limited to the actual costs resulting from the extinguishment or injurious affect to a claimants interests. This would include expenses incurred such as studies, preparatory work and infrastructure.</p> <p>ARTC recognises the Millmerran Operation Company as a key stakeholder and will continue to work collaboratively into the Detailed Design stage.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p>
132	132.0002	Private	Project alignment	Directly impacted landowner	Four (4) residential properties impacted directly during construction and operation of B2G Inland Rail.	Commercial discussion regarding compensation for impacted residents within 500 m of rail line.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps).</p> <p>The preferred location for the proposed rail corridor (as presented in Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
132	132.0005	Private	Land Use and Tenure	Directly impacted landowner	Recycled Water Supply to Millmerran Power Station impacted. Identified possible disruption of essential supply to Power Station.	Interface agreement to be entered into regarding conditions required to satisfy asset owner.	<p>ARTC utilities team have consulted with the Millmerran Operating Company to understand any infrastructure and/or operational impacts that require mitigation.</p> <p>During consultation, ARTC has communicated the proposed relocation/protection treatments for their recycled water main and integrated feedback received into the Scope of Works and Technical Criteria (SWTC) document. This document will form part of the tender information provided to the Project's contractors and includes a reference to the Millmerran Operating Company's interface agreement and other conditions.</p> <p>The Project recognises the Millmerran Operation Company as a key stakeholder and will continue to work collaboratively into the Detailed Design stage. Further details on consultation are provided in Appendix E: Consultation Report.</p> <p>More broadly, outcomes of consultation with individual utility providers have been integrated into the reference design. Specific outcomes included methodologies for treating impacted utilities, providing indications of construction timeframes and the current status of the rail design. The methodology for the mitigating the impact of the interface between utilities and the alignment include modification to the utilities, upgrade of the utilities, and diversion or realignment of the rail. Specific methodologies for individual utilities will be finalised through further consultation with providers and integrated into the design of the alignment in detailed design.</p> <p>Refer to Chapter 8: Land Use and Tenure, Sections 8.5.1 and 8.6.3 (Table 8-51) of the revised draft EIS for further detail.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.3</p> <p>Table 8-51</p> <p>Appendix E: Consultation Report</p>
132	132.0006	Private	Land Use and Tenure	Directly impacted landowner	Dissection of agricultural and Mineral Development resources will occur if the current rout is developed. This limits future use and planning.	Further detail and information regarding route selection and justification required in relation to impacts to Millmerran Power Project assets.	<p>ARTC have consulted with the Millmerran Operating Company and previously amended the alignment in response to consultation.</p> <p>The Project recognises the Millmerran Operation Company as a key stakeholder and will continue to work collaboratively into the Detailed Design stage. Further details on consultation are provided in Appendix E: Consultation Report.</p> <p>Management measures in relation to Millmerran Power Station have been identified in Chapter 8: Land Use and Tenure and Chapter 23: Cumulative Impacts , Section 23.3.1, Table 23-8. These include the following:</p> <ul style="list-style-type: none"> Refinement of the reference design during Detailed Design stage to minimise the Project footprint to the extent required for the construction works and safe operation of the Project in proximity to the Commodore Mine and Millmerran Power Station Rehabilitation of land that is temporarily disturbed in support of construction activities construction (e.g. for access tracks, laydown areas etc.) at the end of its use for construction, unless otherwise agreed with the relevant landowner Development and implementation of a Rehabilitation and Landscaping Management Plan, as a component of the Construction Environmental Management Plan for the Project that is compatible with plans for the adjoining Commodore Mine and Millmerran Power Station and addresses cumulative impacts to agricultural land. Disruption to agricultural operations will be managed through the development of individual property treatments in consultation with landowners/occupants, with respect to the management of cumulative construction activities on or immediately adjacent to private properties. These will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required. Measures, where agreed, will be documented in individual property agreements (or similar). It is noted that a large number of properties surrounding the Commodore Mine and Millmerran Power Station are owned and leased for private occupancy by entities that also have an ownership interest in the mine and power station. 	<p>Chapter 8: Land Use and Tenure</p> <p>Chapter 23: Cumulative Impacts</p> <p>Section 23.3.1</p> <p>Table 23-8</p> <p>Appendix E: Consultation Report</p>
132	132.0007	Private	Surface Water	Directly impacted landowner	Land Resources and Overland flow within the vicinity of currently approved mine infrastructure and Back Creek Diversion. Has modelling taken these risks into consideration?	Detailed modelling to be provided regarding mining infrastructure and works in the areas.	<p>As detailed in Section 8.3.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Back Creek hydraulic modelling is based on 2015 1 m LiDAR (sourced by ARTC) and 2012 Brookstead data flown as part of the Inland Town Stage 4 Project. The inclusion of the Back Creek Diversion Project has not been considered as part of the hydraulic modelling. As part of the Detailed Design of Inland Rail, projects that are likely to affect the local hydrology and floodplain behaviour, and that is likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority. ARTC will consult with Millmerran Operating Company to discuss projects associated with the mine expansion that will influence local hydrology and floodplain behaviour in Back Creek during the Detailed Design stage of the Project.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The impacts of nominated flood events during operation of the Inland Rail Project on Back Creek have been assessed and quantified as part of the Hydrology and Flood Assessment, and reported in Section 8.5 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 14 of the revised draft EIS with a summary of impacts provided in Section 14.8 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 8.3.2</p> <p>Section 8.5</p>
132	132.0008	Private	Economics	Directly impacted landowner	The B2G EIS identifies the long-term permanent footprint of the rail corridor as the limiting factor and undertaken a calculation of impact to land based on their linear project.	Detailed analysis should be considered by the project to identify actual costs/limitations with a linear impediment through future mining resources. To this point, Millmerran Power Partners has had limited detail provided in the form of commercial discussions or alternate routes avoiding mineral development areas.	<p>ARTC conducted a thorough investigation and assessment of various rail alignment options within the 2 km study area during the design development of the revised draft Environmental Impact Statement (EIS). Through active consultation with relevant stakeholders, ARTC has chosen alignment options that minimize the impact on known infrastructure and resources, where technically feasible and without compromising the service offering (detailed throughout Chapter 8: Land Use and Tenure).</p> <p>To reduce the impact on identified resources that were shared with ARTC through consultation with Millmerran Power, a regional business and local employer, the rail alignment next to Millmerran Power underwent an options investigation in 2019. Consequently, the alignment was moved outside the study area, without causing any additional impact on other landowners. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>ARTC has prepared a comprehensive summary of the design changes that have been made since the draft EIS was released for publication. Refer to Section 5.3.3 Chapter 5: Project Description and Appendix B3: Changes to Reference Design since Draft EIS.</p> <p>As outlined in the mitigation measures, ARTC will continue to work with impacted landowners and businesses regarding this change from the draft EIS and will continue to consult with key stakeholders during the Detailed Design stage.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.3.3</p> <p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.6</p> <p>Section 6.6</p> <p>Section 6.7</p> <p>Chapter 8: Land Use and Tenure</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p>
133	133.0001	Private	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	Submitter offers the Millmerran Showgrounds for consideration as prime location.	ARTC determined that the Turallin site was a not a location for an accommodation village for the Project workforce. ARTC advised BNTAC and Toowoomba Regional Council in March 2023 and ARTC also commenced engagement with key stakeholders and the community on potential preferences for a site in the Millmerran area in mid-2023. Engagement with key stakeholders, local businesses and the community will be ongoing and further analysis will be undertaken by on a preferred site location.	Appendix E: Consultation Report
133	133.0002	Private	Traffic and Transport		<p>a. Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre.</p> <p>b. Increase in traffic on narrow roads that are already heavily traversed.</p> <p>c. Impact on Travel time as it is further from the alignment of the rail project.</p> <p>d. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length.</p> <p>e. Could impact on Millmerran town parking availability.</p>	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
133	133.0003	Private	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

133	133.0005	Private	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas), and the Contractor is currently undertaking due diligence to identify a third site in the Millmerran area.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised by the Contractor during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. The Contractor is currently undertaking due diligence to identify a site for the establishment of non-resident workforce accommodation facilities in the Millmerran area. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 17: Social Section 17.5 Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11</p>
133	133.0006	Private	Social Impact Assessment		The camp site could have a possible negative Life Style impact on the small rural historic community.	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas), and the Contractor is currently undertaking due diligence to identify a third site in the Millmerran area.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be nominated by the appointed Contractor. 133	133.0007	Private	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 20.5.1 Section 20.6</p>
133	133.0008	Private	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description Section 5.6.4</p>
133	133.0009	Private	Flora and Fauna		Chance of Flora & Fauna displacement	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4 Chapter 11: Flora and Fauna Chapter 24: Draft Outline Environmental Management Plan</p>
134	134.0001	Private	Social Impact Assessment	Directly impacted landowner	Concerned about maintaining access to their property with proposed new infrastructure, changes to Morris Road and functionality of new infrastructure in heavy rain.	Address property access concerns.	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
134	134.0002	Private	Surface Water	Directly impacted landowner	Concerned about drain issues along railway that borders East Paulsen's Road and drain issues on western end East Paulsen's Road where water drainage from road lies in low Section blocking access on the gravel road impacting access to property.	Address concerns about drainage impacting access to property.	<p>The reference design for the Gowrie to Helidon Project is currently under review as part of the Gowrie to Helidon revised draft EIS. Current flood modelling documented within the revised draft EIS only assesses impacts associated with the Border to Gowrie portion of the Project. Modelling results are mapped within the Gowrie floodplain for the entire hydraulic model domain but these will be further reviewed once the Gowrie to Helidon reference design is confirmed. Impacts associated with the Gowrie to Helidon Project will be reported in the Gowrie to Helidon revised draft EIS.</p> <p>Mitigation measures that have been factored into the Border to Gowrie reference design, or otherwise implemented during the reference design stage for the Project include:</p> <ul style="list-style-type: none"> ▶ The Project has been aligned to be co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes ▶ Refinement of the horizontal alignment considered placement of the Project footprint such that it minimises flooding impacts to the greatest extent possible. ▶ The Project footprint has been established to provide the minimum-sized area required to safely and efficiently construct, maintain and operate the Project <p>Details regarding flooding and geomorphology measures for the Border to Gowrie Project are outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>During detailed design, the Project disturbance footprint will be further refined to that which is required to safely construct, operate and maintain the Project, which will include minimising property acquisition requirements, property severance and disruption to land use and transport networks.</p>	N/A
134	134.0004	Private	Social Impact Assessment	Property Devaluation	Property values will be affected by new railway, increased noise and impacts on visual amenity.	Confirm how ARTC will work with property owner to mitigate the risk to their property value.	<p>ARTC acknowledges that property owners are anxious regarding the potential for property values to decrease as a result of the Project's impacts, as noted in Chapter 17: Social. The Project has committed to a wide range of environmental mitigation and management measures to minimise noise impacts, impacts on scenic amenity and changes to connectivity which could otherwise affect property values.</p> <p>The revised draft EIS is unable to provide advice on individual property values. Appendix X: Social Impact Assessment, Section 7.1 notes that property values may be affected by a range of factors related or unrelated to the project. Any project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers views on impacts such as noise, versus proximity to e.g. employment centres. All relevant research the EIS team could identify is presented within Appendix X: Social Impact Assessment.</p> <p>Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p>	Chapter 17: Social Appendix X: Social Impact Assessment Section 7.1
134	134.0005	Private	Flooding	Modelling	Concerned about draft EIS comments relating to flood modelling and bridges and how the new infrastructure will affect their property during heavy rainfall and consequent flooding. Current drainage along the railway line is extremely poor and backs up and then pools over land alongside the property and in heavy rain on the property causing erosion as well as flow of excess water.	Advise how property impacts from changes to flooding will be mitigated.	<p>ARTC shared the results of the noise modelling and potential mitigation strategies with those sensitive receivers predicted to exceed noise guidelines during the operation of Inland Rail.</p> <p>ARTC notes the structures on this property are more than 750 metres from the proposed level crossing and have not been identified as exceeding said guidelines.</p> <p>ARTC will continue to engage with the community about noise and noise mitigation throughout the Detailed Design, Construction Works and Operations stages of the Project.</p>	N/A
135	135.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
135	135.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. Could impact on Millmerran town parking availability. 	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
135	135.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4

Emergency service would be more readily available if required.</p>	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
135	135.0009	Private - Turalin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
136	136.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

136	136.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20.5.1</p> <p>Section 20.6</p>
136	136.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
136	136.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
137	137.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
137	137.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p>

137	137.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20.5.1</p> <p>Section 20.6</p>
137	137.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
137	137.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
138	138.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. 138	138.0003	Private - Turallin Workers	Air Quality		<p>Location lacks services. Should generators be required to supply power this would create greenhouse emissions.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
138	138.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	<p>a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p>
138	138.0006	Private - Turallin Workers	Social Impact Assessment		<p>The camp site could have a possible negative Life Style impact on the small rural historic community.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. 138	138.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 20.5.1 Section 20.6</p>
138	138.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description Section 5.6.4</p>
138	138.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4 Chapter 11: Flora and Fauna Chapter 24: Draft Outline Environmental Management Plan</p>
139	139.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4</p>
139	139.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Ellerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. Could impact on Millmerran town parking availability. 	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p>
139	139.0006	Private - Turallin Workers	Social Impact Assessment		The camp site could have a possible negative Life Style impact on the small rural historic community.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p>
139	139.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Eilersie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20.5.1</p> <p>Section 20.6</p>
139	139.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
139	139.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
140	140.0001	State Agency	Surface Water		<p>Agriculture - Surface Water Quality - Potential Project impacts include increased debris; changes to water quality and hydrology, (due to increased water turbidity and sedimentation); increased salinity, (which may affect the usability of downstream waters for purposes such as irrigation, farm supply, stock use and recreation, etc.), increased contaminants, erosion, and sedimentation, with exacerbation of these impacts on surface water quality likely if rehabilitation is inadequate. In addition, there are potential impacts to water morphology and the availability of surface water for existing users. Also, structural failure, (of a bridge or culverts within waterways), has the capacity to alter flow regimes and increase degradation of surface water quality due to potential secondary salinity issues. Potential cumulative impacts of the Project on surface water include riparian vegetation loss from vegetation clearing; reduction in the connectivity of waterways, and an increase in erosion and sedimentation in waterways.</p>	<p>Nil. Comment is a summary of issues raised in the submission.</p>	<p>Many Project design elements and commitments have been prepared to mitigate impacts to water quality.</p> <p>The revised reference design has been developed to minimise impacts to watercourses, riparian vegetation and in-stream flora and habitats by adopting a crossing structure hierarchy where bridges are preferred to culverts. Watercourse crossing structures (including culverts and bridges) are designed to minimise the need for ongoing maintenance and inspection to maintain aquatic fauna passage (e.g. fish and turtles) and minimise the risk of blockages in reference to Accepted development requirements for operational work that is constructing or raising waterway barrier works (1 October 2018) (DAF, 2018). Bridges and waterway crossings are designed to minimise impacts to bed, banks and environmental flows, in accordance with relevant regulatory requirements (as per requirements of DAF and the Fisheries Act)</p> <p>The revised reference design has been developed to avoid the need to permanently divert watercourses, as defined and mapped under the Water Act 2000. Two unmapped watercourses are expected to require diversion (Chapter 13: Surface Water, Section 13.5.2 and Chapter 14: Flooding and Geomorphology, Section 14.8.2).</p> <p>Scour protection measures have been included around culvert entrances and exits, on disturbed stream banks and on land bound by a watercourse to avoid erosion. Scour protection or energy dissipation measures have been specifically designed and sized for each culvert location in accordance with Austroads Guide to Road Design Part 5B: Drainage – Open Channels, Culverts and Floodways (Austroads, 2013b) (AGRD) with consideration for flow velocity, soil type and vegetation cover (Chapter 13: Surface Water, Section 13.6.1).</p> <p>Longitudinal drains have been designed to include 3.5 m buffer strips within 100 m swales before the point of discharge into the local waterway system.</p> <p>A Soil Management Plan will be developed which includes the following procedures and protocols relevant to potential impacts on land resources (Chapter 13: Surface Water, Table 13-16):</p> <ul style="list-style-type: none"> Soil/land conservation objectives for the Project Management of problem soils Specification of the type and location of erosion and sediment controls. The erosion and sediment control measures will be developed by a Certified Professional in Erosion and Sediment Control and be in accordance with the International Erosion Control Association Best Practice Erosion and Sediment Control (2008). Requirements for training, inspections, corrective actions, notification and classification of environmental incidents, record keeping, monitoring and performance objectives for handover on completion of construction. <p>The detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).</p> <p>A Rehabilitation and Landscaping Management Plan will be developed for the Project, as a component of the CEMP (Chapter 13: Surface Water, Table 13-16).</p> <p>The Plan will include and clearly identify:</p> <ul style="list-style-type: none"> Location-specific objectives for rehabilitation, reinstatement and/or stabilisation. Objectives and timeframes for rehabilitation and/or reinstatement/stabilisation works (including biodiversity, vegetation establishment and erosion and sediment control outcomes to be achieved) Details of the actions and responsibilities to progressively rehabilitate, regenerate, and/or revegetate areas, whilst minimising the duration of exposure in disturbed areas. 	<p>Chapter 13: Surface Water</p> <p>Section 13.5.2</p> <p>Section 13.6.1</p> <p>Table 13-16</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.2</p>
140	140.0002	State Agency	Groundwater		<p>Groundwater Resources - Potential Project impacts include - loss or damage to existing landowner bores or groundwater use from bores (quality/yield degradation); groundwater level reduction; alteration of acquirer parameters and/or flow patterns; subsidence/settlement of compressible substrates; ARD; groundwater level mounding; and alteration to groundwater recharge/discharge mechanisms. The Project could also change groundwater levels and flow paths, reduce groundwater levels due to seepage into cuttings; and increase contamination causing a reduction of groundwater quality.</p>	<p>Nil. Comment is a summary of issues raised in the submission.</p>	<p>ARTC only anticipate localised minor impact to groundwater levels and quality in the vicinity of the deep cuts which are likely to intercept groundwater. Potential Project impacts are considered in Chapter 15: Groundwater, Section 15.6 and Appendix U: Groundwater Technical Report, Section 7. Proposed mitigation measures are provided in Chapter 15: Groundwater, Section 15.7 and Appendix U: Groundwater Technical Report, Section 8.</p> <p>ARTC have committed to undertaking site inspections prior to the construction of cuts, including visual examination of surface outcrops for sulfide minerals or evidence of sulfide mineralisation. The outcomes and information from these inspections will be utilised to inform the management of potential acid rock drainage (ARD) from cuttings prior to Project works.</p> <p>Cuts are expected to be primarily into the weathered to extremely weathered units portions of the Kumbarrilla Beds and Walloon Coal Measures (WCM); therefore, the risk for ARD could be naturally mitigated as sulphides minerals may have already been oxidised. Unweathered areas of the Kumbarrilla Beds and WCM have been avoided where possible. Potential for acid rock occurrence along the Project alignment is discussed in Chapter 9: Land Resources, Section 9.4.2 and is evidenced throughout Appendix G1: Geotechnical Investigation Results. Potential impacts relating to Acid rock are presented in Chapter 9: Land Resources, Section 9.5.7.</p> <p>Existing contamination in the form of cattle dips, waste facilities, etc encountered within the rail corridor will be removed and the sites remediated during construction such that these sources of contamination will not be present to contaminate groundwater where groundwater will be extracted.</p> <p>Contamination of groundwater may arise as a result of unintended spills and leaks of hydrocarbons (oils, fuels and lubricants) and other chemicals related to maintenance activities (accidental discharge) or rail incidents (e.g., loss of load). In the instance a spill, leak or any accidental discharge occurs during normal operation activities, the impact is likely to be superficial in nature and not expected to impact on shallow aquifers (Section 15.6.3 and Table 15-17 and 15-20 of Chapter 15: Groundwater. Maintenance crews and emergency response teams will be equipped with spill kits and environmental response equipment to intercept spills and leaks and prevent such incidents from impacting groundwater. Mobile plant, drill rigs, and equipment will be maintained in accordance with manufacturer requirements and inspected frequently to minimise breakdowns and decrease the risk of contamination. Contamination or altered water quality impacting vulnerable groundwater resources is considered a moderate risk during construction and low risk during operation (Table 15-23, Chapter 15: Groundwater).</p>	<p>Chapter 9: Land Resources</p> <p>Section 9.4.2</p> <p>Section 9.5.7</p> <p>Chapter 15: Groundwater</p> <p>Section 15.6</p> <p>Section 15.6.3</p> <p>Section 15.7</p> <p>Table 15-17</p> <p>Table 15-20</p> <p>Table 15-23</p> <p>Appendix U: Groundwater Technical Report</p> <p>Section 7</p> <p>Section 8</p>
140	140.0003	State Agency	Flooding		<p>Hydrology and Flooding - Potential Project impacts include - changes to the existing flood regime such as, changes in peak water levels and associated duration of inundation;</p> <ul style="list-style-type: none"> change flood flow distribution across floodplain areas; changes in velocity (leading to localised scour and erosion); and potential impacts on external properties, including increased depth of water, (noting the Project alignment crosses several major waterways (including the Macintyre and Condamine Rivers). 	<p>Nil. Comment is a summary of issues raised in the submission.</p>	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIO) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office, noting these will be subject to further assessment at Detailed Design to remove/reduce the exceedances where possible.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Expert Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment.</p> <p>Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter (Section 5 to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>Flood mapping has been provided in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the Digital Platform for each of the Flood Impact Objectives including:</p> <ul style="list-style-type: none"> Change in peak water levels Change in peak velocity Change in time of inundation Change in hazard Change in velocity (with FIO cut-off's applied) Change in hazard (with FIO cut-off's applied) Change in time of inundation (with FIO cut-off's applied) <p>The Digital Platform includes local and regional catchments for the Existing Case, Developed Case, Change Mapping and Exceedances. The PDF mapping in Appendix T2: Hydrology and Flooding Technical Report Volume 2 includes local and regional catchments for the Existing Case, Developed Case, Change Mapping and Exceedances aligned with the mapping requirements, for the 1% and 20% AEP events. The PDF mapping includes the sensitivity runs and calibration events.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6.3</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 4.2</p> <p>Section 5 - 17</p> <p>Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
140	140.0004	State Agency	Flora and Fauna	Terrestrial fauna	<p>The proponent states that they are consulting with GRC about realignment of the wild dog check fence. The Project interacts with the existing wild dog check fence from Ch 26.8 km to Ch 56.0 km and that the wild dog check fence will need to be reinstated on the left-hand side corridor boundary. Table 3.1 in Appendix M indicates the location of parts of the check fence which are proposed to be reinstated. There are nine parcels of land affected in this Section</p> <p>The proponent has not included the requirements of Section S91 (3) of the Biosecurity Act 2014 and will need to make clear the requirement for consultation with the Chief Executive of the Department of Agriculture and for consultation to be initiated by the Department of Agriculture and</p> <p>Fisheries with the building authority (Goondiwindi Regional Council) and the owner of the land affected by the amendment about the reinstatement of the check fence.</p>	<p>Under the Biosecurity Act 2014, local governments oversee and fund the maintenance of the wild dog check fences to a wild dog-proof standard. The wild dog check fences were built to protect animals in the adjacent cropping and grazing lands. Although the check fences do not physically link up to the wild dog barrier fence, they play an important role in wild dog control in southern Queensland. Most of the wild dog check fences have been well maintained and have been improved from their original condition.</p> <p>Section S91(3) of the Biosecurity Act 2014 requires that before amending the barrier fence map the Chief Executive of the Department of Agriculture and Fisheries must consult with the building authority (Goondiwindi Regional Council) and the owner of land affected by the amendment.</p> <p>There are other references to consulting with GRC about this issue and these should be cross-referenced where relevant.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan includes the following requirement as a mitigation measure: "Where severance of the wild dog check fence or DDMRB rabbit fence is required, fence realignment and reconstruction will be undertaken as an early works package prior to the commencement of construction of rail infrastructure. Replacement fencing will be in accordance with detailed design in consultation and agreement with the with relevant stakeholders, notably DES/QPWS, impacted landowners and lessees, DAF and GRC. "</p> <p>Discussion of mitigation measures for barrier fencing is also detailed in Sections 8.5.1 and 8.6.3 in Chapter 8: Land Use and Tenure.</p> <p>DAF consultation is required before any amendments to the wild dog check fence are undertaken under Section S91(3) of the Biosecurity Act 2014", Appendix L: Terrestrial and Aquatic Ecology Technical Report incorporates the following text: "Further liaison with GRC and DDMRB will be undertaken during Detailed Design to confirm the fencing specifications for the dog check and rabbit exclusion fence, respectively".</p> <p>ARTC and GRC discussions about the realignment of the wild dog check fence are ongoing. At a suitable time during this process, ARTC will consult with DAF about any potential amendment of Section 91(3) of the Biosecurity Act 2014.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.3</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 7.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
140	140.0005	State Agency	Land Resources	Offsets	<p>Agriculture - Regardless of the inconsistency mentioned below, a significant amount of ALC Class A/B land, and land within an Important Agricultural Area will be permanently converted to a non-agricultural use by the project.</p> <p>The mitigation measures proposed for impacts to this finite resource appear to centre on avoidance and minimisation methods through the reference design phase and through amendments at the detail design stage.</p> <p>Given the amount of land to be irreversibly converted to a non-agricultural use and the regions reliance on agriculture economically, DAF is concerned that the mitigation measures proposed aren't adequate to protect the long-term viability and growth of the agriculture sector as per the State Planning Policy nor the Darling Downs Regional Plan, in which agriculture is the priority land use</p> <p>DAF raised this issue at the EIS adequacy stage stating that the proponent does not discuss mitigation strategies regarding the loss of ALC A and B land.</p>	<p>The EIS should consider investigating ways to ensure that there is no net loss of agricultural productivity in the region as a mitigation measure to offset the considerable loss of ALC Class A/B land within the EIS assessment area. This could be achieved by working with affected landowners to 'switch on' areas which are currently not utilised for production, but with new infrastructure or access (etc.) could be used for agricultural production.</p> <p>It is recommended that an equivalent amount of ALC A/B land be switched on to offset the loss of ALC A/B land rendered unusable for agriculture by the project. This land should be protected by covenant on title so that it remains permanently available for ongoing and uninterrupted use for agricultural only.</p>	<p>Development of the reference design for the Project has progressed in parallel with the impact assessment process. Refinement of the horizontal alignment considered placement of the Project footprint such that it traverses along, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA.</p> <p>Where permanent infrastructure is proposed, the Project will sterilise productive agricultural land. However noting that when quantifying agricultural land sterilised by the permanent footprint and identifying the significance of this impact, it was determined that the permanent footprint will traverse less than 0.5 per cent of the Class A and Class B land mapped within the Goondiwindi and Toowoomba local government areas (Section 8.5.4, Table 8-46 of Chapter 8: Land Use and Tenure).</p> <p>There are no legislative requirements for offsetting the loss of Class A and Class B land. As such, during future stages of the Project, the loss of Class A and Class B Agricultural Land will continue to be managed through (as per Section 8.5.4, Table 8-46 of Chapter 8: Land Use and Tenure and Section 23.3.1, Table 23-8 of Chapter 23: Cumulative Impacts):</p> <ul style="list-style-type: none"> Refinement of the Project during Detailed Design to minimise the footprint to the extent required for the construction works and safe operation of the Project Rehabilitation of land that is temporarily disturbed in support of construction activities (e.g. for access tracks, laydown areas, etc.) at the end of its use for construction, unless otherwise agreed with the relevant landowner Construction contract documentation for the Project, as well as adjoining Inland Rail Projects, will have consistent clauses regarding the monitoring and defect correction for revegetated and rehabilitated areas, particularly in areas designated as Class A and Class B agricultural land or within an IAA. <p>This wording has been reviewed and reworded in the revised draft EIS to ensure it addresses the proposed solution.</p> <p>With regard to avoiding, minimising or mitigating any impact on agricultural values when meeting environmental offset requirements required for the Project, the Environmental Offset Delivery Strategy (Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie) typically targets land that holds inherent biodiversity value which reflects those MNES and MSSES likely to be impacted by each Qld Project. On this basis, offset site selection is undertaken on a hierarchical basis which preferentially targets land that contains ecological values generally associated with intact remnant and regrowth ecological communities (habitat) and in doing so, avoids or minimises, to the greatest extent possible, impacts to highly modified agricultural land.</p> <p>The Qld Offset Program will commit to consulting with DAF during the development of the final offset strategy and offset management plans.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.4</p> <p>Table 8-46</p> <p>Chapter 23: Cumulative Impacts</p> <p>Section 23.3.1</p> <p>Table 23-8</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p> <p>Section 5 and 6</p>
140	140.0006	State Agency	Land Resources		<p>Inconsistent approach in reporting intensive animal activities - Table F.2 in Appendix F details land uses based from QLUMP to detail predominant land use. However, Section 7.5.2.2 in Chapter 7 uses EA data to detail land use. As a result Table 5.2 details 2 properties where intensive animal operations are the predominate land use, whereas Section 7.5.2.2 identifies nine intensive animal operations. The inconsistent use of data does not provide for a consistent narrative when discussing agricultural land uses.</p>	<p>The narrative in the EIS needs to be consistent to ensure that agricultural values, based on farming practices and systems, are accurately identified and detailed.</p>	<p>This issue is noted. A consistency check will be made for the revised draft EIS to ensure consistency in terminology.</p> <p>The revised draft EIS Chapter 8: Land Use and Tenure, Sections 8.4.1 and 8.5.1, have been updated in terms of information on land uses as well as information on intensive animal operations. The methodology used to provide the information in the revised draft EIS is presented in Section 8.3.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.3</p> <p>Section 8.4.1</p> <p>Section 8.5.1</p>
140	140.0007	State Agency	Land Resources		<p>Inconsistency with regards to amount of ALC Class A land to be permanently sterilised by the project.</p> <p>Table 8-20 states 1,913.24 ha of ALC Class A/B land will be permanently sterilised, however Table 8.21 totals for Class A land in the Goondiwindi and</p> <p>Toowoomba LGAs don't add up to 1,913.24, rather 1,766.88 which is what is recorded in the narrative.</p>	<p>Amend figures to be consistent throughout this Chapter and others referring to loss of ALC Class A and B land</p>	<p>The agricultural land class (ALC) data has been reviewed and updated in the revised draft EIS (Chapter 9: Land Resources, Table 9.21 and Table 9.22) to incorporate the design changes made since the draft EIS was issued. A consistency check has been made for the revised draft EIS and the tables have been amended.</p> <p>ARTC are committed to minimising loss of agricultural land by co-locating with existing rail or road or aligning with property boundaries, where possible. As described in the revised draft EIS Chapter 2: Project Rationale Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across the Inland Rail program of works. Where the loss of agricultural land was unable to be avoided, refinement of the horizontal alignment was considered (among other environmental, social, cultural, economic and technical constraints) to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>The Project will result in the reduction of productive agricultural land within the Project footprint, which has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. When quantifying potential productive agricultural land sterilised by the permanent footprint, it is assumed that productive land that is mapped by QLUMP as occurring within the existing South Western System and Millmerran Branch Line rail corridors and within existing road corridors has already been sterilised. On this basis, this assessment only considers the areas within the permanent footprint that are located outside of the South Western Line and Millmerran Branch Line rail corridors and existing road corridors.</p> <p>Approximately 1,449.86 ha of land within the permanent footprint is classified as Class A agricultural land, with a further 73.71 ha classified as Class B agricultural land. This equates to a total of 1,523.57 ha of land within the permanent footprint (outside of existing rail and road corridors) classified as Class A or Class B agricultural land, which will be sterilised. These areas are primarily used for grazing and cropping, as well as some irrigated cropping and irrigated perennial horticulture uses. Approximately 1,255.19 ha of land within the permanent footprint is also within an IAA (Table 8-11 of Chapter 8: Land Use and Tenure).</p> <p>Approximately 2,047.65 ha of land within the temporary footprint is classified as Class A agricultural land, and 82.08 ha is classified as Class B agricultural land. This equates to a total of 2,129.73 ha of land within the temporary footprint as being classified as Class A or Class B agricultural land, which will be temporarily used for the construction of the Project. These areas are used mainly for grazing activities. Approximately 1,545.12 ha of land within the temporary footprint is also within an IAA (Table 8-11 of Chapter 8: Land Use and Tenure).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the <i>Acquisition of Land Act 1967</i> (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform the development of the detailed design and Construction Environmental Management Plan.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 8: Land use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p> <p>Table 8-11</p> <p>Chapter 9: Land Resources</p> <p>Table 9-21</p> <p>Table 9-22</p>
140	140.0008	State Agency	Flora and Fauna		<p>Fish passage - Where waterways providing fish passage will be impacted in a manner greater than that described in the ADR, a development approval is required. Further fish surveys should be undertaken during times of adequate flow in the wet season to gain an understanding of fish species composition and population abundance.</p> <p>Only then can the scale of impacts from the project be fully understood.</p>	<p>The report outlines that during three field surveys the presence and abundance of fish species would have been limited by dry conditions. This is evident when noting that the surveys were conducted prior or after significant wet season flows. It is noted that the report states that 'a greater diversity and abundance of fish across watercourses... is therefore assumed...'</p> <p>However, the assumption of greater diversity does not necessarily describe impacts resulting from the development.</p>	<p>As discussed in Appendix L: Terrestrial and Aquatic Ecology Technical Report, an additional targeted fish survey across 12 sites and a eDNA assessment have been conducted since the draft EIS was released for public notification. The scope of works was expanded, and a range of additional survey techniques were applied to assess fish assemblages at aquatic ecology sites that were suitable. Further seasonal fish surveys, for any waterway intersections that do not meet ADR for waterway barrier works requirements, are to be conducted during times of adequate flow to gain an understanding of the baseline fish species composition and population abundance of these species.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 5.3</p>
140	140.0009	State Agency	Flora and Fauna	Terrestrial flora	<p>Biosecurity - To ensure the project aligns with GRC's Biosecurity Plan for the strategic management of priority invasive species, it is recommended that the EIS lists and integrates GRC's priorities for invasive species management in relevant sections of Chapter 10, Chapter 22, and in the development of the Biosecurity sub-plan of the CEMP. This should include GRC's consideration of species not present, the listing of prioritised restricted species, and priority non-declared species.</p>	<p>The proponent has identified and listed restricted invasive species and Weeds of National Significance (WoNS) but has failed to reference the GRC Biosecurity Plan or state how the listed species are to be prioritised for strategic management. There is little alignment with GRC Regional Council's Biosecurity Plan and priorities for invasive species.</p>	<p>Material from the GRC Biosecurity Plan has been incorporated into the revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report including its objectives for invasive species management and a Biosecurity plan will be developed for the Construction Environmental Management Plan(CEMP) as stated in Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p>
140	140.0010	State Agency	Surface Water		<p>This Section outlines that three waterways providing for fish passage will be realigned/diverted. However, this Section does not acknowledge that filling sections of waterways and consequent flow diversions constitute waterway barrier works. Such works are assessable development and require an approval. This Table outlines the mitigation measures relating to impacts to surface waters. Under row construction it is explained that construction tasks within the 1% AEP flood area will be scheduled to avoid periods of elevated flood risk.</p> <p>However, instream works should be avoided in 20% AEP flood events to minimise impacts to waterways providing for fish passage.</p>	<p>The filling of sections of waterways and consequent altering flow means that diversions constitute waterway barrier works that are assessable development.</p> <p>Such works require an approval under the Planning Act 2016.</p> <p>All in-stream works are to be completed as quickly as possible, but must be avoided during times of elevated flows.</p>	<p>A review of the DAF Queensland Waterways for Waterway Barrier Works mapping was undertaken, identifying a total of 100 waterways for waterway barrier works that are intersected by the Project alignment. Section 13.4.1 of Chapter 13: Surface water acknowledges that barrier works include construction, raising, replacement and some maintenance works on structures. Waterways for waterway barrier works that are intersected by the Project alignment are identified in Table 13-8 of Chapter 13: Surface Water.</p> <p>The detailed design will continue to be developed to minimise the extent of impacts to waterways, riparian vegetation and in-stream flora and habitats, in accordance with the intent of DAF' (2018) 'Accepted development requirements for operational work that is constructing or raising waterway barrier works'. Where the Project is unable to comply with the Accepted Development Requirements, a development approval for operational work that is constructing or raising waterway barrier works will be required (Section 13.6.2, Table 13-16 of Chapter 13: Surface Water).</p> <p>During construction, in-stream works will be undertaken in accordance with the Accepted Development Requirements for lower-risk watercourses. In-stream works for higher-risk watercourses will be planned and undertaken in accordance with applicable assessment benchmarks for assessable development.</p>	<p>Chapter 13: Surface Water</p> <p>Section 13.4.1</p> <p>Section 13.6.2</p> <p>Table 13-8</p> <p>Table 13-16</p>
140	140.0011	State Agency	Flora and Fauna		<p>Training in biosecurity risks and prevention and the requirements under the Biosecurity Act 2014 is not included in the list that requires all employees, contractors and subcontractors to receive. The reference to the reinstatement of the wild dog fence does not include a include the Section S91(3) requirement of the Biosecurity Act 2014.</p> <p>(Refer to the above comment)</p>	<p>Recommend that biosecurity is included in the list of training requirements for all employees, contractors and subcontractors. Include a reference to the requirement of the Section S91(3) of the Biosecurity Act 2014.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan states that a Biosecurity Management Plan will be developed as a component of the CEMP. Chapter 24: Draft Outline Environmental Management Plan provides the training and awareness requirements of the Project in relation to the implementation of the CEMP. It states that a training register will be developed and maintained throughout construction and commissioning that identifies requirements in relation to:</p> <ul style="list-style-type: none"> Qualifications and competencies Project-specific environmental training courses, refreshers and inductions relevant to different activities/groups of personnel/locations. <p>Implementation the Biosecurity Management Plan during construction will ensure that training of staff and contractors will occur. The specifics of training will be contained within the Plan which will be prepared during detailed design using field-verified data. Pest animal management controls, including protocols for severing, realigning and reinstating the wild dog check fence and the DDMRB rabbit fence will be included as part of the Biosecurity Management Plan.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
140	140.0012	State Agency	Land Resources		<p>DAF is concerned over the potential for adverse impacts to poultry operations as a result of the operational activities of the project.</p>	<p>What is the mitigation strategy to ensure that adverse impacts to poultry operations, including bird deaths, as a result of the operation of the rail line, will be appropriately mitigated to ensure that there is a no net loss in poultry capacity and production in the regions where impacts occur? The EIS should detail the mitigation strategy in this regard and include this in the projects ongoing commitments and reporting requirements.</p>	<p>In response to public notification of the draft EIS, ARTC has refined the Project alignment, which has changed the potential impacts for a number of agricultural enterprises, including cattle feedlots, piggeries and poultry farms. The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential direct or indirect impacts to a Millmerran-based chicken farm infrastructure and their piggery, poultry and egg farm operations (Chapter 8: Land Use and Tenure, Section 8.5.1). ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community that include (Chapter 2: Project Rationale, Section 2.10.9, and Appendix B3: Changes to Reference Design since Draft EIS):</p> <ul style="list-style-type: none"> Reducing the potential impacts to workers travelling to the Millmerran Power Station, the piggery on Lindenmayer Road and landowners travelling within their community (home and local townships). Reducing the potential impacts on transport requirements for logistical operations required for the current and future farming operations. Reduces the adverse economic and social impacts by: Creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks associated with Inland Rail's operational noise, vibration, light emissions, and potential biosecurity risks. Avoids direct impacts to future planned infrastructure. The access road for the Lindenmayer Road infrastructure no longer requires a level crossing, eliminating any direct impacts to associated traffic for future operations. <p>For more information, refer to Chapter 17: Social, Sections 17.5 and 17.6 and Chapter 16: Noise and Vibration of the revised draft EIS.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.10.9</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Section 17.6</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
140	140.0013	State Agency	Flora and Fauna		Draft EIS does not meet TOR 7.5 - location of rock sample drill sites is expressed in Eastings and Northings not in latitude and longitude.	Meet the TOR requirement.	<p>Revised draft EIS Chapter 13: Surface Water, Section 13.2, and Appendix S: Surface Water Quality Technical Report, Section 3.1 indicate that the Project will have accepted development and assessable development barrier works as part of the secondary approval process.</p> <p>Where the Project transverses mapped waterways for waterway barrier works Appendix S: Surface Water Quality Technical Report, Table 2.1, states the following:</p> <p>"Acceptable development requirements are defined in the DAF guideline: Accepted development requirements for operational work that is constructing or raising waterway barrier works (2018), and at a minimum include standards such as:</p> <ul style="list-style-type: none"> Development work minimises impacts to waterways and fish habitats Where works are for the replacement of an existing waterway barrier work, the defunct waterway barrier work is to be completely removed as soon as possible and within four weeks of the completion of the replacement works For any part of the waterway bed or banks adjacent to the works that has been altered by the waterway barrier works, the site is restored and/or rehabilitated, including fish habitat elements. <p>Inland Rail commits to ongoing consultation during detailed design with DAF, including about the acceptable development requirements regarding timing and construction timing for waterway for watery barrier works.</p> <p>The Project is likely to require applications for waterway barrier works or demonstrate compliance with acceptable development requirements. This will be further described in detailed design and early works and pre-construction activities stages of the Project."</p> <p>The Coordinator-General may impose conditions, stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project.</p>	<p>Chapter 13: Surface Water Section 13.2</p> <p>Appendix S: Surface Water Quality Technical Report</p> <p>Section 3.1</p> <p>Table 2.1</p>
140	140.0014	State Agency	Flora and Fauna		<p>Where waterway crossings are constructed in accordance with DAF factsheet</p> <p>"What is not a waterway barrier work?" or in accordance with the accepted development requirements for operational work that is constructing or raising waterway barrier works, the works do not result in a significant residual impact.</p> <p>Where waterway barrier works require a development approval, the associated assessment of an application will determine whether the development results in a significant residual impact. Any acceptable Significant Residual Impact is likely to require an environmental offset.</p> <p>However, an environmental offset will not be considered until it has been demonstrated that all reasonable measures have been taken to firstly avoid, minimise and/or mitigate impacts to waterways providing for fish passage (refer to Queensland Environmental Offsets Policy).</p> <p>Recommended condition: Enter into an agreed delivery arrangement to deliver an environmental offset in accordance with the Environmental Offsets Act 2014 to counterbalance any significant residual impacts on the matter of State environmental significance, being waterways providing for fish passage.</p> <p>Reason: To counterbalance all significant residual impacts to waterways providing for fish passage.</p> <p>Timing: Prior to commencing any works that impact on waterways providing for fish passage.</p>	The Table 5.18 outlines that the likelihood of a significant residual impact to waterways providing for fish passage is uncertain.	<p>Based on changes to the reference design, additional survey work and impact assessment undertaken in the revised draft EIS, the likelihood of significant residual impacts to waterways providing for fish passage is now "not anticipated" as discussed in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 5.3</p>
140	140.0015	State Agency	Flora and Fauna		<p>This Section of the EIS should be amended to the following effect:</p> <p>Remove all references to "self-assessable codes" and replace with "accepted development requirements".</p> <p>All waterways providing for fish passage, including those that may not be mapped under the spatial data layer Queensland waterways for waterway barrier works must be identified to determine the full extent of impacts the project will have on waterways providing for fish passage.</p> <p>A waterway is defined under the Fisheries Act 1994 and further guidance can be found on Fisheries Queensland's factsheet, What is a waterway? Where a waterway is present on ground but not mapped, the proponent should seek pre-judgement advice from the State Assessment and Referral Agency to seek a determination of the waterway to identify whether works may be accepted or assessable development.</p> <p>Remove text "and some regularly rebuilt waterway barriers" where referred to "self-assessable works".</p>	<p>Aquatic ecology technical report - The reports states that the spatial data layer Queensland waterways for waterway barrier works shows the extent of Fisheries' interests in relation to waterway barrier works and that this layer indicates whether waterway barrier works can proceed under self-assessable code or require a development approval.</p> <p>This is not correct, the Fisheries Act 1994 defines a waterway, not the spatial data layer. The spatial data layer is only a tool to identify whether specific types of waterway barrier works can be constructed under the relevant accepted development requirements or require development approval.</p> <p>Self-assessable codes are obsolete as they have been transitioned to accepted development requirements.</p> <p>This Section states that self-assessable work allows for some regularly rebuilt waterway barriers.</p> <p>"Self-assessable" works conducted under the accepted development requirements do not allow for regularly rebuilt waterway barriers.</p>	<p>Amendments have been made to the wording throughout Appendix L: Terrestrial and Aquatic Ecology Technical Report in relation to the intent of the <i>Fisheries Act 1994</i> (Qld) and to include discussion on "accepted development requirements", where applicable.</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report states that aquatic field surveys were carried out across 34 sites over three survey events. The surveys were used to describe ecological values of watercourses within the study area. The surveys included, but were not limited to, fish surveys, aquatic habitat assessments and waterway barrier works assessments, to determine if a particular feature is a defined waterway that provides for fish passage.</p> <p>Additionally, Appendix S: Surface Water Quality Technical Report Section 3.1.2 states that ground surveys were undertaken for opportunistic water quality sampling at the same time and, in addition to, on-ground aquatic ecology surveys. Unmapped waterways for fish passage have been noted during these on-ground assessments.</p> <p>Reference to "and some regularly rebuilt waterway barriers" where referred to "self-assessable works" has been deleted from Chapter 11: Flora and Fauna and Appendix S: Surface Water Quality Technical Report.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix S Surface Water Quality Technical Report</p> <p>Section 3.1.2</p>
140	140.0016	State Agency	Flora and Fauna		<p>It will be recommended to condition fish salvage in accordance with DAF fish salvage guidelines.</p> <p>Recommended condition: Where waterways and waterbodies require de-watering, fish must be salvaged in accordance with DAF's Guidelines for fish salvage found here: daf.qld.gov.au/business-priorities/fisheries/habitats/policiesguidelines/factsheets/guidelines-for-fish-salvage</p> <p>Additional Advice to attach to this condition as a note: A General Fisheries Permit is required for the use of regulated apparatus and when fish in possession (e.g. during transport to other locations) exceeds the recreational limits prescribed by the Fisheries (General) Regulation 2019. The consequent stocking of fish into Queensland waters may require an authority. Advice should be sought from DAF prior to any fish salvage operations.</p> <p>Reason: To minimise the risks of fish injury and mortality and fish health being compromised by the project.</p> <p>Timing: At all times.</p>	<p>Aquatic Ecology Technical Report - Table 41 highlights that when surface water storages are dewatered, reasonable measures to avoid the spread of pest species will be taken. However, surface water storage areas may contain other (native) fish. Any fish (which is not a declared pest) must be salvaged prior to dewatering to prevent injury and mortality of fish. Fish salvage in accordance with DAF fish salvage guidelines must be undertaken prior to complete dewatering where fish are present.</p>	<p>As stated in Appendix L: Terrestrial and Aquatic Ecology Technical Report, if dewatering of existing storages is required, fish salvage should occur in accordance with the DAF Guidelines for fish salvage.</p> <p>If dewatering of existing storages is required, dewatering strategies will be required to comply with the Biosecurity Act to take reasonable measures to avoid the spread of pest species (e.g. screening of pump intake). This includes the salvage and relocation of native fish. This will be managed in accordance with guidelines for fish salvage (DAF, 2018). An appropriately qualified person will be consulted to make an assessment on the method of recovery, transport and release of fish and other aquatic fauna, as required.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p>
140	140.0017	State Agency	Flora and Fauna		Draft EIS does not meet TOR 6.4 - serious consideration has not been given to avoidance of acid sulphate rocks.	Meet TOR requirement.	<p>Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy do not discuss the use of fencing across small waterways.</p> <p>Chapter 13: Surface Water, Section 13.2, and Appendix S: Surface Water Quality Technical Report, Section 3.1 indicate that the Project will have accepted development and assessable development barrier works as part of the secondary approval process.</p> <p>Where the Project transverses mapped waterways for waterway barrier works Appendix S: Surface Water Quality Technical Report, Table 2.1, states the following:</p> <p>"Acceptable development requirements are defined in the DAF guideline: Accepted development requirements for operational work that is constructing or raising waterway barrier works (2018), and at a minimum include standards such as:</p> <ul style="list-style-type: none"> Development work minimises impacts to waterways and fish habitats Where works are for the replacement of an existing waterway barrier work, the defunct waterway barrier work is to be completely removed as soon as possible and within four weeks of the completion of the replacement works For any part of the waterway bed or banks adjacent to the works that has been altered by the waterway barrier works, the site is restored and/or rehabilitated, including fish habitat elements. <p>Inland Rail commits to ongoing consultation during detailed design with DAF, including about the acceptable development requirements regarding timing and construction timing for waterway for watery barrier works.</p> <p>The Project is likely to require applications for waterway barrier works or demonstrate compliance with acceptable development requirements. This will be further described in detailed design and early works and pre-construction activities stages of the Project."</p>	<p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p> <p>Chapter 13: Surface Water Section 13.2</p> <p>Appendix S: Surface Water Quality</p> <p>Section 3.1</p> <p>Table 2.1</p>
140	140.0018	State Agency	Surface Water		<p>Appendix N - environmental offset delivery strategy Qld. DAF notes that the Project will result in significant adverse impacts, even after the implementation of all mitigation measure, including rehabilitation. As such, offsets will be required under the EPBC Act Offsets Policy and Qld Environmental Offsets Policy 2017.</p> <p>DAF understands that State Agencies will be consulted during the development of Environmental Offset Delivery Plans and Offset Area Management Plans.</p>	<p>Development of the Environmental Offset Delivery Plans and Offset Area Management Plans should ensure that ALC Class A/B land, land within an Important Agricultural Area and productive agricultural lands are not converted to a non-agricultural use for offsetting purposes.</p>	<p>Section 8.5.3 in Chapter 8: Land Use and Tenure states, biodiversity offsets will be delivered as per the relevant legislative requirements, including the EPBC Act, and ARTC's Queensland Offset Program typically targets land that holds inherent biodiversity value which reflects those MNES and MSES likely to be impacted by the Project. Offset site selection is undertaken on a hierarchical basis which preferentially targets land that contains ecological values generally associated with intact remnant and regrowth ecological communities (habitat) and in doing so, avoids or minimises, to the greatest extent possible, impacts to highly modified agricultural land. Offset development will target regrowth areas as a preference rather than active agricultural land.</p> <p>Chapter 24: Draft Outline Environmental Management Plan outlines that during detailed design, ARTC will undertake consultation with DAF for the development of the final Environmental Offsets Delivery Strategy and delivery plans to ensure agricultural values are not adversely impacted by environmental offsets.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.3</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
140	140.0019	State Agency	Flora and Fauna		Draft EIS does not meet TOR 7.7 - Only 7 surveys were filled out from Goondiwindi shire residents to inform the social impact assessment. This is clear evidence of a lack of engagement with local communities. No remediation was provided. ARTC has been criticised by both Goondiwindi Regional Council and Toowoomba Regional Council for not listening and not taking advice. Submitter provides personal examples of engagement with ARTC in Appendix A.	Meet the TOR requirement.	<p>ARTC acknowledge concerns about some of the laydown areas proposed along the alignment. The laydown areas have been strategically located for the Project to enable robust construction methodologies. ARTC are committed to ongoing consultations with impacted landowners through the Detailed Design and Construction Works stages with the contractor. This will enable the Project to further develop and implement property-specific mitigation measures to avoid or minimise impacts.</p> <p>As described in Section 5.6.7 of Chapter 5: Project Description of the revised draft EIS, several laydown areas have been identified along the length of the alignment and positioned to avoid or minimise potential impacts to environmental and social receptors. The locations have been chosen to avoid areas that are within the 1% AEP floodplains where possible. However, by virtue of the requirement of laydown areas for construction bridges, some laydown areas must be within flood plains and near watercourses or drainage features. In such instances, the following precautions will be taken:</p> <ul style="list-style-type: none"> ▶ The site will be surveyed prior to site establishment to understand the exact extent of potential flooding impact to facilities and storage areas ▶ The earthworks and temporary drainage will be designed to minimise flooding impacts. <p>Fuel storage areas will be bunded, capacity restricted to no larger than required for reasonable operations, and preferentially stored at the furthest point away from watercourses.</p>	Chapter 5: Project Description Section 5.6.7
140	140.0020	State Agency	Flora and Fauna		Draft EIS does not meet TOR 10.10(c) - Draft EIS does not identify quantities of wastewater that may be generated during construction.	Meet the TOR requirement.	<p>Wastewater generated during construction would include wastewater from accommodation facilities. A single 300-bed non-resident workforce accommodation with 250 L/person/day water usage could generate up to 0. 04 ML/day of treated wastewater when at 100 per cent occupancy. Therefore two accommodation facilities could generate up to 0. 08 ML/day (Chapter 5: Project Description, Section 5.4).</p> <p>The estimated construction water requirements for civil earthworks, track works and revegetation range between 0.3 to 12 ML/day as shown in Figure 5.23 (Chapter 5: Project Description, Section 5.6.24). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>Since construction water demands are much greater than the quantity of wastewater generated, it is likely that most of the time any wastewater would be used for construction and not discharges are likely. Where industrial or trade waste may be generated by construction activities, the resultant wastewater will be captured and, where possible, recycled. Where recycling is not feasible, the captured wastewater will be collected by a licenced contractor and taken offsite for disposal at an appropriately licenced wastewater facility (Chapter 13: Surface Water, Section 13.6.2, Table 13-16).</p> <p>Predictive modelling has determined that groundwater seepage may occur from the face of deep cuts (>10 m) where groundwater is intersected; however, the assessment has concluded that seepage water, in general, will evaporate (Chapter 15: Groundwater, Section 15.6.2). Groundwater data will be refined during detailed design when additional site-specific data hydrogeological data is combined with the finalised design for model re-calibration and re-run of predictive simulations. Further details are provided in Chapter 15: Groundwater Table 15.20 (Section 15.7.2) and Chapter 13: Surface Water, Section 13.5.1.</p>	Chapter 5: Project Description Section 5.4 Section 5.6.24 Figure 5.23 Chapter 13: Surface Water Section 13.5.1 Section 13.6.2 Table 13-16 Chapter 15: Groundwater Section 15.6.2 Section 15.7.2 Table 15-20 Appendix B5: Construction Water Requirements
140	140.0021	State Agency	Flora and Fauna		Design Drawings part 2 of 2. Plans 2025, 2027, 2032, 2034, 2037, 2039, 2042, 2045, 2049, 2056, 2063, 2065, 2068, 2069	Laydown areas do not have a functional requirement to be located in a waterway and should therefore be placed outside of waterways.	<p>Laydown areas have been revised where possible and are presented in the updated Appendix B1: Design Drawings.</p> <p>ARTC acknowledge the concerns of some of the laydown areas proposed along the alignment. The laydown areas have been strategically located for the Project to enable robust construction methodologies. ARTC are committed to ongoing consultations with impacted landowners through the Detailed Design and Construction Works stage planning process with the contractor. This will enable the Project to further develop and implement property-specific mitigation measures to avoid or minimise impacts.</p> <p>As described in Section 5.6.7 of Chapter 5: Project Description of the revised draft EIS, several laydown areas have been identified along the length of the alignment and positioned to avoid or minimise potential impacts to environmental and social receptors. The locations have been chosen to avoid areas that are within the 1% AEP floodplains where possible. However, by virtue of the requirement of laydown areas for construction bridges, some laydown areas must be within flood plains and near watercourses or drainage features. In such instances, the following precautions will be taken;</p> <ul style="list-style-type: none"> ▶ The site will be surveyed prior to site establishment to understand the exact extent of potential flooding impact to facilities and storage areas ▶ The earthworks and temporary drainage will be designed to minimise flooding impacts. <p>Fuel storage areas will be bunded, capacity restricted to no larger than required for reasonable operations, and preferentially stored at the furthest point away from watercourses.</p>	Chapter 5: Project Description Section 5.6.7 Appendix B1: Design Drawings
140	140.0022	State Agency	Flora and Fauna		<p>Recommended Condition:</p> <ul style="list-style-type: none"> ▶ Spoil is not disposed of within waterways and is managed to prevent acid soil development. ▶ Land profiles within the high banks of waterways that are temporarily disturbed by the development works, other than those within the permanent development footprint, must be promptly restored to pre-work profiles. <p>Reason: To minimise construction impacts to waterways providing for fish passage.</p> <p>Timing: At all times. The following advice should be provided:</p> <p>Under the Planning Regulation 2017, works involving constructing or raising waterway barrier works must be undertaken in accordance with the relevant accepted development requirements or under a development approval (assessable development).</p> <p>The placement of temporary waterway barriers to facilitate construction of bridges may be conducted under DAF's accepted development requirements for operational work that is constructing or raising waterway barrier works (ADR). If any proposed temporary waterway barrier works cannot meet the accepted development requirements, this aspect of the works will need to be covered under a development approval under the Planning Act 2016.</p> <p>The applicant should note that time limitations apply to all temporary waterway barriers in place under the ADR. The prescribed limits are 360 days for mapped green and amber waterways and 180 days for mapped red and purple waterways. Within this timeframe construction must commence and be completely removed from the high banks of the waterway. If there is any possibility (e.g. due to weather, construction delays, etc.) the barriers need to be in place for longer than the prescribed period under the ADR, the applicant is advised to include proposed temporary waterway barrier works in a development application.</p>	<p>The following reasonable and relevant conditions are recommended to be included in the Stated Conditions of the Coordinator General's Evaluation Report for the EIS to minimise impacts on waterways providing for fish passage, a Matter of State Environmental Significance. For bridges that do not constitute waterway barrier works an operational works approval for constructing or raising waterway barrier works is not required.</p> <p>However, temporary waterway barrier works including, but not limited to, haul roads, piling pads, working platforms, coffer dams etc. are likely required to facilitate the construction of bridges. Such development aspects are likely to require an authority.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report outlines that the Project may require obtaining approval for aspects of development that are assessable under Schedule 10 of the <i>Planning Regulation 2017</i> (Qld). For example, modification of the existing Yelarbon levee may be considered a Category 2 levee requiring a development approval under the <i>Planning Act 2016</i> (Qld).</p> <p>Appendix S: Surface Water Technical Report, Section 7.2, Table 7.1 states that:</p> <p>The revised reference design will be further developed during detailed design to:</p> <ul style="list-style-type: none"> ▶ Minimise the potential for diversion of watercourses, (as defined under the Water Act), and waterways (as defined under the Fisheries Act). ▶ Minimise the extent of impacts to waterways, riparian vegetation and in-stream flora and habitats, in accordance with the intent of: Riverine protection permit exemption requirements (WSS/2013/726) (DNRME, 2023) ▶ Site-specific risk assessments for each waterway crossing will be performed after the construction timing and methods have been determined. The proponent commits to develop an assessment procedure that considers site-specific attributes (topography, soil conditions, water quality, in-stream habitat and aquatic ecology, ephemeral nature, fish passage, sediment loading type and intensity of construction works) to minimise risks and impacts on the watercourse and its ecology. Construction procedures will follow the recommended procedures provided in the Soil Management Plan. ▶ An in-stream monitoring program for flora and fauna will be developed in detailed design to inform design and management measures to be used at proposed waterway crossing activities during construction. 	Appendix AB: Earthworks Strategy and Draft Soil Management Plan Appendix S: Surface Water Quality Technical Report Section 7.2 Table 7.1 Appendix L: Terrestrial and Aquatic Ecology
141	141.0001	Private	Flora and Fauna		Draft EIS is missing the following critical details: fauna fencing specifications and locations at which chainages, chainages where fauna spotting will occur during construction.	Provide missing information.	<p>In terms of fencing design, for interfaces along the alignment, the Chapter 21: Hazard and Risk chapter, Section 21.6.2 Table 21-16 notes that 'Specific fencing requirements are to be agreed through discussion with adjoining landowners and asset owners through the design development.' There are various types of fencing that will be required. ARTC has standard drawings for the various types of fences. These eleven standards can be found on the ARTC website at extranet.artc.com.au/eng_track-civil_drawings.html. As there are various standards depending on the type of fence, it is not proposed to list these standards. Typically not all design standards have been listed.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS: Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Revised draft Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Border to Gowrie Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g., revegetation). These scenarios will be used to inform design workshops and community consultation at the Detailed Design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010 respectfully). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the Detailed Design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised draft Appendix P: Fauna Connectivity Strategy.</p>	Chapter 21: Hazard and Risk Section 21.6.2 Table 21-16 Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix P: Fauna Connectivity Strategy
141	141.0002	Private	Surface Water		Draft EIS is missing the following critical details: construction water management plan, modelling of deep cuts required to assess for seepage	Provide missing information.	<p><u>Construction Water</u></p> <p>Information is provided in Section 5.6.24 of Chapter 5: Project Description regarding construction water, specifically the estimated volumes required, water quality parameters, potential sources, access and reliability. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan, to be finalised prior to the commencement of construction.</p> <p><u>Seepage</u></p> <p>Predicative groundwater models have been developed for the revised draft EIS to assess potential groundwater seepage and drawdown due to interception of groundwater and resulting drainage within deep cuts (Chapter 15: Groundwater, Section 15.6.2). Cuts that have been subject to modelling were selected as those most likely to intersect groundwater, as well as best representing local geological conditions and worst-case potential impacts.</p> <p>The modelling results for seepage estimates are presented in Section 15.6.2 of Chapter 15: Groundwater and provide estimates for the entire length of each modelled cut, with rates provided for typical conditions and wet conditions (following periods of high rainfall recharge). These Predictive simulations indicate:</p> <ul style="list-style-type: none"> ▶ Seepage is concentrated at the bottom of the cuts, on both sides of infill material ▶ Temporary increases in seepage may be observed in cuts with sandy soil or weathered sandstone following rainfall events ▶ Seepage of groundwater from bedrock is anticipated to be low except where it may be enhanced by weathering of fractures. <p>The modelling results for drawdown estimates are presented in Section 15.6.2 of Chapter 15: Groundwater. These modelling results indicate that drawdown is only expected to occur at three of the seven modelled locations. At these locations where drawdown is anticipated to occur, the maximum extent of drawdown is predicted to range from 10 m to 43 m from the rail centreline, wholly contained within the Project footprint.</p>	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Section 15.6.2 Appendix B5: Construction Water Requirements

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141	141.0003	Private	Land Resources		Draft EIS is missing the following critical details: mapping the unweathered sections of the Kumbailla beds and Walloon Coal Measures to assess ARD possibility and inform route choice.	Provide missing information.	<p>From both the detailed geotechnical investigation undertaken by Macquarie Geotechnical and the detailed (1:10,000 mapping scale) soil investigation undertaken by Aurecon for the Project to map the distribution of underlying surface geology and soils developed from these materials, there was no indication of the presence of potential acid rock drainage (ARD) from either the unweathered Kumbailla Beds or Walloon Coal Measures (see Appendix G1: Geotechnical Reports - Investigation Results and Appendix G2: Macquarie Geotechnical - Laboratory Results).</p> <p>Revised draft EIS Chapter 9: Land Resources Section 9.4.2 and Section 9.5.7 have been updated to include details of acid sulfate soils and acid rock following these geotechnical investigations.</p>	<p>Chapter 9: Land Resources</p> <p>Section 9.4.2</p> <p>Section 9.5.7</p>
141	141.0004	Private	Social Impact Assessment	Local business and industry procurement	Draft EIS is missing the following critical details: leaving the briefing, capacity building and diversification of local businesses to the principal contractor post appointment (and therefore post approval).	Provide missing information.	<p>ARTC commenced delivery of its Business Capability program in the SIA study area in late 2020, providing local and Indigenous small to medium enterprises (SMEs) and social enterprises with access to workshops, presentations and mentoring support aimed at improving their understanding of how to supply to Inland Rail.</p> <p>Appendix X: Social Impact Assessment, Section 6.2.6 has been updated in this regard.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 6.2.6</p>
141	141.0006	Private	Traffic and Transport		Draft EIS is missing the following critical details: design of individual occupational crossings and road accesses for impacted properties; deferral of the Road Use Management Plan (RUMP) until the detailed design phase, especially with respect to pavement monitoring and rectification of project induced damage.	Provide missing information.	<p>With regard to affecting the land on individual properties:</p> <p>Severance and fragmentation of rural properties are considered in revised draft EIS Chapter 8: Land Use and Tenure, and the results are summarised in Section 8.5.1. It is identified that property severance could affect the configuration of a property, affecting efficiency, productivity and viability, for example as a result of changes in access arrangement for the movement of farm machinery or stock to different areas of a property. Other identified property impacts include impeded access and changes to internal roads.</p> <p>ARTC acknowledges this issue, which will continue to be addressed as the design and construction planning progress. In accordance with mitigation measures in Section 8.6.2 Chapter 8: Land Use and Tenure, the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. Where the proposal affects internal property access arrangements, input has been and will continue to be sought from relevant landowners prior to finalising the detailed design. Where changes to internal property access arrangements are required, ARTC will consult with relevant property owners/occupants regarding alternative access arrangements, where feasible alternatives are available, ARTC will identify feasible and reasonable measures to minimise impacts on existing operational arrangements/properties.</p> <p>Whilst a significant amount of work has been completed to assess the potential road impacts as outline in the Traffic Impact Assessment in Appendix AA: Traffic Impact Assessment of the revised draft EIS, the Principal Contractor is not on board the Project until Detailed Design and as such the construction routes are not finalised by the Contractor. As a result, a complete RUMP cannot be delivered until that time. This is normal process for construction Projects, and is in line with Workplace Health and Safety legislation requirements. This is because many assumptions during the previous stages that will impact on road use management strategies, are not confirmed until detailed design progresses, or construction scheduling allows full visibility of the impact of construction vehicles.</p> <p>However, pavement monitoring and rectification is committed to within the revised draft EIS in Appendix AA: Traffic Impact Assessment Section 5.6.3.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.6.3</p>
141	141.0007	Private	Project scope		Draft EIS is missing the following critical details: fencing standards; specification requirements for rolling stock to use the rail, with respect to safety and environment (including noise) emissions; borrow pits and accommodation camps; deferral of the operational software (ATMS) until the Operations stage of the entire Inland Rail project is operational, with no explanation of signalling and communication in the interim. Signalling and communications on the interrelated Queensland Rail lines are explained, but not for B2G.	Provide missing information.	<p>A revised draft EIS has been prepared based on an updated reference design. The revisions to the EIS and reference design include feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and an additional information request submitted by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3.</p> <p>The revised draft EIS includes additional information on the following matters:</p> <ul style="list-style-type: none"> Fencing standards and approach, to Reference Design Level, are provided in Chapter 5: Project Description, Section 5.4.12. As stated in Chapter 5: Project Description, Section 5.1, at the commencement of operation, the Project will accommodate the use of double-stacked 1,800 metres (m) long freight trains. All chapters of the EIS have been prepared with respect to this rollingstock/rolling stock specification. Details of borrow pits are provided in Chapter 5: Project Description, Section 5.6.15. Details of non-resident workforce accommodation are provided in Chapter 5: Project Description, Section 5.6.4. Details of Advanced Train Management System (ATMS), including integration with Queensland Rail lines, are provided in Chapter 20: Traffic, Transport and Access, Section 20.5.1 and Chapter 5: Project Description, Section 5.4.14 and Section 5.8.9. The Project will be operated using ATMS, a communications-based safeworking signalling system currently being developed by ARTC. ATMS incorporates modern global positioning system controlled train movements. Each train 'knows' where it is on the network and can be automatically braked if it exceeds speed or does not have permission to be on a Section of track. 	<p>Chapter 5: Project Description</p> <p>Section 5.1</p> <p>Section 5.3.3</p> <p>Section 5.4.12</p> <p>Section 5.4.14</p> <p>Section 5.6.4</p> <p>Section 5.6.15</p> <p>Section 5.8.9</p> <p>Chapter 20: Traffic Transport and Access</p> <p>Section 20.5.1</p>
141	141.0008	Private	Social Impact Assessment		Draft EIS is missing the following critical details: details of any legacy benefits, levels of employment hours and contract dollars to be provided to locals.	Provide missing information.	<p>Revised draft EIS Appendix X: Social Impact Assessment (throughout) identifies the Project's potential to leave the following legacies (lasting positive social outcomes):</p> <ul style="list-style-type: none"> Access to construction training and employment opportunities for residents in the project region, which will build the local skills base and support the well-being of personnel and families Training and employment opportunities for people who are disadvantaged in the labour market, increasing both personal capacity and regional labour force capacity Opportunities for local and indigenous businesses to supply goods and services to the construction contractors, with potential to support business capacity and development Potential to support regional economic development which will sustain employment and business activity for the long term, with consequent benefits for the employment of residents in the Ipswich and Scenic Rim LGAs Potential for some laydown areas to be left in place for their legacy value to property owners or businesses, to be determined as part of ongoing engagement with local stakeholders Community benefits of reduced freight truck movements on local and state road networks. <p>ARTC is also sponsoring an independent resource to measure community wellbeing, which will offer shared value to local stakeholders and support future engagement and partnership opportunities.</p> <p>Appendix X: Social Impact Assessment, Section 7.4.9 provides an updated description of legacy benefits. Additional legacy projects continue to be developed in collaboration with local Councils and other stakeholders as described in Appendix X: Social Impact Assessment, Section 8.5.3.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 notes that to boost local workforce numbers, the Project's procurement process for the construction contract enables competitive bidding for local employment targets and procurement targets, incentivising the contractors to maximise local benefits. Inland Rail's tender assessment criteria includes local Indigenous participation as a key element of all construction tender assessments.</p> <p>Strategies for recruitment and training of personnel from the Goondiwindi and Toowoomba LGAs and Targets (numbers and percentages) for employment by location (i.e. SIA study area/LGA) and demographic (e.g. participation by people under 25 years and Indigenous people) will form a key part of the training and recruitment process.</p> <p>As outlined in Section 8.7.3 of Appendix X: Social Impact Assessment, the Contractor will be required to monitor of the number of people from the SIA Study Area that are employed in construction and the number and value of contracts with businesses located in the Goondiwindi and Toowoomba LGAs in line with targets, and report on outcomes.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.4.9</p> <p>Section 8.3.1</p> <p>Section 8.5.3</p> <p>Section 8.7.3</p>
141	141.0009	Private	Land Use and Tenure	Severance of agricultural land	Draft EIS is missing the following critical details: mitigation options for any lost agricultural land.	Provide missing information.	<p>The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none"> 0.02 percent of Class A land, 0.02 percent of Class B land, and 0.01 percent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none"> 0.17 percent of Class A land, 0.22 percent of Class B land, and, 0.19 percent of IAA land <p>Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.5.4</p> <p>Section 8.6.2</p> <p>Table 8-46</p>
141	141.0010	Private	Groundwater		Draft EIS is missing the following critical details: identification of any unregistered bores that may be impacted.	Provide missing information.	<p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project. This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging (see Chapter 15: Groundwater, Section 15.5.4). Real properties (lot/plan) to be intersected by the Project footprint were targeted and landowners were provided an opportunity to be identified via this survey (Chapter 15: Groundwater, Table 15.7). Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users, potential make-good process and measures, and detailed in Chapter 15: Groundwater, Table 15.20. ARTC is engaged with licenced users/landowners to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/substitution make-good solutions are not required.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.5.4</p> <p>Section 15.7.4</p> <p>Table 15-7</p> <p>Table 15-21</p>
141	141.0011	Private	Outline EMP		Draft EIS is missing the following critical details: deferral of the rehabilitation and landscaping management sub-plan, deferral of a biosecurity, soil, groundwater and surface water management sub-plans, deferral of pest species management plan.	Provide missing information.	<p>The Rehabilitation and Landscaping Management Plan, Biosecurity Management Plan, Soil Management Plan, Groundwater Management and Monitoring Program, Surface Water Management Plan and Wildlife Connectivity Plan will be further developed and refined for inclusion in the Construction Environmental Management Plan (CEMP) for the Project should the Coordinator-General decide the Project can proceed (see Chapter 24: Draft Outline Environmental Management Plan). The structure and matters of concern for these Plans and Plans are detailed the chapter. The CEMP must be endorsed by the Environmental Monitor as being consistent with the Final Outline EMP, legislation requirements and conditions of approval, and provided to the Coordinator-General prior to the commencement of any relevant Project works.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
141	141.0013	Private	Editorial		Draft EIS does not meet TOR 7.5 - location of rock sample drill sites is expressed in Eastings and Northings not in latitude and longitude.	Meet the TOR requirement.	<p>It is noted that some of the data provided in technical reports that assisted in the compilation of the EIS such as Appendix G1: Geotechnical Reports - Investigation Results are referenced in MGA 94. However, mapping throughout the EIS is Projected in Geocentric Datum of Australia 1994 (GDA94), or has been converted to GDA94.</p>	<p>Appendix G1: Geotechnical Reports - Investigation Results</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141	141.0015	Private	Land Use and Tenure		Draft EIS does not meet TOR 6.4, 6.8, 7.1, 7.2, and 10.9 - Draft EIS does not consider protecting strategic cropping land or priority living areas. No effort has been made to assess the project against the Regional Planning Interests Act.	Meet the TOR requirement.	<p>The Regional Planning Interests Act 2014 (Qld) is discussed in Chapter 3: Legislation and Project Approvals Process Section 3.4.26. The Project is not a resource activity or a regulated activity under the Regional Planning Interests Act 2014 (Qld) and therefore the Regional Planning Interests Act 2014 (Qld) does not apply to the Project. To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9 by the Project, which provides a total of areas of regional interest in relation to the Project footprints. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Section 8.6.2 and Table 8-51, Chapter 8: Land Use and Tenure).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p>	<p>Chapter 3: Legislation and Project Approvals Process Section 3.4.26</p> <p>Chapter 8: Land Use and Tenure Section 8.5.4</p> <p>Section 8.6.2</p> <p>Table 8-9</p> <p>Table 8-46</p>
141	141.0016	Private	Traffic and Transport		Draft EIS does not meet TOR 6.4 - serious consideration has not been given to avoidance of risk to public safety of level crossings or avoidance of public inconvenience due to level crossings.	Meet TOR requirement.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Appendix BT</p>
141	141.0017	Private	Land Resources		Draft EIS does not meet TOR 6.4 - serious consideration has not been given to avoidance of acid sulphate rocks.	Meet TOR requirement.	<p>From both the detailed geotechnical investigation undertaken by Macquarie Geotechnical and the detailed (1:10,000 mapping scale) soil investigation undertaken by Aurecon for the Project to map the distribution of underlying surface geology and soils developed from these materials, there was no indication of the presence of potential acid sulfate rocks that could result in generation of acid rock drainage (ARD) (see Appendix G1: Geotechnical Reports - Investigation Results and Appendix G2: Macquarie Geotechnical - Laboratory Results).</p> <p>Revised draft EIS Chapter 9: Land Resources Section 9.4.2 and Section 9.5.7 have been updated to include details of acid sulfate soils and acid rock following these geotechnical investigations.</p>	<p>Chapter 9: Land Resources Section 9.4.2</p> <p>Section 9.5.7</p> <p>Appendix G1: Geotechnical Reports - Investigation Results</p> <p>Appendix G2: Macquarie Geotechnical - Laboratory Results</p>
141	141.0018	Private	Social Impact Assessment	Cumulative impacts	Draft EIS does not meet TOR 7.3 - Macintyre Wind Farm precinct is absent from the cumulative impact assessment.	Include the Macintyre Wind Farm precinct in the cumulative impact assessment.	<p>Macintyre Windfarm was not originally identified as part of the project set for cumulative impact assessment. The wind farm will be located approximately 40 km east of the Project footprint. At this distance, cumulative impacts on e.g. the amenity of Inglewood and surrounds are not apparent.</p> <p>However, if construction coincides, there may be potential for cumulative labour draw as is described in Appendix X: Social Impact Assessment, Section 7.6 for a range of other projects.</p> <p>Appendix X: Social Impact Assessment, Section 7.6 has been revised to include Macintyre Windfarm in the cumulative Social Impact Assessment.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.6</p>
141	141.0019	Private	Stakeholder engagement	Baseline/background sampling	Draft EIS does not meet TOR 7.7 - Only 7 surveys were filled out from Goondiwindi shire residents to inform the social impact assessment. This is clear evidence of a lack of engagement with local communities. No remediation was provided. ARTC has been criticised by both Goondiwindi Regional Council and Toowoomba Regional Council for not listening and not taking advice. Submitter provides personal examples of engagement with ARTC in Appendix A.	Meet the TOR requirement.	<p>Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report detail the engagement carried out by ARTC to inform the social impact assessment (SIA). A range of targeted engagement tools were used, including the social impact survey. The purpose of the survey was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey didn't provide a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p> <p>Consultation informing the SIA is detailed in Appendix E: Consultation Report, Section 5.11.</p> <p>ARTC notes that ongoing engagement has continued with the submitter since the draft EIS. ARTC has continued to respond to ongoing requests for information. Additional engagement regarding noise consultation is ongoing.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
141	141.0020	Private	Surface Water	Water quantity	Draft EIS does not meet TOR 10.10(c) - Draft EIS does not identify quantities of wastewater that may be generated during construction.	Meet the TOR requirement.	<p>Wastewater generated during construction would include wastewater from accommodation facilities. A single 300-bed non-resident workforce accommodation with 250 L/person/day water usage could generate up to 0. 04 ML/day of treated wastewater when at 100 per cent occupancy. Therefore two accommodation facilities could generate up to 0. 08 ML/day (Chapter 5: Project Description, Section 5.4).</p> <p>The estimated construction water requirements for civil earthworks, track works and revegetation range between 0.3 to 12 ML/day as shown in Figure 5.23 (Chapter 5: Project Description, Section 5.6.24). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>Since construction water demands are much greater than the quantity of wastewater generated, it is likely that most of the time any wastewater would be used for construction and not discharges are likely.</p> <p>Where industrial or trade waste may be generated by construction activities, the resultant wastewater will be captured and, where possible, recycled. Where recycling is not feasible, the captured wastewater will be collected by a licenced contractor and taken offsite for disposal at an appropriately licenced wastewater facility (Chapter 13: Surface Water, Section 13.6)</p> <p>Predictive modelling has determined that groundwater seepage may occur from the face of deep cuts (>10 m) where groundwater is intersected: however, the assessment has concluded that seepage water, in general, will evaporate (Chapter 15: Groundwater, Section 15.6.2). Groundwater data will be refined during detailed design when additional site-specific data hydrogeological data is combined with the finalised design for model re-calibration and re-run of predictive simulations. Further details are provided in Chapter 15: Groundwater Table 15.20 (Section 15.7.2) and Chapter 13: Surface Water, Section 13.5.1.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.24</p> <p>Figure 5.23</p> <p>Chapter 13: Surface Water</p> <p>Section 13.5.1</p> <p>Section 13.6</p> <p>Chapter 15: Groundwater</p> <p>Section 15.6.2</p> <p>Section 15.7.2</p> <p>Table 15-20</p> <p>Appendix B5: Construction Water Requirements</p>
141	141.0021	Private	Land Use and Tenure		Draft EIS does not meet TOR 11.72 and 11.77 - ARTC has failed to inform the community, included impacted stakeholders, that they can enter into any compensation agreement they choose to negotiate, outside of the Land Acquisition Act.	Meet the TOR requirement	<p>TOR 11.72 Describe the potential for impact on all land uses during construction and operation of the Project. The assessment should include consideration of temporary and permanent impacts on agricultural production.</p> <p>TOR 11.77 Discuss the proposal in context of the applicable regional plans and local planning schemes</p> <p>The revised draft EIS has been updated to address the above Terms of Reference requirements.</p> <p>TOR 11.72 has been addressed in Chapter 8: Land Use and Tenure, Section 8.5 Potential Impacts. The revised draft EIS has been updated to address the above Terms of Reference requirements.</p> <p>TOR 11.72 has been addressed in Chapter 8: Land Use and Tenure, Section 8.5 Potential Impacts. As stated in Chapter 8: Land Use and Tenure, Section 8.6.3, Where land use impacts are confirmed, individual property management measures will be developed in consultation with the landowner to reduce impacts to an acceptable and agreeable level. Management measures will include:</p> <ul style="list-style-type: none"> Individual property mitigation measures developed in consultation with landowners/occupants with respect to the development of detailed design and/or the management of construction on, or immediately adjacent to, private properties. The property mitigation measures will detail required adjustments to fencing, access, farm infrastructure, and relocation of any impacted structures, as required. Consultation with landowners will be undertaken to ensure that owners and occupiers are informed about the timing and scope of activities in their area, particularly in relation to potential impacts to access, services, or farm operational arrangements. This consultation will be ongoing throughout construction. Feedback from landowner consultation, including agreed property mitigation measures, will be incorporated into property agreements (or similar), as appropriate. <p>TOR 11.77 has been addressed in Chapter 8: Land Use and Tenure, Section 8.4.4 Local Government Planning Schemes and Section 8.5.4 Compliance Impact Assessment. Section 8.5.4 considers the consistency of the Project with the land use and planning instruments relevant to the Project footprint and Project activities, being the:</p> <ul style="list-style-type: none"> State Planning Policy (July 2017) Darling Downs Regional Plan (October 2013) ShapingSEQ (August 2017). Goondiwindi Regional Planning Scheme 2018 Toowoomba Regional Planning Scheme 2012. <p>The Project is being assessed under the Office of the Coordinator-General's Coordinated Project Framework and therefore not bound to the requirements of the Goondiwindi Regional Planning Scheme 2018 and the Toowoomba Regional Planning Scheme 2012. However, the strategic framework, zones, and overlays have been explored to provide a local understanding of the area and assessment of the Project's compatibility with the local government's plans and vision for the region.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.4.4</p> <p>Section 8.5.4</p> <p>Section 8.6.3</p>
141	141.0022	Private	Social Impact Assessment		No effort has been made to describe the impact on our farm stay campsites and bed and breakfast cabin. The train line will be clearly visible and audible from our accommodation areas. This will decrease the desirability of our hospitality enterprise, and have flow-on effects to our paddock to plate beef business, as our farm tours and overnight guests provide marketing opportunities for our beef business.	Address impacts on beef and farm stay businesses.	<p>ARTC shared the results of the noise modelling and potential mitigation strategies with those sensitive receivers predicted to exceed noise guidelines during the operation of Inland Rail.</p> <p>ARTC notes the structures on this property are more than 750 metres from the proposed level crossing and have not been identified as exceeding said guidelines.</p> <p>ARTC will continue to engage with the community about noise and noise mitigation throughout the Detailed Design, Construction Works and Operations stages of the Project.</p>	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141	141.0023	Private	Landscape and Visual Amenity		There is no vegetation screening the train line. The land falls away towards Canning Creek and as such the rail will appear elevated from the submitter's house with minimal vegetation to screen sight and sound. This will both affect the usability of the outdoor living areas and contravene the Goondiwindi Council Regional Planning Scheme which encourages outlooks favouring natural landforms in rural areas.	Change the alignment so that the rail crosses Millmerran Ingleswood Road 2.4 km north, or at the next comparable bend in the road. This would improve visual amenity for the submitter and their accommodation guests without decreasing amenity for other receptors.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project.</p> <ul style="list-style-type: none"> As part of the proposed mitigation strategies outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, a commitment has been included to develop a Rehabilitation and Landscaping Management Plan for the Project, as a component of the CEMP. This Plan will be developed in consultation with local governments and affected communities. This will be in addition to location and property-specific reinstatement commitments and handling complaints appropriately. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments. <p>The LVIA has assessed impacts associated with the proposed route. Whilst ARTC appreciates the potential impacts on the submitter's property, ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Ingleswood Road:</p> <ul style="list-style-type: none"> Fewer farms affected mid-block Fewer farm operations/dwellings within 200 metres of alignment No direct impacts to feedlots Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Ingleswood Road. This crossing location minimises impacts to Bringally State Forest, as it is located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State Forests:</p> <ul style="list-style-type: none"> Restriction of access Loss of flora and fauna Changes to bushfire management Weeds and pests Changes to drainage and minimising sediment and erosion Changes to interests on the State Forests e.g. apiaries permits, grazing leases and timber values with the forest. 	Appendix K: Landscape and Visual Impact Assessment Section 4 Section 11.2 Table 95
141	141.0024	Private	Project alignment	Road safety	To reduce landscape amenity impacts the submitter proposes an alternative alignment where the rail crosses Millmerran Ingleswood Road 2.4 km north.	Submission includes Appendix B, which contains a road traffic engineer's assessment of the proposed realignment from a road safety perspective.	<p>As per Section 20.3.6 of Chapter 20: Traffic, Transport and Access, ARTC worked in consultation with the Department of Transport and Main Roads (DTMR), assessing various design alternatives for the Millmerran-Ingleswood road interfaces.</p> <p>The Project alignment crosses Millmerran-Ingleswood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits with an alignment on the eastern side of Millmerran-Ingleswood Road:</p> <ul style="list-style-type: none"> Fewer farms affected mid-block Fewer farm operations/dwellings within 200 metres of alignment No direct impacts to feedlots Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing locations to minimise the skew angle and operational/construction impacts to Millmerran-Ingleswood Road.</p> <p>ARTC will continue to work collaboratively with DTMR as the detailed design progresses regarding the proposed level crossing design solution.</p>	Chapter 20: Traffic, Transport and Access Section 20.3.6
141	141.0025	Private	Social Impact Assessment		Suggesting the lack of tourists mitigates the severity of changes is disingenuous when tourists who visit the area come specifically for the relaxed rural ambience and quiet rural outlook. There has been a surge in domestic tourism since the pandemic that is expected to be long-lived. Tourism is an emerging market in Goondiwindi with plans to capitalise on this trend. The rail will negatively affect the tourism industry in Goondiwindi and the region.	Address the impacts on tourism.	<p>Areas such as Kurumbul, Whetstone and Yelarbon have accommodated a rail line for many decades. Rail corridors are a common occurrence in rural areas and there appears to be no evidence that they detract from tourism visitation. Many historic small towns which offer tourism experiences are centred on rail lines.</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 8.6.2 provides that</p> <p>"When the Project's Detailed Design is confirmed, ARTC will consult with tourism-related businesses located within 10 km of the Project to ensure there is a shared understanding of how road works, changes to the road network or noise/vibration may affect tourism-related businesses. Temporary access arrangements supporting road access to tourism sites and major events will be agreed with DTMR and local Councils as is the standard approach normally adopted by linear transport projects. If consultation indicates the potential for road works or other construction activities to deter tourists, ARTC will work with local Chambers of Commerce, tourist information centres and the Goondiwindi and Toowoomba Regional Councils to develop a strategy to support tourism marketing campaigns to benefit affected tourism businesses."</p>	Appendix X: Social Impact Assessment Section 8.6.2
141	141.0026	Private	Landscape and Visual Amenity		There is no visualisation from viewpoint 4. There is little point in asking for public consultation on a change that has not been illustrated. The draft EIS also states that dense remnant vegetation along the road side protects motorists from the view of the proposed rail corridor. However the picture of Inland Rail near Woodspring shows this is only the case to the south of the crossing, otherwise the rail line is clearly visible from the road and the submitter's house where the views are of dry cropping and grazing land. The Goondiwindi Regional Council Planning Scheme identifies appropriate mitigation measures for this. See submission for further details.	Provide visualisation for all viewpoints.	<p>A visualisation has not been prepared for this viewpoint due to the low sensitivity of the landscape and the overall low impact anticipated in this location. Mitigation measures are still proposed irrespective of whether a visualisation has been prepared for a particular viewpoint.</p> <p>Section 4.9.1 of Appendix K: Landscape and Visual Impact Assessment states that visualisations are generated to illustrate potential visual impacts of the Project. Generation of potential visual representations are based on a range of parameters, including:</p> <ul style="list-style-type: none"> A permanent resident of a dwelling or homestead Drivers or passengers of vehicles passing through the impacted assessment area Members of the public accessing marked recreational areas An industrial or commercial worker <p>Visualisations are prepared to represent potential visual impacts. Visualisations have not been prepared for all viewpoints (including Viewpoint 4, now viewpoint 6) as visualisations are selected on the basis of those illustrating key infrastructure elements likely to be of interest to the community and/or the most sensitive viewpoints, such as from a regionally-significant scenic lookout. A key visual sensitivity of viewpoint 6 (previously viewpoint 4) include:</p> <ul style="list-style-type: none"> Receptors include workers and travellers experiencing transient views at speed along Millmerran-Ingleswood Road and visitors of Bringally State Forest Lack of existing infrastructure and natural setting increases the overall sensitivity of the view This viewpoint is located on the <i>Rural Getaway</i> regional tourist drive <p>Section 8.2.6 of Appendix K: Landscape and Visual Amenity summarises that due to the distance from this viewpoint and the presence of screening vegetation, it is not anticipated that views towards the proposed non-resident workforce accommodation facility or construction laydown areas will be evident from this location, however transient views will be possible for drivers passing along Millmerran-Ingleswood Road. Overall, the potential effect on viewpoint 6 during Construction Works and Operations stages of the Project are considered low.</p>	Appendix K: Landscape and Visual Impact Assessment Section 4.9.1 Section 8.2.6
141	141.0027	Private	Cultural Heritage	Non-Indigenous cultural heritage	A small cabin built around 100 years ago should be considered in the cultural heritage assessment.	If the rail line cannot be realigned to avoid the cabin, it should be relocated to the Ingleswood Historical Society's museum on Albert Street in Ingleswood.	As identified in Section 19.3.3 (Figure 19.1) of Chapter 19: Cultural Heritage, the heritage assessment included a comprehensive review of historical mapping and aerial imagery to identify all current or former structures within 1 km of the Project footprint. No structures were identified at the coordinates of the small cabin provided by the submitter (-28.358994, 151.142013). Further, design changes mean that this location is now 200 m from the Project footprint, and will not be impacted by the Project. If changes through detailed design cause any impacts to the cabin identified by the submitter Inland Rail will have it assessed in discussions with the landowner.	Chapter 19: Cultural Heritage Section 19.3.3 Figure 19.1
141	141.0028	Private	Air Quality	Baseline/background sampling	Draft EIS does not meet TOR 11.29 - Baseline data collected for the air quality study is not representative of the local ambient levels of pollutants. Contamination of tank water is a significant personal and business issue for the submitter.	Further background air quality monitoring should take place.	<p>The background air quality monitoring data used in the assessment is considered representative of the air environment at sensitive receptor locations along the Project corridor. Air quality monitoring data were collected from four monitoring stations which are considered to provide representative data on air quality for the study area.</p> <p>The four stations include Queensland Government's Department of Environment and Science (DES) operated stations located at Mutdapilly (90 km east of the alignment) and Springwood (135 km east of the alignment). These stations are located in areas further away from the alignment but are considered representative of the study area. The other two Inland Rail monitoring stations are closer to the alignment, located at Charlton (Inland Rail AQMS, 0.1 km south of the alignment) and Millmerran (Millmerran AQMS, 0.4 km north of the alignment). Further information on these monitoring stations is provided in Section 12.4.2 in Chapter 12: Air Quality.</p> <p>All available monitoring data has been reviewed for the Inland Rail AQMS and Millmerran AQMS stations as part of the assessment. Additional air quality monitoring has also been undertaken at Millmerran (Millmerran AQMS) for the assessment. Ten years of monitoring data have been reviewed for the Springwood and Mutdapilly stations. Further discussion of background air quality is provided in Section 12.4.2 of Chapter 12: Air Quality.</p> <p>Monitoring recommended for the Project is discussed in Section 12.7 of Chapter 12: Air Quality. Dust deposition monitoring will be conducted during the active period of construction in proximity to Commodore Mine and in urban/semi-urban areas, as discussed in Section 12.7.2 in Chapter 12: Air Quality. No further air quality monitoring (to that proposed in Section 12. .7 of Chapter 12: Air Quality) is considered to be required, and the background air quality monitoring data used in the assessment is considered to be appropriate for the assessment and the study area.</p> <p>To examine the issue of tank water contamination, the air quality assessment also quantitatively investigated potential impacts to tank water quality during the operation of the Project. As noted in Section 12.5.9 of Chapter 12: Air Quality, predicted pollutant concentrations were lower than the drinking water guideline values prescribed by the Australian Drinking Water Guidelines (National Health and Medical Research Council and National Resource Management Ministerial Council 2022) for all pollutant species of concern.</p>	Chapter 12: Air Quality Section 12.4.2 Section 12.7 Section 12.7.2 Section 12.9
141	141.0039	Private	Traffic and Transport	Level crossing	Proposed level crossing adjacent to submitter's home is in appropriate. ALCAM model was inappropriately used to justify level crossing, when it should be used to prioritise the upgrade of existing level crossings. Alcam advises that their score should not be used in isolation and stakeholders should be consulted for local knowledge. Several stakeholders including regulators and councils disagree with the proposed level crossing.	Nil.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Appendix BT
141	141.0040	Private	Traffic and Transport	Level crossing	ARTC have failed to adequately address the impact of level crossings on the community by using a non-representative model of wait times. Eight minutes wait time for emergency services could be critical.	Grade separated crossings should be put in at main roads and roads where there is no alternative route for emergency services to take.	<p>An assessment of potential delays to road traffic at level crossing was undertaken as detailed in revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.8 and 5.9. The modelling undertaken within this assessment provides an accurate representation of the impacts to vehicles, using traffic vehicle numbers and the calculated wait times for specific level crossings.</p> <p>All active level crossings have been analysed in the peak periods, accounting for the individually calculated wait times, in order to determine queue lengths and resultant impacts to traffic. Table 5.69 in Appendix AA: Traffic Impact Assessment provides the individual wait times for the level crossing locations along the alignment. The wait times determined for each individual level crossing were calculated based on;</p> <ul style="list-style-type: none"> Level crossing specific operating speeds (up to maximum design speed of 115 km/hr). The operating speed is impacted by topography and curvature of the alignment Time taken for the train to cross the level crossing Distance from train crossing loops and hence time taken for the train to accelerate from standstill. Train length Boom gate and signal operating times <p>It is acknowledged that the key focus of this submission surrounds the level crossing at Millmerran Ingleswood Road and that the expected wait time at the level crossing is 101 seconds.</p> <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	Appendix AA: Traffic Impact Assessment Section 5.8 Section 5.9 Table 5.69

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141	141.0041	Private	Traffic and Transport		Despite modelling in the EIS showing that traffic during construction would increase up to 177% during the next five years, no commitment is made to contribute to road maintenance.	ARTC should commit to repair the road as required and at project completion.	Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts with Section 5.6.3 and Section 5.6.4 highlighting mitigation measures for pavement damages to state controlled and local government roads, respectively. It is noted that the submission has raised concern regarding maintenance of Millmerran Inglewood Road during construction works. The methodology for assessment and impact mitigation follows the Guide to Traffic Impact Assessment, as required by DTMR. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. The Section that discusses state controlled road highlights the significant methodology in place to maintain the roads damaged by the project, as agreed to by DTMR. This includes different measures depending on the level of impact and also varying mechanisms that are in place for road maintenance, including financial contributions to TMR to maintain that road, and also non-financial contributions made by the Project to contribute to road maintenance. In the case of Millmerran Inglewood Road, the construction assumptions made in the EIS suggest that the 5% threshold will be reached in the early years of construction and as result the road will be maintained using the aforementioned measures.	Appendix AA: Traffic Impact Assessment Section 5.6 Section 5.6.3 Section 5.6.4
141	141.0042	Private	Traffic and Transport	Level crossing	Disputes the claim in the EIS that the project has been aligned to limit road/rail interfaces, ARTC admitted that the only reason to cross Millmerran Road adjacent to the submitter's house is to save time, effort and money resuming land from the State Forestry Dept.	Provide the rationale for crossing Millmerran Road three times. Confirm why the southern Millmerran Inglewood Road crossing is referred to as a road/rail bridge. Limit crossing Millmerran Inglewood Road to one grade separated crossing. Grade separate any road/rail interface where alternative grade sep crossings are not available for emergency services.	The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road: <ul style="list-style-type: none"> ▶ Fewest farms affected mid-block ▶ Fewest farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewest residences within 200 metres. To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringilly State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests': <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track. Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations. ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services) through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.	Appendix AA: Traffic Impact Assessment Section 3.7
141	141.0043	Private	Groundwater	Private groundwater bore/s	A desktop audit was undertaken for bores, but there could potentially be a number of unregistered stock and domestic bores that were drilled prior to the requirement for registration.	While not licenced, these bores are still legal and efforts need to be made to identify and protect them.	ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project. This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging (see Chapter 15: Groundwater, Section 15.5.4), Real properties (lot/plan) to be intersected by the Project footprint were targeted and landowners were provided an opportunity to be identified via this survey (Chapter 15: Groundwater, Table 15.7). Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users, potential make-good process and measures, and detailed in Chapter 15: Groundwater, Table 15.20. ARTC is engaged with licenced users/landowners to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/substitution make-good solutions are not required.	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Table 15-7 Table 15-0
141	141.0044	Private	Project scope		Laydown area B2G-LDN073. 0 is designated for Millmerran-Inglewood Road rail bridge %231. The road rail bridge did not make it to the reference design. Presume this laydown is no longer required.	Confirm if laydown is still required and amend EIS designs accordingly.	As described in Section 5.5.3 of Chapter 5: Project Description of the revised draft EIS and Section 5.6.7 of the revised draft EIS Chapter 5: Project Description , several laydown areas have been identified along the length of the alignment and positioned to avoid or minimise potential impacts to environmental and social receptors. This includes laydown area B2G-LDN073. 0 which will support construction of Pariagara Creek Rail Bridge at Chainage 67.2 kilometres (km) and Cattle Creek Rail Bridge at Chainage 88.2 km.	Chapter 5: Project Description Section 5.5.3 Section 5.6.7
141	141.0045	Private	Surface Water	Erosion	Laydown area B2G-LDN074. 0 is located adjacent to Canning Creek where it borders on the submitter's property. It is a sensitive riparian environment. A laydown area in this location will cause erosion issues. Rehabilitation at the end of construction will be difficult. A sediment basin in this location will be unable to be decommissioned.	Make other arrangements for this laydown area.	Temporary construction facilities and activities will be located with the objective of achieving a setback distance of 30 metres from watercourses, where possible, without the need for further controls. In some instances, a setback of 30 metres cannot reasonably be achieved, i. e. laydown areas in support of bridge construction. In such instances, a setback distance of no less than 10 m will be achieved, with implementation of additional controls to preserve riparian and aquatic values, e.g. erosion and sediment controls. This commitment is provided in of Chapter 24: Draft Outline Environmental Management Plan. A Project-specific Rehabilitation and Landscaping Management Plan will be developed prior to the completion of construction for the management of land that is not required for the Operations stage. As stated in Sections 5.7 and 5.8 of Chapter 5: Project Description, monitoring will occur through Commissioning stage and into Operations stage, to ensure that the Project landscaping continues to be successful. Additional maintenance or intervention works may be required if monitoring demonstrates that landscape and rehabilitation completion criteria established in the Rehabilitation and Landscaping Plan are not being achieved.	Chapter 5: Project Description Section 5.7 Section 5.8 Chapter 24: Draft Outline Environmental Management Plan
141	141.0046	Private	Surface Water	Flood immunity	The drainage structure at chainage 75 (near Laydown area B2G-LDN074. 0) was full of water in the moderate (6m) flood. In a major flood with 3 m more would have more significant impacts.	Make other arrangements for this laydown area.	As detailed within Section 20 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1, where possible, site selection of temporary construction facilities was undertaken to avoid areas impacted by the 1% AEP regional flooding event. Not all proposed facilities were able to achieve this immunity as identified above due to the constraining nature of the Project footprint. As such some control measures will be required to be adopted during the Construction Works stage to minimise impacts on the existing flooding regime and any overland flow paths due to construction activities. The following control measures are proposed: <ul style="list-style-type: none"> ▶ Maintain existing flow paths and avoid direct impact on existing drainage lines. ▶ Siting of facilities on the fringes of regional floodplains, where applicable. ▶ Avoidance of raised construction pads in areas impacted by flooding. ▶ Undertake modelling of more frequent events (50% AEP and more frequent) to determine the impacts associated with the temporary works. As required, undertake secondary approvals processes for temporary works/facilities that may impact flood regimes and outside the approval processes as part of the revised draft EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 20
141	141.0047	Private	Land Use and Tenure		The project is incompatible with the GRC planning scheme. It traverses 60 km of strategic cropping land along the Millmerran Inglewood Road, does not support Yelarbon being a vibrant town centre and is likely to erode 'black soils'.	Nil.	ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided. The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses; <ul style="list-style-type: none"> ▶ 0.02 per cent of Class A land, ▶ 0.02 per cent of Class B land, and ▶ 0.01 per cent of IAA land (Important Agricultural Area) Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2). ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of: <ul style="list-style-type: none"> ▶ Landowners' needs regarding access to the properties and the closure of private roads ▶ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority ▶ The potential for changes to groundwater access. This will inform development of the detailed design and Construction Environmental Management Plan. The Project is being assessed under the Office of the Coordinator-General's Coordinated Project Framework and therefore not bound to the requirements of the Goondiwindi Regional Planning Scheme 2018. However, the strategic framework, zones, and overlays have been explored to provide a local understanding of the area and assessment of the Project's compatibility with the local government's plans and vision for the region. This is further discussed in revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.4 Compliance Assessment. Of the several overlays contained within the Goondiwindi Regional Planning Scheme, the most pertinent to this Project is the Natural Resources Overlay which is aimed to protect natural resources for current and emerging generations. This overlay applies to key resource areas and agricultural land classifications class A and B as identified in the State Planning Policy (SPP), and water resources catchment areas identified in the schemes overlay map. The Border to Gowrie Section of the Inland Rail does not intersect with either the water resource catchment, nor the key resource areas, however it does traverse through land categorised as class A and B. The implications of this intersection have been identified and potential adverse impacts have been minimised and/or mitigated to prevent land degradation and stormwater run-off. ARTC has committed to continued engagement with the Yelarbon community and Goondiwindi Regional Council to plan and implement community projects to offset impacts on the amenity and character of Yelarbon. A detailed soil investigation (refer to Section 3.2.2, Section 4.5 and Section 5.0 of Appendix J: Soil Assessment Report, Appendix H) has also been undertaken along the Border to Gowrie rail alignment disturbance footprint to further understand the soil properties and refine existing soil mapping. Findings from the detailed soil investigation have informed soil-specific management measures and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning. Chapter 9: Land Resources, Section 9.3.2: Detailed soil investigation states that "Building on existing information from geotechnical and soil investigations, a detailed soil investigation was undertaken comprising field and laboratory testing to enable the identification and mapping of soil units within the Project footprint at an approximate 1:10,000 scale within the proposed Project footprint to understand soil properties associated with the extent of Project soils. (Appendix J: Soil Assessment Report). The outcomes of these detailed soil investigations have informed baseline conditions, impact assessment and soil-specific management approaches and mitigation measures for the project including structure design, erosion control measures, soil treatment and site rehabilitation planning. " (Appendix AB: Earthworks Strategy and Draft Soil Management Plan).	Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.2 Table 8-46 Chapter 9: Land Resources Section 9.3.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Appendix J: Soil Assessment Report Section 3.2.2 Section 4.5 Section 5.0
141	141.0048	Private	Project alignment		ARTC is not forthcoming about the approach to route selection. The EIS refers to reports not included in the EIS and not made available to the public when requested. One of the reports acquired by the submitter through FOI identifies that a route option was discounted due to strong community opposition.	Nil.	In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney (Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development. The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route. In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie (Chapter 2: Project Rationale, Section 2.9.3). The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017 (Chapter 2: Project Rationale, Section 2.9.3). Following completion of the Corridor Options Report for the Project in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through the Project phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide wide study area is referenced within Chapter 2: Project Rationale, Section 2.8 and 2.9 of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area. Detailed discussion on the contents of FOI 18-053-doc12 is not within the scope of the EIS.	Chapter 2: Project Rationale Section 2.8 Section 2.8.2 Section 2.9 Section 2.9.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141	141.0049	Private	Stakeholder engagement		ARTC is seeing threats where it should be seeing opportunities.	CG insist ARTC return to the beginning of route selection process, engage a competent Social Impact Assessment consultant and move forward with meaningful community engagement, faithfully following their own stated procedures, to deliver a renewed draft impact statement that is internally consistent.	<p>Stakeholders were engaged to inform the route selection for Inland Rail commenced in 2006 and a summary of this early engagement is provided in the revised draft EIS in Appendix E: Consultation Report, Section 3. In 2017, the Minister for Infrastructure and Regional Development announced the preferred two-km wide impact assessment area for the Project. Following this announcement, ARTC increased its program of briefings and information sessions along the alignment. These included meetings with councils, federal and state MPs, community consultation via public meetings and drop-in sessions, and exhibitions at agricultural shows, together with individual meetings with potentially affected landowners.</p> <p>During this period, ARTC also met with landowners potentially, or likely to be, directly impacted by Inland Rail on more than 2,500 occasions with 525 separate face-to-face consultations undertaken during the last quarter of 2018.</p> <p>Between January 2016 and November 2018, ARTC convened or addressed public meetings and information sessions attended by more than 7,000 people. Further information on the stakeholder engagement supporting route selection and alignment planning can be found in: Route history of Inland Rail 2006-2021 - Inland Rail (available at artc.com.au)</p> <p>In January 2022, following consideration of the draft EIS and stakeholder submissions, the OCG notified ARTC that additional information was required. ARTC has completed additional investigations, assessments, and stakeholder engagement to inform a revised draft EIS and address issues raised in the submissions. This engagement process also included incorporating design refinements and additional mitigation measures into the reference design in response to feedback received from directly and indirectly impacted stakeholders, resulting in several reference design changes and mitigation measures. Some examples of key design changes and mitigation measures in response to stakeholder feedback can be found in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>ARTC will comply with the conditions set by the Coordinator-General.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Appendix E: Consultation Report Section 3
142	142.0001	Private	Surface Water	Modelling	The flooding and hydrology model is inadequate and does not reflect the lived experience of the landowners in the area. There is no 1% AEP hydraulic results between chainage 68.75 and 87.19 in the draft EIS. Omitting hydrology results where the train traverses within 200 m of the creek is irresponsible.	Update the EIS to meet the terms of reference 11.64, 11.36 and 11.69	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendix T1 and T2: Hydrology and Flooding Technical Report - Volumes I and II of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.</p> <p>Ch 68.75 to Ch 87.19 include local catchment culverts and bridges that are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. Mapping of local catchment flood results at these locations has been provided in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online Digital Platform.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 18 Appendix B Appendix T2: Hydrology and Flooding Technical Report - Volume 2
142	142.0002	Private	Surface Water	Increase in flows	There are 11 culverts or bridges between chainage 73.33 and 74.97 to allow for water flow. There is an existing culvert across Millmerran Inglewood Road at this approximate chainage, where water flow has led to a very large scour. ARTC acknowledges that scour mitigation is necessary at 9 of 11 proposed sites but not that any hydrology modelling is required.	Update the EIS to meet the terms of reference 11.64, 11.36 and 11.69	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2) of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.</p> <p>As pointed out by the submitter the local catchment drainage structures allowed for in the Reference Design are described in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. Hydraulic results and impact assessment outcomes for the local catchment drainage structures are presented in Section 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS. Scour and erosion protection measures are outlined in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS, and will be confirmed during Detailed Design when detailed soil mapping becomes available.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 18 Appendix B Appendix T2: Hydrology and Flooding Technical Report - Volume 2
142	142.0003	Private	Surface Water	Scour protection	The Austroads Guide to Road Design part 5B lists allowable water velocities over stiff and hard clays as 1.0-2.0 m/s. ARTC has chosen to use the extreme fast end of this bracket (2 m/s) as their trigger point for sites requiring mitigation.	Update the EIS and project design to include scour mitigation downstream of drains, culverts and bridges where peak water velocity will exceed a more conservative 1.2 m/s	<p>Scour protection requirements for culverts during the revised reference design were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the allowable soil velocities shown in Table 3.1 of AGRD. An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised reference design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design.</p> <p>Details on flooding, hydrology and use of culverts within the Project Area are outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1
142	142.0004	Private	Surface Water	Modelling	ARTC has not provided enough detail for residents of the CG to make meaningful conclusions about flood sensitivities.	Update the EIS to meet the terms of reference 11.64, 11.36 and 11.69	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 1.4. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2
142	142.0005	Private	Surface Water	Increase in flows	Omitting Canning Creek catchment between Pariagara Creek and Cattle Creek fails to take into consideration the impact of flooding at private properties along Millmerran Road. The driveway used by the submitter crosses Canning Creek and it has not been taken into consideration in the EIS. After every flood event the crossing needs to be rebuilt due to erosion.	Update the EIS to meet the terms of reference 11.64, 11.36 and 11.69	<p>The Canning Creek catchment between Pariagara Creek and Cattle Creek has not been omitted from the assessment.</p> <p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.</p>	Appendix T1: Flooding and Hydrology Technical Report - Volume 1 Section 18 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
142	142.0006	Private	Groundwater	Private groundwater bore/s	Only a desktop audit has been done for bores. DFS guidelines provide best practice method for assessing groundwater impacts, including considering both registered and unregistered bores in and adjacent to the project footprint. EIS does not state an intention to contact property managers adjacent to the project footprint unless their property is being resumed or their bore decommissioned.	nil.	<p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project. This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging (see Chapter 15: Groundwater, Section 15.5.4). Real properties (lot/plan) to be intersected by the Project footprint were targeted and landowners were provided an opportunity to be identified via this survey (Chapter 15: Groundwater, Table 15.7). Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users, potential make-good process and measures, and detailed in Chapter 15: Groundwater, Table 15.20. ARTC is engaged with licenced users/landowners to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/substitution make-good solutions are not required.</p>	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Table 15-7 Table 15-0
142	142.0007	Private	Groundwater		The current alignment will not be able to avoid unweathered areas of the Kumbarella Beds and Walloon Coal Measures, which will potentially form leachate that can contaminate aquifers. ARTC has no intention of avoiding acid contamination of groundwater, instead choosing to mitigate/manage the risk.	Cleaning up contaminated groundwater is costly and technically complex. ARTC should prevent groundwater contamination wherever possible.	<p>The preferred alignment for the proposed rail corridor was identified based on an analysis of multiple corridor options, with the final preferred alignment presenting the strongest benefits for industry and the community in general, while minimising impacts to the natural and rural landscape. The location of the alignment was selected in part as it is located within the existing Southern Freight Rail Corridor, gazetted as a future rail corridor in 2010. The Project has been developed to utilise the existing rail corridor protection and minimise land severance and impacts to natural and rural landscapes to the greatest extent possible. However, some excavations (cuts) will be required to achieve suitable landform within the Border to Gowrie section.</p> <p>ARTC have committed to undertaking site inspections prior to the construction of cuts, including visual examination of surface outcrops for sulfide minerals or evidence of sulfide mineralisation. The outcomes and information from these inspections will be utilised to inform the management of potential acid rock drainage (ARD) from cuttings prior to Project works.</p> <p>Cuts are expected to be primarily into the weathered to extremely weathered units portions of the Kumbarella Beds and Walloon Coal Measures (WCM); therefore, the risk for ARD could be naturally mitigated as sulphides minerals may have already been oxidised. Unweathered areas of the Kumbarella Beds and WCM have been avoided where possible. Potential for acid rock occurrence along the Project alignment is discussed in Chapter 9, Section 9.4.2 and is evidenced throughout Appendix G1: Geotechnical Reports - Investigation Results. Potential impacts relating to Acid rock are presented in Chapter 9: Land Resources, Section 9.5.7.</p>	Chapter 9: Land Resources Section 9.4.2 Section 9.5.7
142	142.0008	Private	Groundwater	Baseline/background sampling	EIS groundwater monitoring program is incomplete. It does not include monitoring bores between chainage 71 and 89 of the greenfield Section of track. The presentation of data in the EIS is also problematic - location of exploratory augers is given only in Eastings and Northings and no map is provided to indicate locations.	Update Figure 4.8 in Appendix R with highly contrasting colours and present data in accordance with the TOR. ARTC to collect rock samples adjacent to cuttings to inform risk of acid rock drainage and contamination of groundwater. consult with all landowners within 1 km of the alignment to confirm unregistered stock and domestic bore drill samples	<p>Figure 4.8a-d of Appendix U: Groundwater Technical Report presents the mapped surface geology with the design elements of the Project. Geotechnical investigations are ongoing to refine the understanding of cut material to be intersected.</p> <p>The groundwater monitoring bores installed as part of the feasibility geotechnical/hydrological investigations were to target design elements with potential to impact underlying groundwater, such as deep cuts and piling works. No design elements were identified between chainages 71 km and 89 km as part of the feasibility design. The alignment and reference design has since changed as a result of the value engineering process and the existing Project groundwater monitoring bore network is being reviewed against the current reference design. Where design elements with potential to impact groundwater are identified, review of targeted bores will be completed and installation of replacement or new groundwater monitoring bores will be undertaken where necessary. Revised draft EIS Chapter 15: Groundwater, Figure 15.2 presents the registered and Project (site-investigation) bores along the alignment.</p> <p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project. This bore survey was comprehensive such that all bores with potential to be impacted could be identified. Revised draft EIS Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users. ARTC is engaged with groundwater users/landowners to determine an appropriate make-good strategy on a case-by-case basis. All figures have been reviewed and updated where necessary as part of the revised draft EIS to reflect the current understanding of the presence of groundwater bores and to conform with the EIS TOR (see Appendix A2: Terms of Reference Cross Reference Table). Geotechnical investigations are ongoing and will reflect design changes as part of the value engineering process.</p>	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Figure 15.2 Appendix U: Groundwater Technical Report Figure 4.8a-d Appendix A2: Terms of Reference Cross Reference Table
142	142.0009	Private	Social Impact Assessment	Directly impacted landowner	Draft EIS refuses to adequately address access issues that significantly affect farming enterprises. ARTC informed submitter that unless farms have a gazetted access onto roads that occupational crossings will not be built, regardless of the current or intended use of the land.	ARTC is responsible for the price of legal counsel for landowners requiring occupational crossings. This requirement must be clearly communicated to landowners.	<p>As outlined in Appendix X: Social Impact Assessment, Section 7.1.7, "Design and layout of occupational crossing solutions will be determined based on specific property requirements such as stock movements and vehicle access requirements and alternative access arrangements, safety standards such as criteria for minimum sight distances for trains and vehicles, and rail design and landform. Typical treatments include underpasses (subject to topography), level crossings and diversion to adjacent public road/public road crossings".</p> <p>ARTC has consulted with impacted landowners to obtain an understanding of property access requirements and to present potential private access solutions based on the reference design. Each property solution will be designed on a case-by-case basis through ongoing consultation with landowners and further design refinement.</p>	Appendix X: Social Impact Assessment Section 7.1.7
142	142.0010	Private	Land Use and Tenure	Severance of agricultural land	EIS does not meaningfully address severance, dissection and fragmentation issues and does not make efforts to avoid these impacts. No minimum size for a property is given where taking any of the land means the proponent must take all of the land.	A minimum size could be declared such that when dissection of a rural block makes any remaining section less than 50 acres, ARTC is required to offer to compensate for the loss of the entire dissected section, while only taking possession of the necessary 40 m corridor.	<p>As stated in Chapter 8: Land Use and Tenure, Section 8.6, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties. Where disruption to water supply occurs, crossing points will be provided or the relocation of dams or irrigation systems will be undertaken in consultation with landowners.</p> <p>The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Sections 8.5.1 and 8.6.2 of the revised draft EIS for further detail.</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. 	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6 Section 8.6.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
142	142.0011	Private	Traffic and Transport	Level crossing	The EIS calculates wait times at level crossings using the best case scenario of 1800 m-long trains travelling at 115 km/h. Wait times could be double this for 3600 m-long trains and even longer if non-express services travel at a maximum speed of 80 km/h.	Update the EIS with both representative and worst case scenario modelling of wait times, and allow the community to comment on the actual inconvenience and projected increase in response time for emergency services.	<p>Section 5.9.3 of Appendix AA: Traffic Impact Assessment discusses analysis assumptions a lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (volumes are detailed in Section 2.4). This Section also details on how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> ▶ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line ▶ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate ▶ The time it takes the train to cross the level crossing ▶ Design vehicle consisting of a B-double for input parameters. <p>Train speed and train clearance times (s) calculations and assumptions (as obtained from road-rail interface) for the level crossing are as follows:</p> <ul style="list-style-type: none"> ▶ Train clearance times were calculated based on an assumed maximum train speed of 115 km/h ▶ Calculation of the freight train acceleration rate ▶ Distance of the level crossing from passing loops ▶ Distance required to accelerate to maximum turnout speed (50 km/h) ▶ Distance travelled while at constant maximum turnout speed ▶ Distance required to accelerate to maximum speed after whole train has passed turnout ▶ Total distance required to reach maximum speed for train starting from turnout ▶ Total vehicles' wait time with train length of 1,800 m was estimated to be 104 seconds (including boom closure times). ▶ The wait times determined for each individual level crossing were calculated based on: ▶ Level crossing specific operating speeds which is impacted by topography and curvature of the alignment ▶ Time taken for the train to cross the level crossing ▶ Distance from train crossing loops ▶ Train length ▶ Summarise traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons, as per Section 2.4). ▶ A sensitivity test (to represent a conservative upper level crossing time delay) has been undertaken based on a maximum train speed of 60 km/h (as opposed to up to 115 km/h) to highlight the variability in closure times. <p>Typical active level crossing sequence for boom gate down time is, after 11 seconds (t=11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (t=22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or Road trains), the delay before the booms commence lowering can be increased by a further 5 seconds to 16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F Highway signals become extinguished.</p>	Appendix AA: Traffic Impact Assessment Section 5.9.1 Section 5.9.3 Appendix BT
142	142.0012	Private	Traffic and Transport	Level crossing	EIS uses the outdated Queensland Level Crossing Safety Strategy 2012-2021. The updated policy supports initiatives to "proactively promote the 'new level crossings' policy in Queensland, where appropriate".	Greatly reduce the number of level crossings.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>Further, in June 2020 ONRSR finalised an audit of the Inland Rail Road-Rail Crossing Strategy. The audit recognised a consistent, systematic and comprehensive process for the assessment of level crossings applied to determine adequate treatments, noting that the approach ensures level crossing safety risks are eliminated or minimised, so far as is reasonably practicable in accordance with Rail Safety National Law.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
142	142.0013	Private	Traffic and Transport	Level crossing	The national rail safety regulator released a paper about passive level crossings which found that sight lines are rarely maintained - which is a road safety issue.	Greatly reduce the number of level crossings. Remove the level crossing at chainage 73, which is a 100 km/hr zone with poor visibility in both directions.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>Further, in June 2020 ONRSR finalised an audit of the Inland Rail Road-Rail Crossing Strategy. The audit recognised a consistent, systematic and comprehensive process for the assessment of level crossings applied to determine adequate treatments, noting that the approach ensures level crossing safety risks are eliminated or minimised, so far as is reasonably practicable in accordance with Rail Safety National Law.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. 142	142.0016	Private	Noise and Vibration	Operational rail noise	ARTC has not specified maximum noise emissions targets for rolling stock and has done all their noise modelling based on smooth rails. Reverse curves (S-curves) increase rail noise - including before the level crossing proposed near the Woodspring farm.	Move the level crossing to avoid the S-curves, or commit to a rail roughness mitigation program. ARTC to routinely report on rail roughness and noise impacts at S-curve locations insist that wayside monitoring systems (see submission for list) be present and enforce a penalty for operators whose rolling stock does not meet pre-set limits or Apply a noise-differentiated track access charge.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Correction factors were applied to the noise model to account for impulsive noise as the train passes over turnouts, level crossings and bridges. These correction factors were applied as per the DTMR Interim Guideline (Table 4.1.2). The DTMR assessment criteria includes a Single Event Maximum to support the review of mitigation measures to address impacts such as sleep disturbance.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17
142	142.0018	Private	Project alignment		The EIS and community consultation fail to provide clarity around route selection, with variable weighting given to different criteria to suit ARTC's point-and-predict model. Social impacts are not really considered. Route selection Section of the EIS references reports that are not publicly available. ARTC chose not to release a report as they do not actually value community input or transparent communication.	Nil.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres to 1000 metre wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ ability to enhance the Inland Rail service offering ▶ construction and operating costs ▶ the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ▶ Environmental impacts: 12.5% (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ▶ Community impacts: 12.5% (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ▶ Approvals and stakeholder engagement: 12.5% ▶ Technical viability: 17% ▶ Safety 16.5% ▶ Constructability: 12.5% ▶ Operations: 16.5%. <p>The report referred to was part of the normal process of developing a concept alignment, and as such these reports have not been made publicly available as they are internal working documents. The document was referenced purely to demonstrate that work had been undertaken during 2015 and 2016 to refine the 2015 Inland Rail Implementation Group (IRIG) route into the alignment that became known as the Base Case (Modified) route. The AECOM Report referenced assessed a number of potential options for improving on the 2015 IRIG alignment and resulted in the development of the Base Case (Modified) route. This was one of the four route options assessed by AECOM and Aurecon under the auspices of the Project Reference Group and that reported to ARTC and the Australian Government in the Corridor Options Report (April 2017). The Australian Government announced in September 2017 that it had determined the Base Case (Modified) - via Wellcamp-Charlton as the route for Inland Rail in the Border to Gowrie Section (Chapter 2: Project Rationale, Section 2.9.3). Since late 2017 the AECOM Concept Assessment Report referenced in the submission has had no direct relevance to the further route refinement work undertaken by ARTC.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
142	142.0019	Private	Surface Water	Baseline/background sampling	Ecological survey and surface water sampling is insufficient. Studies took place during on the of the worst droughts in history.	Studies should be repeated four weeks after the floods, which is more representative of the usual ecosystem.	<p>The revised draft EIS has been updated to include an additional 12 months of surface water data collected from December 2020 to November 2021, in addition to the data collected from June 2018 to May 2019. The data has been re-evaluated and presented in the revised draft EIS in Appendix S: Surface Water Quality Technical Report, Sections 3.1.2 and 5.2, and Chapter 13: Surface Water, Section 13.3.3 and 13.4.5.</p> <p>Additionally, more detailed ecological field surveys have been conducted since the release of the draft EIS. The results of these additional surveys have been presented within Chapter 11 and Appendix L of the revised draft EIS.</p>	Chapter 13: Surface Water Section 13.3.3 Section 13.4.5 Appendix S: Surface Water Quality Technical Report Section 3.1.2 Section 5.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
142	142.0020	Private	Landscape and Visual Amenity		Project impacts on visual amenity are understated by selectively choosing sites for viewpoints and providing on 'before' photos for some viewpoints. Submission outlines specific examples including the viewpoint at Yelarbon.	Provide visualisations at all viewpoints as well as a solid plan to address visual amenity in Yelarbon that takes into account the current beautification works, silo art, viewing area and park and rest top and re-release the amended EIS for public comment.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project.</p> <p>The rationale for the selection of viewpoints to provide visualisations for has been provided in Section 4.9 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment. Visualisations have been selected on the basis of those illustrating key infrastructure elements likely to be of interest to the community and/or the most sensitive viewpoints, such as from regionally-significant scenic lookouts.</p> <p>Based on community feedback received through the EIS process, several additional viewpoints have been provided as part of the LVIA and were included in the revised draft EIS, including Viewpoint 22 (previously 17b) showing an alternative view from Pittsworth and Viewpoint 20 (previously 16) which provides an aerial view over Brookstead.</p> <p>An additional site visit was undertaken in October 2021 to assess the potential impact of views from the GrainCorp silo artwork viewing area (which had not been constructed at the time of the original field assessment). As a result, an additional viewpoint assessment (Viewpoint 4) has been included within Appendix K: Landscape and Visual Impact Assessment, Section 8.2.4 and Section 9.1.4. In addition, an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p> <p>ARTC is investigating the design for the noise walls to determine whether satisfactory noise mitigation can be achieved without obscuring views to the silos. If views to the Yelarbon silos were affected by noise walls, ARTC would facilitate provision of mitigation measures e.g. a complementary mural on the noise wall, in consultation with the Yelarbon community and Goondiwindi Shire Council.</p>	Appendix K: Landscape and Visual Impact Assessment Section 4 Section 4.9 Section 8.2.4 Section 9.1.4
142	142.0021	Private	Editorial		EIS contains inconsistencies. For example a road rail interface at Millmerran Inglewood Road is referred to as a road-rail bridge in an Appendix but is referred to as an active level crossing in other locations in the EIS. Also Millmerran-Inglewood Rail Bridge 231 is identified in the visual amenity impact assessment and traffic impact assessment but not the operational noise assessment.	Ensure inconsistencies are addressed in the draft EIS re-released for public comment.	<p>Substantial revisions have been made to the revised draft EIS, capturing the outcomes of on-going investigations and ensuring a document that is more consistent, accurate and appropriate.</p> <p>The Project is proposed to interface with Millmerran-Inglewood Road at three locations across the Project alignment, as described in Table 5.15 of Chapter 5: Project Description. The Proposed interfaces include:</p> <ul style="list-style-type: none"> ▶ Active Level Crossing at Chainage 73. 01 km ▶ Grade Separation rail-over-road at Chainage 115.52 km ▶ Grade Separation rail-over-road at Chainage 127. 00 km <p>Table 2 and Table 3 of Appendix W: Noise and Vibration Assessment – Railway Operations summarises all interfaces incorporated into the revised reference design for the Project, including the three Millmerran-Inglewood Road interfaces.</p>	Chapter 5: Project Description Table 5-15 Appendix W: Noise and Vibration Assessment - Railway Operations Table 2 Table 3
142	142.0022	Private	Surface Water	Erosion	Appendix P states there are two sediment basins at chainage 73, which are supposedly described in Volume 3. There is no volume 3 on the USB provided to the submitter. The sediment basins can be considered 'water storage' under the RPI regulations, which is inconsistent with Chapter 3 that states the RPI Act is only applicable to extractive industries.	Ensure inconsistencies are addressed in the draft EIS re-released for public comment. Acceptance of the EIS be contingent on ARTC applying for an approval under the RPI Act 2014.	<p>Sediment basin 8 (located at chainage 73.6 km) is no longer part of the Project. Sediment Basins have been updated to reflect the revised draft EIS proposed Project requirements (see Table 1.3, Appendix S: Surface Water Quality Technical Report).</p> <p>The locations of sediment basins are shown in working plans and longitudinal sections presented in Appendix B1: Design Drawings of the revised draft EIS.</p> <p>Water storage (dam) is only regarded as a regulated activity under the <i>Regional Interests Planning Act 2014</i> if located in a strategic environmental area (Part 4, Section 11 Regional Planning Interests Regulation 2014). The Project is not located in a strategic environmental area, therefore the RPI Act does not apply to sediment basins established for the Project.</p>	Appendix B1: Design Drawings Appendix S: Surface Water Quality Technical Report Table 1.3
142	142.0023	Private	Land Use and Tenure	Directly impacted landowner	Every property and business owner is left to negotiate for themselves when it comes to compensating for severance and dissection of properties and businesses. There is a real possibility of land owners being under compensated.	Guidelines should be released publicly as a baseline from which negotiations can begin.	<p>Where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld).</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.2 states that assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance.</p> <p>Chapter 17: Social costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> ▶ Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation ▶ Costs related to the purchase of replacement comparable land ▶ Storage and removal costs ▶ Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. <p>Chapter 8: Land Use and Tenure, Section 8.6.2 states that during construction, land will be acquired temporarily in accordance with the Acquisition of Land Act 1967 (Qld). Purchasing or leasing arrangements for these properties will be investigated in consultation with relevant landowners.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.4-states that ongoing consultation with affected landowners, and the wider communities, will be undertaken in accordance with ARTC's consultation plan, as discussed in Chapter 6: Stakeholder Engagement. Negotiation of land acquisition will be undertaken in accordance with the Acquisition of Land Act 1967 (Qld), which includes the process for the resumption of land by a constructing authority (Department of Transport and Main Roads) and compensation. Chapter 17: Social, also outlines mitigation measures within the Social Impact Management Plan in relation to consultation with directly affected landowners.</p>	Chapter 6: Stakeholder Engagement Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.2 Chapter 17: Social
142	142.0024	Private	Project scope		Fencing standards in the draft EIS are inadequate and do not address the needs of landowners or wildlife. Fencing used for Narromine to Narrabri suggested 4 strand barb wire, which is inappropriate as it will not contain sheep, goats, bulls or free range pigs.	Mandate like-for-like fencing standard and where no fence existed prior to the project, require fencing standards be clear and specify with more detail the type of fencing and include details of strainers and creek crossings. If no fencing is in place, ARTC needs to describe how public, livestock and fauna access will be restricted to the rail corridor.	<p>ARTC note the feedback regarding the fencing standards. Additional information is included in the revised draft EIS. Fencing standards and the approach to fencing, to a Reference Design Level, are provided in Chapter 5: Project Description, Section 5.4.12.</p> <p>ARTC will implement its Fencing Strategy on the Project. Wire Netting or Prefabricated Field Fencing Fabric (specifically 7/90/30 tight cross-over knot mesh) will be used for all grazing properties along the alignment unless an alternative standard is mutually agreed with the landowner.</p>	Chapter 5: Project Description Section 5.4.12
142	142.0025	Private	Traffic and Transport	Mitigation measures	EIS says ARTC will come to an agreement with local councils about road maintenance, it fails to consider the likely dearth of available workers with appropriate experience.	Condition the project so that roads used for construction are repaired to a standard assessed by the appropriate council as 'not in a worse condition than pre-project' six months after completion of construction.	<p>Once the construction routes have been confirmed at the next stage of the project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. <p>The agreed arrangements to deal with impacted pavements as a result of construction will be contained in the Third Party Agreement that will exist between the Road Manager and ARTC.</p>	Appendix AA: Traffic Impact Assessment Section 6.2
142	142.0026	Private	Social Impact Assessment		ARTC has not prepared a social impact assessment that documents community and stakeholder engagement, workforce management, housing and accommodation, local business and industry procurement, and health and community wellbeing.	A system for the follow-up of social impacts should be required prior to approval of the draft EIS. The SIMP could include second yearly monitoring and reporting to the Minister of Transport for compliance with noise, vibration, air quality, complaints register and traffic impact and safety, as well as condition of roads use for construction. ARTC needs to be required to remediate any instance of exceeding projected impacts.	<p>Appendix X: Social Impact Assessment, Section 8 includes a Social Impact Management Plan (SIMP) which addresses these five areas in detail. The SIMP also includes detailed monitoring and reporting provisions. SIMP monitoring and reporting commitments are detailed in Appendix X: Social Impact Assessment, Section 8.7.</p> <p>Environmental changes which could result in social impacts (e.g. noise, air quality, traffic) are addressed in detail in other sections of the revised draft EIS.</p>	Appendix X: Social Impact Assessment Section 8 Section 8.7
142	142.0027	Private	Stakeholder engagement		ARTC has held community information sessions masquerading as community engagement sessions. Community concerns have been noted but never addressed. No avoidance or mitigation measures have been forthcoming and the community is highly disillusioned.	A system for the follow-up of social impacts should be required prior to approval of the draft EIS.	<p>ARTC has held numerous community information sessions in the SIA study area. As detailed in Chapter 6: Stakeholder Engagement, Section 6.2, "inform" is one level of the engagement spectrum. As a tool, community information sessions fall into the "consult" level of the spectrum as ARTC acknowledges community concerns and feedback and has provided feedback on how these have been considered in the design process. Examples of areas where consultation has resulted in changes to reference design or mitigation measures can be found in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>Appendix X: Social Impact Assessment notes that a detailed Social Impact Management Plan (SIMP) will be developed, including the following actions plans: community and stakeholder engagement, workforce manage, housing and accommodation health and community wellbeing, local business and industry content.</p>	Chapter 6: Stakeholder Engagement Section 6.2 Section 6.6 Appendix X: Social Impact Assessment
142	142.0028	Private	Social Impact Assessment	Workforce and employment	EIS addressed providing advice, training and capacity building of local businesses but employment goals for traditionally underrepresented groups, such as women, is not addressed. The EIS alludes to goals for local and Indigenous employees but the percentages required are apparently commercial-in-confidence and the decision of the top tier contractor.	Condition the project so that goals for Indigenous, local and female representation in the workforce may not be commercial-in-confidence and must be greater than 10 ongoing full-time jobs during operations, 10% of work hours for residents from within 125 km of the project, 15% of work hours for apprentices, trainees and on-the-job training, 10% of work hours to female employees, 2% of work hours to Indigenous employees and \$500 million in contracts with local businesses. Compliance must be disclosed in reporting.	<p>As noted in Appendix X: Social Impact Assessment, Section 7.2.2, the Project will underpin its planning with the minimum participation targets set by related Commonwealth and Queensland policy. The Project will drive outcomes toward aspirational or incentivised targets with Contractors to exceed these minimum benchmarks. The Project's contractual negotiations will remain commercial in confidence.</p> <p>Where policy benchmarks do not exist, minimum targets have been set with consideration for baseline labour and supply chain conditions, likely cumulative demand and competition for roles or supply at the time of project construction, and with respect for input from related key stakeholder consultation.</p> <p>The Project is committed to a minimum local employment target of 15% (i.e. employment of residents of the SIA study area), which ensures that Project employment targets are enabling local employment choice, while managing the potential for regulated Project employment targets to accelerate or exacerbate local labour draw, which is a serious concern raised by both GRC and TRC. The Project's aspiration is for its Contractors to exceed this employment target should local labour capacity support this, without significant adverse impact to other local industry or supply chains, at the time of Project delivery (Appendix X: Social Impact Assessment, Section 7.2.2).</p> <p>During its Construction Works stage, the Project will also align with the Queensland Government commitment to achieving an 11% female participation target, and aspires to the Department of Employment, Small Business and Training's recently set 15% target for women in frontline construction roles (Queensland Government.2022).</p> <p>Updated analysis of the likely availability of construction labour from the SIA study area will be required prior to construction, to enable the refinement of local and regional recruitment and training strategies.</p> <p>Strategies for recruitment and training of personnel from the Goondiwindi and Toowoomba LGAs and Targets (numbers and percentages) for employment by location (i.e. SIA study area/LGA) and demographic (e.g. participation by people under 25 years and Indigenous people) will form a key part of the selection and contracting process.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.3 has been updated to provide examples of and commentary regarding aspirational targets relevant to local and Indigenous procurement and workforce participation.</p> <p>Once operational, a workforce of approximately 10 - 15 FTE is expected for the Project's operation and ongoing maintenance.</p>	Appendix X: Social Impact Assessment Section 7.2.2 Section 8.3.3
142	142.0029	Private	Social Impact Assessment	Workforce accommodation village	Locals are concerned about the effects of a large influx of non-resident employees in the area. A main concern is the effect on rents and housing availability as vacancies are low in all towns. ARTC has committed to build workers camps out of town for employees to move into if local rents go up. ARTC doesn't say how or when this will be monitored or when it will be acted upon. A local council suggested the accommodation capacity of the local area be increased as a legacy benefit of the project instead of workers camps.	Require ARTC to supply details of discussions with stakeholders that explain why the suggested legacy benefit was not a possible and superior solution.	<p>ARTC acknowledges residents' concerns about housing pressures and the Project includes three proposed workforce accommodation facilities, which are not contingent on whether rents increase.</p> <p>Appendix X: Social Impact Assessment, Section 8.4 provides comprehensive detail on how accommodation needs will be managed and monitored.</p> <p>Opportunities for the future beneficial re-use of the three non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor in consultation with Councils, the owners of sites and local community members.</p>	Appendix X: Social Impact Assessment Section 8.4

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
142	142.0030	Private	Economics		There is no breakdown of the economic impact to the project regions during operation. There are 10-15 operational jobs anticipated but they are shared between neighbouring rail projects so the number will be lower. The impact to hospitality is said to be too small to bother quantifying but no evidence is given to support this. No consideration given for local businesses who may lose their staff to the project. Impact of lost agricultural land is enumerated but mitigation measures are left for detailed design.	ARTC needs to provide details of businesses registered with them as potential suppliers and the economic benefits can be reasonably expected to be realised in each town during construction based on this information. ARTC needs to account for the loss of business from noise and economic cost of the burden of disease from increased ischaemic heart disease and mental health issues due to excessive noise during operation and the expected long term benefits.	<p>As detailed in Appendix Y: Social Impact Assessment, there are local 9 businesses within the study area whose amenity could be affected by construction noise. Short-term accommodation businesses are likely to experience some negative impacts as a result of increased noise and temporary access disruptions during construction which may result in loss of income. ARTC will consult with businesses within towns where construction noise or traffic disruptions could affect their amenity and consider their feedback in finalising plans for works near their businesses.</p> <p>In relation operational impacts, ARTC acknowledges that due to the nature of the Project, the operational economic impacts of the Project will only be fully realised once all components of Inland Rail are completed. Assessing each link of the Inland Rail Program individually and in isolation of the whole Program will not capture all the benefits expected to be generated upon completion of the entire Melbourne to Brisbane connection. For the Border to Gowrie section, it is anticipated that ongoing operation and maintenance of will require a workforce of 10 - 15 FTEs as quoted by the submitter. This does not reflect the potential of additional impacts which may arise from the development of supporting infrastructure such as intermodal terminals. Considering the development of other infrastructure or Project options is outside the scope of this EIS. For other operational impacts are reflected in various chapters of the EIS e.g. noise and vibration impacts (refer to Chapter 16: Noise and Vibration, Section 16.8).</p> <p>ARTC will implement mitigation measures to ensure impacts to the availability of the local workforce is not reduced. These include:</p> <ul style="list-style-type: none"> ▶ Establishing the IR Skills Academy training and capacity building initiatives (to increase the labour pool) ▶ Monitoring labour draw in consultation with key stakeholders ▶ Corrective actions if required e.g. to recruitment or training strategies <p>In terms of loss of agricultural land, in response to public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the revised draft EIS, including to the calculated potential loss for rural communities. Revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0. 07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>In accordance with the Australian Jobs Act 2013 (Cth), ARTC has prepared an Australian Industry Participation Plan (AIP) Plan for the Inland Rail Program which identifies how Australian entities, particularly businesses operating within the Goondiwindi, Toowoomba and nearby Local Government areas (LGAs), will be provided full, fair and reasonable opportunity to bid to supply goods and services to the Project. ARTC is also committed to ensuring that Indigenous businesses, including those operating within the SIA study area, are identified and encouraged to participate in the Project's supply chain. In recognition of stakeholders' expectations, and to ensure local business benefit from the Project, ARTC has developed subgroups to further categorise and define the geographical boundaries of what constitutes local, as discussed in Section 17.6 of Chapter 17: Social, and will report on local supplier participation from within the Goondiwindi and Toowoomba LGAs, as well as at regional, state and national level. The majority of supply opportunities for businesses will be with the construction contractors and their supply chains, not directly with ARTC. Tenderers for Project construction will be made aware of the need to engage loc businesses and required to ensure they have a full, fair and reasonable opportunity to tender.</p> <p>ARTC will implement Inland Rail's Sustainable Procurement Policy (available at inlandrail.artc.com.au/inlandrail-sustainable-procurement-policy) for the Project. The Sustainable Procurement Policy aims to maximise the involvement of businesses, and includes a focus on building local businesses' capacity, to increase the number of businesses in the SIA study area that can successfully compete for Project supply opportunities.</p> <p>ARTC is engaging with the Contractors regarding acceptable standards for subcontracting, and will also work with small businesses to provide information about how to engage with major contractors.</p> <p>ARTC will also consider aspirational targets identified in the Queensland Procurement Policy (Department of Energy and Public Works, 2021) in evaluating the Contractor's targets. The Queensland Procurement Policy's targets include:</p> <ul style="list-style-type: none"> ▶ Increasing government procurement with Aboriginal and Torres Strait Islander businesses to three per cent of addressable spend by 2022 ▶ Sourcing at least 25 per cent of procurement by value from Queensland small and medium enterprises, increasing to 30 per cent by 30 June 2022. <p>ARTC acknowledges the concerns that the local community and businesses along the Project alignment may experience a loss of lifestyle amenity due to construction and operational impacts including noise, vibration and related economic costs to business. Proposed mitigation measures are outlined in Chapter 17: Social, Social Impact Management Plan, Section 17.6.</p> <p>As outlined in the mitigation measures outlined in Chapter 17: Social, Social Impact Management Plan, Section 17.647-4, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> ▶ Direct impacts on properties e.g. severance and loss of productive land ▶ Impacts on property accesses and connectivity, including the location of level crossings on private roads ▶ Impacts on the movement of stock, water, produce and equipment 	Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Chapter 17: Social Section 17.6 Chapter 18: Economics Section 18.3 Section 18.7
142	142.0031	Private	Social Impact Assessment	Aquatic fauna	Increases in population bring about increased demand for services. Apart from a commitment to supply a paramedic, and to inform existing services of anticipated changes in population, there has been no attempt made to address these issues. No attempt has been made to quantify social impacts at the town or region level. Information Qld Health that extra doctors will required short term fails to take into account the town's long-standing problems attracting and retaining physicians. There is currently a wait of several months for driving tests in Inglewood. There is insufficient bandwidth for using the internet at certain times of the day.	The EIS should be amended to add this information and supply meaningful mitigation measures, rather than relying on other agencies to fix their mess.	<p>The revised draft EIS includes a very detailed assessment of social impacts, benefits and mitigation measures, in accordance with the EIS Terms of Reference and Social Impact Assessment Guideline.</p> <p>Heath service shortages are acknowledged in Appendix X: Social Impact Assessment, Section 7.4. Government agencies such as Queensland Health and Queensland Ambulance Service are required and funded to provide services to people in need. ARTC has committed to working cooperatively with the relevant agencies.</p> <p>Expanded measures for mitigation of potential impacts on health services have been provided in the revised draft EIS (Appendix X: Social Impact Assessment, Section 8.5.8 Table 8.12), including providing workplace health and safety services, including health promotion programs and access to GP services for personnel residing in the non-resident workforce accommodation, via either local or remote service providers, and/or through telehealth services.</p> <p>Section 8.5.8 of Appendix X: Social Impact Assessment notes that as part of quarterly consultation with Queensland Health, ARTC will monitor impacts on local health services. If undue strain on local health services is identified to be attributable to the Project, ARTC will work with Queensland Health and DD&WM PHN to implement appropriate measures that may include funding additional health services and programs at non-resident workforce accommodation facilities, or contract arrangements with local or remote health service providers.</p> <p>Additionally, ARTC has implemented measures to minimise the spread of COVID-19 among its workforce and mitigate any associated impacts on local health services (Appendix X: Social Impact Assessment, Section 8.5.8).</p>	Appendix X: Social Impact Assessment Section 7.4 Section 8.5.8 Table 8.12
143	143.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
143	143.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. Could impact on Millmerran town parking availability. 	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. 143	143.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
143	143.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>
143	143.0006	Private - Turallin Workers	Social Impact Assessment		The camp site could have a possible negative Life Style impact on the small rural historic community.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Emergency service would be more readily available if required. 	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas), and the Contractor is currently undertaking due diligence to identify a third site in the Millmerran area.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised by the Contractor during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. The Contractor is currently undertaking due diligence to identify a site for the establishment of non-resident workforce accommodation facilities in the Millmerran area. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>
143	143.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20.5.1</p> <p>Section 20.6</p>
143	143.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. 143	143.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.</p>	Chapter 11: Flora and Fauna Section 11.5
144	144.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
144	144.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Ellerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. Could impact on Millmerran town parking availability. 	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56
144	144.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4
144	144.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property, cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5</p>
145	145.0001	State Agency	Approvals/conditions/recommendations		The Department of Transport and Main Roads (TMR) agrees that the project fits the definition of government supported transport infrastructure; (GSTI) under the Transport Infrastructure Act 1994. However, it has not yet been confirmed if the project fits the definition of GSTI under the Planning Act 2016. TMR understands that the Coordinator General (CG) is currently considering if the project is GSTI and deciding on the projects approval pathway. If the project is GSTI under the Planning Act 2016, TMR would not have the opportunity to review the project after the CGs final Environmental Impact Statement (EIS) evaluation report, other than through contractual negotiations and the limited and specific approvals required for access to, and works on, the state-controlled roads and rail corridors in accordance with the Transport Infrastructure Act 1994. In such a scenario, TMR considers that it would be both reasonable and lawful for the CG to include imposed conditions in the CG evaluation report to protect TMRs state interests and obligate ARTC to undertake their various commitments in the EIS/Outline Environmental Management Plan (and others as needed to protect TMRs interests), where those requirements are not enforceable by other statutory processes similar to the approach taken for the Cross River Rail project.	<p>It is recommended that this Section be reworded to state that the project is considered GSTI under the Transport Infrastructure Act 1994, and updated to reflect the outcomes of the CG's investigation into whether the project is GSTI in accordance with the Planning Act 2016, and any resulting impact that may have on the projects proposed approval process. TMR would appreciate the opportunity to continue to discuss the project approval process with the CG once it has been confirmed, and provide further input regarding the need for, and ultimate format of, any conditions in the CG's final evaluation report for the project to protect TMRs State interests. TMRs expectation is that this discussion will occur in the coming months as ARTC updates the EIS to reflect TMR and other state agencies comments prior to the CG's evaluation report being finalised.</p>	<p>ARTC sought and was granted Coordinated Project status under the State Development and Public Works Organisation Act.</p> <p>The Coordinated Project process allows all Commonwealth matters to be assessed under Queensland legislation through the provisions of the Commonwealth and Queensland bilateral agreement for environmental assessment (in accordance with Section 45 of the EPBC Act) (Section 3.2.2 of Chapter 3: Legislation and Project Approvals Process). Under these provisions the Commonwealth relies on agreed Queensland assessment processes to address matters under the EPBC Act.</p> <p>The Coordinator-General may impose stated conditions that must be incorporated into subsequent development approvals.</p> <p>The revised draft EIS has been updated to reflect outcomes from regular engagements with DTMR and other State agency comments. ARTC commit to on-going engagement with DTMR, other State agencies and local governments throughout the post-approval stages of the Project.</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.2.2</p>
145	145.0002	State Agency	Approvals/conditions/recommendations		The State Assessment and Referral Agency (SARA) has been moved from Queensland Treasury (QT) to the Department of State Development, Infrastructure, Local Government and Planning (DSDILGP). The report refers to SARA in Department of State Development, Tourism and Innovation (DSDTI). The correct department should be referenced. Approvals under the Transport Infrastructure Act 1994 may also include approvals for access to a state-controlled road granted under Section 62. The Table should be updated to reference that approval.	<p>Table 3.4 should be updated to correctly reference relevant Queensland Government Departments, in particular the movement of SARA from QT to DSDILGP. It is also recommended the Table be updated to include approvals granted under Section 62 of the TIA.</p>	<p>Government department names have been updated in the revised draft EIS.</p>	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0003	State Agency	Approvals/co nditions/reco mmendation s		Table 3.5 references development permit for works within, adjacent or impacting state transport infrastructure and the lists the relevant legislation as the TI Act and the Planning Regulation. The relevance of this row/Section in the Table is unclear. The triggers within the Planning Regulation are not necessarily relevant for this project and the approval issued through the Planning Act 2016 do not authorise works within a transport corridor. Approval for works within a transport corridor are granted under the relevant Section of the Transport Infrastructure Act 1994. It is recommended this Section be reworked or removed.	Recommend this row/Section in Table 3.5 be revisited to identify its relevance to the project and either remove or amend as required.	Table 3.5 in the revised draft EIS Chapter 3: Legislation and Project Approvals Process) has been updated to identify potential post-EIS approvals. This includes the indicative requirements for activities during detailed design and construction works. The relevance of the TI Act/Planning Regulation being triggered via the Project undertaking development on State transport infrastructure is for activities proposed to be undertaken during detailed design and construction works. It is also noted within Table 3.5 (Chapter 3: Legislation and Project Approvals Process) that the TI Act has been identified to be triggered due to proposed road works, ancillary works, construction, maintenance and operations that encroach on State-controlled roads. Unless potential exemptions apply, the Contractor will be required to seek approval from DTMR under Section 33 of the TI Act at least 20 business days prior to commencement of Project works that interface with State controlled roads. The Coordinator-General may impose stated conditions that must be incorporated into subsequent development approvals. They may also provide recommendations for other approvals required by the Project.	Chapter 3: Legislation and Project Approvals Process Table 3.5
145	145.0004	State Agency	Project scope		The EIS provides details of two road over rail bridges on state-controlled road in Table 5.11 (Cunningham Highway bridge and Gore Highway bridge). Cross-sectional arrangement for the proposed bridges (rail over road) should not constrain/restrict future growth/capacity for traffic, and should allow ease of structural maintenance, inspection and traffic management for incident management. These aspects need to be acknowledged in the EIS when proposing bridge designs to TMR.	Cross-sectional arrangement for the proposed bridges (rail over road) should not constrain/restrict future growth/capacity for traffic, and should allow ease of structural maintenance, inspection and traffic management for incident management.	ARTC will continue to work collaboratively with DTMR as the Project progresses to detailed design. For the Gore Highway and Cunningham Highway, DTMR has not advised of any plans for future works and therefore the overpass cross Section proposed accommodates the existing lane configuration. ARTC will accommodate any future growth/upgrade plans for DTMR roads, where they have been identified/demonstrated by DTMR through technical forums and in DTMR's Minimum Technical Requirements documentation. From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Refer Chapter 20: Traffic, Transport and Access, Section 20.3 and Section 20.5 for traffic assessment details. Access provisions for structural maintenance, inspection and traffic management for incident management will also be determined during detailed design and the cross Section may be adjusted as required.	Chapter 20: Traffic, Transport and Access Section 20.3 Section 20.5
145	145.0005	State Agency	Traffic and Transport		The EIS notes a number of utility services (communication, electricity, gas, water, sewerage) that have been identified for either protection or relocation to facilitate ARTC works.	The relocation of utility services should not preclude TMR from future development in the road reserve nor should it lead to an increase in cost for TMR future works. Amend the project and EIS as needed.	Section 20.3.6 of Chapter 20: Traffic, Transport and Access confirms all utility owners have been consulted by ARTC during the reference design process to establish potential interface impacts and to identify design solutions. Prior to construction commencing, the relevant land owners (i.e. easements, road corridor, private property) including DTMR and utility owners are required to endorse/approve all proposed utility treatments/designs within land under their management and control. This includes for temporary and permanent roads. ARTC will continue to work collaboratively with stakeholders, including DTMR, regarding their future works in the Detailed Design stage.	Chapter 20: Traffic, Transport and Access Section 20.3.6
145	145.0006	State Agency	Approvals/co nditions/reco mmendation s		The EIS mentions pre-construction activities and early works for establishment of access tracks, stockpiles/laydown areas etc. The EIS however, does not provide details regarding the approval process for undertaking these works in relation to identification, design approval of temporary access from state-controlled road, approval process for traffic management, environmental management and access to road reserves for construction activities from respective road authorities.	Update the EIS to provide an outline of the approval process from road authorities to undertake works.	Chapter 5: Project Description, Section 5.5 describes pre-construction and early works in the following manner: Pre-Construction Activities and Early Works are undertaken prior to full mobilisation of the Contractor. These works may be undertaken under a separate contract but must not start until the Draft Outline Environmental Management Plan has been approved by the Coordinator-General and the relevant Early Works Construction Environmental Management Plan (CEMP) has been endorsed by the Environmental Monitor. Pre-Construction Activities and Early Works include: <ul style="list-style-type: none"> Site preparation for construction Establishment of access roads/tracks Vegetation clearing and other ground disturbance activities that will be required to comply with relevant legislative requirements, approval conditions, guidelines and plans Additional surveys and geotechnical investigations to inform the Construction Works stage Relocation or protection of QR assets that were not required to be undertaken well in advance as part of enabling works Utility/service interfaces that were not required to be undertaken well in advance as part of enabling works Modification of biosecurity fencing Installation of boundary fencing Establishment of site offices and initial laydown areas, including the Whetstone MDC Establishment of non-resident workforce accommodation. Details of the Approvals process will be fully detailed following the Coordinator-Generals assessment of the Project and receipt of state-conditions that must be incorporated into subsequent development approvals.	Chapter 5: Project Description Section 5.5
145	145.0007	State Agency	Project scope		The EIS identifies that although ARTC is applying for trains at a length of 1.8 km all infrastructure works including corridors and land has been designed for 3.6 km trains (including passing loops, land requirements and infrastructure). It is unclear how impacts associated with an increase in train length will be considered.	Clarify how a change to the project approval which is currently for 1.8 km will be considered if the operations of trains increase in length to 3.6 km as identified in the EIS. The increase is likely to include changes to impacts associated with noise and vibration, visual amenity and social impacts.	The revised draft EIS investigations are limited to the impacts of trains of 1,800 metre (m) length, as stated in Chapter 5: Project Description, Table 5-4. All references to a future increase in length have been removed from the revised draft EIS. It is agreed that a future change from 1,800 m to 3,600 m will require a reassessment of environmental impacts including noise and vibration, visual amenity and social impacts.	Chapter 5: Project Description Table 5.4
145	145.0008	State Agency	Project scope		Section 5.4.2 states in relation to the construction schedule that: Contractor award mid-2021. Some tasks can commence prior to contract award. Considering it is now March 2021, it is recommended that these dates are updated in the EIS.	Amend the EIS to reflect a realistic construction timeframe.	The draft EIS was based on assumptions current at the time of assessment. Time frames in the revised draft EIS have been updated to incorporate an updated construction schedule. The anticipated timing of stages for the Project are shown in Chapter 5: Project Description, Table 5-3. Mobilisation and Construction is currently scheduled to commence mid-2024 and be completed in early-2028. Inland Rail, and the Project, are scheduled to be operational in early 2028.	Chapter 5: Project Description Table 5-3
145	145.0009	State Agency	Land Resources		The EIS references dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. This indicates a misunderstanding of best practice amelioration methods by including the use of lime and mixing with a reclaimer/ stabilizer, which could be misinterpreted as being hydrated/ quicklime and would not be appropriate for neutral to alkaline soils. Additionally, there does not seem to be any consideration of amelioration of sodic subsoils for use in homogenous and outer zone of zoned embankments as per TMR Interim Soil Management Manual (SMM).	In the absence of any nominated ARTC standard, include the requirement for mapping or testing to determine the suitability and risks of the project's topsoils and subsoils as the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications prior to disturbance. Amend the EIS accordingly.	A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 3.2.2, Section 4.5 and Section 5. 0. This level of investigation is sufficient to allow determination of the suitability of the soils and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. This enabled the management the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al. , 2008), the <i>Australian soil and land survey field handbook</i> (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015). ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at a 1:10,000 scale in consultation with DoR. The soil investigation report provides detailed soil profile descriptions and laboratory test results. Findings from the detailed soil investigation have been incorporated into Chapter 9: Land Resources, Section 9.3.2 and Section 9.4.2. Section 3 in Appendix AB: Earthworks and Draft Soil Management Plan also presents mitigation measures for soil units within the Project footprint.	Chapter 9: Land Resources. Section 9.3.2 Section 9.4.2 Appendix J: Soil Assessment Report Section 3.2.2 Section 4.5 Section 5.0 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3
145	145.0010	State Agency	Surface Water		The EIS quotes October 2020 figures but these are now six months out of date and inaccurate. The variance in data is quite dramatic and should be revisited. For example: <ul style="list-style-type: none"> Ben Dor Weir is quoted as 81.8% full but by March 2021 it was 46.29% full Coolmunda Dam is quoted as 28.8% full but by March 2021 it was 17% full Talgai weir quoted is as 26.3% full but by March 2021 it was 82% full Lemon Tree weir is quoted as 13.7% full but by March 2021 it is was 62.4% full. Inaccurate water data will likely lead to increased cartage on state-controlled roads. The Terms of Reference (ToR) requires the EIS to use current data. 	Amend the EIS to demonstrate if existing dams have sufficient total capacity for Inland Rail works, instead of available volume.	Appendix S: Surface Water Quality Technical Report and Chapter 13: Surface Water of the revised draft EIS have been updated to remove reference to stored volumes in existing dams, as was presented in the draft EIS.	Chapter 13: Surface Water Appendix S: Surface Water Quality Technical Report
145	145.0011	State Agency	Surface Water		Section 5.4.20.2 regarding other water source opportunities states that potential sources of water from the Commodore mine to be investigated post EIS. The ToR requires the EIS to use current data. Sourcing of water is critical to the project. Therefore it would be appropriate to consider water requirements as part of the EIS.	Office of the Coordinator-General to consider if the lack of data is adequate to meet the requirements of the ToR.	ARTC recognises that water sourcing and availability is critical to supporting the construction program for the Project. Updated information is provided in Section 5.6.24 of Chapter 5: Project Description regarding construction water, specifically the estimated volumes required, water quality parameters, potential sources, access and reliability. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements. Since advertisement of the draft EIS, various land holders and other stakeholders have been forthcoming with offers to sell all or part of their licenced groundwater entitlement to ARTC for use as construction water. To date, offers to sell licenced groundwater entitlement are in excess of 1,870 ML/yr, from registered bores located along the full length of the Project footprint. For context, this volume equates to 67% of the total estimated water requirement for earthwork, track work and revegetation activities. The total volume of water made available through these offers is expected to increase as the Project progress towards construction. Additional sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable. The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan, to be finalised prior to the commencement of construction.	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements
145	145.0012	State Agency	Approvals/co nditions/reco mmendation s		Regarding whether the contractors and ARTC remain ineligible to operate under the exemption requirements, a temporary water permit would be required before taking any water for construction activities. It is unclear whether the timescales and requirements have been adequately assessed if a temporary water permit is required. Additionally, it is unclear if this strategy provides enough volumes.	Update the EIS to adequately assess and consider what implications are for the project if a temporary water permit is required, what are the required timeframes and if the proposal strategy provides sufficient volumes.	ARTC confirm that a temporary water permit will be required for dewatering activities and to manage any groundwater seepage intersected by the cuts and are anticipated to be required for the duration of construction. The final volume and details of the temporary water permit required to enable construction will be determined in Detailed Design stage. The required water permit will be obtained before the commencement of construction aspects that have been identified to interfere with groundwater resources. The initial volume estimates for groundwater, and associated water licencing requirements, post construction (Operations stage) will also be finalised during the Detailed Design stage. As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. The current hierarchy of water supply source preferences prioritises non-potable sources to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, trading or purchasing of existing allocated entitlements will be pursued in the first instance through a water broker. Chapter 5: Project Description Section 5.6.24 of the revised draft EIS details the findings of the current construction water procurement process. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements
145	145.0013	State Agency	Land Resources	Spoil management	Table 5.41 with relation to proposed construction waste quantities has topsoil stripping estimated on three stripping depths (100, 200 and 300 mm) without qualification as to the why and where such depths are to occur. There is also no reference to the type and depth of topsoil and type of underlying subsoil. The EIS has also assumed a blanket approach to topsoil stripping which can result in the contamination of stripped topsoil with sodic and or saline subsoils (and other high-risk subsoils).	In the absence of any nominated ARTC standard, include the requirement for mapping or testing to determine the suitability and risks of the project's topsoils and subsoils as the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. Amend the EIS accordingly.	A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 5.0 Section 3.3 and Figure 3.16. This level of investigation is sufficient to allow determination of the suitability of the soils and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. This enabled the management the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al. , 2008), the <i>Australian soil and land survey field handbook</i> (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015). ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at a 1:10,000 scale in consultation with DoR. The soil investigation report provides detailed soil profile descriptions and laboratory test results. Findings from the detailed soil investigation have been incorporated into Chapter 9: Land Resources, Section 9.3.2 and Section 9.4.2. Appendix AB: Earthworks and Draft Soil Management Plan also presents mitigation measures for soil units present within the Project footprint. Topsoil is aimed to be progressively salvaged, appropriately stockpiled and then reused within the construction footprint. A commitment for the Contractor to develop a stockpile management plan. Soil degradation due to weeds has been considered as a potential impact (Chapter 9: Land Resources Section 9.5.6). Biosecurity risk is considered throughout Chapter 11: Flora and Fauna and specifically in Section 11.4. The EIS provides management measures for stockpiling and management/segregation of topsoil where it contains weed material. Details of the Biosecurity Management Plan prepared for the Project are outlined throughout Chapter 24: Draft Outline Environmental Management Plan with proposed mitigation measures detailed in the chapter.	Chapter 9: Land Resources. Section 9.3.2 Section 9.4.2 Section 9.5.6 Chapter 24: Draft Outline Environmental Management Plan Appendix AB: Earthworks Strategy and Draft Soil Management Plan Appendix J: Soil Assessment Report Section 5.0

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0014	State Agency	Project scope		The EIS notes that there are 12 rail interfaces (tie-ins) with the existing railway corridors (South Western line and Millmerran Branch line). The EIS notes that the project requires the establishment of 145 km new rail and approximately 71.2 km of existing railway corridor. The project will require connection into and upgrade of Queensland Rail's existing railway corridors. Upgrade works will include the removal of existing narrow-gauge track and the construction of the new formation and dual gauge track within the existing railway corridor. Section 5.2.12 Signalling and communications notes that the Advanced Train Management System (ATMS) will replace the existing Direct Traffic Control operational along Queensland Rails (QR) existing rail network. The EIS does not reflect the requirements under Section 255 of the Transport Infrastructure Act 1994 that the railway managers written approval must be obtained where carrying out works in or on a railway corridor or otherwise interfere with the railway or its operations.	Amend the EIS to reflect the requirements under Section 255 of the Transport Infrastructure Act 1994 by inserting the following wording: The staging of the works within the existing railway corridors and the management of potential impacts may be the subject of an interface agreement between ARTC and QR. Approvals under the Transport Infrastructure Act 1994 will be required to be sought from the railway manager where carrying out works in or on a railway corridor or otherwise interfering with the railway or its operations, prior to the commencement of any works in the railway corridors. The railway manager is responsible for maintaining and operating the railway corridor. It is currently assumed that ARTC will be able to occupy sections of the existing rail corridor through temporary possession agreement for extended periods to avoid the need for constrained, short-term possession works. This construction staging approach within existing rail corridors will require confirmation during the detail design stage of the Project, through discussion with and relevant approvals and agreements to be obtained from the railway manager (Queensland Rail).	ARTC note the issue raised with regards to the requirements under Section 255 of the Transport Infrastructure Act 1994 (Qld) (TI Act). The following wording has been added to Chapter 5: Project Description, Section 5.34.2 to reflect the requirements under Section 255 of the Transport Infrastructure Act 1994 (Qld): The staging of works within existing rail corridors and the management of potential impacts will be the subject of an interface agreement between ARTC and QR. It is currently assumed that ARTC will be able to occupy sections of existing rail corridor through a temporary possession agreement for extended periods to avoid the need for constrained, short-term possession works. The Construction staging within existing rail corridors will be confirmed during the Detailed Design stage of the Project. As part of ARTCs ongoing engagement with QR and TMR, roles and responsibilities regarding the Rail Infrastructure Manager (RIM) obligations during Detailed Design, Construction Works and Operations stages will be clarified. Any necessary interface agreements with QR will also be in place prior to the commencement of construction. It is stated in Chapter 3: Legislation and Project Approvals Process, Section 3.4.30 that under the TI Act, various authorisations are required where infrastructure or works are proposed within transport corridors. Approvals and permissions required of the Chief Executive or Railway Manager include: <ul style="list-style-type: none"> ▶ Section 168 — Written approval of the Chief Executive to carry out works near a railway which threaten or a likely to threaten the safety and operational integrity of a railway ▶ Section 255 — Written permission from the railway manager to carry out works in or on a railway corridor or otherwise interfere with the railway or its operation ▶ Section 476B — Written approval of the Chief Executive to carry out works on land which threaten or are likely to threaten the safety and operational integrity of transport infrastructure. DTMR/QR/ARTC are working collaboratively to establish a governance structure to address these matters. ARTC anticipate the roles and responsibilities in relation to RIM status will be resolved prior to construction through a signed agreement. However, agreement in principle is expected to be known significantly earlier, which would enable appropriate discussions during Safety in Design (SID) workshops during the Detailed Design stage.	Chapter 5: Project Description Section 5.4.2 Chapter 3: Legislation and Project Approvals Process Section 3.4.30
145	145.0015	State Agency	Land Resources		Section 5.4.12 of the EIS states that: 'The earthworks will mostly involve the excavation of cuttings and the construction of formation. Non rippable rock will be broken down via drill and blast or by hydraulics rock breakers Significant volumes of non-rippable rock are anticipated within some of the cuttings along the railway corridor, particularly in the northern part of the alignment.' However, the EIS does not detail the interface of the proposed bulk earthworks with the existing railway corridors. The EIS also does not mention any potential impacts of blasting impacts on the state-controlled transport infrastructure.	Amend the EIS and supporting reports to demonstrate how the project will comply with PO3, PO5, PO11 to PO15 of the State Code 2: Development in a Railway Environment, of the State Development Assessment Provisions and Part 2.7 - Filling, Excavation and Ground Disturbance of the Guide for Development in a Transport Environment: Rail. In particular, ARTC should provide the following, amongst, other relevant information: (a) Preliminary Geotechnical Investigation. <ul style="list-style-type: none"> ▶ A RPEQ certified preliminary geotechnical investigation of the site. This should provide preliminary geotechnical design information on the following, amongst other relevant considerations, to inform the structural engineering design and construction management of the development. ▶ earthworks, including methods for the excavation, the excavation and drilling of rock, the stability of open excavations, and filling/back filling and compaction. ▶ permanent and temporary retention options, design loads and geotechnical design parameters. ▶ suitable options for foundation structures, design loads and geotechnical design parameters. ▶ groundwater management. ▶ vibration impacts from drilling, boring, blasting and excavation, - advice on effects on the existing rail transport infrastructure and relevant construction issues. (b) RPEQ certified concept plans for earthworks and structures Provide RPEQ certified conceptual structural engineering design and earthworks plans for the development, including cross sections/elevations and any required supporting technical details showing the earthworks/batters/retaining structures in proximity to the existing railway corridors. This should include:. <ul style="list-style-type: none"> ▶ the location and extent of proposed excavation and filling (earthworks), including likely volumes of cut and fill adjacent to the railway corridor. ▶ the maximum depth of any excavation adjacent to the railway corridor. ▶ the maximum height and intended form/design of any proposed retaining walls or structures adjacent to the railway corridor. ▶ where proposed excavations, filling/backfilling or retaining works will be greater than 1 m in depth or height abutting the railway, RPEQ certified drawings should be provided demonstrating that the works will not de-stabilise rail transport infrastructure or the rail corridor land supporting this infrastructure. This should include the loading configuration of any embankments and retaining walls, including foundation and retaining structures. ▶ demonstrate that any retaining structures, excavations, filling/backfilling and structures will be located outside the railway corridor. (c) Blasting - provide proposal plans demonstrating that any blasting activities will be adequately setback from the railway corridor. - demonstrate that the project does not involve blasting or provide a blasting management plan that has been prepared in consultation with and approved by the railway manager (Queensland Rail). Queensland Rail can be contacted at: developmentenquiries@qr.com.au . ARTC is advised that the construction of the project will need to address vibration, ground movement and loading impacts on the existing railway corridors.	As described in the revised draft EIS Chapter 18: Economics, Section 18.6, the staging of the works within existing rail corridors, and their associated impacts, will be the subject of an interface agreement between ARTC and QR. Chapter 5: Project Description Section 5.4.2 and design drawings part 1 and 2 articulate the preferred construction method of the Project reference design that is planned to be constructed to replace (over the top of) the existing single Queensland Rail (QR) track. <ul style="list-style-type: none"> ▶ QR South Western Line (~47 km between Kurumbul and Whetstone) ▶ QR Millmerran Branch Line (~21 km Between Millmerran and Pittsworth) In response to State Code 2: Development in a Railway Environment, of the State Development Assessment Provisions and Part 2.7 Filling, excavation and retaining structures have been designed with consideration for local geotechnical conditions such that the design life (50-100 years, dependent on component) and functional performance of the railway and rail infrastructure, once completed, is not compromised. Settlement values have been incorporated into the earthworks performance criteria for the Project. These criteria have formed the basis of assessment when undertaking settlement analysis and determining foundation treatments for rail infrastructure. Retaining structures have been designed to the loadings stipulated in AS 5100.2 and in accordance with AS 5100.3. Existing structures within the rail corridor will be assessed to ensure the asset remains fit for purpose post-construction of Inland Rail. Vibration-intensive work is likely to be undertaken at times as part of the construction works. This may include the use of plant, such as piling rigs and vibratory rollers, or the undertaking of activities, such as blasting. The activities conducted will be those required to construct the Project to achieve the adopted performance and design specifications, as well as safety requirements. Where ground movement or vibration does occur within the rail corridor during construction, the potential impacts will be managed in accordance with the controls and mitigation measures specified in Section 16.10 Chapter 16: Noise and Vibration. No retaining walls have been identified in the revised reference design. However, if retaining wall structures are required through design development, the design of such structures will be informed by geotechnical data and will be approved by an RPEQ prior to construction. The visual impacts for retaining and reinforced earth structures would therefore be limited in extent and mitigated by landscaping. Structures will be assessed by an RPEQ prior to construction to assess their compliance to AS5100.2 and 5100.3. Consultation with Third Party Structure owners will be undertaken. Temporary works will be subject to a design process carried out by the contractor for the works. Finally, as part of ARTCs ongoing engagement with QR and TMR, roles and responsibilities regarding the Rail Infrastructure Manager (RIM) obligations during Detailed Design stage, Construction Works and Operations will be clarified. Arrangements between ARTC and the State will be defined through Third Party Agreements. Any necessary interface agreements with QR will also be in place prior to the commencement of construction.	Chapter 5: Project Description Section 5.4.2 Chapter 16: Noise and Vibration Section 16.10 Chapter 18: Economics Section 18.6
145	145.0016	State Agency	Project scope		Section 5.2.10 notes that fencing will be provided to the majority of the railway corridor, with primary purpose to limit access. Fencing in greenfield track areas will be in accordance with ARTC fencing standards. The EIS does not indicate what is proposed to occur along the existing railway corridor boundaries. In particular areas where proposed works in the existing corridor will likely disturb/damage or remove existing railway corridor fencing.	Amend the EIS to include existing and proposed fencing details regarding the existing railway corridor. New and replacement fencing in the the railway corridor will need to be in accordance with the railway mangers standards: <ul style="list-style-type: none"> ▶ Queensland Rail Civil Engineering drawing number QR-C-S3235, Rural Fences ▶ Queensland rail Civil Engineering drawing number QR-C-S3231 Timber Fence ▶ Queensland rail Civil Engineering drawing number QR-C-S3230 1.8 m high Chain Link security fence without rails; or ▶ Queensland Rail Civil Engineering drawing number QR-C-S3229 1.8 m high Chain Link security fence with top and bottom rails. 	To prevent public access to the Project's rail corridor, fencing will be provided for the majority of the rail corridor. Fencing will act to protect adjoining lands from trespass and to prevent livestock and wildlife from gaining access to the railway. Fencing is to extend between the corridor and private lots or property adjoining the railway. Specific fencing considerations will be discussed with relevant landowners as part of the Detailed Design stage. As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will typically be provided according to ARTC guidelines, with specific considerations discussed with local landowners during the Detailed Design stage. Where ARTC proposes to construct within the QR comridor for all returned works (QR South Western Line and Millmerran Branch Line), ARTC will comply with QR standards; this includes for all new and replacement fencing. All existing fencing is proposed to be removed and replaced. Where ARTC is proposing to construct new railway corridor that coincides with road manager or landowner fencing, this will be replaced typically with reference to the ARTC guidelines. Where superior fencing is required, for example where tracks are in close proximity to roads and/or communities, or where trespass is anticipated to occur, a 1.8 m chain link boundary fence may be provided. Fencing standards and approach to the provision of fencing to a Reference Design Level are provided in Chapter 5: Project Description, Section 5.4.12.	Chapter 5: Project Description Section 5.4.12
145	145.0017	State Agency	Hazard and Risk		Table 5.43 indicates a list and levels of dangerous goods and hazardous materials proposed. The project involves dangerous goods in proximity to the existing railway including the use and transport of dangerous goods to and from the site. Any development in proximity to a railway corridor must be designed and constructed to ensure that impacts of a fire, explosion, spill, gas emission or dangerous goods incident can be appropriately mitigated.	Amend the EIS and supporting documents to demonstrate how the proposed project will comply with PO23, Table 2.2.1, of State Code 2: Development in a Railway Environment of the State Development Assessment Provisions. In particular, ARTC engaged with stakeholders should demonstrate whether the proposed uses on the site will involve the handling or storage of hazardous chemicals above the threshold quantities identified in AO23.1. Where these thresholds are exceeded, ARTC engaged with stakeholders is required to provide information demonstrating how the proposed project will be designed and constructed to minimise the impacts of a fire, explosion, spill, gas emission or dangerous goods incident on the railway corridor. ARTC engaged with stakeholders should provide a Registered Professional Engineer of Queensland (RPEQ) certified risk assessment in accordance with Chapter 2.6 Dangerous Goods and Fire Safety and Appendix 1 Development Risk Assessment Guide of the Guide to Development in a Transport Environment: Rail and demonstrate how measures will be incorporated into the project design to minimise the identified risks. This should address the following risks, among other identified risks: minimising or controlling the outbreak of fire, controlling smoke and/or gas release dispersion, minimising heat build-up in structures, limiting the possibility of structural components being blast damages, providing stability or contingency measures in the proposed development, providing safe emergency access and egress to and from the railway, ensuring effective containment and clean-up of dangerous goods incidents. Amend the EIS ('Draft OEMP' and Proponent Commitments) accordingly.	This submission is in reference to Section 2.6 (Dangerous Goods and Fire Safety) of the Guide for Development in a Transport Environment: Rail (TMR, 2015). The purpose of the Guide to Development is to provide developers of land adjacent to a railway with information regarding the issues that need to be considered when planning for development in a railway environment. Section 2.6 of the Guide for Development supports the performance outcomes (PO) and acceptable outcomes (AO) as outlined in PO5 of Module 18: State transport infrastructure protection, 18.1 Filling, excavation and structures state code in SDAP (v1.6, 2015). The intent of PO5 of Module 18 (v1.6) is now addressed by PO26 of State Code 2: Development in a railway environment of the current version of SDAP (v3. 0, 2022). The objective of this PO is to ensure that development involving dangerous goods does not adversely impact on the safety or operations of the railway and rail transport infrastructure. A list of the dangerous goods and hazardous substances that are expected to be required during construction of the Project is provided in Table 21-14 of Chapter 21: Hazard and Risk. These listed substances will be used in a variety of construction tasks at work fronts throughout the Project footprint. The threshold quantities listed in Table 5.2 of the Model Planning Scheme Development Code for Hazardous Industries and Chemicals (Office of Industrial Relations, Department of Justice and Attorney General, 2016) will not be exceeded in any one location.	Chapter 21: Hazard and Risk Table 21-14

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0018	State Agency	Traffic and Transport	Level crossing	<p>The project interfaces 10 times with state-controlled roads, three times at existing level crossings, and seven times at new locations. The seven new proposed crossing are as follows:</p> <ul style="list-style-type: none"> 310-24-P-2 Millmerran-Inglewood Road (Active level crossing) (TMR) 310-11-P-O Cunningham Highway (Grade separation) (TMR) 310-56-P-2 Warrego Highway (Grade separation: rail-over-road (bridge)) (TMR) 310-48-P-8 Oakey-Pittsworth Road (Grade separation: rail-over-road (bridge)) (TMR) 310-55-P-1 Toowoomba-Cecil Plains Road (Grade separation: rail-over-road (bridge)) (TMR) 310-35-P-4 Millmerran-Inglewood Road (Grade separation: rail-over-road (bridge)) (TMR) 310-37-P-12a Millmerran-Inglewood Road (Grade separation: rail-over-road (bridge)) (TMR) <p>All of these seven new state-controlled road interfaces are proposed to be grade separated except 310-24-P-2 Millmerran-Inglewood Road. TMR does not support this proposed level crossing as it is inconsistent with the higher-order function of Millmerran-Inglewood Road, and the other two grade separated crossings proposed for Millmerran-Inglewood Road. Creating new level crossings also does not achieve the objectives of the Queensland Level Crossing Safety Strategy 2012 to 2021.</p>	<p>Amend the project proposed design to ensure that it does not create any new level crossings with state-controlled roads (i.e. ensure 310-24-P-2 Millmerran-Inglewood Road is grade separated). This is a TMR requirement. Amend the EIS accordingly.</p>	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
145	145.0019	State Agency	Traffic and Transport	Level crossing	<p>The project interfaces 57 times with local government roads.</p> <ul style="list-style-type: none"> nine interfaces are proposed to be grade separated 21 interfaces are proposed to be consolidated, relocated, realigned, or diverted resulting in no crossing 11 interfaces are proposed to be new active open level crossings 16 interfaces are proposed to be new passive open level crossings <p>Appendix X (Part 1) state that: The rail crossing impact for the project has centred on vehicle delay and queuing analysis of the project traffic at rail crossings, and at neighbouring closely spaced intersections. This analysis was undertaken for the project at proposed new rail crossings only and was not extended to the 12 existing operational rail crossings. However, Section 18.6.1.2 of Chapter 18 notes: an ALCAM assessment has been undertaken for existing and proposed railway level crossings. ARTC will continue to consult with DTMR and local governments on the preferred road-rail interfaces. Detailed information about the ALCAMs for each of the existing and proposed crossings has not been presented. It is unclear what information was used to inform these ALCAMs (preliminary or detailed design information), what treatments were considered and what informed the ultimate decision to propose the treatments for each crossing. Section 3.3.1 of Appendix X (Part 1) states: The reference design has been developed to prevent short-stacking issues with the project alignment Short stacking issues have been avoided through development of the reference design by maintaining a minimum separation distance between the outer rail of the alignment and the centre of the nearest parallel road in accordance with Section 5.4 of AS1742.7:2017 " Manual of Uniform traffic control devices: Part 7 and with the Manual of Uniform traffic control devices Part 7: railway crossings. .</p>	<p>TMR appreciates that the EIS has sporadically presented information regarding the assessment of level crossing safety. However, this information (and additional information not currently within the EIS) needs to be presented succinctly and clearly for each proposed crossing. Amend the EIS (/TIA) to demonstrate how the proposed level crossings will comply with PQ20 and PQ24 of State Code 2: Development in a railway environment of the State Development Assessment Provisions and Chapter 2 of the Guide to Development in a Transport Environment: Rail. The RPEQ certified Traffic Impact Assessment will be required to address the following: Australian Level Crossing Assessment Model</p> <ul style="list-style-type: none"> the expected traffic distribution on the road network and the proportion of traffic that is likely to use each proposed railway level crossing the expected timeframe for the delivery of the project including the commencement of construction and the completion of the project (including any stages) existing traffic flows (expressed as vehicles per day) anticipated over the proposed railway level crossing/s, including daily (peak hour) fluctuations, and number and percentage of heavy vehicles and buses the expected background traffic growth (expressed as vehicles per day) over the proposed railway level crossing/s, including the number and percentage of heavy vehicles and buses. This should include background traffic growth from the anticipated commencement of construction and each project stage to a ten-year horizon the expected project generated traffic (expressed as vehicles per day), including daily fluctuations (peak hour) and percentage of heavy vehicles and length and number of buses, that will pass over the impacted railway level crossing/s from the commencement of construction, and each project stage to a ten year design horizon the maximum size and type of vehicle (including length, width, height and weight) anticipated over the impacted railway level crossing/s as a result of the project during construction and on-going operation (including any stages) the following data Table is required to be populated for each impacted railway level crossing: ARTC would need to engage a suitably qualified and experienced professional to conduct ALCAM assessments for each of the proposed railway level crossings using the above data requirements and also taking into account other relevant considerations such as field observations/site circumstances. Short stacking Demonstrate that there is sufficient clearance between each proposed railway level crossing and the relevant intersection or vehicular access location to allow the maximum size of vehicle used on the roadway to queue. In particular: <p>The minimum clearance should be 5 m from the edge running rail (of the closest railway track) as per Section 5.4 "Short Stacking and Figure 3.2" Yellow Box Marking of AS1742.7:2016 Manual of Uniform Traffic Control Devices. Part 7: Railway plus the length of the maximum design vehicle. The maximum design vehicle should be the maximum vehicle anticipated to use the roadway</p>	<p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers.</p> <p>An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under peak hour operational traffic conditions for the year of opening (2028) and the 10 year design horizon (2038), based on the peak hour volumes and growth rates summarised in Table 2.17 (raw data provided in Appendix AH, Appendix AI and Appendix AJ).</p> <p>The outputs provided in Section 5.9.3 (Table 5.69) of Appendix AA: Traffic Impact Assessment outlines the maximum expected queue lengths, available storage and largest vehicle accommodated within the available storage. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>Since completing the draft EIS, short stacking operational risks have been discussed further with TMR and an agreed method to assess these risks will be included in their Minimum Technical Requirements document as agreed with TMR.</p> <p>Section 6.3 of Appendix AA: Traffic Impact Assessment provides RPEQ certification of the TIA document.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Section 5.9.3</p> <p>Section 6.3</p> <p>Table 2.17</p> <p>Table 5.69</p> <p>Appendix BT</p> <p>Appendix AH</p> <p>Appendix AI</p> <p>Appendix AJ</p>
145	145.0020	State Agency	Traffic and Transport	Level crossing	Continuation from above.	<p>Provide a plan accurately showing the available clearance between the railway level crossing and relevant intersection/access point and demonstrate how the maximum vehicle length can be accommodated with the 5 m setback from the closest track. Additionally, the vehicle must not encroach on any safety controls, such as but not limited to pavement marking (for example, box marking), for the railway level crossing or road- Provide a RPEQ certified swept path analysis based on the maximum design vehicle for turns into and out of the railway level crossing. Design ARTC should provide RPEQ certified detailed design drawings for each proposed railway level crossing which demonstrate:- Adherence to relevant design standards including the Manual of Uniform Traffic Control Devices, Part 7: Railway crossings and other applicable railway manager standards- Applicable road design standards- That safety risks will be adequately mitigated in accordance with the findings of the ALCAM assessments and short stacking assessments. Other points ARTC (the future railway manager) will be required to enter into interface agreements with the relevant local road managers. There will also be approval requirements from the road managers for any safety controls for the level crossings on the local roads. The EIS should clearly demonstrate why ARTC made the decision to grade separate or have active or passive level crossings for each road/rail interface. Clarification is required pertaining to the heavy vehicle design vehicle used in SIDRA as such parameters are not provided in the TIA report. This is to ascertain whether queueing results account for the longest design vehicle.</p>	<p>As described in Section 3.6.2 of Appendix AA: Traffic Impact Assessment, the revised reference design has been developed to prevent short stacking issues with the Project's alignment. Short stacking issues have been avoided through development of the design in greenfield areas to ensure minimum 60 m separation distance between the outer rail of the Project alignment and the centreline of the nearest parallel road, which is compliant with Section 5.4 of AS 1742.7:2016 and with the Manual of Uniform Traffic Control Devices Part 7: Railway Crossings (DTMR, 2019b).</p> <p>Suitable short-stacking distances were also achieved in brownfield locations; however, this required a combination of horizontal rail alignment changes and road realignments, whilst balancing impacts to surrounding land use and infrastructure constraints. The available short stacking at each level crossing, and the largest design vehicle accommodated is summarised within Section 5.9.3 of Appendix AA: Traffic Impact Assessment.</p> <p>Short stacking will continue to be assessed during design development. Design drawings showing available clearances can be provided to all road managers to demonstrate compliance with relevant standards, at the appropriate design review milestone.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6.2</p> <p>Section 5.9.3</p>
145	145.0021	State Agency	Traffic and Transport		<p>The safety and efficiency of the newly created level crossings may deteriorate to an unsafe level if traffic increases on the affected local government roads post completion of the project. In such scenario, TMR considers that it would be reasonable to obligate ARTC to upgrade the treatment at the crossings (e.g. from passive to active or from at-grade to graded separated).</p>	<p>TMR recommend that ARTC be legally obligated to upgrade any new level crossings created by the project (e.g. from passive to active or from at-grade to grade separated) if the safety and efficiency of the crossing deteriorates to an unacceptable level as established through clear and predetermined threshold criteria. TMR would like to discuss such obligations with the CG once ARTC has provided additional information about each crossing. In addition to the above, the safety and operational integrity of the existing and new level crossings will need to be monitored through interface agreement arrangements. These agreements will require the level of safety risk to be continually monitored and level crossing issues reported as further development is approved and traffic increases. Consideration will have to be given to implementing improved control and safety measures, as required, including grade separation.</p>	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulators (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>In response to the above, ARTC have updated the revised draft EIS Appendix AA: Traffic Impact Assessment (TIA) with details regarding Public level crossing treatment methodology outlined in sub-Appendix BT Inland Rail Road Rail Interface Methodology. This is intended to provide Agencies and the Community with further transparency on the design process undertaken. Noting all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Project.</p> <p>For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p> <p>ARTC regularly consult with TMR regarding the Project and will continue to do so during detailed design and construction. It is noted that the design used traffic counts forecast for 2040.</p>	<p>Appendix AA: Traffic and Transport</p> <p>Appendix BT</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0022	State Agency	Traffic and Transport		Section 5.2.7.2 of Chapter 5 states that the project interfaces with 153 private unformed roads and 62 private formed roads. The EIS notes that ARTC will work with all impacted landowners for appropriate interfaces and level crossing treatments.	The proposal should seek to minimise the number of private occupational crossings it creates as much as possible given the safety concerns associated with private occupational crossings. Greater detail is required in the EIS to demonstrate how ARTC has sought to minimise the number of private occupational crossings.	<p>As outlined in Appendix AA: Traffic Impact Assessment Table 1.1, the TIA has been prepared consistent with QLCSS guidance, with its associated key performance indicators, in order to ensure that mitigation measures determined for all public road-rail interface locations (level crossings) through the analysis process focus on safety, risk and operational efficiency. The QLCSS excludes private (occupational) crossings and crossings that are part of the cane rail network. These crossings, including any which may be accessible to the public, are a workplace health and safety matter and are managed under separate arrangements.</p> <p>The revised draft EIS documentation considers severance and fragmentation of rural properties outside of the TIA, within Chapter 8: Land Use and Tenure and Chapter 17: Social. Within these chapters it is identified that property severance could affect the configuration of a property, affecting efficiency, productivity and viability, for example as a result of changes in access arrangement for the movement of farm machinery or stock to different areas of a property. Other identified property impacts include impeded access and changes to internal roads.</p> <p>ARTC acknowledges this issue, which will continue to be addressed as the design and construction planning progress. In accordance with mitigation measures in Section 8.6 of Chapter 8: Land Use and Tenure, the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners would be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. Where the proposal affects internal property access arrangements, input would be sought from relevant landowners prior to finalising the detailed design. Where changes to internal property access arrangements are required, ARTC would consult with relevant property owners/occupants regarding alternative access arrangements, where feasible alternatives are available and identify feasible and reasonable measures to minimise impacts on existing operational arrangements/properties.</p> <p>During the property acquisition process, ARTC would seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>ARTCs approach to considering level crossing options is consistent with relevant Qld and ONRSR level crossing policies. While ONRSRs policy is that no new level crossings be constructed, it recognises that where a new crossing is necessary, safety risks must be eliminated or minimised by designing new infrastructure consistent with rail safety legislation. The Qld and ONRSR level crossing policies suggest that building new level crossings should be avoided wherever possible and all other options should be explored before a new crossing is proposed.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6</p> <p>Chapter 17: Social</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Table 1.1</p>
145	145.0023	State Agency	Traffic and Transport		Three new road over rail bridges are proposed as listed in Table 5.11. Figure 5.10 shows typical Section with a clearance of 7.1 m between the rail track and underside of the bridge deck. At the technical agency briefing held by the COG on 10/02/2021, Chris Matthews advised that the project is based on trains and double stacked containers with a total height of 7.2 m. The EIS does not state the intended total height of the proposed trains and double stacked container freight.	Amend the EIS to clarify this discrepancy. Demonstrate how the proposed road bridge clearance over the railway corridor in Figure 5.10 will accommodate a design train height of 7.2 m clear of all bridge structure. Relevant standards also exist for required height clearances over railway corridors. These should be investigated with railway managers.	Chapter 5: Project Description Section 5.4.1, the revised reference design was developed as per the "Basis of Design" to provide consistent design requirements and parameters across the Inland Rail Program. The design criteria for road and pedestrian bridge structures over the rail line should have a clearance of 7.1 m to accommodate double stacked container freight. Please note the revised draft EIS has not amended its reference to 7.1 m clearance requirements within Figure 5.9 of Chapter 5: Project Description.	<p>Chapter 5: Project Description</p> <p>Section 5.4.1</p> <p>Figure 5.9</p>
145	145.0024	State Agency	Surface Water		<p>The project proposes interface and connection to the existing railway corridors (South Western Line and Millmerran Branch Line). A Stormwater Management Plan has not been provided to quantify the stormwater impacts of the proposed project/development and indicate how they are to be managed.</p> <p>The EIS and supporting documents should demonstrate how the project complies with PO16 to PO17 of the State Code 2: Development in a Railway Environment, PO10 to PO12 of the State Code 6: Protection of State Transport Networks of the State Development Assessment Provisions and Section 2.8 of the Guide to Development in a Transport Environment: Rail.</p>	<p>Amend the EIS to provide a Stormwater Management Plan demonstrating that the management of stormwater (quantity) post development/project can achieve a no worsening impact (on the pre-development/project condition) for all flood and stormwater events that exist prior to development/project and up to a 1% Annual Exceedance Probability (AEP). This should include at least the following flood and stormwater events: 63.2%, 50%, 39%, 20%, 10%, 5%, 2% and 1% AEP.</p> <p>Stormwater management for the project must ensure no worsening or actionable nuisance to the railway corridor, caused by peak discharges, flow velocities, water quality, sedimentation and scour effects. The report should also demonstrate that flood storage capacity is maintained on the site. Overland flow paths/hydraulic conveyance should be maintained on the site as part of the proposed project. In particular, the following should be addressed:</p> <ul style="list-style-type: none"> Pre-development condition. Verify the existing drainage characteristics of the site, in relation to the railway corridor such as through a site detail and contour survey. All relevant legal points of discharge for the project site should be identified. Earthworks Plan. Provide an earthworks plan, including cross sections/elevations, and any required supporting technical details clearly showing the location and extent of proposed excavation and filling (earthworks), including likely volumes of cut and fill adjacent to the railway corridor and the resulting cut: fill balance. Catchment Analysis. Provide pre-development/project and post-development/project catchment plans that clearly identify all internal catchments on the site, external catchments draining into the site, the flow paths (direction of flow) within each catchment, the size of each catchment and the legal point of discharge for each catchment. Flood impact assessment. Incorporate the findings of the revised Hydrology and Flooding Technical Report Maintain the pre-development/project condition. The pre-development/project flow scenario will need to be replicated in the post development/project condition. The proposed development/project should not impede or interfere with any drainage, stormwater or floodwater flows, including sheet flows, from the railway corridor or vice versa. Retaining structures, filling/excavation, landscaping, buildings and structures or any other works to the land should be designed to include provision for drainage so as not to adversely impact on the railway corridor. The development/project design will need to address any concentration of flows, potential for back-up/ponding and scour/erosion which may undermine the railway corridor. Water quantity assessment. The peak discharge analysis should provide adequate details of the pre and post development/project impervious area of the site and give adequate consideration to the detention basin requirements of the QUDM, Fourth Edition. Conceptual drainage layout. Provide a conceptual stormwater drainage layout plan showing the proposed internal stormwater network on the site, including, drains, pits, dams, detention basins and the like, demonstrating how all surface water flows will be collected and conveyed to the legal points of discharge. This should include the conceptual design and sizing of drainage infrastructure such as but not limited to diversion drains. Mitigation measures. Include details of the mitigation measures proposed to address any potential stormwater and flooding impacts of the proposed development. The design flood peak discharges should be shown for the mitigated case to demonstrate there is no worsening impact on the railway corridor All mitigation measures must be located on the site and not in the railway corridor. 	<p>The impacts of nominated flood events during operation of the Inland Rail Project have been assessed and quantified as part of the Hydrology and Flooding Assessment, and reported in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Appendix T2: Hydrology and Flooding Technical Report - Volume 2, Chapter 13: Surface Water (Section 13.5.2) and Chapter 14: Flooding and Geomorphology of the revised draft EIS. Additional flood impact information in relation to existing railway corridors will be provided in the final EIS. In addition a Surface Water Management Plan will be developed as a component of the Construction Environmental Management Plan (CEMP), which will include Stormwater Management for the project. The Surface Water Management Plan will cover Stormwater Management and will be developed in consultation with DNRME and DES prior to implementation for construction.</p>	<p>Chapter 13: Surface Water</p> <p>Section 13.5.2</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
145	145.0025	State Agency	Land Resources	Mitigation measures	The text in Table 6.6 (Chapter 6, Sustainability) indicates that batters 1:3 or less steep do not need to be vegetated, or that the vegetation of slopes steeper than 1:3 is not standard practice (however it is standard practice as per Transport and Main Roads Specifications - MRTS16 Landscape and Revegetation Works (MRTS16). It is recommended that the EIS reevaluate the technical feasibility options to re-vegetate soil slopes steeper than 1:3.	Update the EIS to include the requirement to vegetate all soil or extremely weathered rock material in cuts and embankments to be vegetated as per MRTS16.	<p>The intention of the statement in question was not to preclude vegetation of batters less than 1:3, but to emphasise the greater complexity of successfully revegetating slopes steeper than 1:3.</p> <p>To avoid confusion, this statement has been deleted from Table 7.6, Chapter 7: Sustainability (re-numbered since the release of the draft EIS).</p> <p>The use of vegetation and vegetation cover of soil has been identified as an effective erosion and sediment control method according to the erosion hazard assessment detailed in Section 9.6 of Chapter 9: Land Resources. Initial mitigation measures for land resources in Table 9.28 and Proposed land resource mitigation measures in Table 9.29 outline the use of vegetation cover as prescribed by the Soil Management Plan (see Chapter 24: Draft Outline Environmental Management Plan)</p>	<p>Chapter 7: Sustainability</p> <p>Table 7.6</p> <p>Chapter 9: Land Resources</p> <p>Section 9.6</p> <p>Table 9.28</p> <p>Table 9.29</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0026	State Agency	Land Resources		The intent of Table 6.6 is understood however, it indicates a misunderstanding on best practice amelioration methods as dispersive soils can be ameliorated using ag-lime, dolomite or ag-gypsum depending on the pH and other soil properties.	In the absence of any nominated ARTC standard, include the requirement for mapping or testing to determine the suitability and risks of the project's topsoils and subsoils as the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. Amend the EIS accordingly.	ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at 1:10,000 scale in consultation with DoR (See Appendix E: Consultation Report Section 4.2 for Engagement with DoR). Soil management units from the investigation are provided in Section 3.2.2, Section 4.5 and Section 5. 0. This level of investigation is sufficient to allow the determination of the suitability of the soils and to manage the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides site-specific soil management measures in Section 3.2 and Section 3.2 (also outlined in Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report 4.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.3 Appendix J: Soil Assessment Report Section 3.2.2 Section 4.5 Section 5.0
145	145.0027	State Agency	Traffic and Transport	Level crossing	<p>Figure 19: 4a-f Project Construction Routes indicates that proposed construction routes will at least use the following existing railway level crossings on the following railway corridors. West Moreton Line</p> <ul style="list-style-type: none"> ▶ Lane Road, Calvert (LXR 4243) ▶ Rosewood Laidley Road (Grandchester) (LXR:4240) ▶ John Street (Ipswich Rosewood Road) (LXR:4244) ▶ Karrabin Rosewood Road, Karrabin (LXR: 4252) ▶ Ebenezer Branch Railway ▶ Ipswich Rosewood Road (LXR 4255) ▶ Coopers Road Interstate Line ▶ Undullah Road ▶ Wyatt Road ▶ Beaudesert Boonah Road <p>However, Section 19.5.1.1 Existing rail crossings states: "There are currently no existing operational level rail crossings within the EIS investigation corridor that would be impacted. The traffic, transport and access study area consist of greenfield rail that will encompass new proposed level crossings. Therefore, no assessment is necessary for existing rail crossings as part of the project. In addition, Section 19.6.1.1 rail network states: "No existing operational level rail crossings within the EIS investigation corridor that would be impacted. Therefore, no assessment is necessary for existing rail crossings. The EIS has not assessed the potential safety impacts on existing railway level crossings on the roads identified through the primary construction transport routes during construction. There are approximately 9 railway level crossings along the primary construction routes used for haulage of materials during construction. The proposed project will increase road traffic, including heavy vehicles and overdimensional road loads over railway level crossings. No information has been provided which clearly identifies the potentially impacted railway level crossings or which demonstrates that the level of safety risk at the impacted railway level crossings is not worsened. This can only be demonstrated via ALCAM (Australian Level Crossing Assessment Model) assessments completed by the relevant railway manager using traffic information verified by the TMR region. Additionally, short stacking issues would need to be addressed. Evidence of such assessments has not been provided by the applicant. The safety impact on existing railway level crossings must be assessed before the application is decided. The commentary provided in the EIS displays a lack of understanding of safety issues at railway level crossings and should be deleted. TMR requires amendments the TIA and EIS to demonstrate how the project will comply with PO20 and PO24 of the State Code 2: Development in a Railway Environment, PO7 to PO9 of the State Code 6: Protection of state transport networks of the State Development Assessment Provisions and Section 2.2 of the Guide to Development in a Transport Environment: Rail for all impacted railway level crossings.</p>	<p>Amend the EIS to identify the railway level crossings impacted upon by the construction routes and level of existing safety controls i. e. active or passive or grade separated road/rail. Also, address any short stacking issues at these existing railway level crossings due to limited clearances/queuing distance between the level crossings and intersections/access points. Amend the EIS wording in sections 19.5.1.1 and 19.6.1.1 to Several railway level crossings have been identified on the project construction routes Figures 19a to f. Development generated construction traffic has the potential to adversely impact on the safety of railway level crossings.</p> <p>Amend the EIS and TIA to demonstrate how the project will comply with PO20 and PO24 of the State Code 2: Development in a Railway Environment of the State Development Assessment Provisions and Section 2.2 of the Guide to Development in a Transport Environment: Rail. In particular, the following should be addressed:</p> <ul style="list-style-type: none"> ▶ detail the expected traffic distribution on the road network as a result of the proposed development, including haulage routes during construction. ▶ identify any and all railway level crossing/s likely to be impacted by project generated traffic (including construction and staff movements). This should include level crossings on local and state-controlled roads and any private (occupational) level crossings. ▶ for each impacted railway level crossing provide: <ul style="list-style-type: none"> (a) Australian Level Crossing Assessment Modelo the expected timeframe for the delivery of the proposed project including the commencement of construction and the completion of the development (including any stages). <ul style="list-style-type: none"> o existing traffic flows (expressed as vehicles per day) over the impacted railway level crossing/s, including daily (peak hour) fluctuations, and number and percentage of heavy vehicles and buses. o the expected background traffic growth (expressed as vehicles per day) over the impacted railway level crossing/s, including the number and percentage of heavy vehicles and buses. This should include background traffic growth from the anticipated commencement of construction and each project stage to a ten-year horizon. ▶ the expected development generated traffic (expressed as vehicles per day), including daily fluctuations (peak hour) and percentage of heavy vehicles and buses, that will pass over the impacted railway level crossing/s from the commencement of construction, and each development stage to a ten year design horizon. It is noted that workers may be transported via bus from workers camps. o the maximum size and type of vehicle (including length, width, height and weight) anticipated over the impacted railway level crossing/s as a result of the project during construction and on-going operation (including any stages). This should include any over-mass and over-dimension vehicles used to transport components. ▶ the following data Table should be populated for each impacted railway level crossing: 	<p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Appendix AA: Traffic Impact Assessment Section 5.8 specifically details the 17 existing level crossings that are located along the proposed construction transport routes. These level crossings are provided in Table 5.66 along with their associated LGA level crossing type and status during construction. For the purpose of the TIA, it is assumed that two sections of the South Western System are proposed to be closed for the duration of construction, including:</p> <ul style="list-style-type: none"> ▶ Millmerran Branch Line, between Wymeera and Millmerran ▶ South Western Line, between Whetstone and Goondiwindi. <p>The majority of existing level crossing locations will not be operational during the construction of the Project, therefore it is considered that current road users will experience a higher level of service at these locations. There are, however, three locations which remain operational during construction, Cunningham Highway (Whetstone) active level crossing, Coolmunda Dam Access Road (Coolmunda) passive level crossing, and Alderley Street (Toowoomba) active level crossing.</p> <p>Prior to the use of these roads and associated level crossings by construction traffic, further consultation with the existing railway manager (QR) will be required in order to mitigate potential impacts. This consultation and engagement will be required during the Detailed Design stage, prior to and during construction. This will include consultation on adequate traffic and safety management plans for the level crossings. Furthermore, access into the existing rail corridor at these locations during construction will also need to be managed in consultation with QR and the relevant LGA. During detailed design, further assessment will be required in order to determine whether the existing level crossing treatments are sufficient for the increased traffic volumes.</p>	Appendix AA: Traffic Impact Assessment Section 5.8 Table 5.66
145	145.0028	State Agency	Traffic and Transport	Level crossing	Continuation from above.	<p>(b) Short stacking</p> <p>Development generated traffic must not worsen vehicular queuing (short stacking) issues over impacted railway level crossing/s. In particular, provide the following for each impacted railway level crossing: <ul style="list-style-type: none"> o Demonstrate that there is sufficient clearance between each railway level crossing and the relevant intersection/vehicular access location to allow the maximum size of vehicle used in the operation to queue. The minimum clearance should be 5 m from the edge running rail (of the closest railway track) as per Section 5.4 "Short Stacking and Figure 3.2" Yellow Box Marking of AS1742.7:2016 Manual of Uniform Traffic Control Devices, Part 7: Railway plus the length of the maximum design vehicle. o Provide a plan accurately showing the available clearance between the railway level crossing and relevant intersection/access point and demonstrate how the maximum vehicle length can be accommodated with the 5 m setback from the closest track. Additionally, the vehicle must not encroach on any safety controls, such as not limited to pavement marking (for example, box marking), for the railway level crossing or road. o Provide a RPEQ certified swept path analysis based on the maximum design vehicle for turns into and out of the railway level crossing. o Over-dimensional Road Loads (Queensland Rail): Under the Transport Infrastructure (Rail) Regulation 2006 permission from the Railway Manager (Queensland Rail) is required to take over-dimensional road loads across Queensland Rail infrastructure (e.g. rail level crossings and rail bridges). Further information can be obtained from Queensland Rails website at: queenslandrail.com.au/forbusiness/overdimensionalloads </p>	<p>As described in Section 3.6.2 of Appendix AA: Traffic Impact Assessment , the revised reference design has been developed to prevent short stacking issues with the Project's alignment. Short stacking issues have been avoided through development of the design in greenfield areas to ensure minimum 60 m separation distance between the outer rail of the Project alignment and the centreline of the nearest parallel road, which is compliant with Section 5.4 of AS 1742.7:2016 and with the Manual of Uniform Traffic Control Devices Part 7: Railway Crossings (DTMR, 2019b).</p> <p>Suitable short-stacking distances were also achieved in brownfield locations; however, this required a combination of horizontal rail alignment changes and road realignments, whilst balancing impacts to surrounding land use and infrastructure constraints. The available short stacking at each level crossing, and the largest design vehicle accommodated is summarised within Section 5.9.3 of Appendix AA: Traffic Impact Assessment.</p> <p>Short stacking will continue to be assessed during design development. Design drawings showing available clearances can be provided to all road managers to demonstrate compliance with relevant standards, at the appropriate design review milestone.</p>	Appendix AA: Traffic Impact Assessment Section 3.6.2 Section 5.9.3
145	145.0029	State Agency	Land Use and Tenure		The EIS provides minimal information regarding the functionality of at-grade crossings for stock routes, given there is an intensification of train movements and any form of mitigation offered at those crossings, if any. The ToR requires the EIS to describe the potential impact of the construction and operation of the project on existing land uses permitted along the proposed alignment and adjacent areas including stock routes.	Update the EIS to provide further detail as to the functionality of at-grade crossings for stock routes and any form of mitigation proposed at these crossings.	<p>The Project interfaces with the State stock route network, which consists of stock routes and reserves, in 11 locations. In each instance, the reference design has been developed to provide continued connectivity along each stock route. The stock route interface treatments that have been included in the reference design are summarised in Chapter 8 Land Use and Tenure, Section 8.5. ARTC will continue to consult with DoR, GRC and TRC through the detailed design process to ensure that the proposed stock route interface treatments are suitable for future useability purposes.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6 states that consultation has taken place between ARTC, DoR, and GRC with respect to redesign and management of stock routes following the construction of the Project. Where the existing stock route crossings are impacted by the Project, at-grade, then level crossings will be provided. All level crossings will be designed to meet the current Australian, ARTC and road managers standards. Design features include, minimum 7.3 m stock crossing width, compliant sighting distances, crossing panels, warning signage, fencing and gates across the road approaches, but not across the tracks. Where the alignment is proposing to run linearly through an existing stock route, allowances have been made to widen the remaining route appropriately to ensure a corridor that is fit for the purpose of transport livestock.</p> <p>The revised reference design for the Project has endeavoured to maintain the integrity (connectivity and functionality) of the stock route network. In circumstances where the Project has the potential to impact on existing stock routes, ARTC has consulted with DoR, GRC and TRC to identify potential solutions for the treatment of rail and stock route interfaces. Outcomes of the several engagements have been summarised in Appendix E: Consultation Report and Appendix B2: Stock Routes.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.3 states that in the event that private stock routes are identified through consultation with landowners, a means of continued stock movement connectivity will be included in the detailed design. Where disruption to private stock movements may occur during construction, appropriate temporary connectivity solutions will be agreed in advance with the relevant landowner.</p>	Chapter 8: Land Use and Tenure Section 8.5 Section 8.6 Section 8.6.3 Appendix B2: Stock Routes Appendix E: Consultation Report Section 5.5.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0030	State Agency	Land Use and Tenure		The EIS states that some of the existing stock routes, where grade separation is not proposed, intend to remain as passive crossing locations. Limited detail is offered as to the functionality of passive at-grade crossings for stock routes given an intensification of train movements and any form of mitigation offered at those crossings, if any. The ToR requires to describe the potential impact of the construction and operation of the project on existing land uses permitted along the proposed alignment and adjacent areas including stock routes.	Update the EIS to provide further detail as to the functionality of passive at-grade crossings for stock routes given an intensification of train movements.	<p>This issue is noted. Further information on the functionality of at-grade crossings has been included in Section 8.5.1 of Chapter 8: Land Use and Tenure and Appendix B2: Stock Routes. ARTC will continue to work collaboratively with DoR, TMR and council on the design solution for these locations during detailed design.</p> <p>The Project interfaces with the State stock route network, which consists of stock routes and reserves, in 11 locations. In each instance, the reference design has been developed to provide continued connectivity along each stock route. The stock route interface treatments that have been included in the reference design are summarised in Chapter 8: Land Use and Tenure, Section 8.5. ARTC will continue to consult with DoR, GRC and TRC through the Detailed Design stage to ensure that the proposed stock route interface treatments are suitable for future useability purposes.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6 states that consultation has taken place between ARTC, DoR, and GRC with respect to redesign and management of stock routes following the construction of the Project. Where the existing stock route crossings are impacted by the Project, at-grade, then level crossings will be provided. All level crossings will be designed to meet the current Australian, ARTC and road managers standards. Design features include, minimum 7.3 m stock crossing width, compliant sighting distances, crossing panels, warning signage, fencing and gates across the road approaches, but not across the tracks. Where the alignment is proposing to run linearly through an existing stock route, allowances have been made to widen the remaining route appropriately to ensure a corridor that is fit for the purpose of transport livestock.</p> <p>The revised reference design for the Project has endeavoured to maintain the integrity (connectivity and functionality) of the stock route network. In circumstances where the Project has the potential to impact on existing stock routes, ARTC has consulted with DoR, GRC and TRC to identify potential solutions for the treatment of rail and stock route interfaces. Outcomes of the several engagements have been summarised in Appendix E: Consultation Report and Appendix B2: Stock Routes.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.3 states that in the event that private stock routes are identified through consultation with landowners, a means of continued stock movement connectivity will be included in the detailed design. Where disruption to private stock movements may occur during construction, appropriate temporary connectivity solutions will be agreed in advance with the relevant landowner.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5</p> <p>Section 8.6.3</p> <p>Appendix B2: Stock Routes</p> <p>Figures 1 - 26</p> <p>Appendix E: Consultation Report</p> <p>Section 5.5.3</p>
145	145.0031	State Agency	Landscape and Visual Amenity		The EIS is not clear regarding who is responsible for long term maintenance of the general landscaping vegetation including the landscaping installed at the rest area in Yelarbon.	Amend the EIS to clarify who is responsible for long-term maintenance of landscaping and vegetation.	ARTC, as the proponent for the Project retains overall responsibility for the Project, including implementing the Project to achieve the environmental outcomes, and comply with all laws and Project obligations, and responsible for monitoring, reporting and auditing the delivery and implementation of the Project in relation to the Construction Environmental Management Plan (CEMP) and Operations EMP.	<p>Chapter 5: Project Description</p> <p>Section 5.8.4</p> <p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.6.2</p> <p>Table 10-76</p>
145	145.0032	State Agency	Flora and Fauna		There is no requirement for ARTC to identify and assess the project soils as per the TMR Interim SMM, SMM Appendix 2 soil forms, TMR Soil Group classifications and CSIRO Clay Mineralogy Maps. Additionally, this should be undertaken by a Certified Professional Soil Scientists (CPSS) as per TMRs interim SMM.	Amend the EIS to include the requirement for mapping or testing to determine the suitability and risks of the project's topsoils and subsoils as the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps and to meet the requirements of MRTS16.	<p>ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at 1:10,000 scale in consultation with DoR. Soil management units from the investigation are provided in Section 4.5. This level of investigation is sufficient to allow the determination of the suitability of the soils and to manage the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps.</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides site-specific soil management measures in Section 3.3 (also outlined in Chapter 24: Draft Outline Environmental Management Plan).</p>	<p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan</p> <p>Section 3.3</p> <p>Appendix J: Soil Assessment Report</p> <p>Section 4.5</p> <p>Figure 3.16</p>
145	145.0033	State Agency	Air Quality	Modelling	<p>Chapter 12 does not provide a clear indication of whether the project has considered emissions from the following cumulative sources:</p> <ul style="list-style-type: none"> Existing Rail Line West of Chainage ~30 NS2B Existing Rail Line East-Northeast of Chainage ~45 Existing Rail Line East of Chainage ~162 Existing Rail Line Northwest of Chainage ~207 Road traffic pollutant emissions have not been modelled for the study area. 	<p>Update the EIS (including Appendix R) to consider the cumulative impacts from rail and road traffic as per the requirement of the ToR. Provide justification as to why the selected background pollutant levels are representative of sensitive receivers (in the vicinity of existing roads) including those within townships.</p>	<p>To ensure that cumulative air quality impacts are assessed, one kilometre of the North Star to NSW/QLD Border Project and the Gowrie to Helidon Project rail sources and 3.5 kilometres of the West Moreton Line have been included in the dispersion modelling at their respective ends of the Project.</p> <p>Other existing rail lines near the Project alignment have not been modelled, but rail traffic volume data for other existing rail lines (i.e. existing rail alignments near Project chainage 30 kilometre (km), 45 km, and 162 km) were analysed for the years 2016 to 2018. Existing monthly traffic volumes for these rail lines ranged from less than 1 train per week to up to 6 trains per week. Compared with the 174 trains per week (peak) that have been assessed for the Project's air quality impact assessment, these volumes represent a very small percentage (i.e., 0.6 to 3.6 per cent) of the overall modelled rail traffic. It is considered that inclusion of these rail sources would not result in an observable change to predicted cumulative results. Therefore, the air quality modelling impact assessment has not included these existing rail lines.</p> <p>Road traffic emissions from sections of the Gore Highway and Warrego Highway within 2 kilometres of the alignment were included in the dispersion model for the assessment of the operation stage of the Project. The methodology for estimating and modelling emissions from the Warrego Highway and Gore Highway represents a conservative approach and is likely to over-predict pollutant concentrations from traffic on these roads.</p> <p>Further discussion of the assessment of cumulative impacts from existing rail lines and roads is provided in Chapter 23: Cumulative Impacts.</p> <p>Background pollutant levels have been adopted following a review of monitoring station data. Four stations were reviewed, including Queensland Government's Department of Environment and Science (DES) operated stations located at Mutdapilly (90 km east of the alignment) and Springwood (135 km east of the alignment), and two Inland Rail monitoring stations located at Charlton (Inland Rail AQMS, 0.1 km south of the alignment) and Millmerran (Millmerran AQMS, 0.4 km north of the alignment).</p> <p>The monitoring stations considered in the assessment are considered to provide representative data on air quality for the study area, noting that the Inland Rail AQMS and Millmerran AQMS are within the study area. Although the Mutdapilly and Springwood stations are located further from the alignment, the stations are located in areas which are representative of the study area, or are considered to be a conservative representation. For example, Springwood is located in a more urban area with more emission sources than the study area, and therefore adopting background concentrations from this monitoring station will provide a conservatively high estimate of ambient pollutant concentrations, including for receptors which may be located near minor roads. Noting that major roads (Gore Highway and Warrego Highway) have been considered in detail in the assessment.</p> <p>Chapter 12: Air Quality and Appendix R: Air Quality Technical report have been updated for the described changes.</p>	<p>Chapter 12: Air Quality</p> <p>Appendix R: Air Quality Report</p>
145	145.0034	State Agency	Air Quality		Section 11.7.5. has not included any approved developments within the study methodology area.	Update the EIS (including Appendix R) to include approved developments as sensitive receivers and revise the assessment as per the requirement of the ToR.	Approved developments (e.g. residential sub-divisions) that may in future become sensitive receptor locations have been reviewed and included in the revised air quality assessment. The sensitive receptors included in the assessment are presented in Section 12.4.5 in Chapter 12: Air Quality and potential air quality impacts are presented in Section 12.5. Appendix R: Air Quality Technical Report has also been updated.	<p>Chapter 12: Air Quality</p> <p>Section 12.4.5</p> <p>Section 12.5</p> <p>Appendix R: Air Quality Technical Report</p>
145	145.0035	State Agency	Air Quality	Modelling	Section 11.7.5 states that predicted pollutant levels are taken to be 0 m above ground but does not provide justification regarding the selected model sensitive receiver height.	<p>Update the EIS to include further justification on the selected model sensitive receiver height given:</p> <ul style="list-style-type: none"> the heights of roofs for drinking water assessment, guidance available in other transport related manuals (e.g. Road Traffic Air Quality Management Manual) which include receiver heights of 1.8 m above ground for ground level receivers. As a minimum provide the likely differences of higher receiver heights verses the selected receiver height. 	<p>Section 12.4.5.2 of Chapter 12: Air Quality has been updated to include discussion and justification of the use of 0 metre (ground level) as the receptor height for sensitive receptors included in the dispersion model for the assessment of the Operations stage.</p> <p>Discrete receptor points have been included for sensitive receptors and have been modelled at ground level (0 metres above ground) as per the requirements of the Queensland Government's Department of Environment and Science guideline <i>Application requirements for activities with impacts to air</i> (2023). In addition to the discrete receptors, grids of receptors have been included in the modelling (at a height of 0 metres above ground) to facilitate the generation of (air emission) concentration contours.</p> <p>It is standard (air quality) industry practice to represent predicted impacts at sensitive receptors at ground level and to determine ground-level concentrations (GLCs). This is stated in several State government air quality modelling guidelines, including the NSW EPA <i>Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales</i> (2022), the South Australia (SA) EPA <i>Ambient Air Quality Assessment Guidelines</i> (2016), and the Victorian EPA (Vic EPA) <i>Guideline for Assessing and Minimising Air Pollution in Victoria</i> (Vic EPA, 2022).</p> <p>For air quality dispersion modelling, the difference in predicted concentration levels between receptors at 0 metres and small heights above ground level (e.g.1.8 metres) is minor in magnitude. This is different to other environmental modelling (e.g. noise) where height above ground has a more significant impact due to the strong influence of line of sight, and travel path distance. Additionally, dust deposition (on ground) results can only be predicted at ground level (0 metres above ground) (Chapter 12: Air Quality, Section 12.4.5.2).</p>	Chapter 12: Air Quality Section 12.4.5.2
145	145.0036	State Agency	Air Quality		Given coal could potentially be transported on the network a Coal Dust Management Plan should be required as part of the mitigation strategy and ongoing requirements.	Update the EIS (including Appendix R and Chapter 22) to ensure a Coal Dust Management Plan is required as part of the mitigation strategy and ongoing requirements.	<p>Coal is not currently proposed to be transported along the proposed Border to Gowrie section. If coal is to be transported in future operation years, the potential for coal dust generation will require management via a Coal Dust Management Plan (CDMP). The measures included in the CDMP will aim to minimise surface lift-off of materials in transit and establish protocols to minimise spillage onto external areas of wagons. The plan will be prepared in consultation with the relevant regulatory agency at the time. The requirement for a CDMP is included in the mitigation measures for the Project.</p> <p>Updates have been made to Section 12.6.2 in Chapter 12: Air Quality with further information on how fugitive emissions from residual coal dust deposits on empty wagons will be mitigated.</p> <p>ARTC presently have no foreseeable market-driven demand for coal to be transported on the Inland Rail network between NSW/QLD border to Gowrie. However, should this change during operations in the future, the potential for coal dust generation would require management by a CDMP.</p> <p>Should coal planned to be transported as part of future operations, prior to transportation of coal, engagement would be undertaken with existing stakeholders and members of the South West Supply Chain regarding coal dust management and monitoring requirements necessary to maintain the integrity of the existing South West Supply Chain Coal Dust Management Plan (2019). This is discussed in Section 12.6.2 in Chapter 12: Air Quality.</p>	Chapter 12: Air quality Section 12.6.2
145	145.0037	State Agency	Surface Water	Overland flow/diversion	It is unclear if the hydrology modelling has consideration water storage/dams (e.g. Turkey's Nest) on downstream private properties which are built to catch rain/surface run off water. The collected water from these dams is utilised for agricultural purposes and as water for stock. Councils also access these seasonal dams for road maintenance purposes.	Update the EIS to investigate and confirm that this impact has been considered and mitigated or minimised.	Hydrologic modelling has not specifically been considered at a local dam/water storage level. Existing flow paths however have been considered and maintained in the revised reference design.	N/A
145	145.0038	State Agency	Groundwater	Construction water supply	It is unclear what the projects percentage reliance on groundwater versus other sources of water for construction purposes like dam, creeks, etc. It is unclear if there is an intention to drill boreholes to extract water for construction purposes. The use of town water for construction purposes is not a sustainable practice. Construction water quality standards are much lower compared to potable town water. Sourcing of town water from smaller regional towns would be a challenge and water may need to be carted over long distances.	Update the EIS to confirm overall water data required for construction purposes including groundwater, bore water, town water and haulage.	<p>The construction water strategy outlined in Chapter 5: Project Description Section 5.6.24 for the Project has been updated to reflect amendments to the reference design, stakeholder feedback received during consultation and from submissions on the draft EIS, as well as advances made in planning for construction of the Project. Revised details are provided in the revised draft EIS regarding:</p> <ul style="list-style-type: none"> Estimated volumes required, by activity The quality of water required for various tasks The sourcing of water, including reliability and access considerations Monitoring of the take and usage of water. <p>The sourcing of water will vary and be dependent on the location of need and the intend purpose of use. In each instance, construction water will be purchased from existing licenced sources that have capacity within the limits of the current licenced entitlement/allocation (Chapter 5: Project Description Section 5.6.24). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>Both Toowoomba Regional Council and Goondiwindi Regional Council have advised through consultation and feedback on the draft EIS that potable water from their networks is not available for use by the Project. Consequently, there is no intention to obtain potable water from Toowoomba Regional Council and Goondiwindi Regional Council sources. Instead, potable water for accommodation facilities and concrete batching will be obtained from potable networks within other LGAs, commercial bulk suppliers or from non-potable sources and subjected to treatment.</p> <p>Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS) (Chapter 5: Project Description Section 5.4). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.24</p> <p>Appendix B5: Construction Water Requirements</p>
145	145.0039	State Agency	Flooding	Increase in peak water levels	Table 12.8 of the report identifies flood impact objectives and allows 100 mm of water overtopping of roadways. 100 mm overtopping of state-controlled roads and railways has not been accepted by TMR and is inconsistent with TMRs no net-worsening policy position for state-controlled transport infrastructure.	Revise the Project and EIS to ensure that the hydrological impacts are consistent with TMRs no net-worsening policy. TMR will not accept a worsening scenario. Therefore, further mitigation measures such as additional cross drainage structures or raising of the existing road by the Project is required to reduce the impact. Flood resilient pavements would need to be designed and constructed depending on the location.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Expert Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment.</p> <p>Flood Impact Objectives (FIO) have been agreed with the Expert Flood Panel, to provide a 10-20 mm change in peak water level target on State-controlled roads (Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads >10 mm have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter (Sections 5 to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road.</p> <p>A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.11</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 4.2</p> <p>Section 5 - 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0040	State Agency	Flooding	Increase in peak water levels	In addition, the EIS has identified several locations using flood modelling where the project creates an increase in inundation depth at existing state-controlled roads. It is also unclear if the EIS has considered the effects of increased velocities and its impact on roads in terms of erosion and flood damage. Are there recommendations to construct flood resilient pavements where an increase in velocities is anticipated?	Amend the objective in the EIS to no net worsening for state transport infrastructure.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as detailed in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Expert Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment.</p> <p>Flood Impact Objectives (FIO) have been agreed with the Expert Flood Panel, with velocity targets provided based on sealed and unsealed surfaces. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. Velocity FIO targets can be found in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Changes in velocity to State-controlled roads has been identified with a summary of this assessment provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road.</p> <p>A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 4.2 Section 5 - 17</p>
145	145.0041	State Agency	Flooding	Modelling	Regarding the Westbrook Creek, it is unclear whether the recent development around Wellcamp been captured to a suitable detail, to determine whether it has an impact on the hydrology in this region. Additionally, it may be that the Toowoomba Cecil Plains Road should be raised and protected from inundation and excess velocities.	Office of the Coordinator-General seek confirmation as to whether this level of information is adequate and meets the requirements of the ToR.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 4.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Additional mapping has been generated by ARTC to provide further information and justification to the Expert Flood Panel. This mapping included within the revised draft EIS provides more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results and further discussion of results. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further consultation with DTMR has helped to shape the updated set of FIOs. The road impact assessment will be revisited and updated in line with the revised FIOs and included in the final EIS.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.10.1 Table 14-117 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5 - 17</p>
145	145.0042	State Agency	Surface Water	Baseline/backgound sampling	Regarding the Surface Water Management Plan, it is unclear how a 12-month baseline monitoring exercise will be undertaken if construction is anticipated to commence mid-2021. Using the anticipated timelines identified by ARTC there is likely to be insufficient time to establish a baseline unless it is happening already.	Update the EIS to confirm timing of works with the baseline monitoring.	<p>The anticipated timing of stages for the Project have been revised since the draft EIS and are presented in Section 5.3.6 of Chapter 5: Project Description.</p> <p>The revised draft EIS has been updated to include an additional 12 months of surface water data collected from December 2020 to November 2021, in addition to the data collected from June 2018 to May 2019. This monitoring has enabled interim site-specific WQOs to be derived. Additional water quality sampling will be conducted before commencement of construction to enable full calculation of site-specific WQOs, reflective of current climatic conditions, as a revision to the interim site-specific WQOs.</p> <p>The data that has been collected is evaluated and presented in the revised draft EIS in Appendix S: Surface Water Quality Technical Report, Sections 3.1.2 and 5.2, and Chapter 13: Surface Water, Section 13.3.3 and 13.4.5.</p>	<p>Chapter 5: Project Description Section 5.3.6 Chapter 13: Surface Water Section 13.3.3 Section 13.4.5 Appendix S: Surface Water Quality Technical Report Section 3.1.2 Section 5.2</p>
145	145.0043	State Agency	Flooding	Increase in time of submergence	Section 12.10.2.2 asserts that the amenity of Toowoomba Cecil Plains Road is not being detrimentally impacted. However, if the depth and time of submergence on the Toowoomba Cecil Plans (sic) Road is increasing due to the project, as suggested in this section, is being detrimentally impacted.	Update the EIS to correctly identify that Toowoomba Cecil Plains Road is being detrimentally impacted and identify any additional mitigation measures required.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5 - 17</p>
145	145.0044	State Agency	Flooding	Increase in time of submergence	Chapter 12 indicates that the change in Average Annual Time of Submergence (AAToS) on the Gore Highway is only 0.4 hours per year. However, up to 12 hours additional time of submergence during a 1% AEP event is significant and should be mitigated against.	Consistent with TMRs approach, the project should be achieving a no net-worsening outcome for flooding impacts to the state-controlled road. Therefore, the EIS should be updated to ensure hydrological impacts on the Gore Highway are adequately mitigated.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
145	145.0045	State Agency	Flooding	Mitigation measures	Chapter 12 suggests that Millmerran-Leyburn Road being cut by floodwaters is insignificant because the Millmerran-Inglewood Road is also cut. However, access needs to be maintained for the railway.	Update the EIS/project to ensure that hydrological impacts are adequately mitigated for Millmerran Leyburn Road.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
145	145.0046	State Agency	Flooding	Mitigation measures	It is unclear from the text of Chapter 12 whether impacts to Millmerran-Inglewood Road as a result of Back Creek and Bringley Creek have been considered and appropriately mitigated.	Update the EIS/project to ensure that hydrological impacts are adequately mitigated for Millmerran Inglewood Road.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
145	145.0047	State Agency	Flooding		The Cunningham Highway and Cunningham Highway North both appear to be affected by increased flooding. Also, access to Yelarbon must be maintained for emergency purposes, presumably the connection with Goondiwindi.	ARTC should continue to work with relevant stakeholders to ensure that access to Yelarbon is adequately maintained and update the EIS accordingly.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
145	145.0048	State Agency	Groundwater	Baseline/backgound sampling	Section 13.5.4 indicates that only one round of groundwater sampling was conducted. It is unclear whether other water quality data has been assessed from other available records.	Update the EIS to confirm that sufficient water quality sampling has been undertaken to establish a baseline and satisfy the requirements of the ToR.	<p>Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (see Chapter 15: Groundwater, Section 15.4.2 to 15.4.4). Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset.</p> <p>Chapter 15: Groundwater, Section 15.7.3 details the proposed groundwater management and monitoring program (GMMP) for each Project stage and has been updated as part of the revised draft EIS. It is further noted that publicly available groundwater data has been considered in conjunction with the data gathered from the Project specific bores and included in the revised draft EIS Chapter 15: Groundwater, Section 15.3.2.</p>	<p>Chapter 15: Groundwater Section 15.3.2 Section 15.4.2 Section 15.4.4 Section 15.7.3</p>
145	145.0049	State Agency	Groundwater	Survey effort/field investigation data	The groundwater irrigation value in Table 13.9 Summary of Environmental Values and Water Quality Objectives refers to threshold salinity tolerances in the Section 4.2.4 of the ANZECC/ARMCANZ Guideline 2018. These referenced guidelines uses ECse (electrical conductivity of saturated soil) and it is possible that the Electrical Conductivity (EC) of the registered bores in the impact assessment area are reported using EC1:5. This is important to qualify as there is considerable difference in the tolerance values due to the conversion factor between the classification schemes. Refer to Section 8.3 of the TMR Interim SMM for details.	Amend the EIS clarify the EC classification schemes for EC testing.	<p>The submitters concern is noted. Revised draft EIS Table 15-9 of Chapter 15: Groundwater has been updated accordingly.</p>	<p>Chapter 15: Groundwater Table 15-9</p>
145	145.0050	State Agency	Groundwater	Contaminated land	Table 13.15 states that Possible Acid Sulphate Soils (PASS) is a risk to the project through sulphide-bear rocks in cuts or the use of sulphide-bearing materials in the embankment fill. This statement is inconsistent with the Spoil Management documents where ARTC predicts no Acid Sulphate Soils or PASS are likely to be encountered.	Confirm whether ASS and PASS are expected to be encountered and update the relevant EIS chapters as required.	<p>PASS is listed as a risk as there is potential for PASS or sulphide-bearing rocks to be encountered during works; however, technical study findings to date indicate the level of risk is very low.</p> <p>Table 15.17 of revised draft EIS Chapter 15: Groundwater has been updated to provide extra information on the likelihood of PASS impact section. ARD and PASS have been presented in two separate rows to minimise confusion between the two.</p>	<p>Chapter 15: Groundwater Table 15.17</p>
145	145.0051	State Agency	Groundwater		Table 13.15 states that Unweathered areas of the Kumbarella Beds will be avoided where possible, through the detail design phase. Considering that the alignment will be largely locked-in by the detail design stage, it is unclear how the Kumbarella Beds will be avoided.	Update the EIS to confirm how Kumbarella Beds will be avoided.	<p>Geology within the Project footprint indicates a potential for the Kumbarella Beds and WCM to host disseminated sulphide minerals (i.e. pyrite), particularly within shale and mudstone units. Given that cuts will primarily be into the weathered to extremely weathered portions of the Kumbarella Beds and WCM, the risk would be naturally mitigated as sulphides minerals may have already been oxidised.</p> <p>The revised draft EIS has been updated with the final alignment and to clarify potential risk relating to intersecting the Kumbarella Beds, see Chapter 15: Groundwater, Section 15.7.4 (Table 15-23). The Detailed Design stage will allow for updates and changes to the design as required to minimise impacts identified in the revised draft EIS.</p>	<p>Chapter 15: Groundwater Section 15.7.4 Table 15-23</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0052	State Agency	Groundwater		The EIS refers to potential impacts that are considered temporary, in particular deep cuts that will likely impact groundwater which will occur for the life of the project. It is recommended the EIS be revisited to consider what is temporary and what are permanent considering the period in which the impacts are to occur.	Update the EIS to confirm what are the actual long-term impacts of the project, as some temporary impacts are actually permanent impacts.	<p>Predictive groundwater modelling was undertaken to evaluate the potential seepage rates for deep cuts with potential to intersect groundwater. The results of the predictive modelling is presented in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3. The impact of deep cuts on groundwater is generally expected during the Construction Works stage (i.e. short-term), as it is anticipated that groundwater seepage into cuts will be minimised following installation of engineering controls. Appendix U: Groundwater Technical Report, Section 3.2 presents the terminology and definition as applied for this Project, for example, Table 3.3 (Appendix U: Groundwater Technical Report) details the timeframes applied to the terms temporary, short-term, medium term and beyond.</p> <p>Geotechnical and hydrogeological investigations and assessment of potential drainage/dewatering impacts associated with the deep cut sections are ongoing with further consideration to be undertaken as part of the Detailed Design stage.</p> <p>Section 15.6.4 of Chapter 15: Groundwater presents the long-term (i.e. Operations stage) predicted impacts on groundwater. While the impacts are considered to be most significant during construction, any impacts that remain into operation will be reduced as groundwater levels are likely to re-establish at a new level after the cuts have been constructed.</p>	<p>Chapter 15: Groundwater Section 15.6.2 Section 15.6.4 Appendix U: Groundwater Technical Report Section 3.2 Section 6.3 Table 3.3</p>
145	145.0053	State Agency	Groundwater	Monitoring	Section 13.8.3.1 states that the Groundwater Monitoring and Management Plan will be developed and implemented during the detail design stage. This may be difficult to be achieved as construction is scheduled to start in 2021. It is unclear if there will be enough time to monitor and create a baseline that will be long-enough to detect trends. Clearing has been acknowledged to create evapotranspiration.	Update the EIS to include more realistic timeframes and consider the development of a Groundwater Monitoring and Management Plan before detailed design. Amend Chapter 22 Outline Environmental Management Plan and Appendix Z Proponent Commitments as needed.	<p>Construction of the Border to Gowrie Section is no longer scheduled to start in 2021. This was the predicted schedule when the draft EIS was being prepared and has since been revised.</p> <p>Chapter 5: Project Description, Section 5.3.6 has been updated with revised Project timeframes.</p> <p>Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (see Chapter 15: Groundwater, Section 15.4.2-15.4.4). Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset. Revised draft EIS Chapter 15: Groundwater, Section 15.7.3 details the proposed groundwater management and monitoring program (GMMP) for each Project stage and has been updated as part of the revised draft EIS.</p>	<p>Chapter 5: Project Description Section 5.3.6 Chapter 15: Groundwater Section 15.4.2 Section 15.4.3 Section 15.4.4 Section 15.7.3</p>
145	145.0054	State Agency	Groundwater		Table 13.21 provides a score (high, moderate, low) for initial significance and residual significance for existing bores (registered and non-registered). It is unclear what criteria is being used to score the residual significance as low.	Update the EIS to confirm what quantitative values/criteria were to assess the significance and determine the scores provided in Table 13.21.	<p>Potential impacts to groundwater values associated with construction and operation of the Project are outlined in Section 15.6.3 and Section 15.6.4 respectively of Chapter 15: Groundwater. These impacts have been subjected to significance assessment as per the methodology introduced in Chapter 4: Assessment Methodology, Section 4.4 and described in Chapter 15: Groundwater, Section 15.3.2. Appendix U: Groundwater Technical Report, Section 3.2 presents the terminology and definition as applied for this Project, for example, Table 3.4 (Appendix U: Groundwater Technical Report) details the sensitivity criteria applied to the terms negligible, low, medium, etc.</p> <p>The initial impact assessment assumes that the design considerations (or initial mitigation measures) factored into the reference design stage (refer Table 15.19, Chapter 15: Groundwater) have been implemented. Additional mitigation and management measures (refer Table 15.20, Chapter 15: Groundwater) were then applied, as appropriate, to future stages of the Project to reduce the level of potential impact and derive a residual significance of impact. The initial and residual significance of potential impacts are presented in Table 15.23 to demonstrate the effectiveness of mitigation measures.</p> <p>Section 3.2 of Appendix U: Groundwater Technical Report also details the criteria and methodology.</p>	<p>Chapter 4: Assessment Methodology Section 4.4 Chapter 15: Groundwater Section 15.3.2 Table 15.20 Table 15.23 Appendix U: Groundwater Technical Report Section 3.2 Table 3.4</p>
145	145.0055	State Agency	Air Quality	Monitoring	Dust monitoring would need to be completed when undertaking construction works, particularly in urban/semi-urban areas like Yelarbon, Brookstead, Pampas and generally at construction sites.	Update the EIS to require dust monitoring during construction activities at a minimum.	<p>Dust deposition monitoring will continue to be conducted during the active period of construction in proximity to the Commodore Mine, at locations where baseline data was collected (refer above), to determine if construction activity is resulting in significant dust impacts. Dust deposition monitoring will be undertaken in accordance with AS/NZ 3580.10.1:2016 – Method 10.1: Determination of particulate matter - Deposited matter - Gravimetric method (Standards Australia and Standards New Zealand, 2016). The results of Construction Works stage dust deposition monitoring will be included in construction environmental reporting, as specified in Chapter 24: Draft Outline Environmental Management Plan (Chapter 12: Air Quality, Section 12.7.2).</p> <p>In addition to air quality monitoring near the Commodore Mine, dust deposition monitoring will also be undertaken in urban and semi-urban areas including, but not limited to, the areas of Inglewood, Yelarbon, Pittsworth, Brookstead, Pampas and Gowrie Mountain. These more urban areas are of higher sensitivity for air quality impacts due to the increased density of sensitive receptors located near construction activity areas and associated dust emission sources. The monitoring locations used for the baseline monitoring (Section 12.7.2.2) will be maintained if land access agreements allow. Where new locations are required, the locations for monitoring in urban and semi-urban areas will be determined after detailed design has commenced. (Chapter 12: Air Quality, Section 12.7.2).</p> <p>Recommendations for air quality monitoring during the Construction Works stage are provided in Section 12.7.2 of Chapter 12: Air Quality. The recommended mitigation and management strategies, including monitoring, will be included in the Construction Environmental Management Plan (CEMP) for the Project. Prior to the start of construction, an Air Quality and Dust Management Plan will be developed as a component of the CEMP. This Air Quality and Dust Management Plan will include commitments and requirements for air quality monitoring, including dust deposition monitoring, real-time dust monitoring, reporting and the complaints and resolution process (Chapter 12: Air Quality, Section 12.7.2).</p> <p>Further information on the proposed mitigation measures, including monitoring, is provided in Section 12.6 of Chapter 12: Air Quality.</p>	<p>Chapter 12: Air Quality Section 12.6 Section 12.7.2</p>
145	145.0061	State Agency	Noise and Vibration	Operational rail noise	Table 14.22 is missing TMRs Interim Guideline - Operational Railway Noise and Vibration (March 2019) ground borne noise criteria for Court of Law (court reporting and transcript areas, Judges chambers).	Update the EIS and including Appendix (Appendix T) to include TMRs Interim Guideline - Operational Railway Noise and Vibration (March 2019) ground borne noise criteria for Court of Law (court reporting and transcript areas, Judges chambers).	The EIS has been amended to include the Department of Transport and Main Road's (DTMR) Interim Guideline - Operational Railway Noise and Vibration (March 2019) railway ground borne noise criteria in Table 3-4 (Section 3) of Appendix W: Noise and Vibration Assessment - Railway Operations.	<p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 3 Table 3-4</p>
145	145.0064	State Agency	Noise and Vibration	Operational rail noise	The WHO limit of 42 dB(A) Lmax is based on a dose-effect related to aircraft.	Update the EIS to justify the use of dose-effect and its applicability to railway noise.	<p>Whilst guidance from the World Health Organisation can, in some circumstances, provide supporting advice on aspects such as sleeping disturbance, ARTC has elected to no longer reference the World Health Organisation guideline noise levels in the revised draft EIS. This decision was based on the noise and vibration assessments for the revised draft EIS now adopting relevant noise and vibration criteria from DTMR's Transport Noise Management Code of Practice Volumes 1 and 2 and the Interim Guideline (Section 16.3 of Chapter 16: Noise and Vibration). The submissions to the draft EIS also highlighted the application of supplemental guideline noise levels was potentially confusing to stakeholders and the community, leading at times to a misinterpretation of the assessment and its findings.</p> <p>References to the World Health Organisation guidelines have been removed from Appendix W: Noise and Vibration Assessment - Railway Operations. Refer to Section 3 of Appendix W: Noise and Vibration Assessment - Railway Operations that provides guidance on the relevant application of legislation, standards and Guidelines for operational rail noise in Queensland.</p>	<p>Chapter 16: Noise and Vibration Section 16.3 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3</p>
145	145.0065	State Agency	Noise and Vibration	Operational rail noise	The EIS identifies a reduction of 7 dB(A) for facade level (external to internal) but does not provide a justification as to why that reduction has occurred. The EIS references AS3671 as the basis for the reduction but does not include the assumed opening percentage to justify the selected values or a comparison with available literature (i.e. values as low as 5 dB(A)).	Update the EIS to justify the selected facade reduction.	<p>Facade reduction is a conservative estimate of the difference between outdoor railway noise and indoor railway noise allowing for windows to be open for ventilation.</p> <p>In the assessment of construction noise impacts, the CoP Vol 2 also prescribes that internal airborne construction noise criteria be met where reasonable and practicable for the sensitive receptor types that include hospital & health care service , educational establishment, community use & place of worship, as discussed in Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. To assess the noise model predicted external noise levels against the internal (indoor) noise limits presented in Table 3-4 of Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, the noise limits are adjusted by a facade correction which accounts for the reduction of noise achieved by the building (with windows open). For the educational establishments and community buildings potentially impacted by the Project, a conservative 7 dB facade noise reduction has been applied, in the absence of actual measurement data, based on the guidance provided in DES Noise and Vibration EIS Information Guideline recommended for typical Queensland buildings. Further to the this, sound insulation testing of facades typically representative of the educational buildings at Yelarbon State School, Brookstead State School, Pittsworth State High School and Southbrook Central State High were measured by WSP (WSP Report B2G Inland Rail Background Noise Monitoring and Facade Sound Insulation testing dated 21 February 2023). This information was also taken into account in the assessment as discussed in Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>The applicable DTMR Interim Guideline operational rail noise criteria for both residential and educational receivers are same and define an outdoor criteria (Section 3 of Appendix W: Noise and Vibration Assessment - Railway Operations). Where these outdoor criteria are exceeded, feasible and practicable noise mitigation measures for non-residential receivers will be further investigated during the Detailed Design stage and installed prior to Inland Rail operations commencing (see Section 16.10 of Chapter 16: Noise and Vibration).</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 3.3 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3</p>
145	145.0066	State Agency	Noise and Vibration	Operational rail noise	The last paragraph of Section 14.7.4.1 states: "It would be expected that residential property, complying to Australian building code and standards, would achieve facade noise reductions greater than the conservative 7 dBA assumption applied in this assessment. "	Update the EIS to state what codes and standards would be expected to achieve a greater reduction than that applied in the assessment.	<p>Facade reduction is a conservative estimate of the difference between outdoor railway noise and indoor railway noise allowing for windows to be open for ventilation.</p> <p>In the assessment of construction noise impacts, the CoP Vol 2 also prescribes that internal airborne construction noise criteria be met where reasonable and practicable for the sensitive receptor types that include hospital & health care service , educational establishment, community use & place of worship, as discussed in Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. To assess the noise model predicted external noise levels against the internal (indoor) noise limits presented in Table 3-4 of Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, the noise limits are adjusted by a facade correction which accounts for the reduction of noise achieved by the building (with windows open). For the educational establishments and community buildings potentially impacted by the Project, a conservative 7 dB facade noise reduction has been applied, in the absence of actual measurement data, based on the guidance provided in DES Noise and Vibration EIS Information Guideline recommended for typical Queensland buildings. Further to the this, sound insulation testing of facades typically representative of the educational buildings at Yelarbon State School, Brookstead State School, Pittsworth State High School and Southbrook Central State High were measured by WSP (WSP Report B2G Inland Rail Background Noise Monitoring and Facade Sound Insulation testing dated 21 February 2023). This information was also taken into account in the assessment as discussed in Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>The applicable DTMR Interim Guideline operational rail noise criteria for both residential and educational receivers are same and define an outdoor criteria (Section 3 of Appendix W: Noise and Vibration Assessment - Railway Operations). Where these outdoor criteria are exceeded, feasible and practicable noise mitigation measures for non-residential receivers will be further investigated during the Detailed Design stage and installed prior to Inland Rail operations commencing (see Section 16.10 of Chapter 16: Noise and Vibration).</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 3.3 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3</p>
145	145.0067	State Agency	Noise and Vibration	Operational rail noise	<p>The assessment of vibration dose value (VDV) requires further clarification based on the following:</p> <ul style="list-style-type: none"> Appendix T, s9.1, Provide the justification/reference document for rail crest factor of 4. Appendix T, s12.2, The Logarithmic VDV versus distance relationship is not clear on Figure 20 Appendix T, s9.2, VDV is based on weighted acceleration. It is unclear why Figure 21 include a vibration velocity spectrum. 	<p>Update the EIS to:</p> <ul style="list-style-type: none"> Justify the selected crest factor. Provide additional logarithmic x-axis labels and chart lines. Data would be clearer if each data set had mean,5/25/50/75/95 percentiles and min/max values plotted. The adopted relationship would be expected to underestimate values at the distance of the Waniool dataset. Discuss the implication of this in relation to the closest sensitive receiver. Provide the source data for VDV measurement and prediction. 	<p>The Department of Transport and Main Roads Interim Guideline Operational Railway Noise and Vibration (2019) standard includes ground-borne vibration criteria for the management of vibration from railway operations and are outlined in Chapter 16: Noise and Vibration, Section 16.8.2 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 3.2. For intermittent events such as train passby events, the vibration dose value (VDV) is applied to assess potential impacts to human comfort. The vibration dose value provides a cumulative measure of the vibration levels associated with all railway operations in the day, evening, or night periods. The VDV considers the combined effects of the level of the ground-borne vibration and the duration of vibration generating events and, as such, is suited for the assessment of transient sources such as train passbys.</p> <p>A crest factor of 4 is sourced from Federal Transit Administration (FTA-US) Transit Noise and Vibration Impact Assessment Manual, 2018. This crest factor, as suggested in the FTA manual, is also consistent with SLR's general observations from rail vibration measurements (Section 13.1 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>Section 13.2 of Appendix W: Noise and Vibration Assessment - Railway Operations of provides data to further support the development of a relationship between VDV vs distance. Based on the fit chosen, it can be seen that the predictions are conservative (as majority of the measured VDV's fall below the line). However, there are many variables involved in determining VDV's precisely, and hence further assessments are recommended during detailed design.</p> <p>Section 13.2 of Appendix W: Noise and Vibration Assessment - Railway Operations further shows a velocity spectrum as this is how source spectra are usually presented and enables comparison of verification against other source spectra. Velocity spectra can be readily converted to weighted acceleration spectra if required.</p>	<p>Chapter 16: Noise and Vibration Section 16.8.2 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3.2 Section 13.1 Section 13.2</p>
145	145.0068	State Agency	Noise and Vibration	Operational rail noise	The assessment of ground borne noise requires further clarification based on the following: Appendix T, s13, the adjustment factors stated (0 dB) seem to be lower than those recommended for generic cases (i.e. where detailed information is not available for individual buildings) by the FTA Transit Noise and Vibration Impact Assessment Manual, 2018 (pg. 145), which recommends up to +6 dB adjustment.	Update the EIS to justify the selected adjustment factors or revise the modelling and assessment. Propose mitigation measures.	The assumption for coupling loss and amplification factor are considered appropriate at this stage of the assessment. Section 14 of the operational noise report has updated to explain the selection of adjustment factor. The FTA manual 2018 recommends a building coupling loss of -5 dB to wood frame houses, but also recommends a +2 dB for floor-to-floor loss and +6 dB for floor amplification/resonance which generally cancel out. As such, the assumptions are deemed appropriate going by generic adjustments from industry practice. However, further detailed review of coupling losses and amplification factors will be undertaken during detailed design where necessary.	<p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 14</p>
145	145.0073	State Agency	Stakeholder engagement		The Inland Rail Project will be a significant infrastructure Project in the Southern Queensland Region. Will educational tours and learning opportunities be offered to schools, institutes, universities and engineering groups as part of engagement activities?	Amend the EIS to comment on the educational opportunities the Project could offer to education providers.	<p>As outlined in the revised draft EIS, ARTC is committed to providing training and development opportunities for the local community. As detailed in Appendix X: Social Impact Assessment, Section 7.2.3, ARTC has established the Inland Rail Skills Academy (IRSA), which is a collection of Projects and partnerships with the aim to:</p> <ul style="list-style-type: none"> increase the number of skilled local people eligible for employment on Inland Rail and associated regional industries increase school student awareness and capability by connecting students with industry best practice create opportunities for local businesses to participate in new supply chains equip ARTC Inland Rail employees with world-class skills. <p>ARTC notes that while the construction sites will be managed by the Contractor, site tours are listed as a requirement in the Project Scope Requirements.</p> <p>Appendix X: Social Impact Assessment, Section 7.2.3 and Section 8.3.2 details the education, skills training and development opportunities that will be provided on the Project.</p>	<p>Appendix E: Consultation Report Section 5.11 Appendix X: Social Impact Assessment Section 7.2.3 Section 8.3.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0074	State Agency	Social Impact Assessment		The scheduling in Table 15.5 is no longer accurate. Phases should be revised to align with likely final EIS CG Evaluation Report and approval by the Commonwealth Minister for EPBC Matters of National Environmental Significance.	Update the EIS (including Table 15.5) to reflect a more realistic schedule.	Revised draft EIS Chapter 5: Project Description, Section 5.3.6 Timing and Table 5-3 Anticipated Timing of the Project Stages and Activities detail the stages of Project.	Chapter 5: Project Description Section 5.3.6 Table 5-3
145	145.0075	State Agency	Stakeholder engagement	Indigenous cultural heritage	Section 15.6.51 indicates that Social Impact Assessment (SIA) consultation with indigenous people identified, 'Potential for the Project cultural sites, such as bora rings, kippa rings or sites associated with ancestors' graves, or massacre sites'. However, these were not detailed in Chapter 17 Cultural Heritage.	Amend Chapter 15 to include additional information regarding consultation with indigenous people.	Since the draft EIS, additional engagement has been undertaken with Indigenous people on matters relating to Indigenous cultural heritage and Cultural Heritage Management Plan (CHMPs), Native Title and Indigenous Participation. A key outcome of engagement has been the establishment of a framework for communication and consultation with the Bigambul Native Title Aboriginal Corporation (BNTAC) on a range of matters. In 2019, ARTC developed a Statement of Commitment with BNTAC as the registered native title holders along the Project alignment. This is outlined in Chapter 6: Stakeholder Engagement, Section 6.6 and Appendix E: Consultation Report, Section 6.2.	Chapter 6: Stakeholder Engagement Section 6.6 Appendix E: Consultation Report Section 6.2
145	145.0076	State Agency	Traffic and Transport	Level crossing	Table 15.14 states that: 'The maximum wait time at a level crossing has been calculated to be approximately 2-3 minutes for pass-by of a train of 1,800 m travelling at 115 km/h. This should be confirmed as waiting time may change based on train speed due to safety, change in grade, nearby crossing loops. Wait time calculation around potential future train length of 3,600 m should also be provided and include road user modelling to enable a better understanding of road user impacts and the need for grade separation.'	The EIS should be updated to provide a level crossing wait time calculation based on train speed variation due to safety (i.e. 80 km hour), change of rail grade, crossing loops, shorter curve in rail track which will require a reduction in speed as opposed to a longer curve which will allow for top speed. Provide a level crossing wait time calculation based on proposed future train length of 3600 m (i.e. four to six minutes). Update the TIA accordingly. This is in addition to TMRs other comments on the proposed level crossings.	Revised draft EIS Section 5.2 of Chapter 5: Project description describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains is not part of the proposal for which approval is being sought. Section 5.9.3 of Appendix AA: Traffic Impact Assessment discusses analysis assumptions a lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (volumes are detailed in Section 2.4). This Section also details on how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m. Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of: <ul style="list-style-type: none"> ▶ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line ▶ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate ▶ The time it takes the train to cross the level crossing ▶ Design vehicle consisting of a B-double for input parameters. Train speed and train clearance times (s) calculations and assumptions (as obtained from road-rail interface) for the level crossing are as follows: <ul style="list-style-type: none"> ▶ Train clearance times were calculated based on an assumed maximum train speed of 115 km/h ▶ Calculation of the freight train acceleration rate ▶ Distance of the level crossing from passing loops ▶ Distance required to accelerate to maximum turnout speed (50 km/h) ▶ Distance travelled while at constant maximum turnout speed ▶ Distance required to accelerate to maximum speed after whole train has passed turnout ▶ Total distance required to reach maximum speed for train starting from turnout ▶ Total vehicles' wait time with train length of 1,800 m was estimated to be 104 seconds (including boom closure times). ▶ The wait times determined for each individual level crossing were calculated based on: ▶ Level crossing specific operating speeds which is impacted by topography and curvature of the alignment ▶ Time taken for the train to cross the level crossing ▶ Distance from train crossing loops ▶ Train length ▶ Summarise traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons, as per Section 2.4). ▶ A sensitivity test (to represent a conservative upper level crossing time delay) has been undertaken based on a maximum train speed of 60 km/h (as opposed to up to 115 km/h) to highlight the variability in closure times. Typical active level crossing sequence for boom gate down time is, after 11 seconds (t=11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (t=22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or Road trains), the delay before the booms commence lowering can be increased by a further 5 seconds to 16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F highway signals become extinguished.	Chapter 5: Project Description Section 5.2 Appendix AA: Traffic Impact Assessment Section 2.4 Section 5.9.1 Section 5.9.3
145	145.0077	State Agency	Social Impact Assessment	Workforce and employment	For Table 15.29 under Community Cohesion, there is no consideration of the likely amenity impact resulting from workforce accommodation that may remain in place post construction to accommodate overseas or interstate travellers requiring quarantining due to COVID, refugee processing/emigration or seasonal farming workforce housing.	Amend the EIS to include a risk consideration for potential long term/permanent use of Inland Rail workforce accommodation for potential other uses post construction.	The workforce accommodation facilities would be temporary for the purpose of construction and would be decommissioned following the completion of construction. Any future use of buildings or infrastructure on the properties would be subject to discussion between ARTC and the owners of properties on which facilities would be located. Secondary approvals including local government approval will be required prior to finalising the location, use and servicing of accommodation facilities.	N/A
145	145.0078	State Agency	Social Impact Assessment	Cumulative impacts	The construction dates in Table 15.30 need to be updated in accordance with the revised schedule for each Section on the Inland Rail proposal as they are no longer accurate. Also, each project represented in this Table should be reassessed in accordance with revised construction schedule for the B2G Section of the Inland Rail proposal.	Update the EIS to ensure construction schedules for all Inland Rail project sections in Queensland are reflective of current EIS and EPBC referral approval timeframes. Social cumulative impacts need to be reassessed in accordance with an updated construction schedule.	The revised draft EIS including Appendix X: Social Impact Assessment (throughout) has been updated to reflect changes to the construction timeframe. This included updating the cumulative social impact assessment (Appendix X: Social Impact Assessment, Section 7.6).	Appendix X: Social Impact Assessment Section 7.6
145	145.0079		Economics		Assuming freight time savings are based on 24 hours travel time achieved between Melbourne and Brisbane, there is no sensitivity analysis presented for loss resulting from any delay on the network. Can the EIS inform what the sensitivity of an hour's delay (due to an incident or maintenance issue) is on the network in relation to travel time on the B2G section?	Update the EIS to explain the significance and sensitivity of delays on individual rail sections as well as the larger Inland Rail project.	All assumptions relating to demand modelling, including the connection to the Port of Brisbane and intermodal terminals, are considered in the Inland Rail Program Business Case (2015). As such the EIS reflects the information contained in the Business Case and does not include any new assumptions. Sensitivity testing was undertaken in the Inland Rail Program Business Case (2015). As such considering demand modelling assumptions and sensitivity analysis relating to this modelling is outside the scope of this EIS. Chapter 20: Traffic, Transport and Access, Section 20.5 of the revised draft EIS, discusses the potential impacts of the construction and operation of the Project on the existing road and rail network. The following impacts may arise because of the increased number of vehicle movements on the existing road network during the Construction Works stage: <ul style="list-style-type: none"> ▶ Increased journey times on road linkages used by construction traffic ▶ Reduced LOS on road links used by construction traffic ▶ Increased waiting time at intersections used by construction traffic ▶ Accelerated degradation of road pavements due to increased volume of traffic and greater axle load. In addition, road users may experience temporarily altered driving conditions in proximity to construction areas, such as reduced speed limits, mobile traffic lights and lane reconfigurations. Altered driving conditions will result in increased travel times through sections of the road network where such controls are implemented. The potential traffic impacts as a consequence of vehicle movements in support of operation and maintenance activities are expected to be negligible. As outlined, demand modelling assumptions and sensitivity analysis relating to this modelling is outside the scope of this EIS. The purpose of the EIS process is to inform decision-makers and the public of the environmental consequences of implementing a proposed Project. Regarding maintenance activities, ARTC will be required to carry out essential rail maintenance and improvement works to the Inland Rail alignment to ensure safety and reliability across the network. Works may include track re-railing, resurfacing and reconditioning, as well as drainage restoration, track ballasting, level crossing upgrades, relocation of utilities, turnout maintenance and bridge maintenance. These essential activities are carried using a "track possession strategy", where freight services are prevented from using an allocated Section of track for a specified time period. ARTC works closely with rollingstock operators and distribution companies to plan these track closures to minimise disruptions to the freight distribution network. Routine maintenance work can be also carried out on active rail line under the supervision of a Track Protection Officer, thereby minimising disruptions to the rail network.	Chapter 18: Economics Section 18.7 Chapter 20: Traffic, Transport and Access Section 20.5
[145.0080		Economics		The EIS does not clearly state that local industry participation is mandated for ARTC.	Update the EIS to clarify that local industry participation has been mandated to ARTC.	In accordance with the <i>Australian Jobs Act 2013</i> (Cth), ARTC has prepared an Australian Industry Participation Plan (AIP Plan) for the Inland Rail Program which identifies how Australian entities, particularly businesses operating within the Goondiwindi, Toowoomba and nearby Local Government areas (LGAs), will be provided full, fair and reasonable opportunity to bid to supply goods and services to the Project. ARTC is also committed to ensuring that Indigenous businesses, including those operating within the SIA study area, are identified and encouraged to participate in the Project's supply chain. In recognition of stakeholders' expectations, and to ensure local business benefit from the Project, ARTC has developed subgroups to further categorise and define the geographical boundaries of what constitutes local, as discussed in Section 17.6 of Chapter 17: Social, and will report on local supplier participation from within the Goondiwindi and Toowoomba LGAs, as well as at regional, state and national level.	Chapter 17: Social Section 17.6
145	145.0081	State Agency	Cultural Heritage		Table 17.17 which is a summary of assessments that indicate cultural heritage significance threshold for site B2G-19-H22 Protest Public Art indicates that this area of interest is of cultural heritage 'State Significance' for the following criteria under the Queensland Heritage Act: Historical, Rarity, Aesthetic, Social and Associational. A Cultural Heritage assessment of B2G-19-H22 should be revisited to confirm if this is indeed State or more likely of Local significance. It is very unlikely this item would meet the criteria to be registered on the Queensland Heritage Register.	A cultural heritage assessment of B2G-19-H22 Protest Public Art should be revisited to confirm if this is indeed State or more likely of Local significance.	B2G-19-H22 Protest Public Art has been reassessed as of local significance, and the cultural heritage assessment in Chapter 19: Cultural Heritage, Section 19.8, Figure 19.2 and Tables 19-2, 19-15, 19-16, 19-19, 19-22, 19-23 and 19-24 have been updated.	Chapter 19: Cultural Heritage Section 19.8 Figure 19.2 Table 19-2 Table 19-15 Table 19-16 Table 19-19 Table 19-22 Table 19-23 Table 19-24
145	145.0082	State Agency	Cultural Heritage		Table 17.22 omits a 'practical completion' phase which should include an end of project Cultural Heritage Audit and the removal of any exclusion zoning fencing ensuring that on ground conditions are the same as when was fenced.	Update Table 17.22 to include a Practical Completion or Finalisation Phase where mitigation and management measures should include: end of project Cultural Heritage Audit <ul style="list-style-type: none"> ▶ the removal of any Cultural Heritage exclusion zoning fencing ensuring that on ground conditions remain the same as when was fenced. 	Chapter 19: Cultural Heritage, Table 19-21 has been updated to include a Practical completion stage.	Chapter 19: Cultural Heritage Table 19-21
145	145.0083	State Agency	Cultural Heritage		Table 17.22 indicates for the construction phase the review for adopting quieter and nonvibrator plant items near sensitive receptors is to be reported as part of ongoing Cultural Heritage site manager notes and subject to auditing requirements for compliance. This should also apply for appropriately sized plant and equipment selected for each construction task.	Consider as part of the Environmental Monitor or Auditing roles and requirements, the review of Site Manager notes to ensure consideration is given to adopting quieter and non-vibrator plant items near sensitive receptors IE Cultural Heritage areas of interest. Amend the EIS accordingly.	Chapter 19: Cultural Heritage, Table 19-21 has been updated to include more detail on the mitigation of potential vibration impacts on heritage sites. This includes measures to reassess potential vibration impacts ahead of works, and to limit these impacts where feasible by selecting quieter, non-vibratory, and appropriately sized equipment and plant.	Chapter 19: Cultural Heritage Table 19-21

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0084	State Agency	Traffic and Transport	Operational traffic	The use of SIDRA analysis for rail/road interfaces will not provide correct analysis with respect to queue length/stacking on side roads, particularly with rail on side roads. From a safety aspect and operation efficiency on state-controlled roads, it is TMR's intention to avoid queues on roads from traffic waiting to turn onto side roads having an interface with rail level crossing. It is TMR's intention to maintain unimpeded movement to traffic on statecontrolled roads.	The EIS should ensure that operational efficiency on the TMR road network is not worsened in the design process.	Appendix AA: Traffic Impact Assessment Section 5.4.5, Table 5.30 lists the intersection with more than 5 per cent aggregated vehicle minutes delay. Table 5.31 lists the intersections with less than 5 per cent aggregated vehicle minutes delay. Detailed output tables and SIDRA output summaries are included in Appendix AV of Appendix AA: Traffic Impact Assessment. Appendix AA: Traffic Impact Assessment Section 5.4.6 details mitigation measures for SIDRA intersection performance parameters that exceed acceptable operational limits. This operational assessment has reviewed the SIDRA intersection performance parameters LOS, DoS, average delay, and 95th percentile queue to determine which intersections are exceeding acceptable operational limits. Table 5.33 lists the typical infrastructure-based mitigation measures applicable to capacity issues. Table 5.34 lists the additional mitigation measures for the intersections along OSOM routes. Table 5.35 summarises the mitigation measures applicable to intersections that exceed 5 per cent net vehicle minutes delay, and also exceed acceptable operational capacity limits.	Appendix AA: Traffic Impact Assessment Section 5.4.5 Section 5.4.6 Table 5.30 Table 5.31 Table 5.33 Table 5.34 Table 5.35 Appendix AV
145	145.0085	State Agency	Landscape and Visual Amenity	Road safety	It is unclear whether any design analysis has been conducted that identified headlight glare from night-time train movements, particularly when travelling through towns or parallel to the highways. The EIS does not mention any details regarding this analysis.	Amend the EIS to clarify whether a design analysis of headlight glare from night-time trains has been conducted.	The LVIA has been conducted in line with the methodology outlined in Section 4. 0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and potential impacts associated with the Project, including Project lighting, are identified in Section 6. A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9 of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated. In addition, an Obtrusive Lighting Assessment (OLA) has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment). The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments. Chapter 24: Draft Outline Environmental Management Plan includes the following in relation and management measures for visual amenity and intrusive lighting: "while ensuring the construction and operational safety is not compromises, Australian Rail Track Corporation (ARTC) would seek to minimise light emissions from the Project (during construction and operation) by select placement, configuration and direction of lighting to reduce potential impacts to the surrounding environment, where practicable, in accordance with Australian Standards. "	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 4.10 Section 6 Section 9 Section 9.2 Section 11.2 Appendix 3: Obtrusive Lighting Assessment Chapter 24: Draft Outline Environmental Management Plan
145	145.0086	State Agency	Traffic and Transport	Road safety	The EIS does not clarify how incidents at road/rail interfaces will be managed and who will be the agency dedicated to incident management. It is unclear if ARTC will be solely responsible for managing incidents or will they receive assistance from other agencies. Similarly management of flooding or fire related disaster events and its impacts at Rail/Road interfaces has not been clarified in the EIS.	Update the EIS to include the process and agency responsible for managing rail/road interface incidents.	Section 5.12.2 of Appendix AA: Traffic Impact Assessment identify the process and agency responsible for managing rail/road interface incidents. Section 5.12.2 states, all Rail Transport Operators (both Rolling Stock Operators (RSOs) and Rail Infrastructure Managers (RIMs)) are required under the Rail Safety National Law (RSNL) to establish, as part of their Safety Management System, an emergency management plan. The RSNL and RSNL National Regulations set out requirements for: <ul style="list-style-type: none"> • Matters that the plan must address. • Consultation required when preparing the Emergency Management Plan and • Keeping, maintaining and testing the emergency plan. The RIM takes the leading role in coordinating with other parties accessing their rail infrastructure and the emergency services, along with any relevant utility providers. The Office of the National Rail Safety Regulator (ONRSR) and Australian Transport Safety Bureau (ATSB) may or may not deploy to an incident site. When an immediately notifiable incident occurs: <ul style="list-style-type: none"> • The ONRSR assesses the incident against publicly available criteria and may: • Investigate the incident, or • Direct the terms of reference of an investigation by the relevant Rail Transport Operator/s and/or • Monitor the relevant RTO's compliance with their Safety Management System and RSNL in relation to the response to, and investigation of, the incident. • The ATSB assesses the incident to determine • Whether or not to investigate based on the potential of an investigation to identify systemic issues, and if so, • The level of investigation that will be conducted. Further detail is discussed in Section 5.12 of the Appendix AA: Traffic Impact Assessment regarding whether deployment has been actioned and rescue.	Appendix AA: Traffic Impact Assessment Section 5.12 Section 5.12.2
145	145.0087	State Agency	Traffic and Transport		Figure 18.1 and Figures 18.2a to 18.2h relate to the project rail alignment as well as the project road-rail interface locations. The figures identify roads as "major roads and "minor roads but it is difficult to determine what roads are state-controlled roads or local government roads.	Amend Figure 18.1 and Figures 18.2a to 18.2h to more clearly identify the road types and relevant ownership.	Appendix AA: Traffic Impact Assessment Figure 1.2a-i provide the Project road rail interface locations with major roads (state controlled roads) highlighted, and the local government areas shown. More details are provided in Table 3.12 which provides the proposed public road-rail interface and design treatment locations separated into road authority areas.	Appendix AA: Traffic Impact Assessment Figure 1.2a-i Table 3.12
145	145.0088	State Agency	Traffic and Transport		Chapter 18 references various parts of the Austroads series Guide to Traffic Engineering Practice. These manuals have been superseded.	Update the EIS to ensure that the latest Austroads manuals are referenced and used.	Appendix AA: Traffic Impact Assessment Section 1.1.1, Table 1-1 details the relevant Austroads guidelines used for the TIA assessment. These include: <ul style="list-style-type: none"> • Austroads Guide to Traffic Management Part 12 (Austroads, 2016) • Austroads Guide to Traffic Management Part 3 (Austroads, 2017) • Austroads Guide to Road Design Part 4A (Austroads, 2017b) • Austroads Guide to Traffic Management Part 6 (Austroads, 2019a) • Austroads Guide to Traffic Management Part 4 (Austroads, 2020) 	Appendix AA: Traffic Impact Assessment Section 1.1.1 Table 1-1
145	145.0089	State Agency	Traffic and Transport		The EIS states that the GTIA defines LOS as a qualitative index for ranking operating conditions on roads; but intersection delay is also used in GTIA to quantify impacts.	The EIS should be updated to ensure the TIA is undertaken in accordance with GTIA noting that some of the performance indicators are different.	Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA. LOS provides a qualitative index while delay provides the quantitative indication of impacts.	Appendix AA: Traffic Impact Assessment
145	145.0090	State Agency	Traffic and Transport		2019 traffic data should be available and used for state-controlled roads. The linear growth rate to be applied to state-controlled roads is to be discussed and agreed prior to finalised of the TIA and PIA.	Prior to finalising the TIA (which will not occur until after a Principal Construction Contractor is appointed), the background traffic growth rates to be applied to state-controlled roads are to be agreed to by TMR. Amend the EIS to illustrate this commitment.	The 2019 traffic data referenced has been used for all state-controlled roads and the updated traffic volume sources have been summarised in Section 2.4. Noting compound growth rate has been used throughout the Appendix AA: Traffic Impact Assessment for SCR and LGR to provide a conservative background traffic for assessment. Appendix AA: Traffic Impact Assessment Section 6.2 includes a commitment to ensure the finalised TIA will be developed in consultation with TMR. ARTC will Consult with TMR, councils, and where relevant QR, in determination of final construction and heavy vehicle routes and update all documentation and reports to ensure the report aligns with final construction traffic volumes, turning movements, routes and vehicle types.	Appendix AA: Traffic Impact Assessment Section 2.4 Section 6.2
145	145.0091	State Agency	Traffic and Transport	Construction traffic	The TIA states that traffic impacts associated with the offsite disposal of waste have not been assessed. The TIA should include a small allowance for the aggregate of all minor movements such as waste, cleaning services, caterers and other servicing vehicles combined to be added to the main construction activities.	Update the EIS to include an allowance for other traffic not covered under the main construction transportation activities.	Appendix AA: Traffic Impact Assessment Table 4.2 provides a summary of total trips by construction activity, per year, and includes a Table note that states traffic impacts associated with the off-site disposal of waste have not been assessed, as waste volumes generated during construction of the Project are not expected to be significant. Refer to Chapter 22: Waste and Resource Management Section 22.3.3 for further detail.	Chapter 22: Waste and Resource Management Section 22.3.3 Appendix AA: Traffic Impact Assessment Table 4.2
145	145.0092	State Agency	Traffic and Transport	Construction traffic	The EIS states that material deficit for the project may be approximately 971,237 m3 and that this has not been included as a construction transportation activity. This surplus may be up to between 97,124 heavy vehicle movements (loaded and unloaded assuming truck and dog combination at maximum legal payload) and 268,958 heavy vehicle movements (loaded and unloaded assuming tandem truck type at maximum legal payload). While it is understood some or all of the spoil can be reused, it is unacceptable to not include the management of a substantial amount of spoil in the assessment of construction transportation activities.	Update the EIS to include a probable and conservative scenario including haulage of spoil. Alternatively, the Traffic Impact Assessment must be updated to include details of construction spoil when specific details are known. Amend Chapter 22 Outline Environmental Management Plan and Appendix Z Proponent Commitments to reflect this commitment.	As stated in Appendix AA: Traffic Impact Assessment, Section 5.12.1, Table 5.14 The horizontal and vertical alignment has been established to optimise the earthworks required and achieve as close to a net-balance as is possible. By minimising the material deficit for construction of the Project, the volume of material required to be imported has been reduced. Less imported material equates to fewer construction truck movements on public roads. Appendix AA: Traffic Impact Assessment, Table 4.1 provides the cut to fill and cut to spoil break down while the management of spoil and number of trips are provided in Table 4.2. Appendix AB: Earthworks Strategy and Draft Soil Management Plan of the revised draft EIS further detail spoil management for the Project. The mass haul quantities of fill and spoil have been estimated based on excavated volume of material, overlaid spatially and temporally across the Project. To generate a conservative number of heavy vehicle trips on the road network, a minimum of 10% of material excavated from each earthworks area has been allocated as spoil that cannot be reused and will need to be disposed of. A detailed assessment of material movement will form part of the mass haul assessment which will be carried out in the Detailed Design stage of the Project to determine the need for and viability of opportunities for material reuse.	Appendix AA: Traffic Impact Assessment Section 5.12.1 Table 5-14 Table 4-1 Table 4-2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan
145	145.0093	State Agency	Traffic and Transport		The statements about the performance criteria and TMRs GTIA are not correct. Nowhere in GTIA 2018 does it state such performance criteria. Similarly, Section 18.6.2.5 incorrectly suggests what GTIA 2018 considers minimum acceptable LOS values.	Update the EIS and TIA to be consistent with GTIA and use GTIA performance criteria.	Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA to indicate performance thresholds for assessment of traffic impact were developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a), GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017). This includes the 5% threshold provided from the GTIA and other acceptable LOS values provided in the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a) and DTMR Guidelines for Assessment of Road Impacts of Development (2017).	Appendix AA: Traffic Impact Assessment
145	145.0094	State Agency	Traffic and Transport		Table 18.6 identifies the impact type and impact assessment year(s) for the project in relation to the requirements of TMRs GTIA. For pavement, the Table states that the impact assessment year related to each year of construction plus year of opening of each stage including the final stage over a 20-year design period. However, the GTIA states that the mitigation of pavement impacts occurs for a period of 20 after the opening of the final stage.	Amend the EIS to correctly reference the requirements of the GTIA in relation to impact assessment year by type.	Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA to use assessment years including year of opening and 10 or 20 years post opening of each stage of the Project (varies between impact assessment type). However, it is envisaged the likely impact from the Operations stage of the Project, mainly from vehicles used for routine maintenance, would be negligible. As such, the operational years have not been considered in the pavement impact assessment including in the final stage over a 20-year design period due to the negligible impact anticipated. As per the GTIA, the PIA will be updated at the Detailed Design stage once the Construction contractor is appointed and the final construction methodology, transport routes and traffic generation is clearer and more certain.	Appendix AA: Traffic Impact Assessment
145	145.0095	State Agency	Traffic and Transport		The last box in Figure 18.5 says Prepare and finalise traffic impact assessment and road use Management Plan/infrastructure agreement if applicable with the asterisk noting that this is to be prior to project commencement. Many details will not be able to be finalised until after a Principal Construction Contractor is awarded. The definition of project commencement must be clearer and there needs to be a mechanism for updating the TIA once new information is available.	Update the EIS to define what project commencement means in the context of TIA and other road use agreements mean. Amend Chapter 22 Outline Environmental Management Plan and Appendix Z Proponent Commitments to reflect ARTCs commitment to update the TIA.	Appendix AA: Traffic Impact Assessment Section 6.2 states a commitment to draft and finalise a Road use Management Plan (RUMP) for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing.	Appendix AA: Traffic Impact Assessment Section 6.2
145	145.0096	State Agency	Traffic and Transport		Section 18.5.6 identifies long-distance coach services that are privately operated that use roads within the impact assessment area. Crisps Coaches runs a service from Moree to Toowoomba that travels along the Cunningham Highway from Goondiwindi to Ingleswood which intersects the proposed alignment where the project is located within the existing corridor.	Confirm and update the EIS as necessary to include the long-distance coach services provided by Crisps that travel from Moree to Toowoomba along the Cunningham Highway.	Appendix AA: Traffic Impact Assessment Section 2.10 details long distance coach services identified to overlap with the construction routes for the Project. This includes the service of Crisps Coaches between Toowoomba and Moree which is noted to interact with construction routes on the Cunningham Highway (Qld) and Newell Highway (NSW).	Appendix AA: Traffic Impact Assessment Section 2.10

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0097	State Agency	Traffic and Transport	Construction traffic	General construction activities are mostly during the day according to this section. It is probably worth indicating that another circumstance were night works will be required (in addition to the delivery of materials) are works to road where traffic volumes during the day do not permit lane closures without causing excessive delays.	Amend the EIS to include road works as another possible circumstance where works could occur outside the standard hours.	<p>Appendix AA: Traffic Impact Assessment, Section 4.1.1 discusses hours of work used for the TIA. The proposed hours of work for the Project are detailed in Section 5.6.2 of Chapter 5: Project Description in accordance with the DTMR's Transport Noise Management Code of Practice: Volume 2 – Construction Noise and Vibration. The proposed hours of work include primary construction hours of Monday to Sunday 6am to 6pm, and no work on public holidays.</p> <p>For the purpose of a conservative assessment, the TIA assumes a 12-hour work day across 22 working days/month. Construction-related traffic is assumed to be linearly distributed across the above work hours.</p> <p>Peak hour traffic volumes were derived from peak daily volumes using the following key assumptions:</p> <ul style="list-style-type: none"> Material delivery movements will be evenly distributed across the standard daily 12 hours of construction It has been assumed that two shifts will occur per day with 50 per cent of total staff working each shift. <p>Appendix AA: Traffic Impact Assessment Section 3.6.3 discusses road–rail interfaces that are newly created by the Project, as well as road closures associated with the Project, are listed in Table 3-12 where relevant changes have been made. It is unlikely that roads impacted by the Project will trigger night works due to their daily traffic volumes. The appointed contractor will design all traffic management measures during detailed design and construction, in consultation with the relevant road managers.</p>	Chapter 5: Project Description Section 5.6.2 Appendix AA: Traffic Impact Assessment Section 4.1.1 Section 3.6.3 Table 3-12
145	145.0098	State Agency	Traffic and Transport	Construction traffic	The project has potential to cause significant disruption to existing rail freight supply and logistics during the course of construction, particularly where online construction is undertaken. Traffic assumptions of the assessment do not address impacts specific to online construction of the project in that it involves displacing rail freight onto road for the duration of the construction work. There is a significant potential for disruption to rail freight including grains that displace rail freight on to road freight. The Traffic Impact Assessment does not consider this. It is unclear how TMR is engaged through this process, particularly where track possession are agreed and traffic assumptions are revised.	Update the EIS to detail traffic type and volumes that may be impacted or generated through the course of online construction methods.	<p>Appendix AA: Traffic Impact Assessment Section 4.2.12 explains routes have been identified for the diversion of materials which would otherwise be transported by rail, however, will be restricted in train movements during the construction of the Project. The following assumptions have been considered by ARTC for the construction of the rail line:</p> <ol style="list-style-type: none"> If the Project utilises the option of road freight for grain and other domestic products during the construction of the QR lines, then the track will be close between certain sections for the length of construction period. Sections of QR track that would be closed: <ul style="list-style-type: none"> a) South Western Line: Whetstone to Kildonan b) Millmerran Branch Line: Millmerran to Pittsworth Alternatively, the Project may elect to construct offline (physically separated from the existing track) through the brownfield corridors, under track closures and possessions. In doing so, the Project would not require the use of road freight for the transportation of grain and/or other domestic commodities. <p>For the purpose of the TIA, it has been conservatively assumed that the Project will require complete closure of the QR lines at the locations specified in Option 1, above. This option requires redirection of all items which would otherwise be travelling via rail, increasing the traffic movements on the road possibly substantially, particularly during peak harvest season.</p> <p>Appendix AA: Traffic Impact Assessment Section 3.2.3 reiterates the assumption for temporary possession of the existing rail corridors for the duration of construction.</p>	Appendix AA: Traffic Impact Assessment Section 4.2.12 Section 3.2.3 Table 4.1
145	145.0099	State Agency	Traffic and Transport	Construction traffic	The report suggests that online construction would result in the existing railway being nonoperational for periods and that alternative means of transportation will be required. Consultation with TMR will be required prior to this arrangement taking place. Depending on the length of time of the rail track closure and the resultant increase in the number of heavy vehicles using the road network, the TIA may have to be updated.	Update the EIS to include TMR as a potential party to any interface agreement. Amend Chapter 22 Outline Environmental Management Plan and Appendix Z Proponent Commitments to reflect this commitment.	Appendix AA: Traffic Impact Assessment Section 3.2.3 discusses the Projects interface with existing Queensland Rail Infrastructure. As part of ARTCs ongoing engagement with QR and DTMR, roles and responsibilities regarding the Rail Infrastructure Manager (RIM) obligations during Detailed Design, Construction Works and Operations stages will be clarified. Any necessary interface agreements with DTMR and QR will also be in place prior to the commencement of construction.	Appendix AA: Traffic Impact Assessment Section 3.2.3
145	145.0100	State Agency	Traffic and Transport		Section 18.6.1.2 is not clear as to the overall forecast daily rail freight traffic - including with existing traffic on the South Western Line and the Millmerran Branch Railway.	Update the EIS to clarify the existing and forecast rail freight traffic.	<p>Appendix AA: Traffic Impact Assessment, Section 2.13 provides a summary of existing rail movements along the South Western Line and Millmerran Branch Line, respectively. Queensland Rail have supplied ARTC with all train movements on the South Western Line and Millmerran Branch Line from January 2015 to May 2022. A representative year (2017) indicated a maximum of 50 monthly train movements (June 2017) and a minimum of five monthly train movements (September 2017). In the same year, the Millmerran Branch Line had a maximum of 19 train movements (August 2017) and a minimum of zero train movements (six of the twelve months).</p> <p>The overall forecast of daily rail freight traffic once Inland Rail becomes operational is provided in Section 3.4 and Section 5.9 of Appendix AA: Traffic Impact Assessment which indicates an annual average of about 14 train services per day during initial years of operation. This is likely to increase to an average of 20 trains per day in 2040, and up to 25 per day during peak operational periods.</p>	Appendix AA: Traffic Impact Assessment Section 2.13 Section 3.4 Section 5.9
145	145.0101	State Agency	Traffic and Transport	Level crossing	To give the reader a better understanding of the wait times at level crossings, Table 18.25 should be updated to include an estimated number of closures per day in certain years. For example, 101 second closure time, 30 times a day in 2030 and 40 times a day in 2040. Include both average number of closures per day and peak number of closures per day. This information is buried in the text but putting it in the Table will make it easier to read.	Update the EIS (including Table 18.25) to include number of closures at level crossing. This is in addition to TMRs other comments regarding the level crossings.	Table 5.69 in Section 5.9.3 of Appendix AA: Traffic Impact Assessment documents the total wait time per closure for all public active and passive level crossing locations along the Project alignment to determine the impacts of the operation of the level crossings on the road network. The analysis is as per the methodology outlined in Section 5.9.1.	Appendix AA: Traffic Impact Assessment Section 5.9.1 Section 5.9.3 Table 5.69
145	145.0102	State Agency	Traffic and Transport	Level crossing	Table 18.25 refers to vehicle wait times but is not considered to be an assessment of actual travel delay. The Table states total wait time per closure (seconds). In addition, it is unclear if wait times include a train at the more likely operational speed as opposed to the 115 km/h design speed, and the full period of advanced warning time and boom gate closure, where applicable. The EIS states delays at level crossings will, in most instances, be five seconds or less. However, SIDRA is not an indicator of average delays to travel time. The EIS does not consider the possibility of opposing trains passing a level crossing and the longest passing times. Road users are more likely to be non-compliant as waiting times increase in terms of frequency as well as duration. The assessment of travel delays should be more thoroughly explored and detailed to consider total wait times, delays caused, and at the likely operational speed in order to fully assess the delays both in terms of link delays and intersection delay proposed to be experienced over the at-grade level crossings of statecontrolled roads.	Revise and update the EIS and TIA to consider vehicle delays including in terms of total boom gate down time in minutes over a 24-hour period. Detail the longest anticipated closure period for simultaneously passing trains at the nominated operational speed. This is in addition to TMRs other comments regarding the level crossings.	<p>Appendix AA: Traffic Impact Assessment Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate The time it takes the train to cross the level crossing Design vehicle consisting of a B-double for input parameters. <p>Train speed and train clearance times (s) calculations and assumptions (as obtained from road-rail interface) for the level crossing are as follows:</p> <ul style="list-style-type: none"> Train clearance times were calculated based on an assumed maximum train speed of 115 km/h Calculation of the freight train acceleration rate Distance of the level crossing from passing loops Distance required to accelerate to maximum turnout speed (50 km/h) Distance travelled while at constant maximum turnout speed Distance required to accelerate to maximum speed after whole train has passed turnout Total distance required to reach maximum speed for train starting from turnout Total vehicles' wait time with train length of 1,800 m was estimated to be 104 seconds (including boom closure times). The wait times determined for each individual level crossing were calculated based on: <ul style="list-style-type: none"> Level crossing specific operating speeds which is impacted by topography and curvature of the alignment Time taken for the train to cross the level crossing Distance from train crossing loops Train length Summarise traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons, as per Appendix AA: Traffic Impact Assessment Section 2.4). A sensitivity test (to represent an upper level crossing time delay) has been undertaken based on a maximum train speed of 60 km/h (as opposed to up to 115 km/h) to highlight the variability in closure times. <p>Typical active level crossing sequence for boom gate down time is, after 11 seconds (t=11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (t=22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or Road trains), the delay before the booms commence lowering can be increased by a further 5 seconds to 16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F highway signals become extinguished.</p> <p>As part of the design process, the Project has considered aspects of longer train lengths to allow for future flexibility in use of the network. However, as stated in Section 5.2 of Chapter 5: Project Description, maximum train lengths assessed within the revised draft EIS is 1,800 m long.</p>	Chapter 5: Project Description Section 5.2 Appendix AA: Traffic Impact Assessment Section 2.4 Section 5.9.1
145	145.0103	State Agency	Traffic and Transport	Construction traffic	Table 18.27 lists a Section of Pittsworth-Felton Road as a Toowoomba Regional Council road. Pittsworth-Felton Road is a state-controlled road. The maps provided in Figure 18.3 are too small to be able to identify which sections of Pittsworth-Felton Road are intended to be used as construction routes. The TIA cannot be finalised until there is clarity on which sections of which roads are intended to be used for construction routes. The appropriateness of the road sections nominated to be used for construction routes has not been evaluated in detail. This will be done once a construction contractor is appointed and construction routes and heavy vehicle volumes are known with more certainty.	Update the EIS to ensure that the correct owner is identified for each of the road sections nominated to be used for construction routes.	Appendix AA: Traffic Impact Assessment has been updated to correct road names and ownership. Pittsworth-Felton Road is no longer referenced within the revised draft EIS.	Appendix AA: Traffic Impact Assessment
145	145.0104	State Agency	Traffic and Transport		The report lists Pittsworth-Tummalville Road as a state-controlled Road. TMR does not manage any road with that name.	Update the EIS to include correct road names and/or correct ownership (TMR or local government).	Appendix AA: Traffic Impact Assessment has been updated to correct road names and ownership. Pittsworth-Felton Road is no longer referenced within the revised draft EIS.	Appendix AA: Traffic Impact Assessment
145	145.0105	State Agency	Traffic and Transport	Road safety	The state-controlled road intersections identified as potentially requiring treatments based from the turn warrants safety assessment within the Traffic Impact Assessment is confirmed to not be based on intersection count data, but does not describe the source of data and detail the assumptions of traffic volumes that are made for the purposes of this assessment.	Clarify the source data adopted for the turn warrants assessments. Update the EIS to provide turn warrants assessment including base data and detail the traffic engineering assumptions, for all state-controlled road intersections of the haulage route that are proposed for any turning movements.	<p>Appendix AA: Traffic Impact Assessment Section 2.4 provides an overview of the traffic data collected and used for the purpose of determining intersection volumes (used for the turn warrants assessment) at SCR intersections and outlines the existing volumes for all intersections. As part of the traffic data collection task, traffic volumes have been collected along the Project construction routes over the recent years including:</p> <ul style="list-style-type: none"> SCR census-based traffic volumes Local Government databases Traffic signal data (from DTMR STREAMS software) Link-based traffic volumes tube counts conducted in: <ul style="list-style-type: none"> September 2019 September/October 2020 March 2021 March 2022. Intersection turning counts conducted in: <ul style="list-style-type: none"> March 2021, around Brookstead March 2022, for the wider network May 2022, for diversion locations. <p>In instances where traffic data was not available from road controlling authorities or traffic surveys conducted, conservative turning volume assumptions have been adopted using the available road link volumes. This methodology has been outlined in a technical memo to TMR which is provided in Appendix BP of Appendix AA: Traffic Impact Assessment. For the intersections where base traffic turning volumes were not available, the intersection assessment will be first undertaken by comparing two 'Base Traffic Scenarios' and then the 'worst case' scenario is considered for delay impacts.</p> <p>During detailed design, once the construction routes are finalised with a construction contractor, it is recommended that traffic counts be obtained for updating the traffic analysis where recent data (i.e. previous 5 years) is not available to accurately determine impacts of final Project alignment, construction program, methodology, routes and vehicle volumes.</p>	Appendix AA: Traffic Impact Assessment Section 2.4 Appendix BP
145	145.0106	State Agency	Traffic and Transport		In addition, the assessment does not identify the year from which existing volumes were determined and projected to the forecast year. It is unclear if and how the base year and assessed year is determined.	Note that any future detailed assessment for the impacted intersections should require detailed intersection counts.	Appendix AA: Traffic Impact Assessment Section 6.2 states ARTC commit 'any potential intersection upgrades will be developed in consultation with DTMR and local councils.' and commit to 'Consult with DTMR, councils and impacted property owners with regards to network connectivity and legal property access to properties prior to the commencement of any construction activities.'	Appendix AA: Traffic Impact Assessment Section 6.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0107	State Agency	Traffic and Transport		Where the consolidation of private accesses or the relocation of a private access results in a change to the State-controlled network, TMR are also to be consulted. Access to a statecontrolled road will generally need TMR approval.	Update Chapter 18 to confirm that any changes to the state-controlled road network shall require consultation with and approval from TMR.	<p>Section 3.6 of Appendix AA: Traffic Impact Assessment discusses crossing consolidation, relocation, diversion or realignment - existing road - rail interfaces may be closed, consolidated into fewer crossing points, relocated or diverted. Roads will be closed where the impact of diversions or consolidations is considered acceptable, or where the existing location is not considered safe and cannot reasonably be made safe. Approval for closures, where required, will be progressed in accordance with the requirements of the relevant legislation.</p> <p>Section 6.2 of Appendix AA: Traffic Impact Assessment contains a summary of commitments by ARTC and the Contractor outlined within Appendix AA: Traffic Impact Assessment. Commitments including:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersection ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 6.2</p>
145	145.0108	State Agency	Traffic and Transport	Level crossing	Pedestrian activity should be anticipated in all towns and connectivity is to be maintained. Although there are no dedicated pedestrian level crossings (which is presumed to mean affirmed footpath crossing), all level crossings within towns should ensure that pedestrians (and cyclists) can use the crossing in a safe way.	Update the EIS to include assess active transport needs at level crossings within towns.	<p>Further assessment of the feasibility of separate pedestrian access has been undertaken as a part of the revised reference design and summarised within Appendix AA: Traffic Impact Assessment. The revised reference design proposal consists of a grade separated road-over-rail crossing (310-11-E-0), where Cunningham Highway crosses the rail corridor approximately 400 m further west of the existing level crossing that is proposed for closure (310-11-E-1). A dedicated active pedestrian level crossing has been added at the existing Cunningham Highway interface location (310-11-E-1) to enable pedestrian movement north/south of the Yelarbon township.</p> <p>ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities, where the need for that facility remains in a Third Party Agreement with local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design.</p> <p>Appendix AA: Traffic Impact Assessment, Section 3.7.2 discusses the Yelarbon pedestrian crossing facilities assessment in detail.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7.2</p>
145	145.0109	State Agency	Traffic and Transport	Level crossing	Table 18.37 under Road-rail interfaces says that Grade-separated crossings of existing roads have been adopted instead of level crossings, where possible.	Update the EIS to accurately reflect the reasons for not grade-separating all crossings and also include commentary that crossing locations are still being negotiated with relevant road authorities. This is in addition to TMRs other comments regarding the level crossings.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>In response to the above, ARTC have updated the revised draft EIS Appendix AA: Traffic Impact Assessment with sub-Appendix BT Public level crossing treatment methodology. This is intended to provide Agencies and the Community with further transparency on the design process undertaken. Noting all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Border to Gowrie.</p> <p>For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Appendix BT</p>
145	145.0110	State Agency	Traffic and Transport		Table 18.37 under Bridges states that Maintenance access to the deck level of all new structures has been incorporated into the design. It is unclear if this is for road over rail bridges as well.	Verify that all new structures include both rail over road and road over rail bridges. Amend the EIS accordingly.	Maintenance access to the deck level of all new bridge structures (including road-over-rail bridges) has been incorporated into the design. Bridge clearances have been established in consultation with the owners of existing assets over which the bridge structures span (i.e., DTMR, local councils and private landowners). Section 5.12 of Appendix AA: Traffic Impact Assessment further details mitigations incorporated into the revised reference design.	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.12</p>
145	145.0111	State Agency	Traffic and Transport	Cumulative impacts	Table 18.40 lists projects included in the traffic and transport cumulative impact assessment. Only Gowrie to Helidon (G2H) has been included. Until such time as construction routes for all Inland Rail projects have been finalised, the cumulative impact assessments cannot be fully assessed. There may be overlap between other Inland Rail project sections as well (for example, Helidon to Calvert (H2C), Calvert to Kagaru (C2K) and Kagaru to Acacia Ridge and Bromelton (K2ARB)).	It is recommended that the report be updated to note that further projects may be included in the cumulative impact assessment once there is more certainty on construction routes for all Inland Rail projects.	<p>Road controlling authorities, local councils, impacted stakeholders and the community have had the opportunity to comment on the draft EIS through the public consultation and submission process which ran between 23 January 2021 and 4 May 2021. ARTC engaged with stakeholders and community members to support the public consultation process and encourage formal submissions regarding the draft EIS.</p> <p>Responses were formulated for all submissions and, where relevant, updates were made to the revised draft EIS document, including within Appendix AA: Traffic Impact Assessment, following review of these submissions. The submissions and formulated responses can be found in revised draft EIS Appendix A1: Revised draft EIS Response to Submissions.</p> <p>A key outcome of the discussions with the Office of Coordinator-General was the preparation of four technical memos for Coordinator-General approval prior to their use for investigation and analysis for TIA for the revised draft EIS, including Base Traffic Data, Road Safety, Cumulative Impact Assessment, and Pavement Impact Assessment. The methodology technical notes were prepared to align with relevant TIA related processes within DTMR's GTIA and PIA and assumptions were outlined where required. The Cumulative Impact Assessment methodology note is provided in Appendix BR of Appendix AA: Traffic Impact Assessment.</p> <p>The quantitative cumulative impact assessment has been undertaken considering the complete Inland Rail construction from North Star to Border Project to Kagaru to Acacia Ridge/Bromelton Project. The traffic, transport and access impact study area considers the overlap of other Inland Rail packages with the Projects proposed construction routes across the complete construction timeframe over the six packages and considers available traffic volume information for the construction activities.</p> <p>The methodology adopted to determine the cumulative impact is summarised in Chapter 23: Cumulative Impact Assessment, Section 23.2 and 23.3.13, which provides an example of where the Project impact assessment area has been overlayed temporally and spatially with Inland Rails Border to Gowrie Project, North Star to Border Project, Gowrie to Helidon project, Helidon to Calvert project, Calvert to Kagaru and Kagaru to Acacia Ridge/Bromelton Project construction volumes. The next step was to undertake the 5 per cent comparison of road link traffic volumes to identify any links where cumulative volumes exceed the Project's volumes and undertake appropriate impact assessment to identify required mitigation measures.</p> <p>The detailed results of the cumulative traffic impact assessment are presented in Appendix AA: Traffic Impact Assessment Section 5.11.</p>	<p>Chapter 23: Cumulative Impact Assessment</p> <p>Section 23.2</p> <p>Section 23.3.13</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.11</p> <p>Appendix BR</p> <p>Appendix A1: Revised draft EIS Response to Submissions</p>
145	145.0112	State Agency	Traffic and Transport	Construction traffic	Conclusion states that Further road-specific analysis, presented in Appendix X: Traffic Impact Assessment, indicates that the state-controlled road segments located in Queensland and NSW would have minimal pavement impact given the duration of construction activities and pavement loading. This statement is misleading as high loading over short durations can still have impacts on pavements that certainly shouldn't be classed as 'minimal'.	Update the EIS so that it does not minimise (or downplay) the potential for pavement impacts.	<p>The pavement impact assessment and road safety assessment has been updated in accordance with GTIA requirements and is documented in Section 5.2 and 5.6 of Appendix AA: Traffic Impact Assessment.</p> <p>ARTC will continue to engage with TMR and other road controlling authorities through the subsequent stages of the project</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2</p> <p>Section 5.6</p>
145	145.0113	State Agency	Traffic and Transport	Level crossing	<p>Table 18.11 indicates the location and level of safety controls at the existing railway level crossings. There are 3 existing state-controlled road level crossings as noted below:</p> <ul style="list-style-type: none"> ▶ 310-11-E-1 Cunningham Highway (Wondalli Street) " active railway level crossing (crossing ID: 1089) ▶ 310-40-E-2 Millmerran-Leyburn Road " passive railway level crossing (crossing ID: 2639) ▶ 310-44-E-2 Gore Highway " active railway level crossing (crossing ID: 682). <p>Section 18.6.1.2 notes an ALCAM assessment has been undertaken for existing and proposed railway level crossings and that ARTC will continue to consult with DTMR and local governments on the preferred road-rail interfaces. The existing state-controlled road level crossings will be upgraded as below:</p> <ul style="list-style-type: none"> ▶ 310-11-P-0 Cunningham Highway (Wondalli Street) - existing active level crossing and will be relocated east via a proposed grade separated railway crossing (road over rail) ▶ 310-40-E-2 Millmerran-Leyburn Road " existing passive level crossing will be upgrade to an active level crossing ▶ 310-44-E-2 Gore Highway " existing level crossing upgrade to a new grade separated crossing (road over rail) 	<p>The EIS, TIA and supporting documents should be amended to illustrate how the proposed treatments to the existing State-controlled road level crossings will comply with PO20 and PO24 of the State Code 2: Development in a Railway Environment, PO7 to PO9 of the State Code 6: Protection of state transport networks of the State Development Assessment Provisions and Section 2.2 of the Guide to Development in a Transport Environment: Rail for all existing impacted railway level crossings.</p>	<p>The revised draft EIS, Chapter 20: Traffic, Transport and Access, and Appendix AA: Traffic Impact Assessment have been undertaken in accordance with State Government requirements, including transport planning frameworks, policies, plans and guidelines listed within Chapter 20: Traffic, Transport and Access, Table 20.1. The State Planning Policy 2017 is specifically referenced, which governs the State Assessment and Referral Agency (SARA) State Development Assessment Provisions (SDAPs) which include the State Code 2: Development in a railway environment, and State Code 6: Protection of state transport networks. The Project Traffic Impact Assessment has been completed in accordance with the Guide to Traffic Impact Assessment (GTIA) to meet the requirements addressed within the SDAP.</p> <p>ARTC can confirm the revised draft EIS Appendix AA: Traffic Impact Assessment has assessed any existing level crossings within an impact assessment area in accordance with GTIA Section 14 and DTMR Guide to Development in a Transport Environment: Rail, refer to Appendix AA: Traffic Impact Assessment Section 5.8 for details.</p>	<p>Chapter 20: Traffic, Transport and Access</p> <p>Table 20.1</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.8</p>
145	145.0114	State Agency	Traffic and Transport		Section 18.5.4 indicates that the project alignment traverses several public transport routes, while Table 18.36 identifies the school bus services that are likely to be impacted by construction and/or operational traffic. If the construction of the project necessitates temporary bus stop and pedestrian access arrangements and/or alternative bus routes, ARTC will need to reach agreement on those arrangements with TMRs TransLink division. Although the draft Outline Environmental Management Plan references the need for the Detail Design phase to acknowledge and consider public transport and bus routes, it is unclear if the EIS references the requirement to obtain TMR TransLink divisions agreement.	Amend Chapter 18 Traffic, Transport and Access to include If any temporary bus stop and pedestrian access arrangements or alternative bus routes are required when construction routes are finalised, the Proponent must reach agreement on suitable arrangements with the Department of Transport and Main Roads TransLink Division (bus_stops@translink.com.au or on 3851 8700) prior to any construction or works commencing and The school bus routes identified in Figure 18.36 and the bus stops and pedestrian access to these stops must be maintained during construction of the development. Accordingly, if any temporary bus stop and pedestrian access arrangements or alternative bus routes are required when construction routes are finalised, the Proponent must reach agreement on suitable arrangements with the Department of Transport and Main Roads TransLink Division (bus_stops@translink.com.au or on 3851 8700) and/or bus operator (whichever is relevant) prior to any construction or works commencing. Amend Chapter 22 Outline Environmental Management Plan and Appendix Z Proponent Commitments to reflect this requirement.	<p>The disruption to bus routes located near the alignment are likely to be during construction of the Project.</p> <p>Construction traffic on known school bus routes, or routes with significant cyclist or pedestrian activity will be restricted during pick-up and set-down times on school days, or peak active transport periods.</p> <p>Further measures may include measures such as signage or protection on construction routes with a high proportion of cyclists or pedestrians, employing contractor driver briefings on safe driving to avoid active transport users and community notifications.</p> <p>Once a construction contractor is appointed, construction routes and vehicle numbers are finalised, specific measures to mitigate impacts to active transport users will be required to be developed for the construction routes on a case-by-case basis. This is to minimise construction vehicles through areas of higher pedestrian or cyclists' activity, such as schools or town centres, in peak periods will reduce the impact and potential safety issues (Section 5.2, Appendix AA: Traffic Impact Assessment).</p> <p>In addition to identifying impact mitigation measures in a TIA for all applications, major developments must generally submit a road-use management plan (RUMP). The purpose of the RUMP is to detail how road impacts of Project traffic, particularly from HV use, will be avoided or managed during the life of the Project using road-use management strategies that are verifiable. The RUMP is detailed further in Section 5.12.3 of Appendix AA: Traffic Impact Assessment. The Contractor will use DTMR Guideline for Preparing a Road Use Management Plan and the Traffic and Road Use Management Manual for guidance and as a source of reference for preparing a RUMP. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing, to ensure management measures to minimise the potential impacts on the transport network are implements and mechanisms are in place to manage these impacts into the future.</p> <p>Given that the school bus routes summarised in Table 5.114 (of Section 5.10.4 Appendix AA: Traffic Impact Assessment) do not tend to have designated bus stops, apart from the termini, prior to the Construction Works stage of the Project, suitable mitigation measures for all of the affected services, including the location of bus stops, should be identified in consultation with bus operators, local councils,</p> <p>impacted schools, Department of Education and the local community and be documented in the TMP to ensure school bus safety and understand any impacts to journey times, if any.</p> <p>It is expected that school bus services would not be substantially impacted from an operational and service reliability perspective as a result of the Project generated traffic during the Project construction. However, the construction contractor should avoid school bus services and school zones, with school zones and routes considered in the preparation of the CEMP, as discussed in Section 5.12.1 Appendix AA: Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2</p> <p>Section 5.10.4</p> <p>Section 5.12.1</p> <p>Table 5.114</p>
145	145.0115	State Agency	Traffic and Transport		The department notes that there are adjoining interfaces with roads, including statecontrolled roads, at some sections of the Inland Rail alignment. The road and rail interface includes any Section of the Inland Rail alignment that abuts, and not necessarily crosses over, a road. The associated risks for construction and operations near state-controlled roads is not considered. For example, the risks associated with direct vehicular access including uncontrolled vehicular access to the road corridor during construction or operations, and the proposed mitigation measures are not detailed in the EIS.	The hazard and risk Chapter provides little guidance as to details on the safeguards that would reduce the likelihood and severity of hazards, consequences and risks to persons, within and adjacent to the project area(s) that are close to state-controlled roads, and in particular through construction and operational stages. Update the EIS to thoroughly consider hazard and risks associated with railway and construction activity adjoining road.	<p>The Project traffic access to the alignment corridor is through controlled vehicle access points to the road corridor during Construction Works and Operations stages. The EIS has been developed with a number of assumptions around the construction process, that will be developed further through Detailed Design and Construction Works stages of the Project.</p> <p>Once a construction contractor is appointed, the construction contractor will develop the Road Use Management Plan (RUMP) and the Traffic Management Plan in order to temporarily mitigate construction related traffic impacts. The construction contractor will be required to undertake risk assessments when preparing appropriate TMP and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and DTMR's specification "MRTS02 – Provision for traffic" requirements. See Chapter 20: Traffic, Transport and Access for details regarding traffic management and road use management controls.</p> <p>As a part of the construction process, consultation between the construction contractor, ARTC, local councils and DTMR regarding the provision of road impact assessments and road safety audits for all impacted LGRs and SCR will be required.</p> <p>Additionally, the contractor will be required to commit to delivering appropriate mitigation measures (which have been agreed by the relevant road authorities) which address all identified road operation and safety matters and issues. Ongoing consultation will ensure directly impacted stakeholders are involved in developing the road safety mitigations.</p>	<p>Chapter 20: Traffic, Transport and Access</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0116	State Agency	Traffic and Transport	Level crossing	The EIS states that for road-rail interfaces: Where grade separation has not been feasible, the design has been developed in accordance with ARTC Engineering Code of Practice 'Level Crossings' (ARTC, 2011). Level crossings have been subject to safe design studies and risk assessments in accordance with ALCAM to identify and reduce, as far as practicable, the potential risks with these crossings. Consistent with TMRs requirements for state-controlled roads, the road safety audits are to be undertaken. These road safety audits may identify other or additional physical controls that will be considered necessary.	Update Table 19.11 of the EIS to ensure it is consistent with TMRs requirements for rail interfaces with State-controlled roads. Note that on routes approved for use by type 1 road trains, investigations should include determining if any particular safety requirements need to be incorporated into the operation of the flashing lights e.g. longer pre-warning times and sight distances to the signals, allowance for greater safe stopping distances by advanced active warning signs. This is in addition to TMR's other comments on railway level crossings.	<p>The road safety assessment presented within the TIA has been undertaken as per the framework laid out in GTIA Part C Section 9. This framework relies on the principle that a road's safety is not significantly worsened as a result of the Project and that any pre-existing or Project -introduced unacceptable safety risk is addressed.</p> <p>The GTIA acknowledges that safety is not readily quantifiable and may require scoring based on expert opinion on the changes to likelihood and/or consequence of a risk being realised. This road safety impact assessment has the following aims in accordance with the Project's TIA – Road Safety Methodology Technical Memo which was agreed with DTMR in November 2022 (Appendix BS of Appendix AA: Traffic Impact Assessment).</p> <p>A safety risk assessment based on existing crash history has been undertaken along the Project construction traffic routes and road-rail interface locations for the following scenarios:</p> <ul style="list-style-type: none"> ▶ 'Without' Project ▶ 'With' Project ▶ 'With' Project and with mitigation measures (required only if the score in the with Project situation is higher than in the without Project situation, or if the without Project score is in the 'high' category). <p>Appendix AA: Traffic Impact Assessment, Section 5.12 provides whole of Project mitigation measures suggested for the Detailed Design and Construction Works stages, which include items such as construction traffic management plans, road use management plans, and non-infrastructure based mitigation measures.</p> <p>Appendix AA: Traffic Impact Assessment, Section 6.1 provides a summary of the intersections, road links and road-rail interfaces requiring mitigation as per the GTIA Part C Section 9 framework. The detailed road safety assessments are contained in Appendix AN, AO AP and AQ of Appendix AA: Traffic Impact Assessment for intersections, road links, road-rail interfaces (construction), and road-rail interfaces (operation) respectively.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.9 details level crossing impact assessment and mitigation - operation, which includes assessment of vehicle wait times. Table 5.111 summarises the road-rail interface mitigation measures.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.9</p> <p>Section 5.12</p> <p>Section 6.1</p> <p>Table 5.111</p> <p>Appendix AN</p> <p>Appendix AO</p> <p>Appendix AP</p> <p>Appendix AQ</p> <p>Appendix BS</p>
145	145.0117	State Agency	Land Resources	Survey effort/field investigation data	The proposed scale of soil mapping is considered excessive and not necessary. The TMR Soil Group Classifications Map provided in virtual document pool for tenderers should be referenced and used to minimise the frequency (scale) of sampling and to target soil sampling to ground-truth the boundaries of the TMR Soil Group mapped boundaries.	It is recommended ARTC use TMR's Soil Group mapped boundaries to minimise the frequency (scale) of sampling. Update the EIS accordingly.	<p>ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at 1:10,000 scale in consultation with DoR. Soil management units from the investigation are provided in Section 4.5. This level of investigation is sufficient to allow determination of the suitability of the soils and to manage the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps.</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides general and site-specific soil management measures in Section 3.2 and Section 3.3 respectively.</p>	<p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan</p> <p>Section 3.2</p> <p>Section 3.3</p> <p>Appendix J: Soil Assessment Report</p> <p>Section 4.5</p> <p>Figure 3.16</p>
145	145.0118	State Agency	Hazard and Risk		A bushfire may be of 'High' consequence rather than Moderate through a high fire risk dry season.	Clarify and update the EIS to ensure that the residual risk with the mitigation strategies proposed through a high-risk seasonal period does not remain to be 'High'.	As detailed in Chapter 21: Hazard and Risk, Table 21-16, during Construction, hot works and other activities that may act as a source of ignition will be restricted during periods with a BoM fire danger rating of 'extreme' or higher to reduce the likelihood of construction activities initiating or exacerbating a bushfire. If hot works or other high fire-risk activities are required during periods of elevated fire danger, these works will be planned in accordance with ARTC's Total Fire Bans Procedure (ETM-13-01) (ARTC, 2020b). Such works may require a permit (e.g. permit to light fire), issued by QFES. Bushfire prevention and response procedures will also be incorporated into the CEMP to reduce the likelihood and impact of bushfires ignited or exacerbated by the Project. During operations of the project existing ARTC management plans and codes of practice, including the Fire Prevention Management Procedure will be applied to the operation of the Inland Rail network, including this Project, to reduce the likelihood of ignition or exacerbation of bushfire.	Chapter 21: Hazard and Risk Table 21-16
145	145.0119	State Agency	Waste and Resource Management	Construction waste	Under the Waste Reduction and Recycling Act 2011 (WRRRA), TMR is required to report annually on the volumes of waste generated, reused, recycled and disposed to landfill. TMR is expected to contribute to the Queensland Government's waste reduction targets and report how this is being achieved. The EIS does not clarify whether the contractors will be reporting on waste generated from their construction sites.	Amend the EIS to clarify whether contractors will conduct monthly reporting on waste as per MRTS 51 requirements.	<p>Conformance with MRTSS1 will only apply for Department of Transport and Main Roads (TMR) assets that will be constructed and/or affected by the Project. Project elements that are not related to TMR assets will be conditioned appropriately and is at the discretion of the regulatory authority, not TMR.</p> <p>Chapter 22: Waster and Resource Management, Table 22-9 has included, as a mitigation measure for waste management, that during the Construction Works stage recorded waste generation and disposal data is to be reported as a component of monthly construction environmental reporting.</p>	Chapter 22: Waste and Resource Management Table 22-9
145	145.0120	State Agency	Project scope	Cumulative impacts	Cumulative impacts are defined as upstream and downstream, not just immediately adjacent. The assessment has only considered Gowrie to Helidon (G2H) in most impacts. Helidon to Calvert (H2C) and Calvert to Kagaru (C2K) also need to be considered, since they will impact on many different factors in the region.	The entire Inland Rail program within Queensland needs to be considered as a holistic operation to fully appreciate the impacts it will have. Amend the EIS and cumulative impact assessment to consider the whole program of Inland Rail works in Qld, not just projects immediately adjacent to the Border to Gowrie (B2G) section	Chapter 23: Cumulative Impacts, Table 23-8 lists projects included in the cumulative impact assessment for each specific matter and maximum overall cumulative impact significance. This includes Helidon to Calvert and Calvert to Kagaru.	Chapter 23: Cumulative Impacts Table 23-8
145	145.0121	State Agency	Project scope	Cumulative impacts	Section 6.1.9 and Table 6.2 lists projects included in the cumulative impact assessment and focuses on the Priority Development Areas, State Development Areas, and some EIS, but does not discuss and potentially omits any other significant developments approved under other legislation.	Update the Cumulative Impact Assessment of the EIS to consider any other permitted developments that may be of relevance. Update any other related technical assessments accordingly.	<p>Chapter 23: Cumulative Impacts, Section 23.2.6 states that 26 projects have been identified for preliminary consideration for their potential to contribute to cumulative impacts, in combination with the Project. These projects are listed in Table 23-6 and shown on Figure 23-1.</p> <p>The list of projects for consideration in the cumulative impact assessment was collated with timelines to demonstrate the temporal relationship between projects (Table 23-6) and through a consideration of the following:</p> <ul style="list-style-type: none"> ▶ Projects subject to assessment under the Environmental Protection Act 1994 (Qld) (EP Act) or the State Development and Public Works Organisation Act 1971 (Qld) (SDPWO Act) with an Initial Advice Statement (IAS) published by the Department of Environment and Science (DES). ▶ Projects listed in Goondiwindi Regional Council (GRC) and Toowoomba Regional Council (TRC) development application databases ▶ Development within Priority Development Areas and State Development Areas ▶ Economic Development Queensland (EDQ) development projects ▶ Community infrastructure designation projects ▶ Projects within the public register of environmental authorities ▶ Department of Transport and Main Roads (DTMR) infrastructure projects ▶ Private infrastructure facilities ▶ Development in accordance with regional planning interests ▶ Inland Rail projects immediately adjacent to the Project: <ul style="list-style-type: none"> ▶ North Star to NSW/QLD border Project ▶ Gowrie to Helidon Project. ▶ Other Queensland based Inland Rail Projects <ul style="list-style-type: none"> ▶ Helidon to Calvert ▶ Calvert to Kagaru ▶ Kagaru to Acacia Ridge and Bromelton <p>The preliminary list of projects was further assessed to identify those that meet at least one of the following criteria:</p> <ul style="list-style-type: none"> ▶ Projects that have been approved but where construction has not commenced ▶ Projects that have commenced construction, subsequent to issuance of the Terms of Reference for the Project, but have potential for overlap in construction activities with the Project ▶ Projects that have been completed, subsequent to issuance of the ToR for the Project ▶ Are operational developments that have future plans for expansion. <p>Projects that were excluded from further assessment were:</p> <ul style="list-style-type: none"> ▶ Existing projects with no known plans for expansion. Such projects are typically considered part of the 'existing environment' and have been accounted for in the impact assessment of each specific matter. Exceptions to this, where they occur, have been included in Section 23.2. ▶ Proposed projects that have not been developed to the point that details of their scale, size, location and core activities would be publicly available. <p>Chapter 23: Cumulative Impacts, Table 23-8 lists that projects have been included in the cumulative impact assessment for each specific matter and maximum overall cumulative impact significance.</p>	Chapter 23: Cumulative Impacts Section 23.2 Figure 23.1 Table 23.6 Table 23.8
145	145.0122	State Agency	Project scope	Cumulative impacts	Projects included in the cumulative impact assessment do not include projects of the Inland Rail programme and is stated to only consider the directly adjoining North Star to Border (NS2B) and Gowrie to Helidon (G2H) sections. The cumulative impact assessment must include all projects of the Inland Rail programme. It is anticipated there will be overlaps and cumulative impacts in some of the technical reports and these are required to be considered.	Update the Cumulative Impact Assessment of the EIS to include whole program of Inland Rail works in Qld, not just projects immediately adjacent to the Border to Gowrie (B2G) section. Update any other related technical assessments accordingly.	Chapter 23: Cumulative Impacts includes consideration of all Inland Rail works in Queensland as seen in Table 23-6: Preliminary list of projects for consideration in the cumulative impact assessment and Table 23-8: Projects included in the cumulative impact assessment for each specific matter and maximum overall cumulative impact significance.	Chapter 23: Cumulative Impacts Table 23-6 Table 23-8
145	145.0123	State Agency	Outline EMP		There appears to be a few deviations between the EIS and reference alignment. The EIS does not discuss how the impacts of the deviations will be assessed regarding environmental impacts, flora/fauna, noise issues and so on, and who will be managing those changes.	Amend the EIS to discuss how the deviations will be assessed regarding environmental impacts, flora/fauna, noise issues and so on, and who will be managing those changes (the process).	<p>As discussed in Chapter 24: Draft Outline Environmental Management Plan, changes to the Project footprint are not anticipated, however during detailed design the alignment will be refined. Should development of the revised reference design lead to changes in the Project footprint, the Proponent will apply to the Coordinator-General to consider a request for Project change. The Coordinator-General may accept the proposed change to the Project footprint, and may impose further conditions or revised conditions as required by the nature of the proposed change and the likely impacts of the change.</p> <p>The Coordinator-General's conditions will be addressed through the finalised Outline Environmental Management Plan and the Construction EMP endorsed by the Environmental Monitor (see Chapter 24: Draft Outline Environmental Management Plan for detail scope for CEMP Plans). Prior to commencement of Construction, the Environmental Monitor is required to review and endorse these EMPs to ensure compliance.</p> <p>The Environmental Monitor will be required to maintain a current version of the Final Outline Environmental Management Plan and the Construction EMP. Both the Operations Environment Management Plan and the CEMP may require revision to address the effects of a change to the Project footprint that has been accepted by the Coordinator-General.</p> <p>Mitigations measures to be included in the revised and endorsed CEMP must address the environmental outcomes established in the Final Outline Environmental Management Plan and the matters addressed in the Coordinator-General's revised conditions. Such matters would likely include requirements pertaining to impacts on acoustic values, air quality values, flora and fauna values, groundwater and surface water values, and land resources. These aspects are addressed in Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0124	State Agency	Outline EMP		This Section of the EIS only discusses the Construction stage. Prior work should also be included for reporting purposes. Prior works will include the required permits and approvals, results from fauna spotter investigations as well as erosion and sediment control installation and failures. These issues (including others not mentioned) should be reported on a monthly basis.	Update the EIS to provide information about the works, investigations and approvals taking place prior to the Construction stage. These should be reported on monthly. Update the draft Outline Environmental Management Plan to reflect this requirement.	<p>The scale and complexity of the construction of the Project requires commencement of Pre-Construction Activities and Early Works packages in advance of the Construction Works stage. The Draft Outline Environmental Management Plan provides for the progressive development of environmental management measures, through the finalised Outline Environmental Management Plan and progressive development of the Construction EMP. The progressive development of the Construction EMP will provide a comprehensive management and reporting framework that addresses the Pre-Construction Activities and Early Works stages specifically. The overarching Construction EMP will continue to evolve in line with design development, detailed construction planning and adaptive management requirements.</p> <p>Environmental monitoring programs and reporting will be developed and undertaken for Pre-Construction Activities and Early Works and Construction Works stages of the Project. The monitoring programs will assess the compliance of the Project with the Construction Environmental Management Plan (CEMP) and determine the effectiveness of mitigation measures. Where required, ARTC will also conduct operational monitoring to ensure commitments in the revised draft EIS are adequately addressed. Inspections, monitoring and reporting will be undertaken to document compliance with imposed conditions, the CEMP and the Operation Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan). Construction compliance reporting will be prepared periodically by ARTC and completed through the Project database system.</p> <p>The CEMP provides the direction for the Project to meet statutory requirements for construction activities. The CEMP must be endorsed by the Environmental Monitor as being consistent with the Draft Outline Environmental Management Plan, Legislation requirements and conditions of approval, and provided to the Coordinator-General prior to the commencement of any relevant Project works (see Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0125	State Agency	Outline EMP		The EIS states that some works will be occurring 24 hours a day, 7 days a week. This may not accurately reflect the actual working hours because while these may be the desired working hours, individual permits and approvals may alter these times.	Amend the EIS to reflection that the hours of works are subject to permits and other restrictions and therefore may be less than 24 hours a day, 7 days a week.	<p>The construction working hours are determined by the requirement to manage potential disruption to the community, particularly from noise. The Department of Transport and Main Roads Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration provides a management framework for standard and non-standard hours for construction work, as detailed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Chapter 24: Draft Outline Environmental Management Plan details primary construction hours which have been established to minimise the length of construction as far as practicable and minimise the potential impacts to the community. Standard construction hours will be as follows:</p> <ul style="list-style-type: none"> Monday to Friday 7. 00 am to 6. 00 pm Saturday 8. 00 am to 1. 00 pm <p>Non-standard hours (day/evening) requiring specific construction mitigation measures will be:</p> <ul style="list-style-type: none"> Monday - Friday 6:00pm - 10pm Saturday 1:00pm - 10:00pm and Sunday 7:00am - 10:00pm <p>Non-standard hours (night time) requiring additional specific construction mitigation measures will be:</p> <ul style="list-style-type: none"> Monday - Sunday 10. 00pm to 7. 00 am <p>There will be no work on public holidays.</p> <p>Where construction planning requires works to be undertaken outside of the standard construction hours, such works will be subject to specific measures to manage and mitigate impacts associated with noise and vibration.</p> <p>Planning of construction activities for non-standard hours would include consultation with the owners and occupants of directly affected properties, the local community and stakeholders to inform of the proposed works, any anticipated impacts and the measures implemented to control possible impacts.</p> <p>Where works are planned for remote areas or areas well removed from sensitive receptors, the Construction EMP will allow for continuous (24/7) construction, with monitoring and the complaints process to support the program.</p> <p>The CEMP will provide for a complaints mechanism to ensure the environmental outcomes are being achieved. The handling and responses to complaints received will be reported in the periodic environmental reports to be provided to the Environmental Monitor and posted on the Project website. Such reporting will also describe any corrective actions taken and the implementation of adaptive management measures. This process is described in the Draft Outline Environmental Management Plan and will be carried forward into the finalised Outline Environmental Management Plan and endorsed CEMP.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0126	State Agency	Outline EMP		TMR's Fauna Sensitive Road Design Manual (2000) is referred to in the fauna movement section. The Fauna Sensitive Road Design Manual (2000) is currently being revised with input from numerous major projects.	ARTC should contact TMR for latest information relating to fauna movement to assist in the detailed design stage.	ARTC notes the Fauna Sensitive Road Design Manual (2000) is currently being revised. The current version at the time will be used during the Detailed Design stage and will be addressed in the development of the Wildlife Connectivity Plan as discussed in Chapter 24: Draft Environmental Management Plan.	Chapter 24: Draft Environmental Management Plan
145	145.0127	State Agency	Outline EMP		<p>Erosion and sediment control should be dealt with through a separate Erosion and Sediment Control not just Section 22.11.2. The plan must:</p> <ul style="list-style-type: none"> be an approved plan prior to preconstruction activities occur for all preconstruction activities be installed prior to all clearing activities require sediment basins to be decommissioned once the site is stable must have a management plans for ongoing maintenance and safety of permanent sediment basins/bioretention basins 	Amend the Outline Environment Management Plan to ensure these requirements are met.	<p>Chapter 24: Draft Outline Environmental Management Plan, provides for the inclusion of an Erosion and Sediment Control Plan (ESCP). The ESCP will be developed as a component of the Construction Environmental Management Plan (CEMP) and will guide development of specific ESCPs and include detailed erosion hazard assessments and erosion and sediment control structure designs.</p> <p>The CEMP will be developed progressively to support the Project works through the Pre-Construction Activities and Early Works stage, as well as through the Construction Works stage. The CEMP must be endorsed by the Environmental Monitor as being consistent with the Finalised Outline EMP, Legislation requirements and conditions of approval prior to the commencement of any relevant Project works (Section 24.1).</p> <p>As stated in Chapter 24: Draft Outline Environmental Management Plan, an ESCP will be developed for each worksite or work area, including areas required for temporary works. Each ESCP will include measures to manage the extent of exposed surfaces, overland flows, erosion, scouring and sediment movement, and water quality management. Each ESCP will also provide for sediment basins to be decommissioned once the site is stable and will include a management plan for ongoing maintenance and safety of permanent sediment basins and bioretention basins.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0128	State Agency	Outline EMP		TMR is expecting to finalise the USQ Fauna Movement Study on the Toowoomba Bypass in July 2021. It is a 12-month study looking at the effectiveness of dedicated fauna movement structures, drainage culverts and bridge structures in the movement of fauna from one side of the road reserve to the other. This information will be pertinent to the environmental and design teams at ARTC during the detailed design stage.	Contact TMR for the latest information relating to fauna movement to assist in the detailed design stage.	<p>ARTC have developed Appendix P: Fauna Connectivity Strategy which assess the effectiveness of dedicated fauna movement structures, drainage culverts and bridge structures in the movement of fauna from one side of the rail to the other which has incorporated the results of multiple assessments and the Department of Transport and Main Roads (2000-2010) Fauna Sensitive Road Design (Vols 1-2).</p> <p>This Fauna Connectivity Strategy has been developed and will be further refined during detailed design. The strategy will identify and refine priority crossing zones (PCZ) and development of a Wildlife Connectivity Plan.</p> <p>The Wildlife Connectivity Plan will be developed having regard to DTMR's revised Fauna Sensitive Road Design Manual and other relevant material, including the USQ Fauna Movement Study.</p>	Appendix P: Fauna Connectivity Strategy Sections 5 and 6
145	145.0129	State Agency	Outline EMP		The current EIS assessment has identified various flora and fauna within the impacted corridor. The EIS does not include a process for managing any newfound species in the project area, including whether ARTC would manage that process as the lead agency.	Update the EIS to include the process for managing newfound species, including the agency that will manage that process.	<p>A qualified Fauna Spotter Catcher will undertake pre-clearance surveys of habitats and vegetation during each stage of the Project. The pre-clearance spotter catcher survey will also be included in periodic monitoring and reporting for the Project (Chapter 24: Draft Outline Environmental Management Plan).</p> <p>To guide methods of pre-clearance fauna surveys, a Biodiversity Management Sub-plan will be developed in detailed design and incorporated into the Construction EMP.</p> <p>The role of a fauna spotter catcher is to monitor progressive clearing and manage the orderly movement and possible removal of protected species from areas affected by the Project works. This approach would extend to new-found species or unreported species.</p> <p>The jurisdiction for management of any newfound species would be determined by the Coordinator-General through the evaluation report.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0130	State Agency	Outline EMP		The EIS does not clearly explain what type of criteria will be used for identifying suitable offset sites. Agencies including TMR and local council have future projects planned, and many of those projects are not currently in the public domain. The selection of offset land sites will require coordination with agencies regarding their future planning/road upgrades requirements. It is unclear whether ARTC will manage the coordination as the lead agency.	Amend the EIS to clarify the type of criteria used to identify suitable offset sites and detail the offset site selection process, including the consultation and coordination process with government agencies.	<p>A Project Offsets Plan will be developed for the Project to provide the delivery of offsets, where appropriate, ahead of relevant clearing works being undertaken and finalised in consultation with relevant regulatory agencies (Appendix Q: Environmental Offsets Delivery Strategy and Chapter 24: Draft Outline Environmental Management Plan).</p> <p>The Project Offsets Plan includes Interim Offset Property Management Plans (IOPMO), which will be guided by each property specific IOPMP. OPMPs will be developed for each acquired offset property and implemented prior to the approval of each Offset Area Management Plan (OAMP). IOPMPs will address the following components:</p> <ul style="list-style-type: none"> Summary of existing land use activities Property description including built infrastructure Legislation and regulatory requirements relating to property management (including Biosecurity regulations, ground disturbance of herbicides, local laws and ARTC policies as applicable) Threats - current and emerging including biosecurity, fire and land use Management areas/zones including no-go zones Management actions and prescriptions based on 'best practice' land management principles Monitoring, evaluation and reporting <p>Should the Coordinator-General decide the Project can proceed, subject to conditions, the requirement for a Project Offsets Plan will form part of those imposed conditions. The Coordinator-General will nominate the entities with jurisdiction for the conditions imposed on the Project, including the requirement for Project Offsets Plan. This process would natural entail a coordination process. ARTC has no jurisdiction nor has it any coordination powers or role.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0131	State Agency	Outline EMP		The EIS does not clearly state who will manage the relocation of fauna during any construction activities. It is unclear whether ARTC will manage the relocation process as the lead agency.	Amend the EIS to clarify who will manage the relocation of fauna during any construction activities.	A qualified Fauna Spotter Catcher will undertake pre-clearance surveys of vegetation and will supervise the subsequent clearing of vegetation and relocation of fauna, if required (Chapter 24: Draft Outline Environmnetal Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
145	145.0132	State Agency	Outline EMP		The Outline Environmental Management Plan omits 'a Biosecurity sub-plan'.	Amend the Outline Environmental Management Plan to require a Biosecurity sub-plan.	<p>A Biosecurity Management Plan will be prepared as part of the CEMP, to be submitted for approval prior to construction works commencing.</p> <p>Chapter 24: Draft Outline Environmental Management Plan includes structure that will guide development of the Biosecurity Management sub plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0133	State Agency	Outline EMP		The pre-construction activities omit the following: the establishment of early erosion and sediment controls and sediment basins associated with pre-construction activities.	Consider amending the EIS to include 'the establishment of early erosion and sediment controls and sediment basins.'	<p>Chapter 24: Draft Outline Environmental Management Plan provides for the inclusion of an Erosion and Sediment Control Plan (ESCP) as part of the Construction EMP (CEMP).</p> <p>The CEMP will be developed progressively to support the Project works through the Pre-Construction Activities and Early Works stage, as well as through the Construction Works stage. The CEMP must be endorsed by the Environmental Monitor as being consistent with the finalised Outline EMP, Legislation requirements and conditions of approval prior to the commencement of any relevant Project works.</p> <p>The specific erosion control measures for each worksite will reflect the topography, drainage and vegetation of the site, and will address the decommissioning and rehabilitation of those sites, in conjunction with the requirements of the Rehabilitation and Landscape Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0134	State Agency	Outline EMP		<p>The general construction activities omit the following.</p> <ul style="list-style-type: none"> Establishment of erosion and sediment controls including the diversion of water around disturbance footprint where practical and feasible. Sequential clearing while utilising a fauna spotter/catcher. 	<p>Consider amending the EIS to require:</p> <ul style="list-style-type: none"> Establishment of erosion and sediment controls including the diversion of water around disturbance footprint where practical and feasible. Sequential clearing while utilising a fauna spotter/catcher. 	<p>Chapter 24: Draft Outline Environmental Management Plan, provides for the establishment of an Erosion and Sediment Control Plan (ESCP). As noted previously, the ESCP will be developed progressively in step with Pre-construction Activities and Early Works, and general Construction.</p> <p>An Erosion and Sediment Control. Each plan will be regularly updated and maintained during construction.</p> <p>The Erosion and Sediment Control Plan will include:</p> <ul style="list-style-type: none"> Locations for specific temporary/permanent erosion and sediment control measures, such as: Berms and other surface flow diversions Sediment fending Scour protection (including in the revised reference design) Sediment retention basins Nomination of location-specific erosion controls will include consideration of site conditions, proximity to environmental receptors, adjoining land uses, climatic and seasonal factors, and will be based on an erosion risk assessment Minimisation of the area of disturbance during each stage to that required to enable the safe construction, operation and maintenance of the rail corridor <p>Revegetation sites in a timely manner following completion of construction</p> <ul style="list-style-type: none"> Minimising disturbance (timing of clearing to minimise amount of exposed soil) Scheduling of works with consideration to periods of higher rainfall (summer months) Establishing and specifying the monitoring and performance objectives for handover on completion of construction Stockpiling and managements/segregation of topsoil where it contains native plants, seedbank or weed material <p>Details of ESCP structure, other supporting plans and mitigation measures are included in Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0135	State Agency	Outline EMP		During project finalisation and as part of the rehabilitation plan, management and appropriate treatment of invasive plants is required as cleared areas free of ground cover are a high risk of weed invasion.	It is recommended the EIS be amended to include the requirement for the management and appropriate treatment of invasive plants as cleared areas free of ground cover are a high risk of weed invasion.	<p>Chapter 24: Draft Outline Environmental Management Plan provides for the preparation of a Rehabilitation and Landscaping Management Plan, and Biosecurity Management Plan as part of the Construction EMP. These plans will be developed during detailed design.</p> <p>As stated in Chapter 24: Draft Outline Environmental Management Plan, the Biosecurity Management Plan to be developed and implemented into the Construction Environmental Management Plan will include:</p> <ul style="list-style-type: none"> Requirements for pre-clearing and operational surveys to determine the risk of weeds or pest animals being present within the Project footprint Weed surveillance and treatment during construction and rehabilitation activities such as: Vehicle and plant washdown requirements for fleet moving from low-risk areas to high-risk areas Weed certification requirements for vehicles, plant and materials arriving onto the construction site Requirements in relation to pesticide and herbicide use, including any limitations on use. Restrictions may apply in proximity to watercourses, known areas of MNES or MSES habitat or land uses sensitive to spray-drift from the application of pesticides and herbicides (e.g. organic farming practices) Corrective actions if the outcomes do not achieve the adopted objectives. 	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0136	State Agency	Approvals/co nditions/reco mmendation s		Section 22.4 includes the following dot point. All employees, contractors and subcontractors will receive an environmental induction that will include, but not be limited to: Relevant imposed conditions. It is unclear if this imposed condition is referring to EIS imposed condition or conditions under secondary approvals.	It is recommended the EIS be amended to more correctly read: EIS Coordinator General Evaluation Report imposed, stated and recommended conditions included secondary approvals and conditions obtain by project for the relevant activities.	<p>Wording has been updated in Chapter 24: Draft Outline Environmental Management Plan, as follows:</p> <p>All employees, contractors and subcontractors will receive an environmental induction that will include:</p> <ul style="list-style-type: none"> ▶ Coordinator-General Evaluation Report Imposed and Conditions of Approval ▶ Secondary approvals and conditions obtained by the Project for the relevant activities etc. 	Chapter 24: Draft Outline Environmental Management Plan
145	145.0137	State Agency	Outline EMP		Section 22.5 indicates that: Section 320 to 320G of the EP Act outline the requirements for the duty to notify of environmental harm. Pollution incidents and activities that cause or threaten to cause serious environmental harm or material environmental harm must be reported within 24 hours to the Department of Environment and Science and other stakeholders. Add the word "potential" before "serious environmental harm" and "material environmental harm". This is to acknowledge that without appropriate investigation within the statutory 24-hour duty to notify obligation, it is unclear what, who, where, how and why an environmental incident has occurred including any environmental/remediation costs.	It is recommended the EIS be amended to read cause potential serious environmental harm or potential material environmental harm.	<p>Each member of the Project delivery team has a 'general environmental duty' under Section 319 of the Environmental Protection Act 1997 (Old) (EP Act), and will not carry out any activities that cause, or are likely to cause, unauthorised environmental harm, unless all reasonable and practical measures are taken to prevent or minimise harm (Chapter 24: Draft Outline Environmental Management Plan). The OEMP includes discussion regarding incidents, notifications and emergencies. The EP Act outlines requirements for the duty to notify of environmental harm. Pollution incidents and activities that cause or threaten to cause potential serious environmental harm or potential material environmental harm will be reported within 24 hours to the Department of Environment, Science and Innovation (DESI), and other stakeholders, as required, so that appropriate action can be taken to prevent or limit possible environmental harm.</p> <p>Chapter 24: Draft Outline Environmental Management Plan wording amended to the following, 'cause potential serious environmental harm or potential material environmental harm'</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0138	State Agency	Outline EMP		For consistency with C2K Chapter 22 OEMP, and to ensure appropriate consultation, assessment and justification is provided for works outside of standard work hours, ensure B2G Ch 22, Table 22.2 includes the following foot note. 1. Works outside of standard hours will only proceed where: a. Consultation with the local community has been undertaken. A site-specific noise risk assessment has been undertaken to identify the environmental risks associated with the works and action required to mitigate these risks. Justification is provided as to why the works are required outside of the hours nominated for surface works above.	<p>It is recommended the EIS be amended to include a footnote at the bottom of Table 22.2 that reads:</p> <p>1. Works outside of standard hours will only proceed where:</p> <p>a. Consultation with the local community has been undertaken</p> <p>b. A site-specific noise risk assessment has been undertaken to identify the environmental risks associated with the works and action required to mitigate these risks</p> <p>Justification is provided as to why the works are required outside of the hours nominated for surface works above.</p>	Chapter 24: Draft Outline Environmental Management Plan details construction hours for the Project. Construction working hours are determined by the requirement to manage potential disruption to the community, particularly from noise. The Department of Transport and Main Roads (DTMR) Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration recommends standard and non-standard hours for construction work. If construction activities are required to take place during non-standard hours consultation with the local community will be undertaken (this includes planning regarding works required) prior to works commencing.	Chapter 24: Draft Outline Environmental Management Plan
145	145.0139	State Agency	Outline EMP		Table 22.4 indicates <ul style="list-style-type: none"> ▶ Encountering potential acid sulphate soils (PASS) and/or acid rock drainage (ARD). All excavated material that is suspected to contain sulphides will be stockpiled, lined and covered, and managed to minimise rainfall infiltration and leaching. <p>There is likely to be PASS disturbed during construction. Stockpiling, lining and covering PASS material may still lead to oxidation and leaching. Soil testing for Actual and Potential Acid Sulphate soils should be undertaken to confirm treatment/liming rate to neutralise the acidification of stockpiled/transported/reused/disposed spoil. Treatment with lime may not be viable or the only option, for example if PASS material is likely to be used in batters where those batters are capped off. Excavated PASS material can also be transported in sealed haulage trucks and treated at disposal sites.</p>	<p>It is recommended the EIS/Chapter 22 Draft Outline Environmental Management Plan be amended to include:</p> <ul style="list-style-type: none"> ▶ Soil testing for Actual and Potential Acid Sulphate soils should be undertaken to confirm treatment/liming rate to neutralise the oxidation and leaching of acids at stockpiled/transported/reused/disposed spoil material. ▶ Treatment with lime may not be viable or the only option, for example if PASS material is likely to be used in batters where those batters are capped off. Excavated PASS material can also be transported in sealed haulage trucks and treated at disposal site. 	Further geotechnical investigation will be undertaken as part of the Detailed Design stage. If Acid Sulfate Soils (ASS) are identified through further investigations and will be disturbed by construction activities, an ASS Management Plan will be developed, if required in accordance with the Queensland Acid Sulfate Soil Technical Manual: Soil Management Guidelines v4. 0 (DSTI, 2014a) and the State Planning Policy (Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
145	145.0140	State Agency	Outline EMP		Options are required for the decommissioning of sediment basins upon practical completion, as follows. <ul style="list-style-type: none"> ▶ Consult with landowners to retain sediment basin as watering hole ▶ Decommission sediment basins ▶ Retain sediment basin for erosion and sediment control with fencing and ongoing maintenance requirements. These do not appear to be covered in the draft Outline Environmental Management Plan. 	<p>During project finalisation consider options for the decommission or retention of sediment basins. Noting that sediment basins that are retained may need to be fenced to reduce drowning.</p>	<p>As part of Chapter 24: Draft Outline Environmental Management Plan, an Erosion and Sediment Control Plan (ESCP) and a Rehabilitation and Landscape Management Plan will be developed as part of the Construction Environmental Management Plan (CEMP).</p> <p>Each of these plans will need to be regularly updated and maintained during construction.</p> <p>Worksite rehabilitation will be completed in accordance with the Rehabilitation and Landscape Management Plan. The Draft Outline Environmental Management Plan requires such rehabilitation to return worked areas to a stable condition that complies with the conditions of landowner agreements and regulatory approvals. Landowner consultation is a central tenant in this process.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0141	State Agency	Outline EMP		An air quality monitoring station is located near Commodore Mine and Millmerran Power Station during construction for background air quality and dust deposition monitoring. The monitoring station is likely to be impacted by cross contamination from the Commodore Mine and Millmerran Power Station. Background monitoring is likely to be compromised due to proximity of Commodore Mine and Millmerran Power Station, and therefore wouldn't be a true indicator of background air quality for environmental nuisance incident monitoring.	It is recommended that air quality monitoring be undertaken at several alternative sites along the B2G alignment where there is less chance of result cross contamination from other airborne dust nuisances.	<p>Chapter 24: Draft Outline Environmental Management Plan includes further detail regarding monitoring. In addition to air quality monitoring near Commodore Mine, monitoring will also be undertaken in urban and semi-urban areas. These areas are of higher concern for air quality impacts due to the increased density of sensitive receptors located near construction areas and associated dust emission sources.</p> <p>Further quantitative assessment of potential dust deposition at sensitive receptors from construction will be completed in future stages (prior to Construction) when more detailed construction information is available. The outcomes of further assessment will guide requirements for the locations of dust deposition monitoring in urban and semi-urban areas.</p> <p>ARTC will monitor for potential dust deposition in urban and semi-urban areas including, but not limited to, the areas of Yelarbon, Pittsworth and Brookstead.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0142	State Agency	Outline EMP		It is unclear if pipe around culverts have been proposed due to the use of zoned embankments. Reactive soils in zoned embankments will require additional mitigation measures where culverts penetrate.	Update the EIS to confirm if pipe zoned embankments have been used, and update and mitigate any requirements as necessary.	The cross-drainage and longitudinal drainage design register has been updated through revision of the revised reference design and hydraulic models. The register will be further updated as detailed design progresses, to incorporate any necessary mitigation measures for specific soils and overland flow considerations. The culvert designs will include mitigations for associated impacts such as fauna movements, erosion and score control, overland flow and soils (Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
145	145.0143	State Agency	Outline EMP		Relating to the treatment of acid sulphate soils, where material is disturbed and exposed to air, testing and appropriated rates of lime treatment need to be calculated and applied to stockpiled materials.	Update the EIS to ensure that material which is disturbed and exposed to air, testing and appropriated rates of treatment (lime) are calculated and applied to stockpiled materials.	<p>Considering the regional location of the Project footprint and the findings of the investigations that informed the Draft Soil Management Plan, the potential for the Project to intercept ASS or PASS is very low to negligible. Any provisions in the finalised Operation Environmental Management Plan and Construction Environmental Management Plan regarding the handling of ASS or acid rock material, are included out an abundance of caution.</p> <p>Chapter 24: Draft Outline Environmental Management Plan states, additional geotechnical investigations will be undertaken to inform the design of earthworks and foundations for structures, suitability of borrow and quarry material, and construction planning for the Project. Additional geotechnical investigations will specifically target locations where the design includes:</p> <ul style="list-style-type: none"> ▶ Cuts ▶ Embankments ▶ Bridge piers, culverts and abutments ▶ The floodplains in cut off relict streams and billabongs or lakes adjacent to Macintyre River, Macintyre Brook, Condamine River and Oxley Creek, may be disturbed by construction. <p>In the highly unlikely event that acid soils or acid rock material is intercepted, an ASS Management Plan will be developed in accordance with the Queensland Acid Sulfate Soil Technical Manual: Soil Management Guidelines v4. 0 (DSTI, 2014a) and the State Planning Policy.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0144	State Agency	Outline EMP		It is unclear whether any additional land requirements have been considered if contaminated leachate is found at deep cuts and ponds.	Update the EIS to confirm deep cuts have an additional footprint in anticipation of requiring more space for ponds.	<p>Chapter 24: Draft Outline Environmental Management Plan includes precautionary mitigation measures for management of Acid Rock Drainage (ARD) (leachate) I acid leachate is detected through monitoring, management measures consistent with Preventing Acid and Metaliferous Drainage: Leading Practice Sustainability Development Program for the Mining Industry (Commonwealth of Australian, 2016) would be developed.</p> <p>If ARD (leachate) is identified during construction, seepage water from relevant deep cuts will be sampled at weekly intervals to determine a trend and mitigations investigated.</p> <p>If contaminated discharge water/leachate is found to be generated from the deep cuts, this water may need to be impounded in ponds and stabilised via treatment with hydrated lime or dilution prior to release into the surrounding catchment or other discharge mechanisms. Determination of additional land requirements for ponds to impound ARD (leachate) will be investigated in detailed design following further geotechnical investigations.</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0145	State Agency	Outline EMP		It is unclear whether alternative borehole locations have already been identified, in anticipation of access being denied/not available.	Update the EIS and the project to identify alternative locations now rather than once the detail design stage commences to manage risk and impacts to project timing and delivery.	ARTC has developed a 'make good' approach to compensating landowners whose access to their bore or bores is either constrained or lost due to the Project works. This process is explained in diagrammatic form in Chapter 24: Draft Outline Environmental Management Plan.	Chapter 24: Draft Outline Environmental Management Plan
145	145.0146	State Agency	Outline EMP		The EIS including Table 22.22 references the Queensland Level Crossing Safety Strategy 2012-2021. It is important to note this policy has been updated with the 2019 Update: On Track to Zero Harm. It is recommended that both versions be referenced.	It is recommended that both the Queensland Level Crossing Safety Strategy 2012-2021 and the 2019 Update: On Track to Zero Harm versions be referenced.	<p>The Appendix AA: Traffic Impact Assessment and relevant mitigation measures have incorporated, where relevant, the reference to the latest Queensland Level Crossing Safety Strategy 2012-2021 which includes the "2019 Update: on Track to ZERO Harm" as a subtitle to the 2012-2021 Strategy.</p> <p>This referencing has been incorporated into Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix AA: Traffic Impact Assessment
145	145.0147	State Agency	Outline EMP		Under Construction (Delivery stage), Bushfire (Aspect), mitigation measures do not include the avoidance and management of vehicles traversing through long/dry grass/vegetation, vehicle inspections and carrying of firefight equipment. During and after travelling through long dry vegetation, there is potential for underbody vehicle ignition and bushfire.	Amend the EIS and draft Outline Environmental Management Plan to require project personnel to avoid where possible the vehicles traversing through long dry grass or similar vegetation, and for personnel to ensure fire safety precautions (firefighting equipment and training) are implemented prior to using vehicles (e.g. inspect vehicle underbody for collected or grass/vegetation in contact with hot exhaust or similar parts.).	<p>Project works will involve early clearing of identified vegetation and stripping of grass and surface materials. The risk of such works triggering grassfire risk is very low.</p> <p>In hot dry conditions, there is a risk for grassfire hazard where survey vehicles advance through long grass on farmland. The Project EMS, worksite WHS plans and ARTCs Total Fire Bans Procedure (ETM-13-01) will address the management of grassfire hazards for survey work. Generally, the Project EMS and the CEMP will address the risk of inadvertent bushfire hazard and hazard reduction (Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan
145	145.0148	State Agency	Outline EMP		TMR recommends adopting circular economy model principles and shifting away from current linear economic model based on the take-make-dispose; approach to managing products and resources. Through circular economy principles <ul style="list-style-type: none"> ▶ design out waste and pollution ▶ keep products and materials in use ▶ regenerate natural systems <p>Noting that the Queensland governments initiative supports circular economy in Queensland.</p>	Adopt a Circular Economy model in the construction, operation, maintenance and decommission of Inland Rail project.	ARTC will assess and confirm opportunities for beneficial use and re-use of materials under the end of waste (EOW) framework. If appropriate to do so, ARTC will register as a resource producer to operate under an EOW code. ARTC will continue to consult with relevant local governments and waste facility operators prior to the commencement of construction to confirm the Project's approach to waste disposal and spoil management Chapter 24: Draft Outline Environmental Management Plan.	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0149	State Agency	Outline EMP		Waste conversion calculations have not been included to determine if volume of waste streams have been correctly converted to tonnes when reporting generated, reused/recycled, recovered and disposed of waste streams.	Update the EIS to ensure there is the provision of waste stream volume conversion to tonnes when reporting waste distribution for consistency with the Department of Environment and Science reporting requirements.	<p>Chapter 22: Waste and Resource Management, Section 22.3 discusses the basis of assessment, limitation and assumptions for waste and resource management includes establishing a basis of significance for waste generated from the Project.</p> <p>Assessing the significance of waste-related impacts involves quantitative and qualitative analysis. Impact significance is specific to the scale of the development proposed and will be influenced by the context in which it operates (Global Sustainability Standards Board, 2021).</p> <p>Section 22.3 has been updated to establish an appropriate materiality threshold to represent the quantified amount and the effect that amount will have in various contexts – in this case, in the context of regional waste disposal.</p> <p>Construction and demolition waste for the Darling Downs-Maranoa region is estimated at 11,086 tonnes, (Recycling and Waste in Queensland 2021, Queensland Government 2021).</p> <p>A disposal permit from DESI would also be required for the transportation of contaminated soil by a licenced service provider to an appropriate licenced facility (Section 22.6.2).</p>	Chapter 22: Waste and Resource Management Section 22.3 Section 22.6.2
145	145.0150	State Agency	Outline EMP		TMR requires a Construction Management Plan (CMP) to address risks to the statecontrolled transport corridors which includes railway corridors and railway level crossings.	<p>The Construction Management Plan must demonstrate that there will be no disruption to the safety and operational integrity of railway corridors and associated state-controlled-transport networks during the course of construction. The Construction Management Plan must address at least the following, among other relevant considerations:</p> <ul style="list-style-type: none"> Construction methodology and work method statements; Management of loading, ground movement and vibration impacts on state-controlled transport infrastructure; Storage locations, site accommodation facilities, laydown facilities, loading/unloading zones and vehicle access tracks; Unauthorised access prevention to the railway corridor (temporary and permanent); Maintenance of emergency/maintenance access to the railway corridor for the railway manager; Railway operational requirements and scheduled railway closures; Adherence to relevant Queensland Rail standards including but not limited to CIVILSR-002 Work in or about Queensland Rail Property and CIVIL-SR-016 Services under railway property (non-Queensland Rail services); Railway level crossing safety; Stormwater management. Certain aspects of the Construction Management Plan will require Registered Professional Engineer of Queensland (RPEQ) certification, for instance, a Traffic Management Plan, stormwater management and earthworks. Amend the EIS (Draft OEMP and Proponent Commitments) accordingly. 	<p>The finalised Operation Environmental Management Plan and Construction Environmental Management Plan will address the predicted environmental impacts of the adopted construction methodology for the Project. The framework for these plans is provided in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>The Project will also develop and implement a Construction Management Plan (CMP) as the means for addressing agency concerns regarding potential impacts on State and local government infrastructure and assets. The CMP will be developed by ARTC, in consultation with relevant stakeholders as the Project scope, technical requirements and detailed design progress through post-EIS refinement.</p> <p>Communication protocols will be established with QFES and QPSW for the operation of the Project, to ensure that all relevant stakeholders are aware of planned (e.g. controlled burns, railway crossing closures) or unintended events (e.g. escaped fires) that have potential to impact on the provision of services by others.</p> <p>Safe corridor access and vehicle turnaround points will be provided in the design for maintenance work, to ensure sufficient setback while working adjacent to live railway. Maintenance and emergency access roads will be designed such that it will allow separation to prevent interaction between trains and vehicles without impeding escape or rescue activities.</p> <p>Traffic management arrangements for construction sites, laydown areas or non-resident workforce accommodation facility sites requiring access directly off and onto a State controlled road will need to be negotiated with and approved by DTMR.</p> <p>Communication protocols will be established with QFES and QPSW for the operation of the Project, to ensure that all relevant stakeholders are aware of planned (e.g. controlled burns, railway crossing closures) or unintended events (e.g. escaped fires) that have potential to impact on the provision of services by others.</p> <p>All works carried out on the QR property will be in accordance with the requirements of QR's Civil Engineering Technical Requirement: Work in or about Queensland Rail Property (CIVIL-SR-002).</p> <p>Key actions outlined within the Queensland Level Crossing Safety Strategy 2012-2021 (which incorporates the latest 2019 update of 'on Track to ZERO Harm') will be implemented as a proposed mitigation measure for road rail interfaces for the Project.</p>	Chapter 24: Draft Outline Environmental management Plan
145	145.0151	State Agency	Surface Water	Scour protection	It is unclear if scour protection at culverts will extend into neighbouring properties where the corridor is narrow and the likelihood is erosion will continue past the rail corridor boundary (e.g. due to high velocities in dispersive soils). Scour/sediment transport may have a knock-on effect on adjoining landowners including state lands, plus QR/TMR drainage.	Update the EIS to confirm ARTC have a policy to extend scour protection beyond their corridor, where calculations have indicated erosion in third party properties.	<p>Since the release of the draft EIS a preliminary Erosion Threshold Velocity (ETV) assessment has been undertaken to inform the scour and erosion protection strategy for the Project. The ETV values along the Project for a 50 per cent vegetation cover scenario have been estimated at between 0.9 and 1.2 m/s (ETV's are detailed in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>An impact assessment was then undertaken against the Flood Impact Objectives (FIO) using the Existing Case and Development Case hydraulic modelling results to define velocity changes/exceedances on properties external to the Project footprint. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. Sealed and unsealed surfaces likely to be impacted by a velocity FIO exceedance have been identified and are reported in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 4.2).</p> <p>In addition to initial scour protection requirements identified during the reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design in accordance with Austroads Guide to Road Design Part 5B: Drainage – Open Channels, Culverts and Floodways (Austroads, 2013b) (AGRD). Scour protection measures for culvert outlets have been designed to ensure that the maximum allowable flow velocities in a 1% AEP, as specified in Table 3.1 of AGRD, are not exceeded. The scour protection length and minimum rock size (d50) have been determined from Figure 3.15 and Figure 3.17 in AGRD. All required scour lengths are predicted to fit within the rail corridor.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Appendix B
145	145.0152	State Agency	Project scope		Design drawings have been included with the EIS. However, the EIS has not included detailed proposal plans on the project interface with the existing railway corridor.	Detailed design plans are required to clarify the interface of the proposed development with the South Western line and Millmerran Branch line, including but not limited to, fencing arrangements to prevent unauthorised access, earthworks, stormwater drainage, services and utilities and the design of new rail transport infrastructure and other rail infrastructure. The design of the development will need to ensure that emergency and maintenance access to the railway corridor is not obstructed or interfered with and that the existing and future operations of the railway corridors are not compromised. Additionally, the placement, design and management of stockpile areas and dangerous goods must ensure there are no adverse impacts on the railway corridor. Amend the EIS (Draft OEMP and Proponent Commitments) accordingly.	<p>As per Chapter 5: Project Description, Section 5.3.2 and the design drawings in Appendix B1: Design Drawings, the Project's reference design is currently planned to raise and replace the existing single Queensland Rail (QR) track.</p> <p>The intention with upgrading and replacing the existing track is to improve QR track conditions and alignment. Utilising the existing rail corridor as feasible minimises or eliminates private and public land impacts by reducing the extent of land acquisition that may otherwise be required. Noting design, construction and operability challenges, this proposal provides significant benefits to DTMR, QR and their rail customers by:</p> <ul style="list-style-type: none"> Upgrading the formation, ballast, sleepers and rail for these sections Replacing the red-boarded track Section through the Condamine floodplain on the Millmerran Branch Line Upgrading track and formation design to allow 30 tonne axle loads Eliminating existing curves less than 1200 m Improving vertical gradients to a maximum of 1:80 Providing track immunity to top of formation across 1% AEP floodplains Providing turnout connections into the existing QR network and upgrades to dual gauge track granting greater interoperability for rail customers in Queensland. <p>Ongoing consultation with QR and DTMR will continue during detailed design.</p> <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. Queensland Fire and Emergency Services (QFES), Queensland Ambulance Service (QAS) and Queensland Police Service (QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p>	Chapter 5: Project Description Section 5.3.2 Appendix B1: Design Drawings
145	145.0153	State Agency	Stakeholder engagement		The dates in Table 5.9 finishes on 23 September 2020 and gives the perception that the working group is no longer meeting.	Amend the EIS to state that fortnightly meetings are ongoing for the life of the project.	ARTC undertook engagement with Government agencies during the development of the draft EIS and revised draft EIS, as detailed in Appendix E: Consultation Report, Section 4. ARTC has updated the revised draft EIS accordingly to reflect submitter's concern.	Appendix E: Consultation Report Section 4
145	145.0154	State Agency	Approvals/conditions/recommendations		The first paragraph states: The decision by the Coordinator-General about whether to approve the Project will be made public via DSDIP's and ARTC Inland Rail's websites. This wording is potentially incorrect, as the Coordinator-General will determine whether the project can proceed.	Consider revising the wording to ensure accuracy.	<p>Chapter 3: Legislation and Project Approvals Process has been updated (no longer incorporating draft EIS wording). At the conclusion of the SDPWO Act EIS process, the Australian Government Minister for the Environment will receive a copy of the Coordinator-General's evaluation report and will take this report into account when making a decision under the EPBC Act. The Australian Government Minister for the Environment will make a decision on whether to approve the Project, and if it is approved, with or without conditions (Section 3.2.2).</p> <p>Section 3.2 details the remaining steps in the coordinated Project process remain to be completed:</p> <ul style="list-style-type: none"> The revised draft EIS will be required to be placed for public notification. Submissions can be made to the Coordinator-General to be considered during evaluation of the revised draft EIS. The Coordinator-General will evaluate the revised draft EIS and may accept is as the final EIS. If accepted as final, the Coordinator-General prepares a report on the final EIS consistent with the requirements of the SDPWO Act. <p>These steps are illustrated in Figure 3-2 of Chapter 3: Legislation and Project Approval Process.</p> <p>Following approval of the EIS and the Draft Outline Environmental Management Plan, the Construction Environmental Management Plan will incorporate Conditions of Approval into the management plans and Plans for the Project (see Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 3: Legislation and Project Approvals Process Section 3.2.2 Figure 3-2 Chapter 24: Draft Outline Environmental Management Plan
145	145.0155	State Agency	Stakeholder engagement		There is no mention of a Stakeholder Risk Register, not having a Stakeholder Risk Register may jeopardise the Queensland Government's commitment to ensuring Queensland gets the best outcome from the project, and that the Australian Government considers and responds appropriately to issues raised by Queenslanders.	Update the EIS to include the requirement for ARTC to develop and maintain a Stakeholder Risk Register (sometimes referred to as a Risk Log) to detail all identified risks, including description, category, cause, probability of occurring, impact(s) on objectives, proposed responses, owners, and current status. Update the EIS to include a document which outlines the results of the Project's qualitative risk analysis, quantitative risk analysis, and risk response planning for Stakeholder Engagement.	<p>ARTC maintains a Project risk register and stakeholder risks are captured within this. A high level risk impact assessment summary is provided in Chapter 21: Hazard and Risk Section 21.7.</p> <p>ARTC continues to monitor Project risks and update the Project register, including stakeholder risks.</p>	Chapter 21: Hazard and Risk Section 21.7
145	145.0156	State Agency	Flora and Fauna		The Terrestrial Ecology and Technical Report has not been undertaken in accordance with TMRs Interim Management Manual (SSM), SMM Appendix 2 soil forms, TMR Soil Group classifications and CSIRO Clay Mineralogy Maps.	In the absence of any nominated ARTC standard, update the EIS to include the requirement to identify, assess, ameliorate and manage the project soils as per the TMR Interim SSM, SMM Appendix 2 soil forms, TMR Soil Group Classifications Map and CSIRO Clay Mineralogy Maps. Amend the EIS accordingly.	<p>ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at 1:10,000 scale in consultation with DoR. Soil management units from the investigation are provided in Section 4.5. This level of investigation is sufficient to allow determination of the suitability of the soils and to manage the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps.</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides site-specific soil management measures in Section 3.3.</p>	Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.33-2 Appendix J: Soil Assessment Report Section 4.5 Figure 3.16
145	145.0157	State Agency	Flora and Fauna		It is industry standard that the technical report be undertaken by a suitably qualified soil practitioner and with consideration to the study team Chapter that does not appear to be the case. A Certified Professional Soil Scientist is required to undertake soil surveying, assessment and management as per TMR's interim SSM.	It is recommended that a Certified Professional Soil Scientist undertake soil surveying, assessment and management as per the Interim TMR Soil Management Manual.	<p>A detailed soil investigation has been undertaken at an intensity to enable mapping at a 1:10,000 scale (see Appendix J: Soil Assessment Report). Appendix J: Soil Assessment Report has identified soil management units to inform appropriate soil management plans (as described in Appendix J: Soil Assessment Report, Section 1.3). The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al., 2008), the Australian soil and land survey field handbook (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015).</p> <p>The soil investigation report (refer to Section 5.0 of Appendix J: Soil Assessment Report) provides detailed soil profile descriptions and laboratory results. Findings from the detailed soil investigation have been incorporated into Chapter 9: Land Resources.</p> <p>The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al., 2008), the <i>Australian soil and land survey field handbook</i> (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015). A suitably qualified certified professional soil scientist prepared the soil survey report, on behalf of ARTC in revised draft EIS Appendix J: Soil Assessment Report, Appendix C.</p> <p>The information provided for the baseline assessment data is considered fit for purpose for the EIS and meeting its intended objectives. A Certified Professional Soil Scientist (CPSS) has peer reviewed the report and determined it meets the requirements in its current form. This was undertaken by a Suitably Qualified/trained Soil Scientists, and the review (including soil management plan) was undertaken by a third-party CPSS (Certification number: s1434). The soil survey work, data collection and laboratory analysis updates have been reflected in Chapter 9: Land Resources.</p>	Chapter 9: Land Resources Appendix J: Soil Assessment Report Section 1.3 Section 5.0 Appendix C

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0158	State Agency	Surface Water		The Surface Water Quality Technical Report, in relation to the management of project soils, has not been undertaken in accordance with TMRs Interim Management Manual (SSM), SMM Appendix 2 soil forms, TMR Soil Group classifications and CSIRO Clay Mineralogy Maps.	In the absence of any nominated ARTC standard, include the requirement to identify, assess, ameliorate and manage the project soils as per the TMR Interim SMM, SMM Appendix 2 soil forms, TMR Soil Group Classifications Map and CSIRO Clay Mineralogy Maps. Amend the EIS accordingly.	<p>Section 9.3.2 of Chapter 9: Land Resources describes the mapping and management of Project Soils. Soils along the Project alignment have been assessed according to the Australian Soil Classification Mapping (2016) and described in Appendix S: Surface Water Quality Technical Report, Section 4.5.2. Mitigation and management of soil measures will be implemented as part of a Soil Management Sub Plan, according to the International Erosion Control Association Best Practice Erosion and Sediment Control 2008. This includes management of problem soils, in Table 9-29 of Chapter 9: Land Resources, such as:</p> <ul style="list-style-type: none"> Acid sulfate soils, which may occur in proximity to wetland features and water storages Erosive or dispersive soils, such as sodosols that are expected to be encountered between the Macintyre River and Yelarbon as well as along the fertile lands north of Inglewood to the west of Kooroongarra Cracking clays (vertosols) that are expected to be encountered between Koorongara and Millmeran and from Yandilla to Gowrie Saline soils, particularly in high salinity hazard areas such as between Kurumbul and Yelarbon. <p>In addition to the mitigation measures identified in Table 7.1 of Appendix S: Surface Water Quality Technical Report and as part of the Detailed Design stage, when finalised positions of infrastructure elements (e.g. abutments/piers etc.) are known and detailed soil surveys are complete, geomorphological assessment of identified risk locations will be undertaken.</p> <p>The revised draft EIS Chapter 24: Draft Outline Environmental Management Plan, provides further context and the framework for implementation of these proposed mitigation and management measures.</p>	<p>Chapter 9: Land Resources Section 9.3.2 Table 9-29 Chapter 24: Draft Outline Environmental Management Plan Appendix S: Surface Water Quality Technical Report Section 4.5.2 Table 7.1</p>
145	145.0159	State Agency	Surface Water	Scour protection	The EIS states that all required scour lengths were predicted to fit within the rail corridor. Topography, erodibility and velocities may well dictate that scour extends beyond the boundary. It is unclear what allowance has been made should scour protection be required to extend beyond the corridor boundary and impinge on third party property (e.g. into cropping land or highway corridor).	Update the EIS to confirm ARTC have a policy to extend scour protection beyond their corridor, where calculations have indicated erosion in third party properties.	<p>Since the release of the draft EIS a preliminary Erosion Threshold Velocity (ETV) assessment has been undertaken to inform the scour and erosion protection strategy for the Project. The ETV values along the Project for a 50 per cent vegetation cover scenario have been estimated at between 0.9 and 1.2 m/s (ETV's are outlined in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>An impact assessment was then undertaken against the Flood Impact Objectives (FIO) using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Project footprint. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. Sealed and unsealed surfaces likely to be impacted by a velocity FIO exceedance have been identified and are reported in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 4.2).</p> <p>In addition to initial scour protection requirements identified during the reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design in accordance with Austroads Guide to Road Design Part 5B: Drainage – Open Channels, Culverts and Floodways (Austroads, 2013b) (AGRD). Scour protection measures for culvert outlets have been designed to ensure that the maximum allowable flow velocities in a 1% AEP, as specified in Table 3.1 of AGRD, are not exceeded. The scour protection length and minimum rock size (d50) have been determined from Figure 3.15 and Figure 3.17 in AGRD. All required scour lengths are predicted to fit within the rail corridor.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2</p>
145	145.0160	State Agency	Flooding	Road safety	Proposed works and impacts on state-controlled roads even if they are included within the project footprint need to be clearly understood. However, no detail of proposed road works are included within the EIS. As it is, impacts on state-controlled roads are not acceptable to TMR and in some cases (i.e. Yelarbon) not even understood, as a levee raise is currently proposed affecting the Cunningham Highway. If affluxes are due to road works, this need to be documented in detail for TMR to have an informed position to comment.	TMR recommends that in addition to updating the EIS as requested in TMRs other comments, ARTC create a separate impacts memorandum that details flooding and hydrology impacts to State-controlled roads discuss that impacts memorandum directly with TMR and the impact of proposed works within and outside the project footprint. A higher level of detail is required to clearly identify all impacts in state-controlled roads due to the proposed railway and ancillary roadworks.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
145	145.0161	State Agency	Flooding	Modelling	Recommend an additional afflux reporting band in accordance with TMR's Hydrology and Hydraulic Modelling Guidelines. Additional band should be between +10 and +20 mm (then 20-50, etc.) as often afflux in sensitive areas can end up just above 10 mm and with only one band covering 10-50, it is not possible to tell visually whether the afflux is just in excess or a lot in excess.	Add an additional afflux reporting bands in accordance with TMR's Hydrology and Hydraulic Modelling Guidelines. Additional band should be between +10mm and +20 mm (then 2050 mm, etc.)	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
145	145.0162	State Agency	Flooding		It is unclear what the Projects approach is to temporary works. Whilst it is appreciated the details of temporary works are not known in detail at this stage, this Project is understood to involve significant and separable earthworks packages, major bridge packages, etc all of which will involve temporary placement of filling within floodplains, hence the potential for hydraulic impacts is significant.	Outline proposed approach to how the flooding, stormwater and drainage impacts of temporary works impacts will be managed.	<p>The revised draft EIS Chapter 24: Draft Outline Environmental Management Plan, outlines the use of temporary and permanent mitigation measures that will be implemented to reduce localised impact from Pre-Construction Activities and Early Works, Construction Works and Operations stages, as detailed in the 'Surface Water' and 'Hydrology & Flooding' sections of the chapter.</p> <p>During future stages, through consultation with the selected contractor team and in line with their construction methodologies, requirements and scheduled duration details of temporary works located near waterways and in floodplains will be confirmed and designed. Where necessary and using the advanced construction detail an appropriate level of hydraulic modelling for temporary works will be undertaken to evaluate the effects of the temporary works on the local hydrological conditions.</p> <p>Based on the outcomes of the hydraulic modelling analysis, appropriate mitigation measures will be determined. These measures may include design adjustments, installation of additional structures or features, or implementation of specific construction techniques to minimize any adverse impacts on the waterways and floodplains. The objective is to ensure that the temporary works are implemented in a manner that preserves the integrity of the surrounding environment and safeguards against any potential detrimental effects.</p> <p>The results of the hydraulic modelling analysis and the proposed mitigation measures will be incorporated into the Detailed Design stage of the Project. This will ensure that the final design accounts for the specific considerations related to the temporary works in waterway and floodplain areas.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
145	145.0163	State Agency	Flooding	Modelling	Section 4.2 and 4.2 states/implies that design events between 20% AEP (1 in 5) and PMF have been considered for impact assessment. It is unclear if frequent type floods (63% and 39% AEP) have been considered. Frequent flood events are the most likely type of flooding to be of concern for many rural areas, where drainage can be more important than flooding.	Ensure all relevant stormwater and flooding events have been considered and assessed:63.2%, 50%, 39%, 20%, 10%, 5%, 2% and 1% AEP, noting that for rural areas, frequent flooding events (63% and 39%) AEP are of particular concern. Amend the EIS accordingly.	<p>Events from 20% AEP up to 1% AEP, 1 in 2000, 1 in 10,000 and PMF have been assessed. Under the 63% and 39% AEP size of events flows will likely be predominantly contained to existing drainage channels and provision of structures to convey the 1% AEP flows will maintain the flow distribution under these smaller events. Therefore impacts will be minimal. During future design stages the relevance of modelling smaller AEP events as proposed will be assessed, mainly for the purpose of construction planning.</p> <p>The flood modelling conducted for the Border to Gowrie Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Details on flooding for the Project are detailed in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
145	145.0164	State Agency	Flooding	Modelling	It is unclear what the hydraulic approach to new railway corridor fencing is within the flood modelling, especially where mesh is tight, and debris can catch. This type of fencing could impact local farm drainage performance.	Clarify the approach to new railway corridor fencing within the flood modelling, particularly where this may cause blockages, catch debris or affect local farm drainage performance. Amend the EIS accordingly.	<p>Based on this consultation feedback from adjacent landowners regarding fencing on the Condamine River floodplain fencing of the rail corridor has not been included in the revised reference design for the Project, across floodplain areas. Instead, guideposts or other alternative means of rail corridor boundary protection will be installed in order to demarcate the rail corridor and deter access to the rail corridor. The track elevation through these areas will also act as a deterrent to trespass or livestock access to the railway, where this may otherwise occur.</p> <p>It is acknowledged that inappropriately placed fencing and/or inadequately designed fencing could cause debris to catch during flood events and impact local drainage performance. During detailed design specific consideration will be given to this aspect on a case-by-case basis. Consultation with affected landowners will be undertaken on a case-by-case basis to ensure that the fencing solution ties in with local farming practises.</p>	<p>Chapter 5: Project Description</p>
145	145.0165	State Agency	Flooding		The types of noise barriers to be used with the project are yet to be determined/finalised. However, the noise barriers may affect the project's hydraulic and flooding impact. It is unclear how this impact has been considered, if at all.	Amend EIS to clarify how the impact of noise barriers can be included in the flood modelling, and how their impact can be suitably mitigated and managed. In addition to not worsening the flood impact, noise barriers should be aesthetically pleasing.	<p>Noise barriers are proposed at Yelarbon, Brookstead and Pittsworth. These structures have been included in the hydraulic models, and accounted for in the Flood Impact Assessment reported in Section 14.10 of Chapter 14: Flooding and Geomorphology.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.10</p>
145	145.0166	State Agency	Flooding	Modelling	Appendix Q Hydrology and Flooding Technical Report should be revised to demonstrate that the management of stormwater and flooding post-development can achieve a no worsening impact (on the pre-development condition) to State transport corridors for all flood and stormwater events that exist prior to development and up to a 1% Annual Exceedance Probability (AEP).	<p>Appendix Q - Hydrology and Flooding Technical Report (reference 3100 and document number 2-0001-310-EAP-10-RP-0213) should be revised to demonstrate that the management of stormwater and flooding post development can achieve a no worsening impact (on the pre- development condition) for all flood and stormwater events that exist prior to development and up to a 1% Annual Exceedance Probability (AEP). In particular provide a revised hydraulic and hydrological analysis demonstrating the design flood peak discharges for the site and surrounding area which exist in the pre and post development scenarios for all flood and stormwater events up to a 1% Annual Exceedance Probability addressing the following:</p> <ul style="list-style-type: none"> At least the following flood and stormwater events: 63.2%, 50%, 39%, 20%, 10%, 5%, 2% and 1% AEP. The flood model needs to adequately encompass the existing and future railway corridor. Mapping (afflux, water level/depth and velocity) should be provided to clearly illustrate the pre-development scenario, and the post development impacts for all relevant design events. Maps scales should be altered to clearly show the potential impacts on the state-controlled transport corridors. The afflux maps should be revised so that a negligible impact is referred to as +/- 10 mm. The report should demonstrate that flood storage capacity is maintained on the site with the development and any early temporary works. Overland flow paths/hydraulic conveyance should be maintained on the site as part of the proposed development. The flood model should be underpinned by a revised General Arrangement Plan which clearly shows the pre and post development impervious area on the site. The flood model should be underpinned by an earthworks plan that clearly shows the location and extent of proposed excavation and filling (earthworks), including likely volumes of cut and fill and the resulting cut: fill balance. The revised report should take into account all comments/recommendations preceding/above. Include details of the mitigation measures proposed to address any potential stormwater and flooding impacts of the proposed development. 	<p>The impacts of nominated flood events during operation of the Inland Rail Project have been assessed and quantified as part of the Hydrology and Flooding Assessment, and reported in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>In addition a Surface Water Management Plan will be developed as a component of the Construction Environmental Management Plan (CEMP), which will include Stormwater Management for the Project. The Surface Water Management Plan will cover Stormwater Management and will be developed in consultation with DOR and DES prior to implementation for construction.</p>	<p>Chapter 14: Flooding and Geomorphology Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0167	State Agency	Flooding	Modelling	Although standards currently do not mention them, a risk assessment may be required for extreme events larger than 2000-year AEP. This comment applies for all sections where there are large impacts during extreme events. Mitigation measures may be necessary/proposed (including more drainage structures).	Amend the EIS documents to analyse and mitigate impacts during extreme events larger than 2000yr AEP.	Extreme events including the 2000-year, 10000-year and Probable Maximum Flood (PMF) events have been assessed to understand potential impacts and risks. The outcomes of this assessment are reported in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 21) and Chapter 14: Flooding and Geomorphology (Section 14.8). Corresponding risk mapping for extreme flood events has also been developed and is presented in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 (Sub-Appendix Q and R) as well as the digital platform.	Chapter 14: Flooding and Geomorphology Section 14.8 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 21 Appendix T2: Hydrology and Flooding Technical Report - Volume 2 Appendix Q Appendix R
145	145.0168	State Agency	Flooding		It is unclear why impacts to flood sensitive receptors are not included in Section 19.6.3.2.	Amend the EIS to include flood sensitive receptors.	Section 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS has been updated to reflect further modelling undertaken recently for the Macintyre River at the request of DPIE. The updates include a review of impacts to Flood Sensitive Receptors. Section 14.8.1 of Chapter 14: Flooding and Geomorphology has also been updated.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 17
145	145.0169	State Agency	Flooding	Scour protection	It is recommended in TMR's Bridge Scour Manual (cited in References at Section 4.4) that specialist assessment by a geomorphologist is undertaken of bridge sites in order to understand the natural scour context of the site so as to build in appropriate allowances in the bridge design for future scour. This general issue is considered particularly important for the study area because of known scour issues associated with "black soil country". There is no evidence of specialist geomorphic assessment of the existing environment at proposed bridge sites in the EIS.	Amend the draft EIS and supporting documents to include specialist geomorphic assessment and input for all proposed bridge sites. Such advice is also advisable for culverts in sensitive areas.	A Geomorphology assessment has been carried out in accordance with the requirements. The outcomes of the Geomorphology assessment are reported in Appendix H: Geomorphology Assessment and Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Appendix H: Geomorphology Assessment
145	145.0170	State Agency	Flooding	Increase in time of submergence	Table 4.2 No impact criteria is nominated for existing rail transport infrastructure and railway corridor land. As for state-controlled roads, TMR and QR require a no-worsening criterion to any existing rail infrastructure and rail corridor land i.e. no impact to the existing local immunity of the railway; no increased risk of subgrade submergence or time of submergence.	Amend the EIS to nominate appropriate impact criteria for existing rail transport infrastructure, other rail infrastructure and railway corridor land. This should be that the post development scenario can achieve a no worsening impact (on the pre-development condition) for all flood and stormwater events that exist prior to development and up to a 1% Annual Exceedance Probability (AEP). This should include at least the following flood and stormwater events: 63.2%, 50%, 39%, 20%, 10%, 5%, 2% and 1% AEP. Stormwater management for the proposed development must ensure no worsening or actionable nuisance to existing railway corridors, including rail transport infrastructure and other rail infrastructure, caused by peak discharges, flow velocities, water quality, sedimentation and scour effects. Flood storage capacity is maintained on the site with the development. Overland flow paths/hydraulic conveyance should be maintained on the site as part of the development.	Flood Impact Objectives (FIO) for a range of AEPs have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17
145	145.0171	State Agency	Flooding		The criteria (other than the water level criteria) in Table 4.2 are vague and not definitive. For example, the extreme event criteria of no unacceptable or unexpected impacts is totally subjective. Best practice is to nominate definitive criteria based on avoidance of actionable nuisance or damage.	Nominate appropriate definitive criteria in Table 4.2 for stormwater and flooding in accordance with best practice and avoid vague criteria. Amend the EIS accordingly.	Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17
145	145.0172	State Agency	Flooding		Other relevant standards/guidelines for design of transport infrastructure in Queensland are: <ul style="list-style-type: none"> Road Drainage Manual (TMR 2019) Hydrology and Hydraulic Modelling Guidelines (TMR 2019) TMR Standard Drawings (various drawings cover drainage structures) Queensland Rail Standard Drawings (various drawings cover drainage structures) Managing the Floodplain: A Guide to Best Practice in Flood Risk Management in Australia. Australian Institute for Disaster Resilience (2017) State Planning Policy State Interest Guidance Material Natural hazards, risks and resilience Flood. Department of Infrastructure, Local Government and Planning (2017) Austroads Guide to Bridge Technology Part 8: Hydraulic Design of Waterway Structures 	Amend the EIS and supporting documents as appropriate to refer to all relevant standards/guidelines concerning flooding and stormwater management.	A review of the suggested additions to the list of flood related standards and guidelines was undertaken with the following approach adopted: <ul style="list-style-type: none"> Road Drainage Manual (TMR 2019) - the 2019 version was not issued when the Project's flood impact assessment was undertaken and therefore has not been included but the 2014 version will be referenced in the revised draft EIS Chapter 14: Flooding and Geomorphology. Hydrology and Hydraulic Modelling Guidelines (TMR 2019) - this document was published after the impact assessment was undertaken and therefore has not been included in the EIS. TMR Standard Drawings (various drawings cover drainage structures) - These drawings are focused on design of drainage structures associated with roads and therefore relevant to the road drainage design Queensland Rail Standard Drawings (various drawings cover drainage structures) - These drawings are focused on design of drainage structures associated with QR rail lines and therefore relevant to the drainage design at the ARTC/QR rail interface Managing the Floodplain: A Guide to Best Practice in Flood Risk Management in Australia. Australian Institute for Disaster Resilience (2017) - has been referenced in the revised draft EIS - Chapter 14: Flooding and Geomorphology. State Planning Policy State Interest Guidance Material Natural hazards, risks and resilience Flood. Department of Infrastructure, Local Government and Planning (2017) - SPP as a whole has been included in Section 4.3 of the Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Austroads Guide to Bridge Technology Part 8: Hydraulic Design of Waterway Structures - Included in Table 14-1 of the revised draft EIS - Chapter 14: Flooding and Geomorphology. The next stages of design will further consider these standards/guidelines where relevant to the Project.	Chapter 14: Flooding and Geomorphology Table 14-1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.3
145	145.0173	State Agency	Flooding	Increase in time of submergence	The Cunningham Highway (crossing near the bridge) flood impact data indicates that with the rail alignment, the 1% AEP depth of inundation increases by 190 mm on the eastern side. The time of submergence increase to 911 hours depending on 5% AEP to 1% AEP event on eastern side, and the increase in time of submergence on the western side is about 1528 hours depending on 5% AEP to 1% AEP event.	TMRs position is that impacts resulting from the project should be no net worsening and an increase will not be accepted. Therefore, further mitigation measures (cross drainage structures) by the project is likely required to reduce this impact. Flood resilient pavements would need to be designed and constructed depending on the location. Amend the EIS accordingly.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0174	State Agency	Flooding	Increase in time of submergence	The Yelarbon-Keetah Road flood impact data indicates that with the rail alignment the 2% AEP time of submergence increases by 14 hours.	TMRs position is that impacts resulting from the project should be no net worsening and an increase will not be accepted. Therefore, further mitigation measures (cross drainage structures) by the project is likely to be required to reduce this impact. Flood resilient pavements would need to be designed and constructed depending on the location. Amend the EIS accordingly.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0175	State Agency	Flooding	Increase in time of submergence	The Gore Highway flood impact data in Table 9.45 indicates that with the rail alignment the 2% and 1% AEP time of submergence will increase by 13 and 12 hours respectively.	TMRs position is that impacts resulting from the project should be no net worsening and an increase will not be accepted. Therefore, further mitigation measures (cross drainage structures) by the project is likely required to reduce this impact. Flood resilient pavements would need to be designed and constructed depending on the location. Amend the EIS accordingly.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0176	State Agency	Flooding		Table 4.1 of the hydraulic report identifies several performance design criteria for the project, but it is unclear what Representative Concentration Pathway (RCP) is considered for climate change.	Amend the EIS to clarify which representative concentration pathway (RCP) is considered for climate change.	Climate change and the selected Representative Concentration Pathway are discussed throughout Chapter 14: Flooding and Geomorphology and Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS (within the climate change assessment of each floodplain section). For the avoidance of doubt the RCP 8.5 (2090 horizon) climate change scenario has been adopted for the Project.	Chapter 14: Flooding and Geomorphology Appendix T1: Flooding and Hydrology Technical Report - Volume 1
145	145.0177	State Agency	Flooding	Increase in peak water levels	Table 4.2 identifies flood impact objectives for the project where the change in peak levels identifies sections where up to 400 mm localised afflux is accepted. An increase in 400 mm localised afflux can be significant.	TMRs recommend 200 mm should be treated as the limit and affluxes larger than 200 mm as non-compliances and review and accept on a case by case basis. Amend the EIS accordingly.	Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0178	State Agency	Flooding	Flood immunity	Apart from the water level criteria, these criteria are not definitive, but vague. For example, the extreme event criteria of "no unacceptable or unexpected impacts" is totally subjective. Best practice is to nominate definitive criteria based on avoidance of actionable nuisance or damage.	Amend the EIS to nominate appropriate definitive criteria in accordance with best practice (for example, but not limited to, add a maximum afflux criterion for events larger than 1% AEP to Table 4.2.)	Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0179	State Agency	Flooding	Flood immunity	The afflux nominated as acceptable impacts for "roads" was not agreed to by TMR as being appropriate for state-controlled roads. TMR will insist on a no-worsening criteria to any state controlled road i.e. no impact to the local immunity of the road, no increased risk of water on the pavement and no increase in the time of submergence to the road.	Amend the EIS and project to clarify and comply with TMR's requirements for state-controlled infrastructure (road and rail) (i.e. no net worsening).	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0180	State Agency	Flooding	Mitigation measures	The EIS identifies that risks posed through climate change will be dealt with via sensitivity analysis. Climate change mitigation measures should be incorporated into the design, in particular for parts of the infrastructure that are difficult to modify later.	Amend the EIS to incorporate climate change mitigation measures within the design, rather than just as a sensitivity analysis.	The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2
145	145.0181	State Agency	Flooding	Modelling	Section 7.4.1.2 related to the January 2011 calibration event states that there was a problem in the rating curve of the gauge, but it is unclear if the recorded flows were re-rated.	Amend the EIS to confirm whether the recorded flows were re-rated as a consequence of the problem in the rating curve.	The modelling for Gowrie Creek has updated at the request of the Independent International Expert Flood Panel, and the revised draft EIS has been updated with the latest modelling results. Please refer to Section 5 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5
145	145.0182	State Agency	Flooding	Blockage of drainage structures	Section 7.9.4 relates to a sensitivity analysis for Gowrie Creek, but the report identifies that blockage was assessed in accordance with Australian Rainfall and Runoff 2016 (ARR2016). Blockage should be included in the design in accordance with ARR2016 rather than as part of the sensitivity analysis.	Recommend amending the EIS to include blocking as part of the design in accordance with Australian Rainfall and Runoff 2019.	Blockage is included in the revised Reference Design for all culverts with an assumed 25% blockage factor. Please refer to Section 5.5 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS of which states: "A blockage factor of 25% was applied to all proposed culverts based on guidelines set out in ARR 2019". In addition, a sensitivity analysis was undertaken with 0% and 50% blockage to gain an understanding of potential impacts on Flood Sensitive Receptors for these additional blockage scenarios.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5.5
145	145.0183	State Agency	Flooding		Section 8.6.3.3 identifies the impacts of the project on state-controlled roads. Table 8.30 indicates that for 1% AEP the depth of inundation for Toowoomba-Cecil Plains Road (a state-controlled road) increases by 70 mm and time of submergence increases by 1.1 hours (on top of top of 330 mm existing inundation). This impact is not considered negligible and is not acceptable to TMR. Additionally, afflux maps in the Appendix seem to suggest larger impacts in the order of 500 mm are observed at the crossing of Inland Rail with Toowoomba-Cecil Plains Road and is not clear if the proposed intersection is an overpass (rail over road or road over rail).	Consistent with TMRs previous advice, TMRs position is that impacts resulting from the project should be no net worsening and a 70 mm increase will not be accepted. Therefore, further mitigation measures (cross drainage structures) by the project is likely required to reduce this impact. Amend the project and EIS accordingly. Flood resilient pavements would need to be designed and constructed depending on the location. Additionally, further detail and information (afflux maps, drainage structure info, etc) is required to understand this impact for all events including extreme events.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0184	State Agency	Flooding	Modelling	Section 9.3.5 states that calibration for the hydraulic model was based upon comparisons made between hydrographs at key gauge locations as well as level and depth comparisons at both anecdotal flood markers and surveyed floodmarks. Further calibration and validation are likely required, including further comparison to floodmarks and anecdotal evidence (in particular for location 12) to further ensure the credibility of the models.	It is recommended that further calibration/validation be undertaken in particular for comparison to floodmarks and anecdotal evidence for locations e.g. flood marker 12 which have poor matches. Amend the EIS accordingly.	The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7.6
145	145.0185	State Agency	Flooding	Increase in time of submergence	The Millmerran-Leyburn Road flood impact data indicates that with the rail alignment the 2% AEP depth of inundation will increase by 60 mm on the eastern side of crossing and decrease by 440 mm on western side of crossing. Similarly, the time of submergence increases by 3 hours on the eastern side and decreases by 4 hours on western side. However, for a 20% AEP event, the time of submergence increases by 40 hours. An increase in velocity is also identified and will need mitigation.	TMRs position is that impacts resulting from the project should be no net worsening and an increase will not be accepted. Therefore, further mitigation measures (cross drainage structures) by the project is likely required to reduce this impact. Flood resilient pavements would need to be designed and constructed depending on the location. Additionally, further detail and information (afflux maps, drainage structure info, etc) is required to understand this impact for all events including extreme events.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0186	State Agency	Flooding	Blockage of drainage structures	It is possible blockage played a role during historical events and might help with calibration.	For noting and consideration in the EIS.	Noted and ARTC considered this guidance when updating the Gowrie Creek flood modelling for the revised draft EIS. The flood modelling conducted for the Border to Gowrie Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Chapter 14: Flooding and Geomorphology Section 14.4 and the supporting technical reports. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Chapter 14: Flooding and Geomorphology Section 14.4
145	145.0187	State Agency	Flooding		The Millmerran-Inglewood Road flood impact data indicates that with the rail alignment the 2% AEP depth of inundation will increase by 10 mm. However, for a 20% AEP event, the time of submergence increases by 5 hours. The afflux maps in Appendix (Figure D-5E) seem to show larger impacts in the order of 50 to 100 mm observed just upstream of the crossing of project alignment with Millmerran Inglewood Road due to the colour palette used for the maps. As in TMRs other comment, it is not clear if the proposed intersection is an overpass (rail over road or vice versa). Similarly, the afflux maps in Appendix D (Fig. F4-E) seem to show larger impacts in the order of 200 to 500 mm observed at Millmerran-Inglewood road at locations other than those reported.	TMRs position is that impacts resulting from the project should be no net worsening and an increase will not be accepted. Therefore, further mitigation measures (cross drainage structures) by the project is likely required to reduce this impact. Flood resilient pavements would need to be designed and constructed depending on the location. Amend the EIS to clarify if larger impacts are the case and provide further detail and information (afflux maps, drainage structure info, etc) to allow TMR to understand this impact for all events including extreme events. This should include any potential mitigation measures required to reduce the impact. Amend the project and EIS accordingly.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0188	State Agency	Flooding		Afflux Maps in Appendix J (Fig. J4-E) seem to show significantly larger impacts in the order of 500 mm observed at the Cunningham Highway (south of proposed levee) and Yelarbon Kestah Road at locations, more than those reported. These impacts on the Cunningham Highway are not considered negligible and are not acceptable to TMR. Also, it is not clear how if the proposed levee will interact with the Cunningham Highway (levee over road or vice versa).	Amend the EIS to provide additional information (afflux maps, drainage structure info, etc) to understand the impacts for all events including extreme events. This should include any required mitigation measures including additional drainage structures etc.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0189	State Agency	Flooding	Modelling	Inglewood-Texas Road and Texas-Yelarbon Road (State-controlled roads) are listed as floodplain infrastructure within the Macintyre Brook floodplain in Section 3.2 of Appendix Q1. Section 16 of Appendix Q1 contains the floodplain analysis for Macintyre Brook and it does not include any data or references to these roads.	detailed design.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts to State-controlled roads' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of road, including a corresponding summary Table itemising all exceedances associated with the impacted sections of road. A condensed summary of flood impact objective exceedances at State-controlled roads is also provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. ARTC will continue conversations with DTMR in relation to mitigation for flood impacts to State Controlled Roads, for further consideration during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5-17
145	145.0190	State Agency	Flooding		The EIS refers to established rail lines as 'Existing QR Rail Line'. There is more than one existing QR Rail Line in the Project area and therefore it is difficult to determine which line is being referred to.	Amend the EIS to refer to existing QR rail lines by their name.	Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for State-controlled roads. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures. All changes on State-controlled roads exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. 145	145.0193	State Agency	Groundwater		It is unclear if the absence of a Groundwater Dependent Ecosystem (GDE) means the area was surveyed and no GDEs were found or that the GDE has no record for that area.	Update the EIS to clarify what the Atlas is indicating to the study and amend the Appendix and relevant EIS Chapter accordingly.	<p>Revised draft EIS Chapter 15: Groundwater Section 15.5 discusses the approach for how GDEs were identified.</p> <p>As outlined in Section 15.5.6 of Chapter 15: Groundwater, the BoM has developed a Groundwater Dependent Ecosystems Atlas (GDE Atlas) as a national dataset of Australian GDEs and potential GDEs which was used to identify potential GDEs for the groundwater impact assessment (see Appendix U: Groundwater Technical Report Section 4.7.6 and 9). The GDE Atlas contains information about three types of ecosystems:</p> <ul style="list-style-type: none"> ► Aquatic ecosystems that rely on the surface expression of groundwater—this includes surface water ecosystems that may have a groundwater component, such as rivers, wetlands, and springs. Marine and estuarine ecosystems can also be groundwater dependent, but these are not mapped in the Atlas. ► Terrestrial ecosystems that rely on the subsurface presence of groundwater—this includes all vegetation ecosystems. ► Subterranean ecosystems—this includes cave, karst and aquifer ecosystems. No subterranean GDEs have been mapped within 5 km of the groundwater impact assessment area. <p>The groundwater impact assessment area for GDEs was expanded to 5 km from the Project as a conservative approach. Additional details are provided in Appendix U: Groundwater Technical Report, Section 4.7.6. Additional details on GDEs identified within the groundwater impact assessment area, in relation to ecological function and surface water quality are discussed in Chapter 11: Flora and Fauna and Chapter 13: Surface Water, respectively.</p> <p>The GDE Atlas indicates that there are no high potential aquatic GDEs located within 5 km of the Project alignment. Areas where potential aquatic GDEs are identified within 5 km are outlined in Chapter 15: Groundwater Section 15.5.6. The location of potential aquatic GDEs in relation to the Project footprint and groundwater assessment area are shown in Figure 15-22a-d and 15-23a-d (Chapter 15: Groundwater).</p>	<p>Chapter 15: Groundwater Section 15.5.6</p> <p>Figure 15.22a-d</p> <p>Figure 15.23a-d</p> <p>Appendix U: Groundwater Technical Report</p> <p>Section 4.7.6</p> <p>Section 9</p>
145	145.0194	State Agency	Groundwater	Survey effort/field investigation data	It is unclear whether one round of water sampling from two years ago is enough to satisfy the requirements of ToR.	Office of the Coordinator-General to confirm if one round of water sampling from 2 years ago is sufficient to satisfy the requirements of the ToR.	<p>Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 to 15.4.4). Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. The groundwater management and monitoring program (GMMP) has been updated as part of the revised draft EIS to reflect to reflect the current bore network and ongoing baseline monitoring program and the requirements for each Project stage (Chapter 15: Groundwater Section 15.4.2, Table 15.3 and Section 15.7.3).</p>	<p>Chapter 15: Groundwater Section 15.4.2</p> <p>Section 15.7.3</p> <p>Table 15-3</p>
145	145.0198	State Agency	Noise and Vibration	Operational rail noise	It is unclear if the operational noise assessment considered the scenario D where one train is waiting on the passing loop with its engines running, plus another train is on the mainline also with its engines running.	Update the EIS to confirm combined noise levels were modelled where receptors are present.	<p>Section 12.1 of Appendix W: Noise and Vibration Assessment - Railway Operations notes that the assessment of railway noise levels included the contribution of railway operations at crossing loops. A review of the predicted noise levels at the sensitive receptors determined the noise level contribution from the crossing loops were up to L₉₀ (24hour) 40 dBA and SEM of 67 dBA. The predicted noise levels from the crossing loops were within the established criteria and are lower than the railway noise levels from the daily train passby events on the main line (4.5 m from the crossing loop), and hence are not a significant influence on the overall daily predicted noise levels and SEM at the sensitive receptors.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 12.1</p>
145	145.0199	State Agency	Noise and Vibration	Operational rail noise	Section 11.6 states that: "when the trains depart from crossing loops the locomotives are required to initially operate under a high notch setting from a standing position. This can cause higher noise emissions but would not be expected to influence the noise levels over the 15-hour daytime and 9-hour night-time assessment periods. This statement is confusing and somewhat contradictory. Recommended that the EIS revisit and more accurately reflect the perceived noise by sensitive receptors, especially at night.	Update the EIS to more accurately reflect the perceived noise by sensitive receptors, particularly at night.	<p>The revised draft EIS has been updated to address potential operational rail impacts from noise and vibration at the sensitive receptors along the Project alignment in accordance with Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019)(Section 4, 6, 10 of Appendix W: Noise and Vibration Assessment - Railway Operations) The criteria in the Interim Guideline includes both Single Event Maximum (SEM) and time average noise level (L₉₀ (24 hour) for residential receivers. If the criteria are exceeded, reasonable and practicable mitigation options should be implemented.</p> <p>In the same way that short-term increases in rail noise don't influence the noise levels over a 15 and 9 hour period, they won't influence noise levels when averaged over a 24 hour period. It should also be noted that the Interim Guideline does not require consideration of background noise levels or the time of day the noise is impacting residential receivers. There is no requirement to reflect perceived impacts on the community in the Interim Guideline. Perception of noise and reactions to noise vary from person to person and therefore it's not possible for ARTC to predict individual's reaction to noise. However, Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018') , further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 10</p> <p>Section 11</p>
145	145.0200	State Agency	Traffic and Transport		TMR notes that the Traffic and Transport Impact Assessment (TIA), Pavement Impact Assessment (PIA) and Safety Audits/Assessments are not comprehensive or conclusive as ARTC has had to make assumptions about haulage routes given a construction contractor has yet to be appointed. In recognition of this limitation ARTC has proposed to update the Traffic Impact Assessment when the project contractors are appointed, and final traffic generation is clearer in accordance with TMRs GTIA. For example, Section 18.4.1.1 states "The TIA may be finalised when project contractors are appointed and the final traffic generation is clearer". TMR does not object to this approach but will need to be confident the ARTC is legally obligated through statutory powers/laws to update the TIA, PIA and Safety Audit/Assessment and then undertake necessary mitigation works, and fulfil its various other commitments (and additional commitments yet to be determined) in the OEMP to protect TMRs State interests. This is particularly important because TMR does not have the power to require ARTC to update the TIA, PIA and Safety Audit/Assessment through the Transport Infrastructure Act 1994.	TMR recommend that ARTC continue to engage with TMR early in the preparation and review of a more detailed Traffic Impact Assessment, Road Pavement Impact Assessment and Safety Audit/Assessment and resultant mitigation measures. Early and continued engagement will ensure a Safe System approach to the delivery of the Inland Rail project that does not detriment the state-controlled road network. The requirement to prepare and review a more detailed Traffic Impact Assessment, Road Pavement Impact Assessment and Safety Audit/Assessment should be added to those requirements already listed in the Traffic, Transport and Access part of the draft Outline Environmental Management Plan. This requirement should clearly articulate that ARTC will consult and work with TMR, and ultimately obtain TMRs endorsement for the TIA and pavement impact assessment (PIA).	<p>The pavement impact assessment and road safety assessment has been updated in accordance with GTIA requirements and is documented in Section 5.6 of Appendix AA: Traffic Impact Assessment.</p> <p>ARTC will continue to engage with TMR and other road controlling authorities through the subsequent stages of the Project to agree on appropriate mitigation measures through the construction of the Project.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.6</p>
145	145.0201	State Agency	Traffic and Transport		<p>The TIA report indicates that extensive consultation has been undertaken with the following stakeholders and associated consultation method:</p> <ul style="list-style-type: none"> ► NSW Roads and Maritime Services (RMS): RFI, Telephone and emails ► QLD Department of Transport and Main Roads (TMR): Request for information (RFI), meetings and emails ► Goondiwindi Regional Council: RFI ► Inverell Shire Council: RFI ► Toowoomba Regional Council: RFI and meetings ► Clarence Valley Council: RFI ► Moree Plains Shire Council: RFI ► Gwydir Shire Council: RFI <p>The TIA indicates that the consultation was used as an opportunity to confirm the acceptability of:</p> <ul style="list-style-type: none"> ► The proposed TIA process ► List of potentially impacted assets included in the assessment ► Guidelines, manuals and policies adhered to for the assessment ► Assumptions (such as traffic growth rates, assumed base volumes, etc.) ► Proposed mitigation measures. <p>It is unclear from the TIA whether all affected road authorities were consulted in preparing the TIA. Although the TIA states the type of information requested from each stakeholder, it is still unclear whether the information requested was actually provided, what information was ultimately provided, if there were any gaps in the provided information, how were these gaps resolved and whether any assumptions had to be made about the provided information.</p>	<p>It is suggested that clarification be provided regarding the outcomes of the consultation whether if there were any agreement/requirements stipulated by TMR, RMS and councils regarding the study area, impact assessment process, key issues to be addressed, performance metrics, mitigation and assumptions for the TIA. It is also suggested that the TIA be updated to elaborate further on the type of information received and any gaps in information which had to be resolved.</p>	<p>Appendix E: Consultation Report details the consultation that has been undertaken with all relevant stakeholders potentially impacted by the Project. Updates have been made to Appendix E: Consultation Report to detail specific consultations undertaken, information requested and provided, gaps and any assumptions made on the information provided for use in the traffic assessment.</p> <p>Appendix AA: Traffic Impact Assessment Section, 1.3.1 details the outcomes of the stakeholder consultation conducted with all stakeholders.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 1.3.1</p> <p>Appendix E: Consultation report</p>

145	145.0202	State Agency	Traffic and Transport	Baseline/ background sampling	<p>The TIA report also indicates that existing traffic volume data was obtained for all impacted local government roads (LGRs) and state-controlled roads. The base year of the TIA assessment is 2021. Traffic data was sourced from a combination of sources including from TMRs detailed segment analysis reports, Queensland Globe, Traffic Viewer, Logan Motorway and Toowoomba Second Range Crossing data, adopting volumes from nearby adjacent roads, traffic surveys and assumed volumes. The TIA report indicates that LGR traffic volumes were estimated based on 7-day 24-hour traffic surveys, volumes obtained from relevant road authorities and assumptions where traffic information is not available. The TIA indicates that 7-day 24-hour traffic surveys were conducted on the following LGRs:</p> <ul style="list-style-type: none"> Goondiwindi Regional Council Gwydir Shire Council Moree Plains Shire Council <p>The TIA indicates that traffic data roads were obtained from the relevant authority:</p> <ul style="list-style-type: none"> Department of Transport and Main Roads Goondiwindi Regional Council Toowoomba Regional Council <p>Traffic volumes were assumed for the roads in the following local government area:</p> <ul style="list-style-type: none"> Clarence Valley Council Goondiwindi Regional Council Gwydir Shire Council Inverell Shire Council Moree Plains Shire Council Toowoomba Regional Council <p>The TIA indicates that data obtained from RMS Traffic Viewer were used to estimate traffic volumes on the following roads:</p> <ul style="list-style-type: none"> Roads and Maritime Services Clarence Valley Council Inverell Shire Council <p>The TIA indicates the following assumptions were made in terms of LOS thresholds for the impacted roads:</p> <ul style="list-style-type: none"> Queensland Globe data was obtained for the following roads: Transport and Main Roads: <p>The TIA indicates that data obtained from volumes were adopted from adjacent surveyed link road or adjacent TMR detailed segment and weekly report data:</p> <p>TMRs review indicate that information was obtained for all LGR and SCR links expected to be impacted and to be used as primary construction transport routes. It was found in the TIA that traffic volume base year dates of all sources of information were for different years. It is unclear from the TIA report how the data from different years were used to estimate base year 2021 traffic and clarification is required.</p>	<p>The EIS (TIA) should use the most up to a date and latest traffic data. Clarification is required explaining what traffic data has been obtained from Queensland Globe, how they have been used in the TIA and why the TMR detailed segment report data was not used instead. Clarification is required on how the assessment has taken into account the lower traffic demand on the road network in 2020 and 2021 given the COVID-19 situation. Clarification is required on how traffic volume data for the Logan Motorway were used in the TIA. Clarification is required on how traffic data from the Toowoomba Second Range Crossing were used in the TIA. It is unclear from the TIA the basis of the road hierarchy and LOS thresholds defined per road. LOS thresholds were not defined for highway class links. Clarification is required in the TIA report. It is unclear from the report how traffic volume data obtained from 7-day 24-hour counts relates to AADT as it is not a 365-day count. Clarification is also required describing how the data obtained from the 7-day 24-hour counts were converted into AADT and representative peak hour volumes. It was found in the TIA that the traffic volume data obtained were from different years. Clarification is required relating to how the data from different years were used to estimate base year 2021 traffic and clarification is required. Clarification is required on the rationale and how the assumed traffic volumes were estimated for the impacted roads. Amend the EIS (TIA) to respond to these issues accordingly.</p>	<p>Appendix AA: Traffic Impact Assessment, Section 2.4.2 provides an overview of the traffic data collected and used for the purpose of determining intersection volumes (used for the turn warrants assessment) at SCR intersections and outlines the existing volumes for all intersections. As part of the traffic data collection task, traffic volumes have been collected along the Project construction routes over the recent years including:</p> <ul style="list-style-type: none"> SCR census-based traffic volumes Local Government databases Traffic signal data (from DTMR STREAMS software) Link-based traffic volumes tube counts conducted in: <ul style="list-style-type: none"> September 2019 September/October 2020 March 2021 March 2022. Intersection turning counts conducted in: <ul style="list-style-type: none"> March 2021, around Brookstead March 2022, for the wider network May 2022, for diversion locations. <p>In instances where traffic data was not available from road controlling authorities or traffic surveys conducted, conservative turning volume assumptions have been adopted using the available road link volumes. This methodology has been outlined in a technical memo to TMR which is provided in Appendix BP of Appendix AA: Traffic Impact Assessment. For the intersections where base traffic turning volumes were not available, the Intersection assessment will be first undertaken by comparing two 'Base Traffic Scenarios' and then the 'worst case' scenario is considered for delay impacts.</p> <p>During detailed design, once the construction routes are finalised with a construction contractor, it is recommended that traffic counts be obtained for updating the traffic analysis where recent data (i.e. previous 5 years) is not available to accurately determine impacts of final Project alignment, construction program, methodology, routes and vehicle volumes.</p> <p>Details about the Construction Works stage of the Project are provided in Appendix AA: Traffic Impact Assessment Section 4.1.1. This provides a simple overview of traffic generation relevant for the TIA, with further detailed information about the Construction Works stage provided in revised draft EIS Chapter 5: Project Description, Section 5.46.</p> <p>The peak period has been determined by overlaying the construction program spatially and temporally across the Project study area to determine individual link and movement peak volumes. Appendix AA: Traffic Impact Assessment, Section 4.1.1 and 4.2 details the traffic generation and distribution of construction trips.</p> <p>Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA. LOS provides a qualitative index while delay provides the quantitative indication of impacts. Section 5.5 defines the performance thresholds for assessment of traffic impact developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a), GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017) as:</p> <ul style="list-style-type: none"> An impact occurs if construction and operational traffic generated by the development exceeds five percent of the existing AADT on the road Section LOS C can be considered the minimum standard on rural roads. However, LOS D may be accepted in case of event traffic. LOS E should be considered the limit of acceptable for urban area operation and remedial works would be needed if LOS F would otherwise result. <p>Classifications for LOS that have been used in this capacity assessment have been provided in Section 5.5 of Appendix AA: Traffic Impact Assessment. Refer to Section 5.5 for the HCS highway facility and multilane facility, respectively.</p> <p>The traffic data used within the revised draft EIS is the most up to date data obtained from road controlling authorities at the time of the assessment, and assumptions made were provided to these authorities at multiple stages during the draft EIS for review.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.46</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4.2</p> <p>Section 4.1.1</p> <p>Section 4.2</p> <p>Section 5.5</p> <p>Appendix BP</p>
145	145.0203	State Agency	Traffic and Transport		<p>The TIA report indicates that the following SCR (TMR) intersections will be impacted by the Projects construction turn movements:</p> <ul style="list-style-type: none"> Transport and Main Roads: 88 intersections Goondiwindi Regional Council: 15 intersections Toowoomba Regional Council: 18 Intersections Roads and Maritime Services: 16 intersections Clarence Valley Council: 10 intersections Moree Plains Shire Council: 1 Intersection Gwydir Shire Council: 2 intersections <p>The TIA report indicates that the following SCR (TMR) intersections are potentially impacted by the Projects operation:</p> <ul style="list-style-type: none"> Goondiwindi Regional Council: 23 intersections Toowoomba Regional Council: 32 intersections Gwydir Shire Council: 2 intersections Moree Plains Shire Council: 1 Intersection <p>It is unclear from the TIA report what type of Intersection information was obtained from each controlling authority such as turn movement counts and their durations, vehicle classifications, etc., and whether traffic surveys were conducted. Clarification is required elaborating on the type of information obtained for each impacted intersection. TMRs review was unable to confirm the veracity of the Intersection volume data used for the Intersection analysis in the TIA.</p>	<p>It is unclear from the TIA report what type of traffic data for intersections have been used for the assessment of Intersection performance. TMRs review was unable to confirm the veracity of the Intersection volume data used for the Intersection analysis in the TIA. Clarification is required in the TIA. Amend the TIA accordingly.</p>	<p>The traffic data used within the revised draft EIS is the most up to date data obtained from road controlling authorities at the time of the assessment, and assumptions made were provided to these authorities at multiple stages during the development of the revised draft EIS.</p> <p>Details about the Construction Works stage of the Project are provided in Appendix AA: Traffic Impact Assessment Section 4.1.This provides a simple overview of traffic generation relevant for the TIA, with further detailed information about the Construction Works stage provided in revised draft EIS Chapter 5: Project Description, Section 5.6.</p> <p>As previously described in Section 2.3.1 of Appendix AA: Traffic Impact Assessment, the road network utilised by construction traffic has been split into 526 road links with unique traffic volumes, consolidated into 267 road sections accounting for most road sections being used in both directions. These road links indicate sections of roads with consistent traffic volumes, taking into account where background traffic volumes change and where construction traffic turn on and off the road.</p> <p>Appendix AA: Traffic Impact Assessment Table 2.5 provides details relating to the source of the background traffic data. Background traffic volumes for links were obtained from a variety of sources, including road controlling authorities, Intersection counts and link counts. Table 2.5 provides a summary of the data sources used for the purpose of the TIA (Section 2.4.1 Appendix AA: Traffic Impact Assessment).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.3.1</p> <p>Section 2.4.1</p> <p>Section 4.1</p> <p>Table 2.5</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0205	State Agency	Traffic and Transport		<p>The TIA report presents the traffic generated based on the quantities of construction materials, workforce and equipment, with buffer factors applied to each transportation task to allow for additional journeys that may be required as a consequence of factors such as material quality compliance issues, breakages etc. The total number of trips by construction activity are summarised in the TIA Table 5.14 (see submission). The TIA assumed the following construction schedule and construction activities in order to establish development generated traffic (see Table in submission). Clarification is required whether the construction program includes activities such as internal road construction/external access upgrade work and site preparation works. The TIA mentions that although some materials might be delivered prior to construction start and end dates. However, it was assumed that delivery and construction start and end dates would occur during the same time. Clarification is required to confirm the proposed schedule for delivery of materials and start of construction. Clarification is required regarding the arrival patterns of work force and material/equipment and how overlapping peaks were taken into consideration. The TIA report identified the impacted roads and intersections for the transport of construction material and equipment refer to Section 2.1 of this table. The TIA assumed the locations of the following:</p> <ul style="list-style-type: none">▶ Borrow sites for borrow material at the following locations and proposed use:<ul style="list-style-type: none">▶ Cemetery Road Structural Fill▶ Moorroobie Lane Structural▶ Woodcocks Road Structural▶ Taits Red Ridge Structural▶ Texas-Yelarbon Road Structural▶ Bybera Road Structural▶ Fosters Road Structural▶ Mosquito Road Structural▶ Millmerran-Inglewood Road Structural▶ Kooroongarra Andersons Road, Canning Creek Structural▶ Kooroongarra Road Structural▶ Heckendorf's Road Structural Fill▶ Ballast material will be sourced from the following quarries:<ul style="list-style-type: none">▶ Inglewood Quarry▶ Captains Mountain Quarry (Millmerran)▶ Quarry Road Bland Quarries Pittsworth▶ Wellcamp Quarries▶ Holcim Australia Toowoomba Quarry▶ Precast concrete and batch plant facilities <p>The TIA mentions that a concrete batch plant and precast facility has been proposed. For the purpose of the TIA, it is assumed that all precast material for the bridges will be supplied from the proposed Precast Concrete Facility and Concrete Batch Plant North. Two locations have been identified for the temporary siting of a precast concrete facility and concrete batch plant for the Project. Whilst two locations have been nominated, only one plant is expected to be necessary to supplement the supply of concrete from established plants. The proposed locations are immediately north and south of the Condamine River floodplain outside the 1% AEP flood line. The locations are: All precast elements for culvert construction are assumed to be supplied from Toowoomba. The remaining in-situ concrete required along the alignment will be sourced from existing concrete suppliers (Holcim, Roda and Humes) within supply distance to the Project. Construction water will be sourced from the following supplies for each activity:</p> <ul style="list-style-type: none">▶ 2536 ml for earthworks▶ 15.0 ml for the temporary batching and precast concrete plant (water requirement for concrete supplied by existing concrete/precast concrete suppliers not included)▶ 2.16 ml for trackwork The TIA mentions that water will be supplied to various points along the alignment by water trucks. Origin locations where water will be transported from, have been provided in the TIA, Appendix N, Rail sleepers The TIA has assumed that ARTC will supply all of the concrete sleepers. The concrete sleepers are assumed to originate from NSW (town of Grafton) and be distributed via the road network to various laydown areas. Two overarching transport routes have identified as below:▶ North of Millmerran utilises the Pacific, Warrego and Gore Highways, including the new Toowoomba Second Range Crossing▶ South of Millmerran utilises Summerland Way and the Bruxner Highway <p>Proposed construction transport routes for sleepers are illustrated in Appendix M of the TIA. Rail tracks The TIA assumes that rail tracks will be transported by rail to laydown areas. Clarification is required how rail will be transported from origin to destination for the new gauge construction as this is not mentioned in the TIA report. Workforce The TIA mentions that accommodation demands in the northern extent of the project are expected to be sufficiently met by established accommodation in Toowoomba, Pittsworth and Southbrook. South of Pittsworth, the TIA indicates that worker camps would be optimally located in the proximity of the townships of Yelarbon, Inglewood and Millmerran to accommodate the construction workforce. Each facility will be required to hold 300 staff during the peak between weeks 50 and 70. The average occupancy of the non-resident workforce accommodation outside of the peak period will be approximately 150 people per facility. It was assumed that workers will travel to the sites in light vehicles. The TIA mentions that operational traffic would be minimal and irregular to assess. Traffic would consist of will consist of low vehicle movements to/from depots and transportation of maintenance material within the rail corridor. Clarification with sufficient justification is required regarding the expected operational vehicles likely to be generated during a typical peak hour. TMRs review was unable to determine whether sufficient information is available to determine both construction and operational development generated traffic.</p>	<p>Clarification is required to confirm the proposed schedule for delivery of materials and start of construction. Clarification is required how rail will be transported from origin to destination for the new gauge construction as this is not mentioned in the TIA report. The TIA mentions that operational traffic would be minimal and irregular to assess. Clarification with sufficient justification is required regarding expected operational activities and the expected operational vehicles likely to be generated during a typical peak hour. The TIA does not appear to provide much information regarding the worker transport routes, workforce traffic volumes by route and the mode of travel to be used from population centres of accommodation to work site. Any borrow pits intended to be utilised for TMR works are to be TMR/local authority approved. Amend the EIS, TIA and Chapter 22 Outline Environmental Management Plan accordingly.</p>	<p>Details about the Construction Works stage of the Project are provided in Appendix AA: Traffic Impact Assessment Section 4.1.1. This provides a simple overview of traffic generation relevant for the TIA, with further detailed information about the Construction Works stage provided in Chapter 5: Project Description, Section 5.6.</p> <p>The peak period has been determined by overlaying the construction program spatially and temporally across the Project study area to determine individual link and movement peak volumes. Appendix AA: Traffic Impact Assessment Section 4.1 details the traffic generation and distribution of construction trips.</p> <p>Appendix AA: Traffic Impact Assessment is only for the construction activities, as defined in Section 1.2.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6</p> <p>Appendix AA Traffic Impact Assessment</p> <p>Section 1.2</p> <p>Section 4.1</p> <p>Section 4.1.1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0206	State Agency	Traffic and Transport		<p>The TIA determined the peak periods and peak traffic loads based on the following parameters and assumptions:</p> <ul style="list-style-type: none"> Working hours for general construction activities: <ul style="list-style-type: none"> Monday to Friday *6.30 am to 6 pm Saturday 6.30 am to 1 pm No work planned on Sundays or public holiday Track possessions will proceed on a 7-day/24-hr calendar basis, subject to agreement with QR. Workforce on site is estimated to peak at 900 full time equivalents between weeks 50 and 70. <p>The average number of full-time equivalent workforce on site across the full construction period is over 400 people. From TMRs review, it was found that the peak periods were estimated with consideration of the following:</p> <ul style="list-style-type: none"> An equal average monthly distribution of total construction traffic loads across the construction duration in number of months were assumed in the TIA. This was done to determine an average monthly traffic volume applicable to each construction activity throughout the delivery timeframe. An equal average distribution of monthly construction traffic loads per day was determined by dividing the average monthly traffic load by 22 working days in a month. This was done to determine an average daily traffic volume applicable to each construction activity throughout the delivery timeframe. An equal average distribution of daily construction traffic loads per day was determined for each construction activity by dividing the average daily traffic load by 12 working hours in a day. This was done to determine an average hourly traffic volume applicable to each construction activity throughout the delivery timeframe. The peak period (peak daily and hourly construction traffic) were then estimated by overlapping all construction activities and the distribution of average daily traffic loads across the construction schedule. This was done to determine the peak period (duration in the construction schedule) where construction traffic will be the highest. <p>The TIA indicates that peak delivery movements for different construction activities will likely not coincide with each other as the start date of construction activities are typically reliant on the end date of others. It is unclear from TMRs review how micro fluctuations in peaking would be accounted for by using an average distribution and sequential construction schedule. Clarification and sufficient justification are required as the construction schedules is anticipated to overlap i.e. concurrent construction activities. Furthermore, it was assumed that delivery and construction start, and end dates would occur during the same time. The design peak hour during construction was not indicated in the TIA. It is unclear from TMRs review how the peak of 900 workers during weeks 50 and 70 were taken into account as the TIA assumed equal average distribution of work force generated traffic across the entire construction schedule. Clarification is required regarding the peak number of workers in the design peak hour, arrival patterns of the work force and material/equipment and how overlapping peaks were taken into consideration. The work force usually arrives on site before equipment/material arrives on site and leaves the site after material supply. Clarification is required as TMRs review was unable to determine whether workforce traffic peaks were adequately determined. TMRs review was unable to confirm if both construction and operational development generated traffic in the peak periods has been adequately addressed in the TIA. It is also unclear from the TIA what is the adopted design peak period (month, day and hour) based on the construction traffic profile in the TIA. It is suggested that a graph be included in the TIA illustrating the overlapping activities, schedules and generated traffic in order to identify the peak periods.</p>	<p>Clarification is required regarding the peak number of workers in the design peak hour, arrival patterns of the work force and material/equipment and how overlapping peaks were taken into consideration. It is also unclear from the TIA what is the adopted design peak period (month, day and hour) based on the construction traffic profile in the TIA. It is suggested that a graph be included in the TIA illustrating the overlapping activities, schedules and generated traffic in order to identify the peak periods. Clarification and sufficient justification are required as the construction schedules is anticipated to overlap i.e. concurrent construction activities. Furthermore, it was assumed that delivery and construction start, and end dates would occur during the same time. Amend the EIS (/TIA) to respond to these issues accordingly.</p>	<p>The peak period has been determined by overlaying the construction program spatially and temporally across the Project study area to determine individual link and movement peak volumes. Appendix AA: Traffic Impact Assessment Section 4 details the traffic generation and distribution of construction trips.</p> <p>Appendix AA: Traffic Impact Assessment Section 4.3.1 provides the peak construction trips per year across all links. Section 4.3.2 provides the peak construction trips per day across all links.</p> <p>For each assessment area required by the GTIA the appropriate peak impact period (month, day and hour) has been used. For example road link capacity is daily volumes, whereas vehicle minutes delay assessment uses peak hour.</p>	<p>Appendix AA Traffic Impact Assessment</p> <p>Section 4.3.1</p> <p>Section 4.3.2</p>
145	145.0207	State Agency	Traffic and Transport		<p>The TIA report identified the use of applicable K-values from the Road Planning and Design Manual (RPDM), Chapter 5: Traffic Parameters and Human Factors pertaining to different road types. These K-values were applied to base AADT volumes to estimate base 30th highest hourly design volumes to account for seasonal fluctuation. This was done for all road links forming part of the construction routes. The K-values considered for the roads consist of:</p> <ul style="list-style-type: none"> Rural arterials = K-value of 0.15 Outer urban arterials = K-value of 0.12 In the absence of existing traffic count data for a particular road link, the use of generic Kvalues from the RPDM is considered acceptable. However, traffic count data were collected for the study road links and intersections, which can be used to determine the appropriate Kvalues for each link and intersection. 	<p>It is suggested to use the existing observed traffic volume count data be used to estimate the appropriate K-values for each impacted link and intersection. Applying generic global K-values is not representative of local traffic conditions. Clarification is required. Update TIA with revised Kvalues.</p>	<p>Appendix AA: Traffic Impact Assessment, Section 2.4 discusses the analysis within the TIA being updated to adopt the peak hour factor from the nearest DTMR AADT site, using the DTMR hourly summary data available through the Queensland Government Open Data Portal. This approach was adopted as many intersection and link counts had very low traffic volumes. It was therefore determined using the intersection counts to determine peak hour factors would be inappropriate due to significant fluctuation between days of the week. An analysis was undertaken of the intersection and link counts with higher traffic volumes across the study area and the peak hour factor was compared with that of the closest DTMR AADT site. A summary of this analysis is provided in Appendix AA: Traffic Impact Assessment Table 2.7. The analysis found that the closest DTMR AADT site could reasonably be used to represent the daily variation in the area.</p> <p>Appendix AA: Traffic Impact Assessment Table 2.8 provides details on which DTMR AADT site was used for each road link and its corresponding AADT growth rate, HV growth rate and peak hour factor for the AM and PM peaks in both directions.</p> <p>No global k-values are used in the revised TIA.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4</p> <p>Table 2.7</p> <p>Table 2.8</p>
145	145.0208	State Agency	Traffic and Transport		<p>The TIA report does not describe the trip distribution methodology and how directional splits by construction activity were estimated in the peak periods (daily and peak hour). Further clarification is required in the TIA report.</p>	<p>Clarification is required on trip distribution and how directional splits of peak traffic (daily and peak hour) were estimated for each construction activity i.e. workers and general construction traffic movements. Amend the EIS (/TIA) accordingly.</p>	<p>The peak period has been determined by overlaying the construction program spatially and temporally across the Project study area to determine individual link and movement peak volumes. Appendix AA: Traffic Impact Assessment, Section 4.1 and 4.2 details the traffic generation and distribution of construction trips.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 4.1</p> <p>Section 4.2</p>
145	145.0209	State Agency	Traffic and Transport		<p>The TIA indicates that the development would generate the following peak daily construction traffic volumes distributed along the LGR and SCR road network for each assessment year:</p> <ul style="list-style-type: none"> 9592 vehicles/day in year 2021 13,922 vehicles/day in year 2022 8882 vehicles/day in year 2023 7275 vehicles/day in year 2024 4782 vehicles/day in year 2025 3031 vehicles/day in year 2026. <p>The estimated daily and peak traffic volumes indicate that the highest traffic demand occurs in year 2022, which aligns with the peak workforce (900 workers) expected in weeks 50 and 70, according to the construction start date of 2/1/2021.</p>	<p>nil.</p>	<p>Appendix AA: Traffic Impact Assessment, Section 2.4.1 discusses the background traffic data sources. Traffic data base year varies from 2006 – 2022 due to different sources. It is noted that DTMR data was primarily sourced from 2019 count summaries in order to avoid under-estimation of traffic volumes due to COVID-19.</p> <p>It is noted that COVID-19 has had many impacts to the road network and traffic volumes. It remains unclear how travel will return in a post-COVID-19 world, however, sensitivity testing may be undertaken in the Detailed Design stage to account for differences in local growth due to COVID-19, as deemed necessary by stakeholders.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4.1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0210	State Agency	Traffic and Transport	Operational traffic	The TIA mentions that operational phase traffic would only account for irregular maintenance and emergency service vehicles. The operational traffic is envisaged to make use of the existing road system and account for low volume traffic with no impact on existing operations. It is suggested that clarification with justification be provided pertaining to the generation of low operational traffic volumes.	Clarification with justification be provided pertaining to the generation of low operational traffic volumes and the consequent insignificant impact. Amend the EIS (/TIA) to accordingly.	<p>Appendix AA: Traffic Impact Assessment Section 4.1 details the traffic generation assumptions used to inform the trip volumes for both construction and operational assessments completed within Appendix AA: Traffic Impact Assessment.</p> <p>With regard to construction traffic generation, Appendix AA: Traffic Impact Assessment Section 4.2 details the trip distribution methodology applied to the Project. Trips are distributed on the road network as per the construction routes to laydown areas along the length of the Project alignment. These laydown areas are situated next to the rail corridor to facilitate direct access to/from the laydown to the rail corridor. The laydown areas will act as a centralised point for all material storage.</p> <p>The exact schedule of delivery is unknown at this stage of the Project; therefore, a uniform delivery schedule has been utilised as an indicative schedule. Further information on the construction delivery schedule will be required to be developed by the appointed construction contractor once delivery materials and routes are determined. Consideration of micro fluctuations will need to be taken into account at that stage. Nonetheless, the mitigation measures provided as a part of this assessment acknowledge these possibilities and the requirement for a traffic management plan to ensure that the impact on the road network is managed.</p> <p>Primary construction routes determined for the Project are used for the purposes of the TIA, the categories of routes include workforce, water supply, mass haul, precast concrete bridges and culverts, in-site concrete, quarry materials, concrete sleepers, rail, plant, tools and materials, non-resident workforce accommodation, and rail to road diversion routes. Proposed construction transport routes are identified in Section 1.2, while Appendix U to Appendix AE of Appendix AA: Traffic Impact Assessment illustrate the various primary construction routes. Appendix AF of Appendix AA: Traffic Impact Assessment shows the routes identified for diversion routes resulting from the temporary closure of existing rail lines.</p> <p>Where possible, routes generally follow roads suitable for HV use, considering distance and staying on arterial roads and avoiding populated areas such as town centres. The NHVR journey planner was used to identify roads suitable for HVs. All routes passing through or originating in Toowoomba are using the Toowoomba Bypass, if practical. Haulage routes that were used for the construction of the Toowoomba Second Range Crossing (now Toowoomba Bypass), as well as those suggested in TRC feedback, have been considered.</p> <p>The revised draft EIS Chapter 5: Project Description Section 5.6 provides further detailed information about the construction strategy proposed for the Project.</p> <p>With regard to operational road traffic generation, in relation to rail operational traffic and maintenance processes, rail operational traffic volumes are likely to be negligible, with no envisaged impact to operational conditions of the surrounding road networks. Appendix AA: Traffic Impact Assessment Section 4.1.2 provides further detail.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 1.2</p> <p>Section 4.1</p> <p>Section 4.1.2</p> <p>Section 4.2</p> <p>Appendix U-AE</p> <p>Appendix AF</p>
145	145.0211	State Agency	Traffic and Transport	Construction traffic	<p>The TIA mentions that the NHVR journey planner tool has been used to determine routes most likely to be used for the transport of construction material from origin to destination.</p> <p>The transport route will impact on the following:</p> <ul style="list-style-type: none"> ➤ 70 SCR (TMR) links ➤ 25 SCR (RMS) links and ➤ 139 LGR links ➤ 88 intersections affecting TMR ➤ 16 intersections affecting RMS ➤ 46 intersections affecting local government ➤ 10 level crossings to intersect with the SCR (TMR) ➤ 66 level crossings to intersect with local government roads. <p>The use of the NHVR tool to determine construction transport routes is an acceptable industry standard for feasibility purposes. However, such routes might have other constraints relating to bridge heights and widths, load limits, conditions of operations, etc. , which was not examined in the TIA.</p> <p>The TIA stipulates the use of the following design heavy vehicles in the TIA:</p> <ul style="list-style-type: none"> ➤ Austroads Vehicle Class 5-4 Axle Rigid Truck (27.5 tonne) ➤ Austroads Vehicle Class 7 4 Axle Semitrailer (31.5 tonnes) ➤ Austroads Vehicle Class 9 - 6 Axle Semitrailer (42.5 tonne) ➤ Austroads Vehicle Class 10 - 7 Axle B-Double (55.5 tonne) ➤ Assumed OSOM for Precast concrete bridges Unloaded Class 3 Rigid Truck with 4 Axle Dolly and 4 Axle Jinker (70t payload). <p>The use of Performance Based Standards (PBS) trucks was not proposed by ARTC. TMR require that ARTC consider the PBS3B as the design vehicle for queue length and turnpaths which may impact on the selected transport routes and stacking distance requirements at level crossings.</p>	Update transport routes to take into account other constraints such as those relating to bridge height and widths, load limits, vehicle swept path impacts, as well as other aspects of height and vehicle manoeuvrability impacts on conditions of operations etc. Amend the EIS (/TIA) to accordingly. Update the TIA to take into consideration the PBS3B as the design vehicle for queue length and turn-paths.	<p>The nominated construction transport routes have taken into consideration the restrictions on vehicle sizes through the NHVR Journey Planner Tool. However, if required and necessary for the Project, all oversized vehicles required to transport special equipment will require permits, to be obtained from the relevant road managing authorities. The transport requirements adopted within the revised draft EIS may change during the Detailed Design stage. Appendix AA: Traffic Impact Assessment, Section 5.7.3 provides swept path analyses have been undertaken for all proposed routes used by OSOM vehicles, as well as consideration of bridge and culvert constraints and outlines mitigation measures. OSOM routes were ground truthed through site visits, with details of observations provided in Appendix AA: Traffic Impact Assessment sub-Appendix BU.</p> <p>At this stage, oversize vehicles are only assumed to be required for the transportation of 29 m Super-T precast concrete girders, with the assumed vehicle a Nicolas 22 Row OSOM (details provided within Appendix AA: Traffic Impact Assessment sub-Appendix BB, and swept path in sub-Appendix BC). As stated, this requirement may change during Detailed Design stage. Similarly, at this stage, the performance based standard level 3B (PBS3B) vehicles are not nominated as the design vehicle for construction traffic, while the majority of the construction routes are not suitable for this vehicle type. The construction contractor may stipulate the use of these vehicles but will be required to prepare route assessments accordingly. Should the design vehicle change from those assessed in the Appendix AA: Traffic Impact Assessment, swept path analysis will be undertaken by the construction contractor once the appropriate design vehicle has been chosen to determine any temporary changes to the existing layout which may be required to accommodate construction traffic movements, such as localised widening or removal of signage and lighting, beyond those assessed and presented within Appendix AA: Traffic Impact Assessment, Section 5.7.3.</p>	<p>Appendix AA Traffic Impact Assessment</p> <p>Section 5.7.3</p> <p>Appendix BB</p> <p>Appendix BC</p> <p>Appendix BU</p>
145	145.0212	State Agency	Traffic and Transport	Road safety	It should be noted that any changes to access configurations, nearby intersections, bus stop locations, cycling facilities, footpaths and so on, once designed, should be assessed via a Road Safety Audit to identify if they introduce any additional safety issues.	Any changes to access configurations, nearby intersections, bus stop locations, cycling facilities, footpaths and so on proposed by the project will require a Road Safety Audit as per the requirements of the GTIA. See TMRs other comments about updating the TIA, PIA and RSA.	<p>As noted within the revised draft EIS Appendix AA: Traffic Impact Assessment Section 5.7, a safety assessment of the detailed design and proposed construction traffic routes will be required, in accordance with the GTIA. The safety assessment will determine the locations where road safety audits are required. Road safety audits will be undertaken by an accredited road safety auditor, in accordance with the Austroads Guide to Road Safety Part 6A: Implementing Road Safety Audits (Austroads, 2019c).</p> <p>Road safety audits will be undertaken at certain stages of the design as set out in the DTMR Minimum Technical Requirements document for Inland Rail.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.7</p>
145	145.0213	State Agency	Traffic and Transport	Road safety	<p>The safety assessment in the TIA indicates that the risk rating increases due to the impact of the Project on the following state-controlled roads and LGRs:</p> <ul style="list-style-type: none"> ➤ Cunningham Highway (TMR) ➤ Core Highway (TMR) ➤ Logan Motorway (TMR) ➤ Millmerran-Inglewood Road (TMR) ➤ Toowoomba-Cecil Plains Road (TMR) ➤ Warrego Highway (TMR) ➤ Bruxner Highway (RMS) ➤ Gwydir Highway (RMS) ➤ New England Highway (RMS) ➤ Newell Highway (RMS) ➤ Pacific Motorway (RMS) ➤ Summerland Way (RMS) ➤ Bruxner Way (ISC) <p>It is unclear from the TIA report what the specific safety/risk factors and concerns were on each of the SCR links which would cause an increase in risk rating to existing crashes. Clarification is required with elaboration and reasoning for the increase in risk rating from Medium to High on impacted state-controlled roads and LGRs.</p> <p>Where the TIA indicates no change to existing safety conditions clarification is required to support this conclusion. The TIA indicates that mitigation measures would be required to reduce the risk rating and recommends the following measures:</p> <ul style="list-style-type: none"> ➤ Fatigue management measures should be introduced and enforced for all workers ➤ Any required works to be identified in ongoing Road Use Management Plans prepared to support the project ➤ Heavy vehicle movements are associated with construction activities and therefore the use of school bus routes should be avoided if possible, or carefully managed to avoid conflicts. ➤ Consideration should be given to limiting construction traffic on school bus routes during pick-up and set-down times on school days, alternatively appropriate school bus infrastructure could be installed. ➤ Temporary traffic management to be implemented, for example road signs stipulating reduced speed limits. Findings from TMRs review indicates that the road link safety assessment was adequately performed to determine the increase in the likelihood and consequence of safety as result of development generated traffic. <p>However, clarification is required relating to specific safety/risk factors and concerns on each of the SCR links which would experience an increase in risk rating to existing crashes. In addition, elaboration should be provided in the TIA describing how these mitigation measures would demonstrate that they are measurable and auditable to ensure compliance. Consideration should be given to avoid schools along the transport routes.</p>	<p>Clarification is required with elaboration and reasoning for the increase in risk rating from on impacted state-controlled roads and LGRs. The TIA indicates that there would be no change to existing safety conditions along other roads, clarification is required in the TIA to support these conclusions. Elaboration should be provided in the TIA describing how these mitigation measures would demonstrate that they are measurable and auditable to ensure compliance. Consideration should be given to avoid schools along the transport routes or how the impact of heavy vehicle movements will be managed on school routes. Amend the EIS (/TIA) to respond to these issues accordingly.</p>	<p>The road safety assessment presented within the Appendix AA: Traffic Impact Assessment Section 5.2 has been undertaken as per the framework laid out in GTIA Part C Section 9.This framework relies on the principle that a road's safety is not significantly worsened as a result of the Project and that any pre-existing or Project -introduced unacceptable safety risk is addressed.</p> <p>The GTIA acknowledges that safety is not readily quantifiable and may require scoring based on expert opinion on the changes to likelihood and/or consequence of a risk being realised. This road safety impact assessment has the following aims in accordance with the Project's TIA – Road Safety Methodology Technical Memo which was agreed with DTMR in November 2022 (Appendix BS of Appendix AA: Traffic Impact Assessment).</p> <p>A safety risk assessment based on existing crash history has been undertaken along the Project construction traffic routes and road-rail interface locations for the following scenarios:</p> <ul style="list-style-type: none"> ➤ 'Without' Project ➤ 'With' Project ➤ 'With' Project and with mitigation measures (required only if the score in the Project situation is higher than in the without Project situation, or if the without Project score is in the 'high' category). <p>Appendix AA: Traffic Impact Assessment, Section 5.12 provides whole of Project mitigation measures suggested for the Detailed Design and Construction Works stages, which include items such as construction traffic management plans, road use management plans, and non-infrastructure based mitigation measures.</p> <p>Appendix AA: Traffic Impact Assessment, Section 6.2 provides a summary of the intersections, road links and road-rail interfaces requiring mitigation as per the GTIA Part C Section 9 framework. 145	145.0215	State Agency	Traffic and Transport	Construction traffic	The TIA report indicates that several laydown areas have been proposed throughout the length of the alignment. These laydown areas are situated next to the corridor to facilitate direct access to/from the laydown to the alignment. The TIA further indicates that a total of 74 laydown areas are proposed. The TIA provides a typical construction traffic access configuration which will be applied to laydown areas as well as a general discussion regarding the access and egress movements of construction traffic. The exact locations of the proposed laydown areas could not be reviewed as maps and figures were not provided illustrating the localities, although general locations are prescriptive in the TIA. It is suggested that although acceleration and deceleration lanes are proposed for each laydown area. A turn warrant assessment is to be conducted for access intersections to each laydown area in order to determine the requirement for the provision of dedicated right turn lanes.	It is suggested that a turn warrant assessment be conducted for each laydown area access intersections in order to determine the requirement for the provision of dedicated right turn lanes and/or any other turn lane requirements. The turn warrant assessment should be done for each year of construction as well as 10 years post opening phase for the operational stage. Amend the EIS (/TIA) accordingly.	<p>Seventy-eight laydown areas have been allocated within the construction footprint of the alignment. Establishing temporary laydown areas will involve clearing, grubbing, topsoil stripping, installing environmental controls, laying hardstand material and constructing parking areas, and access tracks. All temporary laydown areas are intended to be used for the Project during construction. Full list of laydowns are summarised in Table 3.9 of Section 3.5 of Appendix AA: Traffic Impact Assessment.</p> <p>A turn warrants assessment has been conducted at all access locations to laydown areas in order to identify the required turning treatments to accommodate Project traffic flows. The method to determine turn treatment requirements is generally consistent with the warrants outlined in Austroads Guide to Traffic Management Part 6: Intersections, Interchanges and Crossing Management (2019a). The timing of potential access tracks upgrade works will be determined during the Detailed Design stage, including any permit changes. For the purpose of the access impact assessment, it was assumed that all laydown area access locations will be developed as new access intersections and as such have no 'existing' scenarios have been assessed, only a 'with Project' scenario was investigated. It was also noted that these laydown areas will only be used during construction of the Project and therefore only the peak impact month was assessed (Section 5.3 of Appendix AA: Traffic Impact Assessment).</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.5</p> <p>Section 5.3</p> <p>Table 3.9</p>
145	145.0216	State Agency	Traffic and Transport	Construction traffic	The TIA evaluated the impact of the Project on the road link capacity using the following process: A 5% AADT volume comparison was undertaken by calculating the traffic generated by the Project as a percentage of the background traffic. This was performed for all construction transport road links mentioned in TMR's comments re Section 2.1 of the GTIA and each year of construction.	In the absence of existing traffic count data for a particular road link, the use of generic K-values from the RPDM is considered acceptable. However, traffic count data were collected for the study road links, which can be used to determine the appropriate K-values for each link which would take into account local conditions. Update TIA with revised K-values. The use of the Austroads Part 2 " Guide to Traffic Engineering Practice: Roadway Capacity guide is considered inadequate as the guide is superseded by the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis, 2017. It is proposed that the analysis be updated to reflect the use of the latest Austroads guide.	<p>Appendix AA: Traffic Impact Assessment Section 2.4.1 discusses the analysis within the TIA being updated to adopt the peak hour factor from the nearest DTMR AADT site, using the DTMR hourly summary data available through the Queensland Government Open Data Portal. This approach was adopted as many intersection and link counts had very low traffic volumes. It was therefore determined using the intersection counts to determine peak hour factors would be inappropriate due to significant fluctuation between days of the week. An analysis was undertaken of the intersection and link counts with higher traffic volumes across the study area and the peak hour factor was compared with that of the closest DTMR AADT site. A summary of this analysis is provided in Appendix AA: Traffic Impact Assessment, Table 2.7. The analysis found that the closest DTMR AADT site could reasonably be used to represent the daily variation in the area.</p> <p>Appendix AA: Traffic Impact Assessment Table 2.8 provides details on which DTMR AADT site was used for each road link and its corresponding AADT growth rate, HV growth rate and peak hour factor for the AM and PM peaks in both directions.</p> <p>No global k-values are used in the revised draft Appendix AA: Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4.1</p> <p>Table 2.7</p> <p>Table 2.8</p>
145	145.0217	State Agency	Traffic and Transport	Construction traffic	Road sections in the transport corridor where the Project related traffic exceeds 5% were identified and highlighted in the report. The TIA indicates 12 SCR roads which exceed the 5% threshold.	It is acknowledged that the Levels of Service (LOS) during construction should not exceed LOS C along the affected TMR road links and intersections, according to the information supplied (worst case scenario). This complies with the generally acceptable limits prescribed in the GTIA. TMR's predominant responsibility, however, lies in the preservation of existing LOS, given the critical freight and transport routes involved. In this regard, future negotiations with ARTC regarding triggered intersection upgrades, sequential planning of works and other related activities are required with a view to maintain, as a minimum existing LOS. Amend the EIS (/TIA) accordingly.	<p>Appendix AA: Traffic Impact Assessment has been updated to include impact assessment performance criteria and methods in Section 5, in accordance with GTIA requirements. Where the non-infrastructure-based mitigations detailed above are assessed to be insufficient to reduce the overall impact area aggregate vehicle minutes delay down to under 5 per cent, a review of intersection operational performance (LOS, DoS, average delay, and 95th percentile queue) has undertaken to determine which intersections are require infrastructure-based mitigation measures.</p> <p>The delay-based analysis criteria adopted for the purposes of the TIA are adopted from Austroads Guide to Traffic Management Part 3: Transport Study and Analysis Methods and are provided in Table 2.22. The Table indicates the LOS per intersection control type associated with a respective delay per vehicle measured in seconds. This has been incorporated into the TIA to assist in determining appropriate mitigation measures.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.5 defines the performance thresholds for assessment of traffic impact developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a). GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017) as:</p> <ul style="list-style-type: none"> ▶ An impact occurs if construction and operational traffic generated by the development exceeds five percent of the existing AADT on the road Section ▶ LOS C can be considered the minimum standard on rural roads. However, LOS D may be accepted in case of event traffic. ▶ LOS E should be considered the limit of acceptable for urban area operation and remedial works would be needed if LOS F would otherwise result. <p>Classifications for LOS that have been used in this capacity assessment have been provided in Section 5.5. Refer to Section 5.5 for the HCS highway facility and multilane facility, respectively.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5</p> <p>Section 5.5</p> <p>Table 2.22</p>
145	145.0218	State Agency	Traffic and Transport	Construction traffic	The TIA indicates that state-controlled roads (RMS) and Clarence Valley LGRs would not exceed the 5% threshold. These road sections were further analysed to determine the incremental change (deterioration) in the Level of Service (LOS) as a result of the development generated traffic (construction traffic). The TIA evaluated the impacts on the LOS by applying the methodology as stipulated in Austroads Part 2 " Guide to Traffic Engineering Practice: Roadway Capacity to analyse the two-way-two-lane highway and multi-lane highway segments for each year of construction where the 5% threshold is exceeded. The use of the guide is considered inadequate as the guide is superseded by the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis, 2017. It is proposed that the analysis be updated to reflect the use of the latest Austroads guide. The link analysis also indicates that K-values consisting of 0.15 and 0.12 as mentioned in TMRs comments relating to GTIA Section 3.3 were used. In the absence of existing traffic count data for a particular road link, the use of generic K-values from the RPDM is considered acceptable. However, traffic count data were collected for the study road links, which can be used to determine the appropriate K-values for each link. Clarification should be provided whether local K-values were used where available.	nil.	<p>Appendix AA: Traffic Impact Assessment, Section 2.4.1 discusses the analysis within the TIA being updated to adopt the peak hour factor from the nearest DTMR AADT site, using the DTMR hourly summary data available through the Queensland Government Open Data Portal. This approach was adopted as many intersection and link counts had very low traffic volumes. It was therefore determined using the intersection counts to determine peak hour factors would be inappropriate due to significant fluctuation between days of the week. An analysis was undertaken of the intersection and link counts with higher traffic volumes across the study area and the peak hour factor was compared with that of the closest DTMR AADT site. A summary of this analysis is provided in Appendix AA: Traffic Impact Assessment Table 2.7. The analysis found that the closest DTMR AADT site could reasonably be used to represent the daily variation in the area.</p> <p>Appendix AA: Traffic Impact Assessment Table 2.8 provides details on which DTMR AADT site was used for each road link and its corresponding AADT growth rate, HV growth rate and peak hour factor for the AM and PM peaks in both directions.</p> <p>No global k-values are used in the revised draft Appendix AA: Traffic Impact Assessment.</p> <p>The link capacity methodology has been updated as a part of the revised TIA. The methodology is discussed within Appendix AA: Traffic Impact Assessment Section 5.5, and includes:</p> <ul style="list-style-type: none"> ▶ Determining the existing geometric conditions of the road links triggering the 5 per cent threshold within the Project TIA study area to determine the capacity assessment type. ▶ Sealed roads with line markings will undertake a LOS analysis through the Highway Capacity Software (HCS) to determine LOS without and with Project traffic. <p>Roads that are unsealed or have no line markings are not able to undergo a HCS analysis so have been assessed through a volume/capacity check as shown in Section 5.5 with the capacity based on the DTMR Cost-Benefit Analysis Manual.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4.1</p> <p>Section 5.5</p> <p>Table 2.7</p> <p>Table 2.8</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0219	State Agency	Traffic and Transport		<p>The TIA report indicates that the following intersections will be impacted:</p> <ul style="list-style-type: none"> Transport and Main Roads: 88 Intersections Goondiwindi Regional Council: 15 Intersections Toowoomba Regional Council: 18 Intersections Roads and Maritime Services: 16 Intersections Clarence Valley Council: 10 Intersections Moree Plains Shire Council: 1 Intersections Gwydir Shire Council: 2 Intersections <p>Details regarding each intersection is provided in TMRs comments regarding Section 1.3 of the GTIA. The TIA did not perform a 5% peak hour volume comparison analysis as well as an intersection delay assessment for the intersections identified to be impacted. A turn-lane warrant assessment was conducted to determine upgrade requirements. The turn-lane warrant assessment methodology in the TIA was found to comply with the approach as contained in the Austroads Guide to Road Design, Part 4A: Unsignalised and Signalised Intersections. However, it is unclear whether the analysis was done for all impacted intersections. Clarification is required to confirm whether all the affected state controlled roads (TMR and RMS) and local government intersections were evaluated by means of a turn-lane warrant assessment. The TIA provides turn warrant analysis findings of the intersections where results indicate upgrades are required. Upgrades are recommended at 13 intersections based as below: Goondiwindi Regional Council</p> <ul style="list-style-type: none"> Cunningham Highway/Bybera Road - CHR(s) turning treatment is required Cunningham Highway/Elizabeth Street - AUL turning treatment and a CHR turning treatment Cunningham Highway/Millmerran-Inglewood Road - AUL turning treatment and a CHR turning treatment East Sawmill Road/Unnamed Road - AUL turning treatment Toowoomba Regional Council Gore Highway/Geltz Road - CHR turning treatment and an AUL turning treatment Gore Highway/Linthorpe Road - CHR turning treatment and an AUL turning treatment Gore Highway/Millmerran-Inglewood Road - AUL turning treatment Gore Highway/Scrubby Road - AUL or CHL turning treatment are required Gore Highway/Tummalville Road - CHR(s) turning treatment and an AUL(s) turning treatment Gore Highway/Athol School Road - AUL turning treatment Millmerran-Inglewood Road/Campbell Street - AUL(s) turning treatment and a CHR(s) Toowoomba Cecil Plains Road/Wellcamp Westbrook Road - CHR turning treatment Warrego Highway/Leesons Road - CHR turning treatment <p>Most of the intersections listed under the ownership of Toowoomba Regional Council and Goondiwindi Regional Council in the TIA are actually managed by TMR. Clarification is required in the TIA. Clarification is required relating to the traffic volume information used to do the turn lane warrant assessment as it was found from the TIA that turn volumes were assumed for the analysis. It is suggested that the TIA be updated with a 5% peak hour volume comparison analysis and intersection delay assessment as per the GTIA. This review is unable to determine whether the intersection analysis has been adequately assessed.</p>	<p>It is suggested that the TIA be updated to indicate the intersections where the development traffic exceeds 5% of the base traffic for any movement in the design peak period(s) in the year of opening of each construction stage and operations stage. The TIA to incorporate intersection delay assessments at those intersections to determine if the average delay to base traffic movements is greater than 5% in aggregate. Appropriate mitigation measures should be formulated to address the increase, if any, to the aggregate delay. Clarification is required to confirm whether all the affected SCR (TMR and RMS) and local government intersections were evaluated by means of a turn-lane warrant assessment. Clarification is required relating to the traffic volume information used to do the turn lane warrant assessment as it was found from the TIA that turn volumes were assumed. Amend the EIS (/TIA) accordingly.</p>	<p>Appendix AA: Traffic Impact Assessment, Section 2.4.1 provides the methodology used to develop background traffic volumes. In instances where traffic data was not available from road controlling authorities or traffic surveys conducted, conservative turning volume assumptions have been adopted using the available road link volumes, as outlined in the technical memo provided in Appendix BP. Therefore, for the intersections where base traffic turning volumes were not available, the intersection assessment will be first undertaken by comparing two "Base Traffic Scenarios" and then the 'worst case' scenario is considered for delay impacts.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.1.2 identifies the Project intersections that likely to experience a 5 per cent increase in turning volumes through the intersection.</p> <p>In accordance with GTIA requirements, each intersection has undergone SIDRA analysis to assess the peak period operational performance for the without Project and with Project scenarios. Table 5.28 lists the intersection with more than 5 per cent aggregated vehicle minutes delay. Table 5.29 lists the intersections with less than 5 per cent aggregated vehicle minutes delay. Detailed output tables and SIDRA output summaries are included in Appendix AV of Appendix AA: Traffic Impact Assessment. Intersections that require mitigation measures to be applied are documented in Section 5.4 Appendix AA: Traffic Impact Assessment.</p> <p>Turn warrant assessment has been undertaken on all affected state-controlled roads and local government turn movements. The results of the assessment are presented in Section 5.4.3, Table 5.23, and Table 5.24 Appendix AA: Traffic Impact Assessment.</p>	<p>Appendix AA Traffic Impact Assessment</p> <p>Section 2.4.1</p> <p>Section 5.1.2</p> <p>Section 5.4.3</p> <p>Table 5.23</p> <p>Table 5.24</p> <p>Table 5.28</p> <p>Table 5.29</p> <p>Appendix AV</p> <p>Appendix BP</p>
145	145.0220	State Agency	Traffic and Transport		<p>Performance Based Standard (PBS) Vehicles The TIA does not specifically address heavy vehicle road corridor use according to the GTIA requirements. It is unclear whether the proposed development will generate Performance Based Standard (PBS) vehicles (Class BNHR), if so, a heavy vehicle assessment needs to be undertaken in accordance with Transport and Main Roads Performance Based Standards Queensland Network Classification Guideline " Level 2B, Level 3B, Level 4B Roads (November 2014). This should be determined and updated accordingly in the TIA. The TIA mentions that Oversize Over mass vehicles would be required to transport items such as precast bridges, however details regarding the volumes, routes to be used, impacts of such vehicles in terms of swept paths, heights and loading were not assessed. These items are to be identified and addressed in the TIA.</p>	<p>Clarify if the Project will generate PBS vehicles. If it does, to update the TIA with mitigation measures determined through the assessment process using Transport and Main Roads Performance Based Standards Queensland Network Classification Guideline " Level 2B, Level 3B, Level 4B Roads (November 2014). It is also suggested to indicate which haulage routes are gazetted approved multi-combination vehicle (MCV) and higher mass limit (HML) vehicle routes along with locations which have restrictions. Mitigation measures should be provided in the TIA report where routes have restrictions and are not gazetted heavy vehicle routes. The assessment to include how the movement of Oversize Over mass (OSOM) vehicles will be addressed in the TIA.</p>	<p>Appendix AA: Traffic Impact Assessment has been updated to address GTIA requirements. In addition, through the greenfield sections of the Project the design caters for future provision of oversized vehicles such as the PBS2B (42m) vehicle. All brownfield corridors have a minimum of 36.5 m short stacking for formed public roads (not including stock route road reserves).</p> <p>Appendix AA: Traffic Impact Assessment, Section 4.3.1, Table 4.16 specifies total oversize overmass trips per year and Section 4.1.1 identifies what vehicle types are required for route types.</p> <p>Mitigation measures for oversize overmass movements have been nominated where required by GTIA, including pinch point assessment at intersections.</p>	<p>Appendix AA Traffic Impact Assessment</p> <p>Section 4.1.1</p> <p>Section 4.3.1</p> <p>Table 4.16</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0221	State Agency	Traffic and Transport	Construction traffic	<p>Active Transport Impacts The TIA indicates that the following cycle routes within the Principal Cycling Network with be impacted by construction traffic routes:</p> <p>Transport and Main Roads:</p> <ul style="list-style-type: none"> Warrego Highway, between Tor Street and Kingsthorpe Haden Road Toowoomba Bypass, between Mort Street and Toowoomba Cecil Plains Road Toowoomba-Cecil Plains Road, between Warrego Highway and Hanrahan Road Gore Highway, between Harrow Street and Ferguson Road Warrego Highway, between Wulkuraka Connection Road and Mt Crosby Road Toowoomba Regional Council: Charlton Connection Road, between Warrego Highway and Toowoomba Cecil Plains Road McDougall Street, between Toowoomba-Cecil Plains Road and Hursley Road Drayton-Wellcamp Road, between Double Road and Euston Road Railway Street, between Toowoomba Road and Murray Street Short Street, between Railway Street and Yandilla Street, Yandilla Street between Short Street and Cypress Street Roads and Maritime Services Oliver Street, between Clarence Street and Mary Street Mary Street, between Oliver Street and Fry Street Fry Street, between Mary Street and Alice Street Summerland Way, between Eccles Street and Bruxner Highway Bruxner Way, between Bulwer Street and New England Highway New England Highway, between Bruxner Highway and Rouse Street <p>The TIA note that a number of the proposed construction routes currently traverse through areas of moderate to high pedestrian activity through the city centres of Toowoomba, Pittsworth, Millmerran, Inglewood, Yelarbon and Grafton. The TIA does not specifically address the impact of construction traffic on pedestrian paths and cycle routes. Clarification is required in the TIA on how the impact of construction and operational traffic on pedestrian paths and cycle routes will be managed to safeguard the passage of pedestrians and cyclist. Bus Public Transport</p> <p>The TIA identified that there would be minimal impacts to existing bus public transport services as a result of construction of the Project. No existing bus services travel across the road rail interfaces, therefore there is minimal operational impacts to the services.</p> <p>School Buses</p> <p>The following school bus services are likely to be impacted by the proposed rail alignment:</p> <ul style="list-style-type: none"> P1883 AM & PM Athol to Bunkers Hill State School P473 Yuraraba to Inglewood State School P510 Southbrook North to Southbrook Central State School P522 Mt Emlyn area to Millmerran State School P772 AM & PM Tummaville to Millmerran State School P938 Bringailly to Millmerran State School P957 AM & PM Ivanhoe to Millmerran State School S118 AM & PM Pittsworth to Brookstead Area S178 Kingsthorpe Secondary to Harristown State High School S577 Kingsthorpe/Wellcamp to Harristown State High School S740 AM & PM Millmerran Years 11 and 12 to Pittsworth State High School <p>Prior to the construction phase of the Project, a suitable detour route for all of the affected services will be identified. Both prior to and during the construction phase of the Project, bus operators and affected schools will be consulted as part of the Project and made aware of the various construction activities. The contractors will be made aware of the presence of school bus routes and their operational hours as part of the project induction process.</p>	<p>Clarification is required in the TIA on how the impact of construction traffic on pedestrian paths and cycle routes will be managed to safeguard the passage of pedestrians and cyclist. Amend the EIS (/TIA) to respond to these issues accordingly.</p>	<p>ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the Project alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards.</p> <p>A review of existing cycling infrastructure impacted by the Project alignment and construction routes are presented in revised draft EIS Appendix AA: Traffic Impact Assessment, Section 2.16.1.</p> <p>Relevant mitigation requirements for the roads, intersections, and road-rail interfaces sharing a path with vulnerable road users are listed in Appendix AA: Traffic Impact Assessment, Section 5.2.2 and Section 5.10.7 which summarise pedestrian and cycle network mitigation measures on construction routes.</p> <p>Pedestrian and cyclist provisions at road-rail interfaces will be confirmed and agreed with road controlling authorities and local councils on a case-by-case basis requirements during detailed design once the alignment has been confirmed. At this stage, some road rail interfaces are likely to include integration of active transport facilities, including Crime Prevention Through Environmental Design considerations and access control.</p> <p>ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities, where the need for that facility remains in a Third Party Agreement with relevant local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design. Once agreed, changes to active transport networks will be communicated to active transport users through regular Project channels.</p> <p>Cyclist and pedestrian road safety has been considered with cyclist mitigation requirements as per the GTIA guidelines summarised in Appendix AA: Traffic Impact Assessment, Section 5.2.2.</p> <p>Section 5.10.3 of the Appendix AA: Traffic Impact Assessment discusses impacts to public transport routes and the proposed mitigations. There are five existing public transport services that have been identified with routes that are proposed to be used, in part, by construction traffic for the Project. Based on the above low increase in construction traffic comparatively to background traffic, it is considered unlikely that increased journey times would be experienced on these public transport services as a consequence of construction traffic for the Project. During the Detailed Design and Construction Works stages of the Project, TransLink and other public transport operators will be consulted to identify public transport service constraints on the local road network. Other service operators would be consulted, as required. The presence of bus routes will be considered in the preparation of the CEMP, as discussed in Section 5.12.3 Appendix AA: Traffic Impact Assessment.</p> <p>Section 5.10.4 of the revised draft EIS Appendix AA: Traffic Impact Assessment discusses the impacts on school bus services. Most significantly, it is no longer proposed to use the Yelarbon rest area as a laydown area for Project construction activities, therefore mitigating the impacts associated with student bus transfers at this location. ARTC also commits to maintaining existing bus stops during the Project construction. Where these require alteration, this will be agreed with the relevant service provider. The school bus routes identified in Table 5.114 and the bus stops and pedestrian access to these stops must be maintained during construction of the development. Accordingly, if any temporary bus stop and pedestrian access arrangements or alternative bus routes are required when construction routes are finalised, the contractor must reach agreement on suitable arrangements with the DTMR TransLink Division (bus_stops@translink. com. au or on 3851 8700) and/or bus operator (whichever is relevant) prior to any construction or works commencing.</p> <p>ARTC will continue to engage in consultation with community stakeholders and relevant government agencies through the Detailed Design and Construction Works stages to ensure that all safety concerns and issues are addressed.</p>	<p>Appendix AA: Traffic impact assessment</p> <p>Section 2.16.1</p> <p>Section 5.2.2</p> <p>Section 5.10.3</p> <p>Section 5.10.4</p> <p>Section 5.10.7</p> <p>Section 5.12.3</p> <p>Table 5.114</p>
145	145.0222	State Agency	Traffic and Transport		<p>Certification of the Traffic Impact Assessment Report by a Registered Professional Engineer Queensland using the pro-forma as per GTIA not provided.</p>	<p>Certification of the Traffic Impact Assessment Report by a RPEQ using pro-forma in the GTIA is required. Amend the EIS (/TIA) accordingly.</p>	<p>Appendix AA: Traffic Impact Assessment Section 6.3 provides Registered Professional Engineer of Queensland (RPEQ) certification of the Project TIA as per the requirement of the GTIA.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 6.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0223	State Agency	Traffic and Transport		<p>The TIA undertook a 5% SAR4 pavement loading comparison analysis on 71 SCR links (67 TMR and 4 RMS) expected to be impacted to identify road segments where development pavement loading exceeds the background pavement loading by 5% or greater. From TMRs review, it was found that the PIA area was adequately defined, highlighting road sections which exceed the 5% threshold and require further analyses. The PIA indicates the following 34 road sections which exceed the 5% threshold: Impacted State-controlled roads (TMR):</p> <ul style="list-style-type: none"> ▶ Toowoomba Bypass 319 - Between Gore Highway and Toowoomba-Cecil Plains Road ▶ Toowoomba Bypass 319 - Between Toowoomba-Cecil Plains Road and New England Highway ▶ Toowoomba Bypass 319 - Between New England Highway and Warrego Highway ▶ Cunningham Highway 17D - Between NSW/QLD Border and Leichhardt Highway ▶ Cunningham Highway 17D - Between Leichhardt Highway and Wyaga Road ▶ Cunningham Highway 17D - Between Wyaga Road and Yelarbon-Keetah Road ▶ Cunningham Highway 17D - Between Yelarbon-Keetah Road and Texas Yelarbon Road ▶ Cunningham Highway 17D - Between Texas-Yelarbon Road and Inglewood Texas Road ▶ Cunningham Highway 17C - Between Inglewood Texas Road and Millmerran- Inglewood Road ▶ Cunningham Highway 17C - Between Millmerran-Inglewood Road and Inglewood Quarry Access Road ▶ Cunningham Highway 17C - Between Inglewood Quarry Access Road and Coolmunda Dam Access ▶ Gore Highway 28A - Between Millmerran-Inglewood Road and Millmerran-Leyburn Road ▶ Gore Highway 28A - Between Millmerran-Leyburn Road and Pampas-Horrane Road ▶ Gore Highway 28A - Between Pampas-Horrane Road and Brookstead-Norwin Road ▶ Gore Highway 28A - Between Brookstead-Norwin Road and Tumnaville Road ▶ Gore Highway 28A - Between Tumnaville Road and Vines Street ▶ Gore Highway 28A - Between Vines Street and Toowoomba Bypass ▶ Gore Highway 28A - Between Toowoomba Bypass and Westbrook Road ▶ Gore Highway 28A - Between Westbrook Road and Warrego Highway ▶ Inglewood Texas Road 231 - Between Cunningham Highway and Greenup Limevale Road ▶ Inglewood Texas Road 231 - Between Greenup Limevale Road and Texas Yelarbon Road ▶ Warrego Highway 18A - Between Tallegalla Two Tree Hill Road and Haigslea Amberley Road ▶ Warrego Highway 18A - Between Haigslea Amberley Road and Brisbane Valley Highway ▶ Warrego Highway 18A - Between Brisbane Valley Road and Mount Crosby Road ▶ Warrego Highway 18A - Between Mount Crosby Road and Cunningham Highway ▶ Barwon Highway 31A - Between Leichhardt Highway and Town Common Road ▶ Charlton Connection Road 320 - Between Toowoomba-Cecil Plains Road and Jordan Court ▶ Charlton Connection Road 320 - Between Jordan Court and Warrego Highway ▶ Gore Highway 28A - Between Blackwell Road and Saleyards Road ▶ Gore Highway 28A - Between Saleyards Road and West Street ▶ Gore Highway 28A - Between West Street and Millmerran-Inglewood Road ▶ Pampas-Horrane Road 327 - Between Gore Highway and Bostock Road ▶ Pittsworth-Felton Road 332 - Between Golf Course Road and Short Street ▶ Yelarbon-Keetah Road 241 - Between Cunningham Highway and Old Warwick Road ▶ Logan Motorway 210A - Between Ipswich Motorway and Pacific Motorway ▶ Pacific Motorway 12A - Between Logan Highway and NSW/QLD border <p>Edwards Street Between North Star Road and I B Bore Road Impacted State-controlled roads (RMS):</p> <ol style="list-style-type: none"> 1. Bruxner Highway Between New England Highway and Summerland Way 2. Gwydir Highway Between Stephens Road and Delungra Road 3. Gwydir Highway Between Delungra Road and Delungra Bypass Road 4. 145	145.0224	State Agency	Traffic and Transport		All traffic volume data used in the PIA consist of the same data as mentioned in Section 1.2 of this table. The road links considered for the PIA are the same links as used for the traffic impact assessment. Road asset data from TMR (ARMIS, as-constructed plans, maintenance plans) was however not considered in the assessment. The PIA assumed a generic pavement composition for all SCR links in the PIA. The assumed generic pavement comprises thin bituminous surfacing (asphalt 50 mm or spray seal) on unbound granular road base. This is not considered appropriate, especially given the that the FAMLIT model contains cost contribution rates for each 100 m of each SCR link. The pavement composition of each road link is typically available from TMRs ARMIS database and any associated as constructed or maintenance drawing records. This is not considered appropriate, especially given the that the FAMLIT model contains cost contribution rates for each 100 m of each SCR link. The pavement composition of each road link is typically available from TMRs ARMIS database and any associated as constructed or maintenance drawing records. It is suggested that actual pavement composition data be obtained from TMR (ARMIS) and RMS to more accurately inform the pavement impact analysis, especially with respect to pavements containing structural/thick asphalt and bound layers (example cement treated bases) which require an assessment of SAR5 and SAR12 axle loads.	It is suggested that the FAMLIT model and ARMIS data be used with associated load damage exponential I factors based on pavement type for all impacted road links in the TIA. Amend TIA accordingly.	Appendix AA: Traffic Impact Assessment, Section 5.6.2 provides an overview of the vehicle configurations, 5 per cent comparison method and calculation of contributions, taking into consideration Austroads' Freight Axle Mass Limits Investigation Tool asset data and associated Project generated SAR4, SAR5 and SAR 12 load impacts. The assessmnt has been informed by data acquired from TMR road asset team. Appendix AA: Traffic Impact Assessment Table 5.54 indicates the Austroads vehicle types by construction activity that have been adopted for the assessment and it's corresponding SAR/HV values for load damage exponential factors SAR4, SAR5 and SAR12. The vehicle types were determined through the constructability assessment, with Austroads vehicle classes assigned to each of these (including the transport of ready-mix concrete). The SAR/HV values were sourced from the DTMR Guide to Traffic Impact Assessment Practice Note: Pavement Impact Assessment for Austroads Classes 5 – 10. The SAR/HV values for the OSOM vehicle was determined based on standard axle loading for different axle groups and the anticipated loading spread across the proposed vehicle. A breakdown of the OSOM SAR/HV calculation is included in Appendix AZ of Appendix AA: Traffic Impact Assessment for 100 m increments of each impacted SCR link.	Appendix AA: Traffic Impact Assessment Section 5.6.2 Table 5.54 Appendix AZ
145	145.0225	State Agency	Traffic and Transport	Modelling	The percentage (%) growth rate for background traffic was determined using linear regression for all vehicles (light and heavy vehicle streams inclusive), between the years 2010 and 2016. This has resulted in an equivalent average 2% (compound) growth rate for all vehicles. This average growth rate has been used to extrapolate the growth in background heavy vehicles during the construction period (2021 to 2026). The application of a traffic growth rate based on all vehicles to heavy vehicles is not appropriate. From TMRs review it was found that there are significant differences in heavy vehicle growth rates as compared to the growth rates for all vehicles. Additionally, the adoption of a single average traffic growth rate for background traffic for all impacted State controlled roads is considered not appropriate. Individually calculated heavy vehicle traffic growth rates (background traffic) for each impacted road link needs to be used in order to capture local conditions along the link.	It is suggested that individually calculated heavy vehicle traffic growth rates (background traffic) for each impacted road link be used in the TIA. Amend the TIA accordingly.	Appendix AA: Traffic Impact Assessment Section 2.4.1 outlines the growth rates used for assessment and all road links growth rates are provided in Table 2.8. These factors were both determined based on the closest DTMR AADT site to the road link. Both the AADT and HV growth rates were determined in response to requests from DTMR and Coordinator-General for specific HV growth rates to be imputed and be adopted for the pavement impact assessment to capture local conditions and HV data. The growth rates for assessment have been determined based on the following order of hierarchy: 1. 10-year growth rate 2. 5-year growth rate 3. 1 year growth rate 4. 3 per cent p. a. (Pavement Impact Assessment Practice Note (DTMR, 2018b) states 'in the absence of site-specific data, an annual growth rate of 3 per cent p. a. should be adopted'). Appendix AA: Traffic Impact Assessment Section 6.2 includes a commitment to ensure the finalised TIA will be developed in consultation with TMR. ARTC will Consult with TMR, councils, and where relevant QR, in determination of final construction and heavy vehicle routes and update all documentation and reports to ensure the report aligns with final construction traffic volumes, turning movements, routes and vehicle types.	Appendix AA: Traffic Impact Assessment Section 2.4.1 Section 6.2 Table 2.8
145	145.0226	State Agency	Traffic and Transport	Construction traffic	<p>The TIA provides an overview of all stockpile, laydown areas, routes and construction material quantities to be transported along SCR links for purpose of the following:</p> <ul style="list-style-type: none">➤ Cut-to fill mass haul earthworks➤ Cut-to-spoil mass haul earthworks➤ Imported capping material for rail formation works➤ Rail sections➤ Rail sleepers➤ Rail ballast➤ Precast concrete bridge elements➤ In-situ concrete bridges➤ Pre-cast concrete culverts in-situ concrete culverts/drainage structures➤ Construction water (material conditioning, compaction, concrete batch plants, concrete precast yard, dust suppression, haul road maintenance)➤ Delivery/collection of plant, tools, other materials➤ Staff an in-depth review of the construction quantities was not undertaken and is outside the scope of this review. A breakdown of the construction quantities was provided for all construction activities, for all stockpile, laydown areas and routes along SCR links. <p>The TIA stipulates the use of the following design heavy vehicles in the TIA:</p> <ul style="list-style-type: none">➤ Austroads Vehicle Class 5-4 Axle Rigid Truck (27.5 tonne) and 4.087 ESA/HV➤ Austroads Vehicle Class 7 4 Axle Semitrailer (31.5 tonnes) and 5.019 ESA/HV➤ Austroads Vehicle Class 9 - 6 Axle Semitrailer (42.5 tonne) and 4.93 ESA/HV➤ Austroads Vehicle Class 10 - 7 Axle B-Double (55.5 tonne) and 7.72 ESA/HV <p>Assumed OSOM for Precast concrete bridges Unloaded Class 3 Rigid Truck with 4 Axle Dolly and 4 Axle Jinker (70t payload) and 12.21 ESA/HV The SAR4/HV values in the TIA were sourced from DTMRs GTIA Practice Note: Pavement Impact Assessment. The SAR4/HV for the OSOM vehicle to transport the 29 metre Super-T precast concrete bridge elements was calculated consistent with Austroads Guide to Pavement Technology Part 2: Pavement Structural Design which is considered acceptable. Findings from TMRs review indicate that the proposed ESA/HV values for the design vehicles considered align with the GTIA Practice Note: Pavement Impact Assessment provided values for the purpose of analysing the 5% comparison. However, findings from TMRs review indicates that development generated pavement loads account for ESA/SAR values per heavy vehicle only. Load damage exponential values for pavements with multiple layers consisting of SAR5s and SAR12s was not taken into account or calculated as road asset data from the FAMLIT model was not evaluated based on pavement type according to 100 m increments. The TIA should be updated to take into consideration FAMLIT asset data and associated development generated SAR5 and SAR12 load damage exponential factors/rates to calculate marginal cost contributions. The TIA indicates that it is envisaged that the delivery and collection of plant, tools and materials to the construction areas will be cascaded across the road network and occur irregularly. It is considered that the spreading of the trips of this construction activity across the external road network would have a minimal impact and be of an irregular pattern to model. It has therefore been conservatively assumed that these activities would follow the same proposed routes as the workforce. Plant delivery is assumed to be 150 vehicles per month. Clarification is required relating to assumed routes likely to be used for plant and tool transport and expected peak hourly and annual volumes by an assumed design vehicle type as these trips would have an impact on pavement loading. It is suggested that the TIA be updated to reflect accordingly.</p>	<p>From TMRs review the following and discrepancies have been identified which is suggested to be updated in the TIA: The TIA report has identified that all rail sections will be delivered to site via existing rail however, the construction traffic loads schedule has identified that a significant amount of rail sections would be delivered to stockpiles/laydowns/sites by road. This inconsistency is to be clarified as it has a significant impact on construction traffic generation and assessment of their impacts. Clarification is required on the number of trips and routes used by staff/workers, which are assumed to be from the surrounding towns. Clarification is required on the offsite disposal of any spoil, and anticipated traffic generation. Clarification is required on the transport routes (origin/destination) for water supply. The TIA report has identified that railway sleepers will be delivered to stockpiles/laydowns/sites by Austroads Class 10 heavy vehicles with a 55-tonne payload capacity. The construction traffic loads schedule notes that the assumed capacity for freighting railway sleepers of 78 items. A precast concrete sleeper typically weighs 450*550 kg. The 78 sleepers would weigh a total of 40 tonnes, which indicates that the proposed vehicle would have sufficient payload capacity. The TIA report has identified that ready-mix concrete will be transported to site by trucks with 6m3 capacity, presumably agitator trucks. These trucks are typically Austroads Class 5 trucks with twin steer axles and TAPS chart identifies typical ESA/HV factors of 4.2*4.4. The TIA used an updated Class 5 truck which is considered sufficient. The TIA report has identified that construction water will be transported to stockpiles/laydowns/ sites by 20 kilolitre water trucks.20 kilolitre water trucks typically have a GCM of up to 43 tonnes and an ESA/HV factor of up to 5.5, which aligns with an equivalent Austroads Class 7 heavy vehicle as per the TAPS chart. This has been addressed in the TIA. Amend the EIS (/TIA) to respond to these issues accordingly.</p>	Appendix AA: Traffic Impact Assessment, Section 5.6.2 provides an overview of the vehicle configurations, 5 per cent comparison method and calculation of contributions, taking into consideration Austroads' Freight Axle Mass Limits Investigation Tool asset data and associated Project generated SAR4, SAR5 and SAR 12 load impacts. The assessment has been informed by data acquired from TMR road asset team. Appendix AA: Traffic Impact Assessment Table 5.54 indicates the Austroads vehicle types by construction activity that have been adopted for the assessment and it's corresponding SAR/HV values for load damage exponential factors SAR4, SAR5 and SAR12. The vehicle types were determined through the constructability assessment, with Austroads vehicle classes assigned to each of these (including the transport of ready-mix concrete). The SAR/HV values were sourced from the DTMR Guide to Traffic Impact Assessment Practice Note: Pavement Impact Assessment for Austroads Classes 5 – 10. The SAR/HV values for the OSOM vehicle was determined based on standard axle loading for different axle groups and the anticipated loading spread across the proposed vehicle. A breakdown of the OSOM SAR/HV calculation is included in Appendix AZ of Appendix AA: Traffic Impact Assessment for 100 m increments of each impacted SCR link.	Appendix AA: Traffic Impact Assessment Section 5.6.2 Table 5.54 Appendix AZ

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0227	State Agency	Traffic and Transport	Construction traffic	All construction traffic was converted to equivalent SAR4 repetitions and compared to the base traffic SAR4 during each year of construction 2021*2026, for each SCR link. The ratio of the development SAR4 to the background SAR4 has been calculated in accordance with the TMRs GTIA Practice Note: Pavement Impact Assessment, which calls for the SAR4 pavement impact ratio to be calculated, for each construction year, as the development traffic divided by the background traffic. The findings of the PIA show that several state-controlled roads are likely to surpass the 5% SAR threshold, with several road segments (mentioned in Section 5.1 of this table) exceeding this threshold by a significant margin. It is worth noting that while the analyses conservatively assume fully loaded vehicles in each direction, there are numerous inconsistencies within the application of the PIA methodology and calculations that need to be addressed in the TIA. Mitigation measures to counter pavement impacts are summarised in the TIA documents. The content has been reviewed and found to be generically adequate however, suitable mitigation measures should be identified for particular SCR links which may contain features or peculiarities that cannot be generically addressed. The mitigation of pavement impacts has only been conducted for the construction phase of the Project. The PIA 20 years after the opening of the final stage needs to be assessed in the TIA as required in the Practice Note: Pavement Impact Assessment.	The ratio of the development SAR4 to the background SAR4 has been calculated in accordance with the TMRs GTIA Practice Note: Pavement Impact Assessment, which calls for the SAR4 pavement impact ratio to be calculated, for each construction year, as the development traffic divided by the background traffic. The mitigation of pavement impacts has only been conducted for the construction phase of the Project. The PIA 20 years after the opening of the final stage needs to be assessed in the TIA as required in TMRs GTIA Practice Note: Pavement Impact Assessment. Amend the EIS (/TIA) to respond to these issues accordingly.	Appendix AA: Traffic Impact Assessment, Section 5.6.2 provides an overview of the vehicle configurations, 5 per cent comparison method and calculation of contributions, taking into consideration Austroads' Freight Axle Mass Limits Investigation Tool asset data and associated Project generated SAR4, SAR5 and SAR 12 load impacts. The assessment has been informed by data acquired from TMR road asset team. Appendix AA: Traffic Impact Assessment Table 5.54 indicates the Austroads vehicle types by construction activity that have been adopted for the assessment and it's corresponding SAR/HV values for load damage exponential factors SAR4, SAR5 and SAR12. The vehicle types were determined through the constructability assessment, with Austroads vehicle classes assigned to each of these (including the transport of ready-mix concrete). The SAR/HV values were sourced from the DTMR Guide to Traffic Impact Assessment Practice Note: Pavement Impact Assessment for Austroads Classes 5 – 10. The SAR/HV values for the OSOM vehicle was determined based on standard axle loading for different axle groups and the anticipated loading spread across the proposed vehicle. A breakdown of the OSOM SAR/HV calculation is included in Appendix AZ of Appendix AA: Traffic Impact Assessment for 100 m increments of each impacted SCR link.	Appendix AA: Traffic Impact Assessment Section 5.6.2 Table 5.54 Appendix AZ
145	145.0228	State Agency	Traffic and Transport		No marginal cost calculations were undertaken or provided in Appendix X " Traffic Impact Assessment, contrary to the requirements of TMRs GTIA. This should be addressed in the TIA.	It is suggested that the marginal cost contribution calculation be conducted in the TIA in accordance with TMRs GTIA Practice Note: Pavement Impact Assessment. Note that the current guideline is limited to the extent that it can only predict for increases in development traffic within 5%-40%. A review of traffic volumes presented in the report indicates that development traffic in excess of 100% may be generated. Assessment for such a significant increase in traffic will require special consideration by the TMR during the detailed design phase for marginal cost calculations.	Appendix AA: Traffic Impact Assessment, Section 5.6.1 presents the methodology used for determining contributions for road rehabilitation and maintenance have been determined for DTMR road links where the Project generated traffic SAR exceeds 5 per cent of the base traffic SAR in either direction on the link in the year of analysis. The marginal cost contribution has been calculated in accordance with Practice Note: Pavement Impact Assessment December 2018. The 5% comparison assessment concluded that 12 DTMR roads exceed the 5 per cent threshold in at least one year of construction. Since the 5 per cent threshold has been reached, contributions for these sections of the SCR network may be required. Contribution amounts for the SCR network have been calculated and provided in a technical memo to the Coordinator-General. No estimate was undertaken for local government roads as marginal cost information is not available for these roads.	Appendix AA: Traffic Impact Assessment Section 5.6.1
145	145.0229	State Agency	Traffic and Transport		The EIS states: The TIA has been undertaken consistent with the 2017 GTIA, consistent with the ToR, which is also generally in accordance with the 2018 GTIA (and with no material implications to assessment outcomes). GTIA 2018 does introduce a new measurement for intersection delay (measured in vehicle minutes) as a means of quantifying a developments impact rather than capacity. It also has a stronger focus on safety. Future revisions of the TIA will need to adhere to the 2018 GTIA in all aspects, not just the PIA.	Update the EIS to acknowledge that the entire TIA will be in accordance with GTIA 2018, not just the PIA.	Appendix AA: Traffic Impact Assessment has been updated with the revised draft EIS and prepared in accordance with GTIA 2018.	Appendix AA: Traffic Impact Assessment
145	145.0230	State Agency	Traffic and Transport		The EIS makes reference to and uses the Austroads Guide to Traffic Engineering Practice, Part 2: Roadway Capacity " this Austroads publication has been superseded and replace by the Austroads Guide to Road Design and Austroads Guide to Traffic Management.	Update the EIS to ensure that the latest Austroads manuals are referenced and used.	Appendix AA: Traffic Impact Assessment Section 1.1.2 details the legislation, policy and guidelines used within the assessment. The list includes Austroads Guide to Road Design and Guide to Traffic Management.	Appendix AA: Traffic Impact Assessment Section 1.1.2
145	145.0231	State Agency	Traffic and Transport		The EIS has assumed a k30 value for a number of situations, but k30 values may not be suitable for all of them. Further justification is required as to why k30 values have been applied within the report	Update the EIS and TIA to provide more information regarding the values assumed and provide necessary justifications as to why they were chosen.	Appendix AA: Traffic Impact Assessment, Section 2.4.1 discusses the analysis within the TIA being updated to adopt the peak hour factor from the nearest DTMR AADT site, using the DTMR hourly summary data available through the Queensland Government Open Data Portal. This approach was adopted as many intersection and link counts had very low traffic volumes. It was therefore determined using the intersection counts to determine peak hour factors would be inappropriate due to significant fluctuation between days of the week. An analysis was undertaken of the intersection and link counts with higher traffic volumes across the study area and the peak hour factor was compared with that of the closest DTMR AADT site. A summary of this analysis is provided in Appendix AA: Traffic Impact Assessment Table 2.7. The analysis found that the closest DTMR AADT site could reasonably be used to represent the daily variation in the area. TIA Table 2.8 provides details on which DTMR AADT site was used for each road link and its corresponding AADT growth rate, HV growth rate and peak hour factor for the AM and PM peaks in both directions. No k30 values are used in the revised draft Appendix AA: Traffic Impact Assessment.	Appendix AA: Traffic Impact Assessment Section 2.4.1 Table 2.7 Table 2.8
145	145.0232	State Agency	Traffic and Transport		It is not appropriate to assume 400 AADT on some rural local roads.	The TIA must use AADT values approved by the appropriate road authority.	Appendix AA: Traffic Impact Assessment, Section 2.4.1 outlines the methodology used to determine background traffic volumes. Existing traffic volumes have been determined for 2022 based on the background traffic data, traffic growth rate and seasonal variation factor (Section 2.4 of Appendix AA: Traffic Impact Assessment). The 2022 and future traffic volumes have been determined by a compound traffic growth estimation, and the volumes growth rates are provided in Table 2.8, Appendix AA: Traffic Impact Assessment. These factors were both determined based on the closest DTMR AADT site to the road link. Both the AADT and HV growth rates were determined in response to requests from DTMR and Coordinator-General for specific HV growth rates to be imputed and be adopted for the pavement impact assessment to capture local conditions and HV data.	Appendix AA: Traffic Impact Assessment Section 2.4.1 Table 2.4
145	145.0233	State Agency	Traffic and Transport		The report says that the GTIA defines LOS as a qualitative index for ranking operating conditions. Note that the 2018 GTIA uses intersection delay as a measure for impact and must also be assessed. LOS is not relevant to intersection performance.	The finalised TIA should follow the performance criteria and impact assessment measures as specified in the 2018 GTIA.	Appendix AA: Traffic Impact Assessment has been updated to include impact assessment performance criteria and methods in Section 5, in accordance with GTIA requirements.	Appendix AA: Traffic Impact Assessment Section 5
145	145.0234	State Agency	Traffic and Transport		The EIS states: An evaluation of available traffic growth rates on State-controlled roads identified an overall annual average AADT growth rate of two per cent. This linear growth rate was the used to establish future background traffic volumes for all roads where data was not available. This is unclear as data is available for most roads. While few State-controlled roads identified within the haul and construction route plans contain permanent traffic count sites, traffic growth rates are available and should be established for each road. The adoption of a single average traffic growth rate for background traffic for all roads does not accurately represent regional roads. In addition the 2% linear growth is determined based on AADT however this as a basis for the assumption could be substantially undervaluing the specific background growth seasonal patterns of heavy vehicles. In addition the 2% linear growth is determined based on AADT however this as a basis for the assumption could be substantially undervaluing the specific background growth seasonal patterns of heavy vehicles.	Establish background heavy vehicle growth rates based on road link data and assumptions that are agreed by the department.	The 2019 traffic data referenced has been used to develop heavy vehicle growth rates for all state-controlled roads. The traffic volume sources have been summarised in Section 2.4.1 of Appendix AA: Traffic Impact Assessment. It is noted compound growth rate has been used throughout the TIA for SCR and LGR to provide a conservative background traffic for assessment. Appendix AA: Traffic Impact Assessment, Section 6.2 includes a commitment to ensure the finalised TIA will be developed in consultation with TMR. ARTC will Consult with TMR, councils, and where relevant QR, in determination of final construction and heavy vehicle routes and update all documentation and reports to ensure the report aligns with final construction traffic volumes, turning movements, routes and vehicle types.	Appendix AA: Traffic Impact Assessment Section 2.4.1 Section 6.2
145	145.0235	State Agency	Traffic and Transport		Table 1.4 identifies LOS criteria that is not contained within the GTIA.	Update and correct the EIS as stating that these criteria are in the 2018 GTIA is misleading.	The delay-based analysis criteria adopted for the purposes of the Appendix AA: Traffic Impact Assessment are adopted from Austroads Guide to Traffic Management Part 3: Transport Study and Analysis Methods and are provided in Table 2.22. The Table indicates the LOS per intersection control type associated with a respective delay per vehicle measured in seconds. This has been incorporated into the Appendix AA: Traffic Impact Assessment to assist in determining appropriate mitigation measures.	Appendix AA: Traffic Impact Assessment Table 2.22
145	145.0236	State Agency	Traffic and Transport		In Table 1.4 the EIS states: LOS C can be considered the minimum standard on rural roads. However, LOS D may be accepted in case of even traffic. The department may not consider this accurate or accept a worsening in LOS. A broad application of a minimum standard LOS to roads misrepresents the intention of Austroads and the department's requirements for road planning and design.	EIS should accurately reflect the requirement that any road planning and design be fit for purpose. Should the level of service be significantly impacted mitigation measures will require investigation.	Appendix AA: Traffic Impact Assessment, Section 5.5.1 defines the performance thresholds for assessment of traffic impact developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a). GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017) as: ▶ An impact occurs if construction and operational traffic generated by the development exceeds five percent of the existing AADT on the road section ▶ LOS C can be considered the minimum standard on rural roads. However, LOS D may be accepted in case of event traffic. ▶ LOS E should be considered the limit of acceptable for urban area operation and remedial works would be needed if LOS F would otherwise result. Classifications for LOS that have been used in this capacity assessment have been provided in Section 5.5 of Appendix AA: Traffic Impact Assessment. Refer to Section 5.5 of Appendix AA: Traffic Impact Assessment for the HCS highway facility and multilane facility, respectively.	Appendix AA: Traffic Impact Assessment Section 5.5 Section 5.5.1
145	145.0237	State Agency	Traffic and Transport		There seems to be some confusion about what is required to be assessed and what is required to be mitigated. Table 1.5 for example is titled Trigger criteria for the application of mitigation measures. This is not correct. The information in the Table is actually the criteria for if a particular road link, intersection or road infrastructure needs to be included in the assessment. Once it is determined that a particular road link, intersection or road infrastructure is to be included in the assessment, then the assessment must quantify the impact and determine whether the Project is responsible for mitigating that impact. The thresholds (or triggers) for determining whether a road link, intersection or road infrastructure are to be included in the assessment are not the same as the thresholds (or triggers) for whether the Project is responsible for mitigating their impact.	The EIS should be updated to describe the impact assessment process as per the GTIA more clearly.	Appendix AA: Traffic Impact Assessment has been updated in the revised draft EIS to detail the impact assessment process in Section 5, in accordance with GTIA requirements.	Appendix AA: Traffic Impact Assessment Section 5
145	145.0238	State Agency	Traffic and Transport	Baseline/backgr ound sampling	The report says that Table 2.3 lists the locations where pedestrians currently have access from one side of the proposed Project alignment to the other. Table 2.3 is local roads only. The Cunningham Highway in Yelarbon (a state-controlled road) is another location where there is currently pedestrian access across the railway line.	Update the EIS to ensure all locations where pedestrians currently access across the project alignment have been identified in the report.	Further assessment of the feasibility of separate pedestrian access has been undertaken as a part of the revised reference design and summarised within Appendix AA: Traffic Impact Assessment. The revised reference design proposal consists of a grade separated road-over-rail crossing (310-11-E-0), where Cunningham Highway crosses the rail corridor approximately 400 m further west of the existing level crossing that is proposed for closure (310-11-E-1). A dedicated active pedestrian level crossing has been added at the existing Cunningham Highway interface location (310-11-E-1) to enable pedestrian movement north/south of the Yelarbon township. ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities, where the need for that facility remains in a Third Party Agreement with local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design. Appendix AA: Traffic Impact Assessment Section 3.7.2 discusses the Yelarbon pedestrian crossing facilities assessment in detail.	Appendix AA: Traffic Impact Assessment Section 3.7.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0239	State Agency	Traffic and Transport		The Section says that the Contract Award is indicatively at the end of 2021. Given that this is not going to occur (it is now 2021), the indicative construction timetable should be updated accordingly.	Update the EIS to ensure the latest indicative construction timetable is provided in the report.	Appendix AA: Traffic Impact Assessment Section 3.3Table 3.6 provides a breakdown of indicative construction activities and timeline. Table 3.7 provide anticipated timing of all Inland Rail Projects in Queensland.	Appendix AA: Traffic Impact Assessment Section 3.3 Table 3 6 Table 3 7
145	145.0240	State Agency	Traffic and Transport	Level crossing	TMR have not requested separation distances for two A-triple vehicles. TMRs current position is for storage of a Type 1 Road Train/PBS 3B (42m) one of which may be stored on the through road. This is different to what is written in the report.	Update the EIS to ensure the report represents TMRs current position accurately. Also see TMRs comment regarding swept path analysis for level crossings.	Appendix AA: Traffic Impact Assessment, Section 3.7 documents the reference design reviews and updates since the draft EIS submission. Appendix AA: Traffic Impact Assessment, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.	Appendix AA: Traffic Impact Assessment Section 3.7 Section 5.9
145	145.0241	State Agency	Traffic and Transport		In Table 4.10, the column headings say peak volume. It is assumed this is peak hour volume not peak half hour or peak two hours.	Update the EIS to ensure tables headings include full units of measure.	All tables within Appendix AA: Traffic Impact Assessment include full units of measure as appropriate.	Appendix AA: Traffic Impact Assessment
145	145.0242	State Agency	Traffic and Transport		In Table 4.10, why are %HV not applicable for three of the interface locations (Gore Highway, Toowoomba-Cecil Plains Road and Warrego Highway)?	Update the EIS to justify why certain roads are not adequately populated in the table, and update and amend the EIS as required.	Appendix AA: Traffic Impact Assessment, Section 2.4, Table 2.6 provides Background traffic volumes and heavy vehicle percentages.	Appendix AA: Traffic Impact Assessment Section 2.4 Table 2.6
145	145.0243	State Agency	Traffic and Transport		Note that the roads listed are not all state-controlled roads.	Update the EIS to ensure the report accurately describes any accesses from state-controlled roads.	Appendix AA: Traffic Impact Assessment, Section 2.3.1, Table 2.2 provides Surrounding road network details - road links, split into appropriate road authority groups.	Appendix AA: Traffic Impact Assessment Section 2.3.1 Table 2.2
145	145.0244	State Agency	Traffic and Transport		The EIS states:“Road rail-interface analysis: It was considered to adopt 95th percentile output results from SIDRA modelling results instead of industry standard 85th percentile outputs. This is considered conservative as it accounts for additional vehicle queue and delay which might be induced through higher traffic volumes and slower moving vehicles. Adopting 95th percentile as output from SIDRA would not have intent to and would not necessarily reflect traffic volumes during a seasonal peak. It would in the first instance be considered conservative to adopt an AADT value factored for the peak harvest season before then considering queue lengths.	Revise the EIS assessment to include probable and conservative traffic assumptions for peak harvest season/s. Alternatively, the Traffic Impact Assessment must be updated to include these details.	Section 2.4.1 of the revised draft Appendix AA: Traffic Impact Assessment discusses calculation of updated seasonal variation factors for the study area based on DTMR AADT sites which had year-long traffic data. Five DTMR AADT sites within the Project study area which fit this criterion. Areas of influence were chosen not simply by proximity but rather by the extents in which the DTMR sites provide the volume for. These sites and areas of influence are shown in Appendix AA: Traffic Impact Assessment, Figure 2.2. The seasonal variation factor was calculated by finding the factor required to multiply the ADT for each month to the peak month ADT for the site. This has been used to factor base traffic counts from a given month up to the peak month of the year. DTMR weekly data was used from the Queensland Government Open Data Portal and the middle day of the week was used to determine which month to include the week in. Appendix AA: Traffic Impact Assessment, Table 2.10 provides a summary of the seasonal variation factor determined for each site over the twelve months of the year.	Appendix AA: Traffic Impact Assessment Section 2.4.1 Table 2.10 Figure 2.2
145	145.0245	State Agency	Traffic and Transport		The report says that the intersection would be designed to the largest construction vehicle. This will need to be confirmed by the appropriate road authority. The design vehicle may need to be larger depending on the access level of the roads involved.	Amend Transport Chapter of the EIS and TIA to note this requirement.	Heavy vehicle route restrictions have been considered in the development of construction routes, in order to prioritise use of roads which are designed to a higher standard and are better suited to accommodate larger construction vehicles. This considered, often the first and last mile to material providers or laydown areas occur on local government roads with limited design for heavy or OSOM vehicles. Where use of roads deviates from defined routes allowing the design vehicle, consultation and agreement will be required with the road authority. Appendix AA: Traffic Impact Assessment, Section 2.20.2 provides a summary of heavy vehicle routes and restrictions.	Appendix AA: Traffic Impact Assessment Section 2.20.2
145	145.0246	State Agency	Traffic and Transport		Bybera Road is not a gazetted B-double route. There will need to be an approval process through the appropriate authority to access for larger vehicles than what a road is gazetted for.	Amend Transport Chapter of the EIS and TIA to note this requirement.	Appendix AA: Traffic Impact Assessment Section, 1.3.1 provides a summary of the stakeholder engagement undertaken, which includes Bybera Road. In addition to discussions with road managers, engagement with directly affected and nearby landowners has been undertaken. The construction routes identified within the revised draft EIS are proposed construction routes only. Use of these for the Project, and by the construction contractor, will require further assessment at Detailed Design stage which will include vehicle approvals by Council in the case of Bybera Road. This will be specific to the design vehicle that ARTC and the construction contractor stipulate.	Appendix AA: Traffic Impact Assessment Section 1.3.1
145	145.0247	State Agency	Traffic and Transport		With relation to the Cunningham Highway/Bybera Road intersection, the design will also need to comply with any TMR requirements in addition to Austroads GRD Part 4A. The intersection should be treated as a Slagged-T which may impact on the configuration of the turning lanes.	Update the EIS and TIA to more accurately expand upon the design requirements.	The updated Appendix AA: Traffic Impact Assessment provides a summary of intersection turn warrant assessments within Section 5.4.3, with detailed results and calculations in Appendix AT of Appendix AA: Traffic Impact Assessment, with the analysis indicating an upgraded right turn treatment (CHR(S)) to accommodate construction related traffic. Detailed design of intersection upgrades is not considered within the Appendix AA: Traffic Impact Assessment.	Appendix AA: Traffic Impact Assessment Section 5.4.3 Appendix AT
145	145.0248	State Agency	Traffic and Transport	Construction traffic	Section 6.3.1 discusses the turn warrants for right turn movements, whereas the third column of Table 6.14 refers to peak hour left turn volume into Bybera Road (QR).	Update the EIS to clarify column headings under Section 6.3 regarding Construction intersection analysis.	Appendix AA: Traffic Impact Assessment Section 5.3.3 outlines the turn warrants assessment methodology, which is in accordance with Austroads Guide to Traffic Management Part 6: Intersections, Interchanges and Crossing Management (2019a). Access impact assessment (for laydown areas) is discussed in Section 5.3.3 Appendix AA: Traffic Impact Assessment and includes left and right turns. Intersection impact assessment is discussed in Section 5.4.3 and includes left and right turns (Appendix AA: Traffic Impact Assessment).	Appendix AA: Traffic Impact Assessment Section 5.3.3 Section 5.4.3
145	145.0249	State Agency	Traffic and Transport		The Cunningham Highway/Yelarbon-Kurumbul Road intersection will be reconfigured as part of the permanent works. Any assessment of the mitigation treatments proposed here must be cognisant of this.	Amend EIS and TIA to take account of the reconfiguration.	The safety assessment within the Appendix AA: Traffic Impact Assessment has considered the implications at Yelarbon-Kurumbul Road pre and post Project. These are summarised in Table 5.12 with detailed results in Appendix AA: Traffic Impact Assessment sub-Appendix AN. Section 5.4.3 outlines the turn warrant requirements at this Section without and with the Project traffic.	Appendix AA: Traffic Impact Assessment Section 5.4.3 Table 5.12 Appendix AN
145	145.0250	State Agency	Traffic and Transport		The second paragraph says undated TIA instead of updated TIA for the Cunningham Highway/East Sawmill Road intersection.	Amend the EIS to state “updated rather than “undated.	The revised draft EIS has been reviewed and updated in accordance with the additional information request from the Office of the Coordinator-General. The process of updating the draft EIS includes, but is not limited to, technical reviews as well as quality control reviews.	N/A
145	145.0251	State Agency	Traffic and Transport	Level crossing	Where side roads are being closed (primarily to remove the need for a level crossing) and the traffic is diverted to an existing intersection with a state-controlled road, the operation of the existing intersection will also need to be assessed for potential impacts due to the increase in traffic.	Update the EIS to ensure that existing intersections affected through the closure of accesses are operating within acceptable limits.	A road diversion assessment has been undertaken at the locations where the rail alignment and road-rail interface crossing type has led to a requirement for redirection of traffic to an alternative route. Within the Border to Gowrie Study area, the following seven diversions have been identified: <ul style="list-style-type: none"> ▶ Athol School Road, Athol ▶ Biddeston Southbrook Road, Southbrook ▶ Lochaber Road, Pittsworth ▶ Oakey Pittsworth Road, Pittsworth ▶ Tip Road, Pittsworth ▶ Ware Street, Brookstead ▶ Fysh/Harris Road, Pampas. In Appendix AA: Traffic Impact Assessment, Section 5.9 a detailed assessment has been undertaken at each of these diversion locations, to summarise the: <ul style="list-style-type: none"> ▶ Existing situation, including the road network and active and public transport provisions ▶ Required site distance length ▶ Traffic information and rerouting assumptions ▶ Capacity (SIDRA) and turn warrants assessment without and with Project ▶ Recommendations. The Ware Street diversion is an exception to above, as this diversion location has had a separate traffic impact assessment undertaken. As such, the previous Appendix AA: Traffic Impact Assessment work (Section 5.9.4) has been summarised within this report, with the full assessment included in Appendix BM of Appendix AA: Traffic Impact Assessment.	Appendix AA: Traffic Impact Assessment Section 5.9.4 Appendix BM
145	145.0252	State Agency	Traffic and Transport	Cumulative impacts	It is noted that the values in Table 7.3 represent B2G-generated traffic only. The additional traffic generated from all other Inland Rail projects will also need to be factored in as this may increase these percentages above 5% for some road sections.	The TIA should include traffic generated by all other Inland Rail projects when determining whether impact assessment thresholds are reached. Amend the EIS/TIA accordingly.	The cumulative traffic assessment has been updated in the revised draft EIS Appendix AA: Traffic Impact Assessment and is documented in Section 5.11. This now includes consideration of all other Inland Rail projects with overlapping construction routes.	Appendix AA: Traffic Impact Assessment Section 5.11
145	145.0253	State Agency	Traffic and Transport		The assumed seven-axle B-double is an atypical vehicle for quarry operations. The makeup of quarry fleet are typically tandem trucks or truck and dog combination ensuring wider and unrestricted access across the road network. These vehicles including within same classes can have substantially differing payloads. The assumed vehicle type is not made clear and it is therefore unclear what effect this has on the PIA.	Revise the assessment to include probable heavy vehicle traffic combination types for the intended activities. Undertake a detailed PIA in accordance with TMR’s assessment criteria. This is in addition to TMRs other comments on the PIA.	The vehicle types adopted for this assessment, as presented in Appendix AA: Traffic Impact Assessment Table 5.53, are in line with standard Classes 5, 7, 9 and 10 vehicles as well as the assumed size of the OSOM vehicles used to transport the precast concrete bridge sections, and have been utilised in the construction trip generation task for the calculated construction load. However, the construction vehicle types adopted for the assessments during the draft EIS and revised draft EIS will need to be reconfirmed during the Detailed Design stage once a construction contractor is appointed. The pavement impact assessment has been undertaken based on the SARs calculated for these vehicle types consistent with the Guide to Traffic Impact Assessment Practice Note: Pavement Impact Assessment December 2018.	Appendix AA: Traffic Impact Assessment Table 5.53
145	145.0254	State Agency	Traffic and Transport	Cumulative impacts	The PIA is not cross-referenced with other significant developments, in particular, other sections of the Inland Rail proposal, to inform cumulative impacts.	In consultation with the department undertake a detailed PIA in accordance with TMR’s assessment criteria. Include the cumulative impacts of the Inland Rail programme and to maintain consistency with requirements of the ToR.	The cumulative traffic assessment has been updated in the revised draft EIS Appendix AA: Traffic Impact Assessment and is documented in Section 5.11. This now includes consideration of all other Inland Rail projects with overlapping construction routes.	Appendix AA: Traffic Impact Assessment Section 5.11
145	145.0255	State Agency	Traffic and Transport	Cumulative impacts	There is potential for other Inland Rail projects, namely H2C, C2K and K2ARB, to increase traffic volumes on the road network, not just North Star to Border and Gowrie to Helidon, yet only North Star to Border and Gowrie to Helidon are included in Table 11.4. All Inland Rail projects should be assessed for potential overlap of haulage routes and construction schedules, not just NS2B and G2H.	The TIA should include traffic generated by all other Inland Rail projects.	The cumulative traffic assessment has been updated in Appendix AA: Traffic Impact Assessment and is documented in Section 5.11. This now includes consideration of all other Inland Rail projects with overlapping construction routes.	Appendix AA: Traffic Impact Assessment Section 5.11
145	145.0256	State Agency	Traffic and Transport		The AADT data used in the calculation of growth rates does not appear to be correct. When the finalised TIA is developed, the correct and most current traffic data is to be used (ignoring any Covid-19 impacted data). It is not correct to fill in the gaps with data from adjacent years.	All growth rates for state-controlled roads are to be agreed to by TMR.	Appendix AA: Traffic Impact Assessment, Section 2.4.1 outlines the growth rates used for assessment and all road links growth rates are provided in Table 2.8. These factors were both determined based on the closest DTMR AADT site to the road link. Both the AADT and HV growth rates were determined in response to requests from DTMR and Coordinator-General for specific HV growth rates to be imputed and be adopted for the pavement impact assessment to capture local conditions and HV data. The growth rates for assessment have been determined based on the following order of hierarchy: <ol style="list-style-type: none"> 1. 10-year growth rate 2. 5-year growth rate 3. 1 year growth rate 4. 3 per cent p. a. (Pavement Impact Assessment Practice Note (DTMR, 2018b) states ‘in the absence of site-specific data, an annual growth rate of 3 per cent p. a. should be adopted’). 	Appendix AA: Traffic Impact Assessment Section 2.4.1 Table 2.8

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0257	State Agency	Traffic and Transport		The accuracy of the data supplied in Appendix D cannot be verified as the conversion of heavy vehicle types and volumes has not been supplied. This will need to be supplied to TMR as part of the development of the finalised TIA.	All data used for the PIA is to be supplied to TMR to allow for verification of the data provided.	The existing traffic volumes for all road links has been determined based on available data of background traffic volumes, growth rates, seasonal variation factors and peak hour factors. Traffic data sources are listed in Appendix AA: Traffic Impact Assessment, Table 2.5 which includes data provided by TMR. The methodology to determine the existing traffic volumes and future traffic volumes is explained in Section 2.4 Appendix AA: Traffic Impact Assessment. This methodology is consistent with the method provided to the Coordinator-General as requested as a part of the additional information request process (technical memo provided in Appendix BP of Appendix AA: Traffic Impact Assessment).	Appendix AA: Traffic Impact Assessment Section 2.4 Table 2.5 Appendix BP
145	145.0258	State Agency	Traffic and Transport		The EIS states that crossing loops will initially accommodate 1800 m long trains. There is no mention of the potential to accommodate 3600 m long trains in this section. The 3600 m long trains are mentioned in other sections of the TIA.	Update Section 3.3to include reference to potential operations of 3600 m long trains.	The revised draft EIS Chapter 5: Project Description describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. approval for 3,600 m trains is not part of this stage of the Project for which approval is being sought.	Chapter 5: Project Description
145	145.0259	State Agency	Traffic and Transport	Construction traffic	Section 5.6.9 states that temporary laydown areas will generally involve clearing, grubbing, topsoil stripping, installing environmental controls, laying hardstand material, and constructing parking areas and access tracks.	Please provide more certainty about the use/nature of 'temporary laydown areas' and the construction stage in which they are being established (e.g. pre or during construction).	Each laydown area has been positioned to avoid or minimise potential impacts to environmental and social receptors. Laydown areas were initially selected based on investigations using aerial imagery and ground truthing to confirm general suitability and avoidance of environmental and social receptors. The draft EIS assessed these laydown areas as part of the Project and identified suitable mitigation measures. Adjustments to the laydown areas have been based on stakeholder feedback and further optimised for field validated ecology. The locations of the laydown areas have been chosen to avoid areas that are within the 1% AEP floodplains where possible, and areas of native vegetation. However, by virtue of the requirement of laydown areas for constructing bridges, some laydown areas must be within floodplains and near watercourses or drainage features. In such instances, the following precautions will be taken: ► The site will be surveyed prior to site establishment to understand the exact extent of potential flooding impact to facilities and storage areas ► The earthworks and temporary drainage will be designed to minimise flooding impacts Fuel storage areas will be bunded, capacity restricted to no larger than required for reasonable operations, and preferentially stored at the furthest point away from watercourses. A full list of laydown areas and their planned uses is provided in Table 5-24, Section 5.6.7 of Chapter 5: Project Description.	Chapter 5: Project Description Section 5.6.7 Table 5-24
145	145.0260	State Agency	Traffic and Transport	Construction traffic	The EIS states that laydown areas have been nominated for the Project that would need to be accessed directly off a State-controlled road, including: ► Pittsworth-Tummalville Road ► Southbrook Rockview Road These roads are not owned by the state government and the EIS also does not provide traffic data for these roads.	Please clarify the locations of the laydown areas that are being accessed by state-controlled roads and provide information and data for all relevant roads.	A full list of laydown areas and their planned uses is provided in Table 5-24, Section 5.6.7 of Chapter 5: Project Description.	Chapter 5: Project Description Section 5.6.7 Table 5-24
145	145.0261	State Agency	Traffic and Transport	Construction traffic	The construction route maps are small and difficult to read. It is requested that GIS files for construction haulage routes are to be provided to TMR to allow for assessment.	Provide GIS files for construction haulage routes to TMR.	The revised draft EIS has been reviewed and updated in accordance with the additional information request from the Office of the Coordinator-General. The proposed primary construction transport routes incorporated in the TIA study area are provided in Figure 1.3, with specific material transport routes provided in Appendix U to Appendix AE (Appendix AA: Traffic Impact Assessment). Ultimately, the determination of the final construction routes will be subject to the EIS approval conditions and consultation and agreement between DTMR, the relevant LGA, the construction contractor and, where relevant, QR (Appendix AA: Traffic Impact Assessment, Section 1.2). Consult with DTMR, councils, the Contractor, and where relevant QR, in determination of final construction and HV routes. Further summary of ARTC and Contractor commitments are in Section 6.2 of Appendix AA: Traffic Impact Assessment.	Appendix AA: Traffic Impact Assessment Section 1.2 Section 6.2 Figure 1.3 Appendix U-AE
145	145.0262	State Agency	Traffic and Transport	Construction traffic	It is unlikely that the construction schedule as plotted on the x-axis is to be achieved. The finalised TIA must contain updated versions of these graphs using the best available construction program (which may be the version supplied by the construction contractor).	Update the EIS/TIA to include construction timeframes that are more realistic.	The construction schedule has been updated as part of the revised draft EIS. The anticipated timing of stages for the Project (including for the revised draft EIS) is shown in Table 5-3, Section 5.3.6 of Chapter 5: Project Description. Pre-construction activities and early works are undertaken prior to full mobilisation of the contractor. These works may be undertaken under a separate contract but will not commence until the Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) has been approved by the Coordinator-General and the Australian Government Minister for the Environment, and the relevant early works Construction Environmental Management Plan (CEMP) has been endorsed by the Environmental Monitor.	Chapter 5: Project Description Section 5.3.6 Table 5-3 Chapter 24: Draft Outline Environmental Management Plan
145	145.0263	State Agency	Traffic and Transport	Construction traffic	Some of the graphs do not start from 0. Does that mean that construction traffic is already on the road network (as of March 2021)?	Update the EIS to ensure that there are no errors or missing information to allow stakeholders to adequately assess the information.	The construction schedule has been updated as part of the revised draft EIS. The anticipated timing of stages for the Project (including for the revised draft EIS) is shown in Table 5-3, Section 5.3.6 of Chapter 5: Project Description. Commence construction activities in the third quarter of 2024, as summarised in Table 3.6, with some site ► early works (e.g., site preparation, surveys, initial laydown areas and establishment of non-resident ► workforce accommodation) commencing earlier – assumed to be February 2024 as a part of the Appendix AA: Traffic Impact Assessment.	Chapter 5: Project Description Section 5.3.6 Table 5-3 Appendix AA: Traffic Impact Assessment Table 3.6
145	145.0264	State Agency	Traffic and Transport		Some cells seem to have an error in them. Recommend ARTC provide a more final document without errors to ensure stakeholders can adequately consider the information.	Update the EIS to ensure that there are no errors or missing information to allow stakeholders to adequately assess the information.	The revised draft EIS has been reviewed and updated in accordance with the additional information request from the Office of the Coordinator-General. The process of updating the draft EIS includes, but is not limited to, technical reviews as well as quality control reviews.	N/A
145	145.0264	Private - Turalin Workers	Traffic and Transport		Some cells seem to have an error in them. Recommend ARTC provide a more final document without errors to ensure stakeholders can adequately consider the information.	Update the EIS to ensure that there are no errors or missing information to allow stakeholders to adequately assess the information.	The revised draft EIS has been reviewed and updated in accordance with the additional information request from the Office of the Coordinator-General. The process of updating the draft EIS includes, but is not limited to, technical reviews as well as quality control reviews.	N/A
145	145.0265	State Agency	Traffic and Transport	Level crossing	Level crossings] See TMRs other comments regarding level crossings Structural Adequacy The TIA report does not evaluate prevailing structural integrity issues of the transport infrastructure (for example, bridges or culverts) which may occur on any of the proposed construction transport routes. These items are to be identified and addressed in the TIA.	Amend the EIS to evaluate the prevailing structural integrity issues of the transport infrastructure (bridges, culverts etc) in accordance with Section 4.5 of GTIA.	Appendix AA: Traffic Impact Assessment Section 5.7 provides details the transport infrastructure impact assessment and mitigation undertaken for transport infrastructure in accordance with GTIA requirements. This includes bridges and culverts, heavy vehicle routes, and oversize overmass vehicles. Appendix AA: Traffic Impact Assessment Section 5.7.1 details the impact assessment and mitigation undertaken for bridges and culverts. No detailed assessment has currently been undertaken with regards to bridge and culvert limits, however, a preliminary assessment identified a number of potential construction traffic restrictions along local government roads as provided in Table 5.60. These were confirmed in a site visit, with site visit photos provided in Appendix BU of Appendix AA: Traffic Impact Assessment. Should HVs be required to traverse these bridges or culverts, an assessment will need to be undertaken and further investigation and inspections will need to take place – the outcomes of which may lead to upgrading these bridges for construction and operational purposes.	Appendix AA Traffic Impact Assessment Section 5.7 Section 5.7.1 Table 5.60 Appendix BU
145	145.0266	State Agency	Land Resources	Spoil management	According to the figures, only 1.19% of cut material is expected to be unsuitable. What degree of confidence is attributed to it in light of the volume of GI undertaken to date? i.e. roughly one borehole every 5 km	Update the EIS to confirm quantity of ground investigation undertaken so far is sufficient to provide this low % of unsuitable material and confirm degree of confidence in the figure.	A detailed geotechnical survey was undertaken in 2021 and is provided in Appendix G1: Geotechnical Reports - Investigation Results and G2: Macquarie Geotechnical - Preliminary Soil Assessment. The volume of site won cut material and fill requirements for the Project earthworks has been determined using a 12D Design Model overlain with detailed geotechnical and soil investigation data (Table 2.5: Summary of bulk Project earthworks in Appendix AB: Earthworks Strategy and Draft Soil Management Plan). This has enabled all materials that will be encountered by Project earthworks to be classified, as per material types and classification within Section 2, Part A: Draft Earthworks Strategy in Appendix AB: Earthworks Strategy and Draft Soil Management Plan. The approximate percentage of 5 per cent spoil, has been derived on the assumption that all site won material, with the exception of those classified as 'inherently unsuitable', will be re-usable within Project earthworks.	Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 2 Table 2.5 Appendix G1: Geotechnical Reports - Investigation Results Appendix G2: Macquarie Geotechnical - Laboratory Results
145	145.0267	State Agency	Land Resources	Spoil management	Reference is made to sodic (dispersive) soils and amelioration methods which indicate a misunderstanding on best practice amelioration methods.	In the absence of any nominated ARTC standard, include the requirement to identify, assess, ameliorate and manage the project soils as per the TMR Interim SMM, SMM Appendix 2 soil forms, TMR Soil Group Classifications Map and CSIRO Clay Mineralogy Maps.	The soils baseline assessment has provided field-verified data (including the identification of soil management units) to inform impact assessment and allow the revised reference design and future construction works to be further refined accordingly, to avoid, reduce and mitigate impacts. Site-specific soil management and mitigation measures are detailed in Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Section 3.3, which address soil stripping procedures, amelioration procedures, topsoil and subsoil management during various stages of the Project. ARTC will continue to pursue additional soil testing as required and determined during detailed design development in order to ensure the Project can manage the risks of the Project's topsoils and subsoils as per the TMR Interim Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group Classifications Map and CSIRO Clay Mineralogy Maps.	Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.3
145	145.0268	State Agency	Land Resources	Spoil management	There is also a blanket approach to topsoil stripping which can result in the contamination of stripped topsoil with sodic and or saline subsoils (and other high-risk subsoils). Additionally, reference is made to a Soil Management Sub-plan but only refers to the inclusion of contaminated soils and ESC in the plan.	It is recommended that the EIS be amended to include topsoil and subsoil, surveying, assessment and management, topsoil stripping depths, and soil amelioration in the Soil Management Sub-plan.	A detailed soil investigation (see Section 4.5 of Appendix J: Soil Assessment Report) has been undertaken along the Project footprint to further understand the soil properties and refine existing soil mapping. Findings from the detailed soil investigation have informed soil-specific management measures (Chapter 9: Land Resources, Section 9.3.2 and Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Section 3.3) and will assist in planning, detailed design of structures, embankments, erosion control measures (both temporary and permanent), soil treatment and management, and site rehabilitation planning. Soil handling protocols prioritising the protection of topsoil have been detailed in a Soil Management Plan in Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Part B (Section 3). A Project concept erosion and sediment control plan (concept ESCP) will be developed to guide the development of area, site or Section specific ESCPs and include detailed erosion hazard assessments and ESC structure designs. Each of these will need to be regularly updated and maintained during construction. Topsoil is aimed to be progressively salvaged, appropriately stockpiled and then reused within the construction footprint. A commitment for the Contractor to develop a stockpile management plan is included within Chapter 24: Draft Outline Environmental Management Plan. Soil degradation as a result of weeds has been considered in the revised draft EIS (Chapter 9: Land Resources, Section 9.5.6) as a potential impact. Biosecurity risk is considered in Chapter 11: Flora and Fauna. The revised draft EIS provides management measures for stockpiling and management/segregation of topsoil where it contains weed material. Details of the Biosecurity Management Plan prepared for the Project are outlined throughout Chapter 24: Draft Outline Environmental Management Plan with proposed mitigation measures detailed in the chapter.	Chapter 9: Land Resources Section 9.3.2 Section 9.5.6 Chapter 24: Draft Outline Environmental Management Plan Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Section 3.3 Appendix J: Soil Assessment Report Section 4.5
145	145.0269	State Agency	Land Resources	Spoil management	Contrary to the EIS, existing railway corridors are not considered potential sources of contamination. They are to be assumed fully contaminated and ARTC have acknowledged this in their PSTr.	Update the EIS to remove existing railways from list of potential contamination and acknowledge that existing railway corridors are to be assumed as fully contaminated.	For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9.17 and the full results will be presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates. The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM. The investigation included the identification of potential sources of contamination within the impact assessment area through a desktop assessment (Chapter 9: Land Resources, Section 9.4.5) and also included findings from a limited contaminated land investigation completed by Macquarie Geotech within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines. Consistent with the requirements of ASC NEPM, the data quality objectives for contaminated land investigations need to be informed by detailed design information (e.g. proposed future re-use of materials). A contaminated land management strategy for any future assessments is provided in Chapter 9: Land Resources, Section 9.6.2 and Figure 9-24.	Chapter 9: Land Resources Section 9.4.5 Section 9.6.2 Table 9-15 Table 9-24 Appendix I: EMR Search Certificates and Soil Laboratory Certificates

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
145	145.0270	State Agency	Land Resources	Proponent commitments	With reference to land resources, there should be a commitment to meet the requirements of TMR's MRTS16 and TMR's Interim SSM. This includes the requirement to; to identify and assess the project soils as per the TMR Interim SMM, SMM Appendix 2 soil forms, TMR Soil Group Classifications Map and CSIRO Clay Mineralogy Map, for the suitably qualified soil practitioner to be a CPSS as per the TMR Interim SMM.	Amend the EIS and Proponent Commitments to ensure that the applicant meet the requirements of the MRTS16 and the Interim SSM.	ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at 1:10,000 scale in consultation with DoR. Soil management units from the investigation are provided in Section 4.5. This level of investigation is sufficient to allow determination of the suitability of the soils and to manage the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides general and site-specific soil management measures in Section 3.2 and 3.3.	Appendix J: Soil Assessment Report Section 4.5 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3
145	145.0271	State Agency	Surface Water	Proponent commitments	Surface water quality should, in addition to rain events, be monitored weekly during or prior to site inspection and daily visual site observation that there is a change in turbidity or visual contamination such as oil. Moreover, downstream water quality should be compared against baseline and upstream water quality sampling.	It is recommended that water quality monitoring be undertaken following significant rain events, weekly during site inspections, and daily after visual site observation that indicate a change in turbidity or contamination such as oil, or environmental incident or compliant. Amend the EIS. Proponent Commitments and Outline Environmental Management Plan accordingly.	The locations, frequency and parameters of interest for water quality sampling during construction will be subject to confirmation as part of the CEMP. The frequency and location of surface water sampling during construction of the Project will be established with consideration for: <ul style="list-style-type: none"> ➤ Construction activities with potential to impact water quality ➤ Seasonality ➤ Sensitivity of receiving watercourse. ➤ Water quality monitoring requirements will be developed in consultation with DRDMW and DES, to be reviewed and accepted by the Environmental Monitor. This is documented in Section 13.6.3 of Chapter 13: Surface Water. 	Chapter 13: Surface Water Section 13.6.3
145	145.0273	State Agency	Traffic and Transport	Proponent commitments	Regarding traffic and transport, ARTC is only committing to undertaking further assessment, but there is no commitment to undertake any the requirements or mitigation measures identified in the traffic impact assessment.	Amend the EIS (including Proponent Commitments) to ensure ARTC commits to undertaking the mitigation measures required as a consequence of the updated TIA. This includes any pavement contribution as a consequence of the updated PIA, upgrading any necessary intersections, as well as the requirement to develop and implement the outcomes of a Road-use Management Plan. Additionally, ARTC should continue to work with TMR regarding the appropriate mechanism to manage impacts to the State-controlled road (for example "an infrastructure agreement).	Any proposed mitigations identified within Appendix AA: Traffic Impact Assessment are the baseline mitigation measures for the Project. The construction contractor will further develop the alignment design, determine their construction methodology and construction routes are finalised, specific mitigation measures on top of these baseline mitigations will be required to be developed and applied to the Project. A Traffic Management Plan (TMP) and Road Use Management Plan (RUMP) will be prepared for the Project in accordance with the GTIA to support works to the existing road network. This will be developed in consultation with DTMR, local councils and emergency service providers and will be finalised prior to the commencement of construction.	Appendix AA: Traffic Impact Assessment
145	145.0274	State Agency	Waste and Resource Management		Waste will be managed in accordance with the waste hierarchy by reducing the amount of waste generated in the first instance, the segregation of waste into waste streams to facilitate appropriate reuse, recycle, waste recovery for fuel/energy and least preferable, dispose.	Update the EIS to ensure waste will be managed in accordance with the waste hierarchy by reducing the amount of waste generated in the first instance, the segregation of waste into waste streams to facilitate appropriate reuse, recycle, waste recovery for fuel/energy and least preferable, dispose.	As per Section 22.6 of Chapter 22: Waste and Resource Management, mitigation measures pertaining to waste management have been developed for the Project in accordance with relevant legislative requirements, aligning with the 2018 National Waste Policy and the Waste Reduction and Recycling Act 2011 (Qld) hierarchy. Waste management strategies that avoid the generation of waste materials in the first instance will be prioritised. Where waste cannot be avoided, waste materials will be segregated by type for collection and removal by licenced contractors.	Chapter 22: Waste and Resource Management Section 22.6
145	145.0275	State Agency	Outline EMP		Regarding the Environmental Management Plan, the Construction Environmental Management Plan is required to have an Erosion and Sediment Control Sub-Plan.	Update the EIS (Outline Environmental Management Plan and Proponents Commitments) to ensure that an Erosion and Sediment Control Sub-Plan is required.	An Erosion and Sediment Control Plan will also be developed as a component of the Construction Environmental Management Plan (CEMP) (Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
145	145.0276	State Agency	Editorial		Appendix Z: Proponent Commitments Table 1, for the Environmental Management Plan, the dot point Appointment of an Environmental Monitor to: repeats twice. Consider removing the second reference to Environmental Monitor.	Consider removing second reference to appointing an environmental monitor and continue sequence of dot point comments.	The contents of draft EIS Appendix AC: Proponent Commitments, Table 1: Summary of ARTC Project Commitments have been relocated to Chapter 24: Draft Outline Environmental Management Plan under the Roles and Responsibilities Section in the revised draft EIS. The second reference in the Table to the need for an Environmental Monitor has been corrected to Community Relations Monitor.	Chapter 24: Draft Outline Environmental Management Plan
146	146.0001	Private - Turalin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turalin/Millmerran area	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing. Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report). The Turalin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
146	146.0002	Private - Turalin Workers	Traffic and Transport		a. Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. b. Increase in traffic on narrow roads that are already heavily traversed. c. Impact on Travel time as it is further from the alignment of the rail project. d. Turalin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. e. Could impact on Millmerran town parking availability.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing. Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report). The Turalin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
146	146.0003	Private - Turalin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage. Following this consultation, feedback through the draft EIS and a site feasibility study, Turalin is no longer being considered as a suitable location for a non-resident workforce accommodation facility. As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.3738 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing. It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.	Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4

146	146.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property, cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community. 146	146.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	Chapter 5: Project Description Section 5.6.4 Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 20 Section 20.6
146	146.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.	Chapter 5: Project Description Section 5.6.4
						Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).	Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.	
							Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.	
146	146.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.	Chapter 11: Flora and Fauna Section 11.6 Section 11.7

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
147	147.0001	Private	Land Resources	Severance of agricultural land	Project will destroy and cause loss of strategic cropping land on submitter's property. The rail cuts off most valuable Section of the farm which is also where the water bore is located. This will impact the farm's economic viability. Loss of farmland/strategic cropping land is a loss to Queensland not just the farm owners.	Realign the corridor to the one suggested at the Senate Inquiry that travels further to the west of the current Wellcamp to Gowrie corridor (refer submission).	<p>The Project has been aligned to be co-located with existing rail and road infrastructure, where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. However, for several reasons, including topography and operational design parameters, a portion of the alignment has to traverse agricultural land. Chapter 8: Land Use and Tenure, Section 8.5.1, has been updated for the revised draft EIS, detailing land to be sterilised due to the revised alignment. ARTC will continue to engage with affected landowners to minimise impacts on existing agricultural practices.</p> <p>As described in Chapter 2: Project Rationale, Section 2.8-2.10, of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>Where the loss of agricultural land was unable to be avoided, refinement of the horizontal alignment was considered (among other environmental, social, cultural, economic and technical constraints), and placement of the rail corridor such that it traverses around or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided (Chapter 8: Land Use and Tenure, Section 8.5.4 Table 8-46).</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed based on these over-arching factors; therefore, a like-for-like replacement for the loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint cannot avoid the severance of agricultural land and enterprises due to the partial property acquisition, the acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design in accordance with the <i>Acquisition of Land Act 1967</i> (Qld) (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none">➤ Landowners' needs regarding access to the properties and the closure of private roads➤ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority➤ The potential for changes to groundwater access.	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Chapter 8: Land use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Table 8-46
147	147.0003	Private	Surface Water	Private groundwater bore/s	Concerned about loss of rapid aquifer recharge water bore. Reliable bore water supply underpins value of the property, which may not be replicated north of the proposed rail corridor.	Move the rail corridor.	<p>It is acknowledged that the rail corridor will separate the submitter's southern Section of the property containing the bore from the remainder of the property, including buildings, to the north. ARTC is in the process of consulting with landowners to determine an appropriate make-good strategy on a case-by-case basis. Through this process, the measures developed for each impacted bore will be unique and commensurate with the level of impact realised (Chapter 15: Groundwater, Section 15.7.4).</p> <p>Impacts to groundwater during construction and operation will be monitored as part of the Groundwater Management and Monitoring Program (GMMP). Monitoring will be performed at locations (distance and depth/aquifer) up and down-gradient of the site where construction activities are occurring and at reference bores outside the anticipated extent of impact (Chapter 15: Groundwater, Section 15.7.3). If the submitter is concerned about the potential for impacts to their bore, then the submitter can contact ARTC at inlandrailqld@artc.com.au to nominate the bore for inclusion in the GMMP.</p> <p>Where a groundwater bore is expected to be decommissioned or have access/usage impaired as result of the Project, 'make good' measures will be agreed in consultation with the affected landowners during detailed design. An overview of the draft bore groundwater 'make-good process' is presented on Figure 15-31 of Chapter 15: Groundwater. If the landowner does not accept the 'make good' assessment (either whether there is an impairment in the first place, or the level of impairment), ARTC will:</p> <ul style="list-style-type: none">➤ Advise the landowner that they are entitled to obtain an assessment from a suitably qualified person (SQP)➤ Advise the landowner that ARTC will pay their reasonable costs➤ Provide ARTC's bore assessment to the landowner for review by the landowner's SQP➤ Advise landowners of their expectations as to the reasonable costs of obtaining a bore assessment.	Chapter 15: Groundwater Section 15.7.3 Section 15.7.4 Figure 15-31
148	148.0001	Private - Brookstead	Social Impact Assessment	Modelling	<p>The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.</p> <p>The SIA survey does not represent views of the community members who may be impacted by the project.</p>	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
148	148.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	<p>No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.</p> <p>The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase.</p> <p>The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
148	148.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4
148	148.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none">➤ ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community.➤ ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners.➤ The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.➤ ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.➤ ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.➤ The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none">➤ ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development.➤ ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts.➤ A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6.➤ Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none">➤ Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS.➤ In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022.➤ ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none">➤ A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment). Appendix X: Social Impact Assessment, notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope.➤ ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment). <p>Future consultation:</p> <ul style="list-style-type: none">➤ As noted in Chapter 24: Draft Outline Environmental Management Plan Section, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.	Chapter 6: Stakeholder Engagement Section 6 Section 6.2.4 Section 6.2.5 Section 6.4 Section 6.5 Section 6.6 Appendix E: Consultation Report Section 2.1 Section 4.1 Section 5.3 Appendix X: Social Impact Assessment

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0010	State Agency	Approvals/ conditions/ recommend-ations		Any condition within the Department of Resources submission is a recommended imposed condition. The Department of Resources can assist by providing technical advice to the Coordinator-General if the need arises.	For noting by the OCG.	This issue is noted. Submission is to be considered by the Office of the Coordinator-General.	N/A
149	149.0020	State Agency	Editorial		Recent machinery of government changes has resulted in state agency name changes, since the EIS was drafted. Therefore, all references to the former Department of Natural Resources, Mines and Energy (DNRME), require amending to either the Department of Resources or the Department of Regional Development, Manufacturing and Water (DRDMW) to reflect machinery of government changes. In general, this will require all references to the former DNRME, in sections that do not relate to water matters, being changed to Department of Resources.	Change all references to the former Department of Natural Resources, Mines and Energy, to either Department of Resources or Department of Regional Development, Manufacturing and Water (DRDMW) to reflect machinery of government changes.	Department names have been reviewed and updated throughout the EIS. In some circumstances it is appropriate to maintain older name of previous departments where it applies to reports or guidelines that were prepared by a previous department.	N/A
149	149.0030	State Agency	Editorial		The department and unit name relating to State Land interests needs to be amended throughout the Draft EIS to reflect recent machinery of government/departmental changes.	Change all references in the Draft EIS from State Land Asset Management (SLAM), to Land Administration and Acquisition (LAA). Change all references to the departments name (relating to State Land) from Department of Natural Resources, Mines and Energy, to Department of Resources.	A detailed review of all Government department names has been undertaken throughout the EIS to ensure currency and continuity.	N/A
149	149.0040	State Agency	Approvals/ conditions/ recommend-ations	Land acquisition/ compensation	Table 3.5 (Land Act and NT Act row) State land dealings may take an extended amount of time to resolve and early engagement is recommended to minimise the risk of any delays to the project.	Amend Table 3.5 Land Act and NT Act row to include additional column (as included in Chapter 3: Project Approvals Table 3.4 of Calvert to Kagaru draft EIS) Indicative approval processing timeframe. Under this new column include the following: No statutory timeframes can be lengthy and early engagement with Department of Resources is required. For noting: Department of Resources, Land Administration and Acquisition contact: Julie Douglas Senior Land Officer Department of Resources PO Box 2 (Corner of Fitzroy and Guy Streets) Warwick QLD 4370 SLAM warwick@resources.qld.gov.au Recommended condition If the above changes are not made to Table 3.5, it is recommended that the OCG impose the following condition on the EIS: Development on State Land, including road, must obtain relevant Land Act 1994 approvals through the administering authority the Department of Resources, Land Administration and Acquisition, unless another appropriate legislative land dealing process i.e., under the Transport Infrastructure Act 1994 is implemented.	The submitters recommendations have been adopted according to consultation detailed in Section 5.2 and Table E-18, E-38 and E-73-of revised draft EIS Appendix E: Consultation Report.	Appendix E: Consultation Report Section 5.2 Tables E-18, E-38 and E-73
149	149.0050	State Agency	Land Use and Tenure		No mention of the Land Act 1994 upfront and within the introduction of Chapter 7 Land Use and Tenure. The Land Act 1994 and associated State land policies will play a significant role in enabling tenure/land dealings required to facilitate the Inland Rail project.	Amend Section 7.1 Introduction to include the additional text: 'This Chapter identifies the land use and tenure aspects relevant to the Project and, in doing so, addressees the following: The relevant legislative context including the Land Act 1994 for land use and tenure for the Project (refer Section 7.3)'. Recommended condition: If the above changes are not made to Table 7.2, it is recommended that the OCG impose the following condition on the EIS: Development on State Land, including road, must obtain relevant Land Act 1994 approvals through the administering authority the Department of Resources, Land Administration and Acquisition, unless another appropriate legislative land dealing process i.e., under the Transport Infrastructure Act 1994 is implemented.	This issue is noted. The legislation and relevant planning instruments Section have been updated to incorporate all legislation of relevance. Chapter 8: Land Use and Tenure, Section 8.2 and 8.4.1 have been updated to incorporate the Land Act 1994 and other legislation as relevant to land use and tenure.	Chapter 8: Land Use and Tenure Section 8.2 Section 8.4.1
149	149.0060	State Agency	Land Use and Tenure		Table 7.2 Policies, Standards and Guidelines Relevant to the Project does not include any information on the Land Act 1994. The relevance of the Land Act 1994 needs to be described in Table 7.2 because multiple parcels of State Land will be impacted by the project (as stated in Appendix V). Additionally, Chapter 3 Legislation and Project Approvals Process, Section 3.5.14 Land Act 1994, states that the Land Act 1994 will be used in tenure processes, therefore Table 7.2 needs to be updated accordingly.	Amend Table 7.2 by adding a row for the Land Act 1994 (QLD) and include a description under the Relevance to the Project heading stating how the Land Act 1994 will be used for tenure dealings. This has not been included in Table 7.2 Policies, Standards and Guidelines relevant to this Assessment, Page 734. Recommended condition: If the above changes are not made to Table 7.2, it is recommended that the OCG impose the following condition on the EIS: Development on State Land, including road, must obtain relevant Land Act 1994 approvals through the administering authority the Department of Resources, Land Administration and Acquisition, unless another appropriate legislative land dealing process i.e., under the Transport Infrastructure Act 1994 is implemented.	This issue is noted. The legislation and relevant planning instruments been updated to incorporate all legislation of relevance. Chapter 8: Land Use and Tenure, Section 8.2 has been updated to incorporate the Land Act 1994 and other legislation as relevant to land use and tenure.	Chapter 8: Land Use and Tenure Section 8.2
149	149.0070	State Agency	Land Use and Tenure		State land dealings may take an extended amount of time to resolve and early engagement is recommended to minimise the risk of any delays to the project.	Include additional text in Section 7.5.1 to identify that tenure processes under the Land Act 1994 will be complied with. For example, amend the EIS to include the following: In some instances, appropriate tenure or interest in State land, that supports the proposed development, will be secured by ARTC under the Land Act 1994. In this case, contact must be made as soon as possible with the Department of Resources Land Administration and Acquisition Team to discuss options and to begin proceedings under the Land Act 1994. For noting: Department of Resources, Land Administration and Acquisition contact: Julie Douglas Senior Land Officer Department of Resources PO Box 2 (Corner of Fitzroy and Guy Streets) Warwick QLD 4370 SLAM warwick@resources.qld.gov.au Recommended condition: If the above changes are not made to Section 7.5.1, it is recommended that the OCG impose the following condition on the EIS: Development on State Land, including road, must obtain relevant Land Act 1994 approvals through the administering authority the Department of Resources, Land Administration and Acquisition, unless another appropriate legislative land dealing process i.e., under the Transport Infrastructure Act 1994 is implemented.	Chapter 8: Land Use and Tenure has been amended accordingly. Section 8.5.1 Permanent change in tenure and loss of property, has been updated and now includes the following text: In some instances, appropriate tenure or interest in State land that supports the proposed development will be secured by ARTC under the Land Act 1994. In these cases, contact will be made as soon as reasonably practicable with the Department of Resources Land Administration and Acquisition Team to discuss options and to begin proceedings under the Land Act 1994.	Chapter 8: Land Use and Tenure Section 8.5.1
149	149.0080	State Agency	Land Use and Tenure	Baseline/backgr ound sampling	While this Section mentions revocation of State Forest, no mention is made of the impact on the grazing leases on State forest.	Include additional text in 7.6.1 Permanent change in tenure and loss of property "State forest revocation page 7, 158 and 7.7.2.1 Change in land tenure and loss of property State forest 180", to identify that impacts on grazing leases over State forests may require tenure processes under the Land Act 1994. For example, where grazing leases over State Forests are impacted, it is recommended that ARTC contact the Department of Resources, Land Administration and Acquisition Team as soon as possible to discuss options and to begin proceedings under the Land Act 1994. For noting: Department of Resources, Land Administration and Acquisition contact: Julie Douglas Senior Land Officer Department of Resources PO Box 2 (Corner of Fitzroy and Guy Streets) Warwick QLD 4370 SLAM warwick@resources.qld.gov.au Recommended condition: If the above changes are not made to Section 7.6.1 and 7.7.2.1, it is recommended that the OCG impose the following condition on the EIS: Development on State Land, including road, must obtain relevant Land Act 1994 approvals through the administering authority the Department of Resources, Land Administration and Acquisition unless another appropriate legislative land dealing process i.e., under the Transport Infrastructure Act 1994 is implemented.	This issue is noted. The revised draft EIS, Chapter 8: Land Use and Tenure, Section 8.5.1 Impacts to State Forests has been updated to incorporate the recommended text. The following has been included in the update: The Project footprint traverses with grazing leases over the Bringallie and Whetstone State forest. ARTC plan to negotiate the full or partial surrender of these leases with lessees. If unsuccessful, ARTC will require Department of Transport and Main Roads, as the constructing authority, to make a request to DoR to progress the resumption of these leases by way of order in council under the Land Act 1994 (Qld).	Chapter 8: Land Use and Tenure Section 8.5.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0090	State Agency	Land Use and Tenure		<p>This Section needs to be updated to include a description of the impacts of the project on land administered under the Land Act 1994. The following public uses will be impacted by the Project: Goondiwindi Regional Council LGA</p> <ul style="list-style-type: none"> 1SP150781 Reserve for Parks and Gardens permanent impact to footpath and infrastructure. 1Y5698 Reserve for Recreation southern access road and small part of cricket oval permanently impacted. 37MH878 Reserve for Camping & Water (Stock Route Reserve Primary & Open with water facility) - eastern boundary of reserve and adjacent access road permanently impacted. 89SP140808 Reserve for Racecourse small area of permanent impact (0.01 ha identified in Appendix V). 2Y56916 Reserve for Local Government small areas temporarily impacted (0.03 ha identified in Appendix V). 41MH778 Reserve for Local Government small area along northern boundary temporarily impacted (0.05 ha identified in Appendix V). 110SP171826 Reserve for Pasturage (Stock Route Reserve Minor & Unused, Open) permanent impact, possible fragmentation. Toowoomba Regional Council LGA. 84SP109985 Reserve for Recreation 100% of reserve permanently impacted. 140DER34129 Reserve for Water 	<p>Update Sections 7.6.1 to include potential impacts on land administered under the Land Act 1994. Specifically list the following reserves in Section 7.6.1. Goondiwindi Regional Council LGA</p> <ul style="list-style-type: none"> 1SP150781 Reserve for Parks and Gardens permanent impact to footpath and infrastructure. 1Y5698 Reserve for Recreation southern access road and small part of cricket oval permanently impacted. 37MH878 Reserve for Camping & Water (Stock Route Reserve Primary & Open with water facility) eastern boundary of reserve and adjacent access road permanently impacted. 89SP140808 Reserve for Racecourse small area of permanent impact (0.01 ha identified in Appendix V). 2Y56916 Reserve for Local Government small areas temporarily impacted (0.03 ha identified in Appendix V). 41MH778 Reserve for Local Government small area along northern boundary temporarily impacted (0.05 ha identified in Appendix V). 110SP171826 Reserve for Pasturage (Stock Route Reserve Minor & Unused, Open) permanent impact, possible fragmentation. Toowoomba Regional Council LGA 84SP109985 Reserve for Recreation 100% of reserve permanently impacted. 140DER34129 Reserve for Water. Also, within sections 7.6.1 refer to Appendix F: Impacted Properties. In doing so acknowledge that Appendix F contains the complete and inclusive description of all parcels of State land proposed to be impacted. 	<p>This issue is noted. The properties listed in this comment summary have been reviewed.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.1 of the revised draft EIS has been updated to include details of specific impacts to Land Act 1994 (Qld) parcels provided within the Submission comment and Proposed Solution and the requested reference to Appendix F: Impacted Properties is provided.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Appendix F: Impact Properties</p>
149	149.0100	State Agency	Flora and Fauna	Mitigation measures	<p>The following advice was previously provided to ARTC, however continues to be absent from the draft EIS:</p> <ul style="list-style-type: none"> Gates are to be incorporated across the rail track so to prevent stock from entering the track corridor while crossing the track. Minimum stock crossing width of 7.3 m has been stipulated to provide practical movement of large mobs through the opening while minimising injury to stock and damage to infrastructure from animal pressure. When reviewing the Typical Private Level Crossing for High Use Livestock and Machinery with Rail Maintenance Access Road -Drawing STD-T0169 within Appendix M Preliminary Fauna Movement Provision and Fencing Strategy, it is apparent that neither stock routes advice have been incorporated. 	<p>Resources recommends the Coordinator General includes the following condition on the EIS approval: Gates are to be incorporated across the rail track so to prevent stock from entering the track corridor while crossing the track and A minimum stock crossing width of 7.3 m is provided across the rail/track corridor. or To the satisfaction of the Chief Executive administering the Stock Route Management Act 2002, an alternative livestock crossing design which facilitates the practical movement of large mobs of livestock across the rail track corridor while minimising injury to livestock and damage to infrastructure from animal pressure is sought.</p>	<p>As described in Chapter 8: Land Use and Tenure of the EIS, the revised reference design has been developed to provide continued connectivity and functionality along each stock route and where reasonably practicable a grade separated solution such as an underpass has been included in the design. The revised reference design for the Project interfaces the stock route network in 11 locations. Details of these stock routes and the potential impacts, along with the proposed interface treatments are outlined in Table 8-35.</p> <p>In circumstances where the Project has the potential to impact on existing stock routes, ARTC has consulted with DoR, GRC and TRC to identify potential solutions for potential solutions for the treatment of rail and stock route interfaces. This consultation will continue through the Detailed Design stage and as the construction approach is confirmed to further ensure that potential impacts are appropriately managed. For example, construction activities for the Project may result in temporary disruption to the connectivity of the stock route network, particularly in and around the rail-road interface locations. Stock routes mitigation outcomes stated in Appendix E: Consultation Report includes scope to be determined on a case-by-case basis and basis scope documented within third-party agreement with further engagement noted. In addition to the State stock route network, there may also be private stock routes that are used to transfer stock to various grazing paddocks and holding yards within or across the Project footprint. Consultation is ongoing with individual landowners within the Project footprint to identify property-specific impacts, if any, to private stock routes.</p> <p>Of the 11 stock route interfaces along the Project alignment, 5 are proposed to be at grade level crossing treatments, with 2 of these coinciding with formed public roads (shared use) (Chapter 8: Land Use and Tenure, Table 8-35). Several risk workshops have been conducted to support the development of shared use level crossing designs for greenfield Projects. ARTC acknowledge the controls that have been put forward and propose the following approach:</p> <ul style="list-style-type: none"> ARTC accept this requirement and will ensure that all level crossings where there is a travelling stock route are designed to have a minimum width of 7.3 m. Gates across the track are not supported by ARTC for the following reasons: <ul style="list-style-type: none"> Track gates are not an accepted stock crossing design feature as this is inconsistent with ARTC Safety Management System and the rules that govern ARTC Network. In forming the response to DOR's submission, a review was undertaken of ARTC's incident data across the whole network with the result being that there was very little evidence of stock getting hit at a level crossing. Although the risk is low, we understand that the community is concerned about the potential for stock to access the railway corridor at a level crossing and then potentially getting hit by a train. Cattle grids will be used at the rail tracks near level crossings to avoid cattle entering the corridor. ARTC will continue to work collaboratively with DoR and council on the design solution for these locations during Detailed Design stage. 	<p>Chapter 8: Land Use and Tenure</p> <p>Table 8-35</p> <p>Appendix E: Consultation Report</p> <p>Section 5.5</p>
149	149.0110	State Agency	Approvals/ conditions/ recommendations	Terrestrial flora	<p>Category C areas (high value regrowth) - The EIS identifies that clearing of category C areas will occur or is proposed to occur as a result of the Project. Clearing vegetation to the extent the clearing is in any category C areas is not for a relevant purpose under the Vegetation Management Act 1999. Accordingly clearing of vegetation in these areas cannot be approved under a development approval. Clearing vegetation in any category C areas must be undertaken as exempt clearing work or in accordance with an Accepted Development Vegetation Clearing Code (ADVCC). Clearing vegetation in any category C areas that is not exempt or not in accordance with an ADVCC is prohibited development. Exchange Areas - Clearing of category C areas in accordance with an ADVCC may require the provision of an exchange area if the clearing exceeds the area or widths prescribed in the ADVCC. Exchange areas must be legally secured either through a voluntary declaration or a property map of assessable vegetation and must be managed in accordance with a management plan. The exchange area must comply with the exchange areas Section of the ADVCC under which the clearing is being notified.</p>	For noting.	<p>This issue is noted. According to Table 11.1 (Section 11.2) of Chapter 11: Flora and Fauna, the clearing of vegetation regulated under the VM Act (e.g. Category B and C regulated vegetation) will occur as a result of the Project. Regulated regrowth vegetation (in this instance, Category C areas only) can be undertaken as exempt clearing, or in accordance with an accepted development vegetation clearing code – refer to revised draft EIS Chapter 3: Legislation and Project Approvals Process, Section 3.4.33.</p> <p>Clearing of relevant remnant or regulated regrowth vegetation constitutes operational works under Schedule 10 of the Planning Regulation that will require development approval, unless the clearing is exempt clearing work, or the clearing is undertaken in accordance with an accepted development clearing code. Under Schedule 21, Part 1, Item 14 of the Planning Regulation, the following clearing work is 'exempt clearing work' for which a development permit is not required:</p> <ul style="list-style-type: none"> Clearing vegetation for the construction or maintenance of infrastructure stated in Schedule 5, if: <ul style="list-style-type: none"> the clearing is on a designated premises, or the infrastructure is government supported transport infrastructure. <p>The clearing of vegetation regulated under the VM Act (e.g. Category B and C regulated vegetation) is considered to be eligible for exemption under Schedule 21 of the Planning Regulation (i.e. government supported transport infrastructure) and does not require a development approval. This includes clearing for early works and pre-construction activities, including the establishment of laydown areas and access roads as described in Section 5.5 of Chapter 5: Project Description (Chapter 3: Legislation and Project Approvals Process).</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.433</p> <p>Chapter 5: Project Description</p> <p>Section 5.5</p> <p>Chapter 11: Flora and Fauna</p> <p>Section 11.2</p> <p>Table 11.1</p>
149	149.0120	State Agency	Flora and Fauna	Terrestrial flora	<p>Section 3.5.9.3 states an initial assessment of Significant Residual Impacts on prescribed matters has been undertaken against the Department of Environment and Heritage Protection (2014) Significant Residual Impact (SRI) Guideline and the Department of the Environment, Water, Heritage and the Arts (Department of the Environment, 2013) Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. However, an assessment of significant residual impacts should also be assessed against the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014), because clearing for the Project has yet to be confirmed as exempt under Schedule 21 of the Planning Regulation as government supported transport infrastructure, and some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016.</p>	<p>Amend Section 3.5.9.3 to include information in relation to the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. For noting: The DSDILGP SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dsmipprd.blob.core.windows.net/general/dsdilp-significant-residual-impact-guideline.pdf.</p>	<p>ARTC considers that Inland Rail is Government Supported Transport Infrastructure under the Planning Act 2016. Accordingly, Inland Rail meets the requirements for government supported transport infrastructure for the Planning Regulation.</p> <p>Chapter 3: Legislation and Project Approvals Process (Section 3.421) has been revised to reflect that the Project is Government Supported Transport Infrastructure under the Planning Act 2016 because:</p> <ul style="list-style-type: none"> it is infrastructure for transport, being rail transport infrastructure it is infrastructure for transport that is for public use and it is funded partly by the Commonwealth Government. <p>The Coordinator-General may impose conditions, stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project.</p> <p>The revised draft EIS has been updated to reflect DoR and other State agency comments.</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report includes assessment of impacts in accordance with the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie has been amended to provide further clarification on the use of the relevant SRI guideline.</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.421</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p>
149	149.0130	State Agency	Approvals/ conditions/ recommendations	Terrestrial flora	<p>Sections 3.5.19.2 and 3.5.31 and Table 3.5 states that clearing within the gazetted project footprint will be exempt clearing for the construction of government supported transport infrastructure under Schedule 21 of the Planning Regulation 2017. It is the Department of Resources understanding that the State is yet to confirm if the project is government supported transport infrastructure. Until this is confirmed, the related vegetation clearing exemption does not apply. This should be more clearly reflected and articulated throughout Chapter 3.</p>	<p>Amend sections 3.5.19.2 and 3.5.31 so that there is no ambiguity surrounding the fact that clearing vegetation for the development will require a development approval unless the project is confirmed as government supported transport infrastructure by the Queensland Government. This should be identified upfront in these sections rather than at the end. Amend Table 3.5 to clearly identify if a development approval will be required for clearing vegetation on prescribed land unless the clearing is exempt. For noting: To confirm application of exemptions, and requirements for any approvals and permits under the States vegetation management framework, the proponent is advised to contact the State Assessment Referral Agency (SARA) in the Department of State Development, Infrastructure, Local Government and Planning (DSDILGP): planning.qld.gov.au/contact-us.</p>	<p>Section 3.2 of Chapter 3: Legislation and Project Approvals Process discusses the permits and approvals that are expected to be required and that will be obtained following the Coordinator-General's evaluation report (also outlined in Table 3-5 of the revised draft EIS).</p> <p>Inland Rail is Government Supported Transport Infrastructure under the <i>Planning Act 2016</i>. Inland Rail meets the requirements for government supported transport infrastructure pursuant to the <i>Planning Regulation 2017</i>.</p> <p>Chapter 3: Legislation and Project Approvals Process Section 3.421 has been revised to reflect that the Project is Government Supported Transport Infrastructure under the <i>Planning Act 2016</i> based on, the following:</p> <ul style="list-style-type: none"> it is infrastructure for transport, being rail transport infrastructure it is infrastructure for transport that is for public use and it is funded partly by the Commonwealth Government. <p>The Coordinator-General may state conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project.</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.2</p> <p>Section 3.421</p> <p>Table 3-5</p>
149	149.0140	State Agency	Approvals/ conditions/ recommendations	Terrestrial flora	<p>Section 3.5.31.3 Project compliance, implies that some proposed clearing may not be exempt under Schedule 21 of the Planning Regulation 2017 and therefore may require approval. However, this clearing cannot be currently identified. Without the details of these proposed developments, no assessment of vegetation clearing can be undertaken, and therefore no specific conditions to attach to any approval can be provided.</p>	<p>Amend the EIS to clearly identify the location, extent and purpose of any clearing that will not be conducted in accordance with an applicable exemption in Schedule 21 of the Planning Regulation 2017. Recommended Condition: It is recommended that the Coordinator-General include a condition on the EIS approval that ensures clearing of native vegetation must only occur for the following: Exempt clearing work (as defined in Schedule 21 of the Planning Regulation 2017); or Where it complies with an Accepted Development Vegetation Clearing Code; or Where it complies with a development approval for clearing native vegetation</p>	<p>Inland Rail is Government Supported Transport Infrastructure under the <i>Planning Act 2016</i>. Inland Rail meets the requirements for government supported transport infrastructure pursuant to the <i>Planning Regulation 2017</i>.</p> <p>Chapter 3: Legislation and Project Approvals Process Section 3.421 has been revised to reflect that the Project is Government Supported Transport Infrastructure under the <i>Planning Act 2016</i> based on the following:</p> <ul style="list-style-type: none"> it is infrastructure for transport, being rail transport infrastructure it is infrastructure for transport that is for public use and it is funded partly by the Commonwealth Government. <p>The Coordinator-General may impose stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project.</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.421</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0150	State Agency	Approvals/ conditions/ recommendations	Terrestrial flora	Pre-construction activities/early works - Section 5.3 identifies some pre-construction activities and early works that may involve clearing including surveying, establishment of access tracks, and utility and service relocations. The extent and location of these works has not been identified and it is unclear whether any associated clearing could be carried out as exempt clearing. Environmental and planning approvals - Section 5.3.1 states clearing of vegetation is exempt under Schedule 21, Part 1, item 14 of the Planning Regulation 2017 i.e. for government supported transport infrastructure. As identified elsewhere, until the exemption is confirmed the clearing exemption does not apply. Laydown, Stockpile and Storage Areas - Section 5.4.7 states laydown, stockpile and storage areas, including constructing parking areas and associated access tracks will be required along the length of the Project corridor and may involve the clearing of vegetation. It is unclear whether these will be able to be carried out as exempt clearing.	Amend the EIS to identify the location and extent of any clearing required for pre-construction/early works and any laydown, stockpile, and storage areas, particularly any works located outside of the gazetted development footprint. The EIS must detail whether these works are proposed to be carried out under the government funded transport infrastructure exemption (if it is confirmed that it applies to the project), or whether other exemptions/clearing codes or approvals need to be considered. Amend Section 5.3.1 to remove ambiguity surrounding the fact that clearing vegetation for all aspects of the development will require a development approval unless clearing is carried out under an exemption or an applicable ADVCC. This is particularly relevant for statements that refer to Schedule 21, Part 1, item 14 of the Planning Regulation 2017 for government supported transport infrastructure. To confirm application of exemptions, and requirements for approvals and permits under the States vegetation management framework, the proponent is advised to contact the State Assessment Referral Agency (SARA) in the DSDILGP: planning.qld.gov.au/contact-us .	Details of the locations and extents of all clearing required for pre-construction activities and early works will not be finalised until detailed design. Similarly, approval process details for those pre-construction and early works will not be fully determined until the Coordinator-General's Evaluation Report has been completed along with any attached conditions. Section 3.21 of Chapter 3: Legislation and Project Approvals outlines that the Coordinator-General may impose conditions (stated conditions must be imposed on subsequent development approvals) and make recommendations for other approvals required by the Project. The revised draft EIS has been updated to reflect DTMR and other State agency comments.	Chapter 3: Legislation and Project Approvals Process Section 3.21
149	149.0160	State Agency	Flora and Fauna	Terrestrial flora	Table 10.2 lists the Department of Environment and Heritage Protection (2014) Significant Residual Impact Guideline is to be used to assess for SRI impacts on MSES. However, an assessment of SRI impacts should also be assessed against the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014), because clearing for the Project has yet to be confirmed as exempt under Schedule 21 of the Planning Regulation 2017 as government supported transport infrastructure, and some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016.	Amend Table 10.2 to include information in relation to the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. For Noting: The DSDILGPs SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dspmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	ARTC considers that Inland Rail is Government Supported Transport Infrastructure under the Planning Act 2016. Accordingly, Inland Rail meets the requirements for government supported transport infrastructure for the Planning Regulation. Chapter 3: Legislation and Project Approvals Process Section 3.421 has been revised to reflect that the Project is Government Supported Transport Infrastructure under the Planning Act 2016 because: <ul style="list-style-type: none"> It is infrastructure for transport, being rail transport infrastructure It is infrastructure for transport that is for public use and It is funded partly by the Commonwealth Government. The Coordinator-General may impose conditions, stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project. The revised draft EIS has been updated to reflect DoR and other State agency comments and includes assessment of impacts against the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014), see Appendix L: Terrestrial and Aquatic Ecology Technical Report.	Chapter 3: Legislation and Project Approvals Process Section 3.421 Appendix L: Terrestrial and Aquatic Ecology Technical Report
149	149.0170	State Agency	Flora and Fauna	Terrestrial flora	Sensitive environmental receptors for MSES - Section 10.4.2 states that sensitive environmental receptors for the project are those defined as prescribed environmental matters in Part 2, Section 5 of the Environmental Offsets Regulation 2014. However, while Section 10.4.2 identifies regional ecosystems and wildlife habitat as sensitive environmental receptors, it does not identify regulated vegetation that intersects a wetland or watercourse. These are identified as MSES in the Environmental Offsets Regulation as prescribed environmental matters and should therefore be identified in Section 10.4.2. Impact assessment methodology for MSES - It is identified that significant impact assessment for MSES to inform potential offsets will be guided by the Queensland Environmental Offsets Policy (QEOP) Significant Residual Impact (SRI) Guidelines (DEHP 2014) However for clearing that is not exempt, significant impact assessment for MSES under the Planning Act 2016 should rather be guided by the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014).	Amend EIS to include regulated vegetation that intersects a wetland or watercourse in the list of sensitive environmental receptors (that are Environmental Offsets Regulation 2014 prescribed environmental matters) in Section 10.4.2. Include information in relation to the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016(Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. The DSDILGP's SRI guideline is located at: dspmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	The discussion of results and the significant residual impact assessment for MSES have been updated in Chapter 11: Flora and Fauna. The discussion and significant residual impact assessment include addressing regulated vegetation that intersect wetlands and watercourses. Chapter 11: Flora and Fauna provides area calculations for all MSES occurring within the Project footprint, including a prescribed RE within a defined distance from the defining banks of a relevant watercourse or relevant drainage feature, prescribed RE that intersects with a Vegetation Management Act 1997 (Qld) wetland and essential habitat. Proposed mitigation measures and a quantification of residual significant impacts relating to MSES are outlined in Chapter 11: Flora and Fauna. Significant residual impacts for MSES were assessed against the Significant Residual Impact Guideline for matters of State environmental significance and prescribed activities assessable under the Sustainable Planning Act 2009 (Qld) and the <i>Queensland Environmental Offsets Policy</i> (DSDIP, 2014) as detailed in Chapter 11: Flora and Fauna.	Chapter 11: Flora and Fauna Section 11.3.6 Table 11-20
149	149.0180	State Agency	Flora and Fauna	Terrestrial flora	Amend Section 10.5.3.2 to identify that Category X areas on State land tenures is assessable unless an exemption or ADVCC applies. Amend Table 10.6 to identify any impacted category X areas on State land tenures. Amend Table 10.7 to identify any impacted category X areas on State land tenures AND that are located a defined distance from a VMA watercourse or wetland. Of the impacted vegetation identified in both tables 10.6 and 10.7 include a column detailing the area of impacted vegetation that may be exempt and associated exemption provisions thought to apply. Amend Table 10.8 to identify the preclearing regional ecosystem of any impacted category X areas on State land.	Vegetation communities - Section 10.5.3.2 suggests that clearing of category X areas is generally exempt. However, clearing of category X areas on State land is assessable unless done under an exemption or an ADVCC. Tables 10.6 Extent of category B, C, R areas of regulated vegetation within the impact assessment area and Project footprint); and 10.7 Extent of regulated vegetation located a defined distance from a watercourse or wetland within the impact assessment area and Project footprint. Tables 10.6 and 10.7 refer only to Category A, B, C and R areas. Category X areas on State land tenures should be identified as well as any exemptions that may apply. Table 10.8 Descriptions of Regional Ecosystems (category and C regulated vegetation) within the impact assessment area - Table 10.8 describes the mapped REs within the impact area. For assessable category X areas, the preclearing regional ecosystem should be identified in this table.	All Regional Ecosystems within the Project footprint have been ground truthed as seen in Appendix L: Terrestrial and Aquatic Ecology Technical Report and has been incorporated into the impact assessment for the revised draft EIS. Category "X" areas (i.e. Non-remnant areas) under the Vegetation Management Act 1999 (VM Act) is defined as vegetation that is generally exempt from requirements under vegetation management laws (Chapter 11: Flora and Fauna). This type of vegetation has typically that has been subject to previous clearing for agriculture, grazing, mining, industry and transport (Appendix L: Terrestrial and Aquatic Ecology Technical Report). ARTC considers that Inland Rail is Government Supported Transport Infrastructure under the Planning Act 2016. Accordingly, Inland Rail meets the requirements for government supported transport infrastructure for the Planning Regulation. Chapter 3: Legislation and Project Approvals Process Section 3.421 has been revised to reflect that the Project is Government Supported Transport Infrastructure under the Planning Act 2016 because: <ul style="list-style-type: none"> infrastructure for transport, being rail transport infrastructure it is infrastructure for transport that is for public use and it is funded partly by the Commonwealth Government. Chapter 3: Legislation and Project Approvals Section 3.21 outlines that the Coordinator-General may impose conditions, stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project. Under Schedule 21, Part 1, Item 14 of the Planning Regulation, the following clearing work is exempt clearing work for which a development permit is not required. Clearing vegetation for the construction or maintenance of infrastructure stated in Schedule 5, if: <ul style="list-style-type: none"> the clearing is on a designated premises, or the infrastructure is government supported transport infrastructure. The Project is Government Supported Infrastructure as per requirements of the Planning Regulation and therefore is exempt from requirements of the VM Act. Therefore exemptions from the VM Act have been identified. The revised draft EIS has been updated to reflect DoR and other State agency comments.	Chapter 3: Legislation and Project Approvals Section 3.21 Section 3.421 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Technical Report
149	149.0190	State Agency	Flora and Fauna	Aquatic flora	Section 10.7 states that sensitive environmental receptors for the project are those defined as 'prescribed environmental matters' in Part 2, Section 5 of the Environmental Offsets Regulation 2014. However, while Section 10.7 identifies regional ecosystems and wildlife habitats/essential habitat as sensitive environmental receptors, it does not identify regulated vegetation that intersects a wetland or watercourse. These are identified as MSES in the Environmental Offsets Regulation as 'prescribed environmental matters' and should therefore be identified in Section 10.4.2.	Amend EIS to include regulated vegetation that intersects a wetland or watercourse in the list of sensitive environmental receptors in Section 10.7.	Sensitive environmental receptors for the Project are those defined as "prescribed environmental matters" in Part 2, Section 5 of the <i>Environmental Offsets Regulation 2014</i> . However, while it is identified regional ecosystems and wildlife habitat/essential habitat as sensitive environmental receptors, it does not identify regulated vegetation that intersects a wetland or watercourse. These are identified as MSES in the Environmental Offsets Regulation as "prescribed environmental matters".	Chapter 11: Flora and Fauna Section 11.4 Table 11-19
149	149.0200	State Agency	Flora and Fauna	Aquatic fauna	Table 10.35 does not include area calculations for regulated vegetation associated with a wetland or watercourse. The Table does include those for Essential Habitat, and for consistency should include data for VMA wetland and watercourses within the Project area. Table 10.38 does not include information related to regulated vegetation associated with a watercourse or wetland. The Table does include those for Essential Habitat and for consistency should include information for VMA wetland and watercourses within the Project area.	Amend Table 10.35 and Table 10.38 to include area calculations for regulated vegetation that is associated with a VMA wetland or watercourse.	Chapter 11: Flora and Fauna provides area calculations for all MSES occurring within the Project footprint, including a prescribed RE within a defined distance from the defining banks of a relevant watercourse or relevant drainage feature, prescribed RE that intersects with a <i>Vegetation Management Act 1997</i> (Qld) wetland and essential habitat. Proposed mitigation measures and a quantification of residual significant impacts relating to MSES are outlined in Chapter 11: Flora and Fauna.	Chapter 11: Flora and Fauna Section 11.5 Section 11.7
149	149.0210	State Agency	Flora and Fauna	Terrestrial flora	Amend EIS to clarify that environmental offsets imposed under the Planning Act 2016 for a MSES must use the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014). Update Table 10.41 if relevant following assessment of SRI using DSDILGP's SRI Guideline. For Noting: The DSDILGP's SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dspmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	Section 10.12.3 does not clarify that the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) is used to assist in deciding whether or a not a prescribed activity will or is likely to have a significant residual impact on a MSES for offsets imposed under the Planning Act 2016. A revised SRI assessment should be undertaken for MSES matters using DSDILGP's SRI guideline and the calculations in Table 10.41 updated if relevant.	Revised draft EIS Chapter 11: Flora and Fauna has been updated to include both guidelines and the use of the relevant guideline as appropriate. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie has been amended to provide further clarification on the use of the relevant SRI guideline.	Chapter 11: Flora and Fauna Section 11.3 Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie
149	149.0220	State Agency	Flora and Fauna	Terrestrial flora	Section 10.13 does not include a correlation between matter of MNES and MSES to enable an understanding of assessment of impacts remaining post MNES being addressed/offset. Section 10.13.2 does not clarify whether DSDILGP's SRI Guideline was used to assess and quantify the SRI impacts outlined in Table 10.43. The SRI assessment and quantification should be repeated using the DSDILGP's SRI Guideline and the values in Table 10.43 revised if relevant, including any SRI impacts for wetlands.	Amend Section 10.13 to include a Section that details and quantifies the matters and area (hectares) of overlap between MNES and MSES matters and offset requirements. Identify that environmental offsets imposed under the Planning Act 2016 for MSES must use the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014). Update Table 10.43 if relevant following assessment of SRI using DSDILGP's SRI Guideline. For Noting: The DSDILGP's SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dspmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	Appendix L: Terrestrial and Aquatic Ecology Technical Report includes assessment of impacts in accordance with the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the <i>Planning Act 2016</i> (Qld). Chapter 11: Flora and Fauna, also provides discussion on significant residual impact assessment. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie has been amended to provide further clarification on the use of the relevant SRI guideline. Chapter 11: Flora and Fauna, summarises the quantification of significant residual impacts to MNES and MSES and provides discussion on how ARTC proposes to provide its offset obligations for the Project.	Chapter 11: Flora and Fauna Section 11.3 Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 3 Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0230	State Agency	Flora and Fauna		Appendix J Section 1.2.3 states an initial assessment of Significant Residual Impacts on prescribed matters have been assessed against the Department of Environment and Heritage Protection (2014) Significant Residual Impact Guideline and the Department of the Environment, Water, Heritage, and the Arts (Department of the Environment, 2013) Significant Impact Guidelines 1.1—Matters of National Environmental Significance. However, an assessment of SRI impacts should also be assessed against the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014), because clearing for the Project has yet to be confirmed as exempt under Schedule 21 of the Planning Regulation 2017 as government supported transport infrastructure, and some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016.	Amend Section 1.2.3 to include information in relation to the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. For Noting: The DSDILGPs SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dsmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	Appendix L: Terrestrial and Aquatic Ecology Technical Report includes assessment of impacts in accordance with the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the <i>Planning Act 2016</i> (Qld). Chapter 11: Flora and Fauna, also provides discussion on significant residual impact assessment. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie has been amended to provide further clarification on the use of the relevant SRI guideline. Chapter 11: Flora and Fauna, summarises the quantification of significant residual impacts to MNES and MSES and provides discussion on how ARTC proposes to provide its offset obligations for the Project.	Chapter 11: Flora and Fauna Section 11.3 Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 3 Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie
149	149.0240	State Agency	Flora and Fauna	Terrestrial flora	Amend Table 2.1 to include the following: <ul style="list-style-type: none"> Vegetation Management Act 1999o Identify that clearing native vegetation in category X areas on State land tenures are also regulated and assessable. Clarification that clearing vegetation for the development will require a development approval relative to the VMA unless the clearing is exempt. Identify that environmental offsets may also be imposed under the Planning Act 2016, with referral to the DSDILGP's SRI guideline located at: dsmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf . <p>For Noting: To confirm application of exemptions, and requirements for any approvals and permits under the State's vegetation management framework, the proponent is advised to contact the State Assessment Referral Agency (SARA) in the DSDILGP: planning.dsdmp.qld.gov.au/planning/resources/contact-us.</p>	Appendix J Table 2.1 – State – Vegetation Management Act 1999a) Applicability of the VMA: <ul style="list-style-type: none"> Statements do not identify that native vegetation mapped as a category X area on State land tenures including Road, Trust land, USL, is also regulated. Statements propose that clearing within the gazetted project footprint will be exempt clearing for the construction of government supported transport infrastructure under Schedule 21 of the Planning Regulation 2017. <p>It is the Department of Resources understanding that the State is yet to confirm if the project is government supported transport infrastructure. Until this is confirmed, the related vegetation clearing exemption does not apply. This should be more clearly reflected and articulated throughout the EIS. In addition, some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016. Table 2.1 does not identify that environmental offsets may be imposed under the Planning Act 2016 (PA) e.g., for Vegetation Management Act 1999 matters. The Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) is used to assist in deciding whether or a not a prescribed activity will or is likely to have a significant residual impact on a MSES for which an offset is required under the Planning Act 2016.</p>	All Regional Ecosystems within the Project footprint have been ground truthed as seen in Appendix L: Terrestrial and Aquatic Ecology Technical Report and has been incorporated into the impact assessment for the revised draft EIS. Category "X" areas (i.e. Non-remnant areas) under the Vegetation Management Act 1999 (VM Act) is defined as vegetation that is generally exempt from requirements under vegetation management laws (Chapter 11: Flora and Fauna. This type of vegetation has typically that has been subject to previous clearing for agriculture, grazing, mining, industry and transport (Appendix L: Terrestrial and Aquatic Ecology Technical Report). ARTC considers that Inland Rail is Government Supported Transport Infrastructure under the Planning Act 2016. Accordingly, Inland Rail meets the requirements for government supported transport infrastructure for the Planning Regulation. Chapter 3: Legislation and Project Approvals Process Section 3.421 has been revised to reflect that the Project is Government Supported Transport Infrastructure under the Planning Act 2016 because: <ul style="list-style-type: none"> it is infrastructure for transport, being rail transport infrastructure it is infrastructure for transport that is for public use and it is funded partly by the Commonwealth Government. <p>Chapter 3: Legislation and Project Approvals Section 3.21 outlines that the Coordinator-General may impose conditions, stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project. Under Schedule 21, Part 1, Item 14 of the Planning Regulation, the following clearing work is exempt clearing work for which a development permit is not required. Clearing vegetation for the construction or maintenance of infrastructure stated in Schedule 5, if: <ul style="list-style-type: none"> the clearing is on a designated premises, or the infrastructure is government supported transport infrastructure. <p>The Project is Government Supported Infrastructure as per requirements of the Planning Regulation and therefore is exempt from requirements of the VM Act. Therefore exemptions from the VM Act have been identified. The revised draft EIS has been updated to reflect DoR and other State agency comments.</p></p>	Chapter 3: Legislation and Project Approvals Section 3.21 Section 3.421 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report
149	149.0250	State Agency	Flora and Fauna	Terrestrial flora	Appendix J Section 3.44 states that the Significant Residual Impacts on prescribed matters have been assessed against the Department of Environment and Heritage Protection (2014) Significant Residual Impact Guideline, and the Department of the Environment, Water, Heritage, and the Arts (Department of the Environment, 2013) Significant Impact Guidelines 1.1—Matters of National Environmental Significance. However, an assessment of SRI impacts should also be assessed against the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014), because clearing for the Project has yet to be confirmed as exempt under Schedule 21 of the Planning Regulation as government supported transport infrastructure, and some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016.	Amend Section 3.44 to include information in relation to the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. For Noting: The DSDILGPs SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dsmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	Appendix L: Terrestrial and Aquatic Ecology Technical Report includes assessment of impacts in accordance with the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the <i>Planning Act 2016</i> (Qld). Chapter 11: Flora and Fauna, also provides discussion on significant residual impact assessment. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie has been amended to provide further clarification on the use of the relevant SRI guideline. Chapter 11: Flora and Fauna, summarises the quantification of significant residual impacts to MNES and MSES and provides discussion on how ARTC proposes to provide its offset obligations for the Project.	Chapter 11: Flora and Fauna Section 11.3 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie
149	149.0260	State Agency	Flora and Fauna	Terrestrial flora	Amend Section 4.5.18 to note that category X areas on State land tenures is assessable unless an exemption applies. Amend Table 4.19 to include quantification of regulated and assessable category X areas within the Project area. Amend Table 4.21 to include quantification, if any, of regulated and assessable category X areas on State land tenures and that are associated with a VMA watercourse/wetland that are impacted by the Project. Amend Table 4.22 to include a description of the regional ecosystem types of regulated and assessable category X areas that are impacted by the Project.	Appendix J Section 4.5.18 does not identify that category X areas on State land tenures including Road, Trust land, Unallocated State Land, is assessable unless an exemption applies. This should be noted throughout Section 4.5.18. Until an exemption for all aspects of the Project is confirmed, regulated category X areas (i.e., category X areas on State land tenures) are assessable. Table 4.19 does not quantify the extent of regulated category X areas within the project area. Table 4.21 does not provide clarity regarding whether impacted assessable category X areas associated with a watercourse/wetland are included in the calculations. Table 4.21 infers all category X areas are exempt. Table 4.22 does not quantify the extent of regulated category X areas that are impacted by the Project. This would include Road, Trust land, Unallocated State Land etc. Unallocated State Land may include several watercourses that are impacted by the Project – keeping in mind that VMA watercourses are not necessarily a watercourse under the Water Act. Although some regulated category X areas may not be remnant, the on-ground vegetation may be characteristic of a regional ecosystem.	All Regional Ecosystems within the Project footprint have been ground truthed as seen in Appendix L: Terrestrial and Aquatic Ecology Technical Report and has been incorporated into the impact assessment for the revised draft EIS. Category "X" areas (i.e. Non-remnant areas) under the Vegetation Management Act 1999 (VM Act) is defined as vegetation that is generally exempt from requirements under vegetation management laws (Chapter 11: Flora and Fauna. This type of vegetation has typically that has been subject to previous clearing for agriculture, grazing, mining, industry and transport (Appendix L: Terrestrial and Aquatic Ecology Technical Report). ARTC considers that Inland Rail is Government Supported Transport Infrastructure under the Planning Act 2016. Accordingly, Inland Rail meets the requirements for government supported transport infrastructure for the Planning Regulation. Chapter 3: Legislation and Project Approvals Process Section 3.421 has been revised to reflect that the Project is Government Supported Transport Infrastructure under the Planning Act 2016 because: <ul style="list-style-type: none"> it is infrastructure for transport, being rail transport infrastructure it is infrastructure for transport that is for public use and it is funded partly by the Commonwealth Government. <p>Chapter 3: Legislation and Project Approvals Section 3.21 outlines that the Coordinator-General may impose conditions, stated conditions that must be imposed on subsequent development approvals and make recommendations for other approvals required by the Project. Under Schedule 21, Part 1, Item 14 of the Planning Regulation, the following clearing work is exempt clearing work for which a development permit is not required. Clearing vegetation for the construction or maintenance of infrastructure stated in Schedule 5, if: <ul style="list-style-type: none"> the clearing is on a designated premises, or the infrastructure is government supported transport infrastructure. <p>The Project is Government Supported Infrastructure as per requirements of the Planning Regulation and therefore is exempt from requirements of the VM Act. Therefore exemptions from the VM Act have been identified. The revised draft EIS has been updated to reflect DoR and other State agency comments.</p></p>	Chapter 3: Legislation and Project Approvals Section 3.21 Section 3.421 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Technical Report
149	149.0270	State Agency	Flora and Fauna	Aquatic flora	Table 5.11 does not include area calculations for regulated vegetation associated with a VMA wetland or watercourse. Table 5.6 does not include information related to regulated vegetation associated with a VMA wetland or watercourse. Section 5.3.4 – there is ambiguity surrounding the role of DSDILGP's SRI guidelines in assessment of the project's SRI on MSES. This Section initially states that SRI for MSES is assessed against the Department of Environment and Heritage Protection (2014) Significant Residual Impact Guideline. It only later refers to the DSDILGP's Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016, and in a context that does not clearly set out when it must be used. It is important to delineate when either the DES's SRI guideline or DSDILGP's SRI guideline applies. This is because clearing for the Project has yet to be confirmed as exempt under Schedule 21 of the Planning Regulation as 'government supported transport infrastructure', and some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016. The DSDILGP's SRI guideline must be used for any clearing that is assessable under the Planning Act 2016.	Amend Table 5.11 to include area calculations for regulated vegetation that is associated with a VMA wetland and watercourse. Amend Table 5.12 to include information for regulated vegetation that is associated with a VMA wetland or watercourse. Amended Section 5.3.4 so there is no ambiguity surrounding the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. For Noting: The DSDILGPs SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dsmipprd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	The discussion of results and the significant residual impact assessment for MSES have been updated in the revised draft EIS in Chapter 11: Flora and Fauna. The discussion and significant residual impact assessment include addressing regulated vegetation that intersect wetlands and watercourses. Chapter 11: Flora and Fauna, details the areas (ha) of MSES within the Project footprint (including regulated vegetation that intersects wetlands and watercourses) and the results of the significant residual impact assessments for MSES are provided also provided. Significant residual impacts for MSES were assessed against the Significant Residual Impact Guideline for matters of state environmental significance and prescribed activities assessable under the <i>Sustainable Planning Act 2009</i> (Qld) and the <i>Queensland Environmental Offsets Policy</i> (DSDIP, 2014) as detailed in Chapter 11: Flora and Fauna.	Chapter 11: Flora and Fauna Section 11.7
149	149.0280	State Agency	Flora and Fauna	Aquatic fauna	Appendix J Section 5.4 does not include a correlation between MNES and MSES to enable an understanding or assessment of impacts remaining post MNES being addressed/offset. Section 5.4.2 identifies potential significant residual impacts of the project on prescribed matters, including remnant vegetation intersecting a wetland. However, VMA wetlands are not identified in Table 5.22. Section 5.4.3 defines the scope of the Environmental Offset Delivery Plan including quantifying the SRI of the project on MSES and MNES and detailing the offsets to address the SRIs. The Environmental Offset Delivery Plan should also detail the overlap of MNES and MSES and how a MNES-offset will also deliver an appropriate offset for the MSES prescribed matter.	Amend Section 5.4 to include a Section that details and quantifies the matters and area (hectares) of overlap between MNES and MSES and offset requirements. Amend Table 5.22 to included wetlands under the Regulated Vegetation section. Amend Section 5.4.3 to identify the scope of the Environmental Offset Delivery Plan will also include a breakdown of the overlap of MNES and MSES and will detail how a MNES offset will also deliver an appropriate offset for the MSES prescribed matter.	Further field assessments have been undertaken as part of the revised draft EIS to target threatened species, reassess the likelihood of occurrence and refine habitat mapping. This additional information was then used to update and refine the Impact Assessments for significant residual impacts to MNES and MSES as provided in Chapter 11: Flora and Fauna. The detailed assessments are provided in Appendix L: Terrestrial and Aquatic Ecology Technical Report for MSES and Appendix O: Matters of National Environmental Significance Report for MNES. MNES, being threatened species and communities under the <i>Environment Protection and Biodiversity Conservation Act 1999</i> (Cth) as the controlling provision for the Project, have been assessed and documented in Appendix O: Matters of National Environmental Significance Report. Where there is overlap between MNES and MSES, they are addressed in detail in the MNES report and cross referenced in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The offset strategy has been amended to clarify the overlap of MNES/MSES. ARTC intend to deliver offsets in line with the <i>Environmental Offsets Act</i> (Qld), which outlines that, if the same or substantially the same impact or matter is assessed under the EPBC Act then there can be no offset condition imposed at the State level, regardless of whether an offset is required under the EPBC Act. As such, there is no requirement to demonstrate how the MNES offset will offset MSES values. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie informs the development of offset delivery components including an Environmental Offset Delivery Plan and Offset Area Management Plans. Further detailed information is found in Table 2-2 and Table 3-2 of Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie.	Chapter 11: Flora and Fauna Section 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Report Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie Section 3.2 Table 2-2 Table 3-2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0290	State Agency	Flora and Fauna	Offsets	Appendix N in general does not include a correlation between matter of MNES and MSES to enable an understanding or assessment of impacts remaining post MNES being addressed/ offset. Section 1.3 defines the scope of the Environmental Offset Delivery Plan including quantifying the SRI of the project on MSES and MNES and detailing the offsets to address the SRIs. The Environmental Offset Delivery Plan should also detail the overlap of MNES and MSES and how a MNES-offset will also deliver an appropriate offset for the MSES prescribed matter. Section 2.2 identifies the framework for the Queensland Environmental offsets including the Department of Environment and Heritage Protection (2014) Significant Residual Impact Guideline. However, for clearing that is not exempt under the Planning Act 2016, it is DSDILGP's SRI guideline that must be used. A note of this should be made in this section. Section 2.2.2 – for Qld Environmental Offsets Policy - This Section states that the most applicable SRI guideline is the Department of Environment and Heritage Protection (2014) Significant Residual Impact Guideline. However, for clearing that is not exempt under the Planning Act 2016, it is DSDILGP's SRI guideline that must be used. A note of this should be made in this section. Section 3 - Table 2 and 3 offer a separate breakdown of the MNES and MSES. However, neither identify those overlapping MSES. A correlation between MNES and MSES must be provided to enable an understanding and assessment of the impacts remaining post-MNES offsets. Section 4.1 identifies that the offset requirements for MSES will be assessed against the QEOP's SRI Guideline. However, an assessment of SRIs should also be assessed against the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016(Department of State Development, Infrastructure, Local Government and Planning, December 2014), because clearing for the Project has yet to be confirmed as exempt under Schedule 21 of the Planning Regulation as 'government supported transport infrastructure', and some clearing for the Project outside of the gazetted area may be assessable under the Planning Act 2016.	Amend Section 2.2 and 2.2.2 to identify that DSDILGPs SRI Guideline must be used for clearing that is not exempt under the Planning Act 2016. Amend Section 3 to include a Table or other presentation format that details and quantifies the matters and area of overlap between MNES and MSES matters and offset requirements. Amend Section 4.1 to include information in relation to the use of the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities assessable under the Planning Act 2016 (Department of State Development, Infrastructure, Local Government and Planning, December 2014) for clearing that may not be exempt under Schedule 21 of the Planning Regulation 2017. For Noting: The DSDILGPs SRI guideline for prescribed matters made assessable under the Planning Act 2016 can be found at: dsdmippdrd.blob.core.windows.net/general/dsdip-significant-residual-impact-guideline.pdf .	The revised draft EIS has been updated and significant residual impact assessment for matters of state environmental significance has been incorporated into Appendix L: Terrestrial and Aquatic Ecology Technical Report. Appendix L: Terrestrial and Aquatic Ecology Technical Report, Section 7.1 includes assessment of impacts in accordance with the Significant Residual Impact Guideline for Matters of State Environmental Significance and Prescribed Activities. Table 71 of Appendix L: Terrestrial and Aquatic Ecology Technical Report evaluates the requirement for MNES/MSES impact assessments guided by Section 1.4 of the Queensland Environmental Offsets Policy (v1.16). Table 71 of Appendix L: Terrestrial and Aquatic Ecology Technical Report identifies each respective MNES/MSES and its relative Commonwealth and State Government conservation listing overlap as well as identifying if the matter was assessed as a MNES or MSES. As outlined in Table 21 of Appendix L: Terrestrial and Aquatic Ecology Technical Report, the clearing of vegetation regulated under the VM Act is considered to be eligible for exemption under Schedule 21 of the Planning Regulation (i.e. GSTI) and does not require a development approval. This includes clearing for early works and pre-construction activities, including the establishment of laydown areas and access roads as described in Chapter 5: Project Description (see Chapter 3: Legislation and Project Approvals Process). As such, it has been determined that the Significant Residual Impact Guideline for Matters of State Environmental Significance (MSES) and prescribed activities assessable under the Nature Conservation Act 1992 (DEHP, 2014) (SRI Guidelines) relevantly applies to the assessment of MSES impacts. Section 8 of Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie (EODS) outlines those overlapping MNES/MSES and therefore identifies those MSES that will be assessed under the Queensland Environmental Offsets Policy (v1.16)	Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 7.1 Table 21 Table 71 Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie Section 8
149	149.0300	State Agency	Land Use and Tenure		The draft EIS identifies that native title may continue over ten properties including Reserve and State land tenure. However, it is also possible for Native Title rights and interests to exist on the State Lease Land identified in Table 14 Tenure within the Impact Assessment Area page 28, for example where there are leases for low impact uses such as grazing.	Within this Section it should be stated that a detailed native title assessment for all identified parcels within the footprint of the development should be carried out in accordance with the states native title work procedures.	This issue is noted. A detailed Native Title assessment has been undertaken for the Project, in accordance with the State's native title work procedures. The revised draft EIS has been amended to state that a detailed native title assessment has been carried out, and the results have been outlined in Chapter 8: Land Use and Tenure. ARTC is in the process of engaging with the relevant parties where native title has not been extinguished on land within the Project footprint regarding the process and approach to the surrender or acquisition of the native title rights and interests in question.	Chapter 8: Land Use and Tenure Section 8.4.2 Section 8.5.2 Figure 8.4 Figure 8.8
149	149.0310	State Agency	Land Use and Tenure		Native Title is mentioned throughout Chapter 7, for example: <ul style="list-style-type: none"> Section 7.5.1.4 Native Title, page 7 -36 contains information regarding Native Title Claims. Section 7.6.2 Native Title, page 7 – 162 discusses what sections of the Native Title Act may apply to the project and the effect it has on the Native Title status of the land. Section 7.7.2.1 Change in land tenure and loss of property, Native Title, page 7 – 180, mentions ILUA's where Native Title has not been extinguished. <p>No information has been included which confirms the requirement to identify existing and potential native title rights which can only occur from a detailed native title assessment being performed on all impacted properties identified in Appendix F.</p>	Provide a detailed native title assessment for the properties identified in Appendix F Impacted Properties, so that the native title status of each impacted property is known. Please use the native title work procedures to assess native title and comply with native title requirements.	This issue is noted. A detailed Native Title assessment has been undertaken for the Project, in accordance with the State's native title work procedures. The revised draft EIS has been amended to state that a detailed native title assessment has been carried out, and the results have been outlined in Chapter 8: Land Use and Tenure. ARTC is in the process of engaging with the relevant parties where native title has not been extinguished on land within the Project footprint regarding the process and approach to the surrender or acquisition of the native title rights and interests in question.	Chapter 8: Land Use and Tenure Section 8.4.2 Section 8.5.2 Figure 8.4 Figure 8.8
149	149.0320	State Agency	Land Use and Tenure		These parts of the draft EIS (Section 15.8.1.1, Table 15.14, Table 15.29) identify that native title may continue over ten properties including Reserve and State land tenure. However, it is also possible for Native Title rights and interests to exist on other land included in Appendix F Impacted Properties. For this reason, all impacted properties should have native title assessed in accordance with the native title work procedures.	Amend these sections of the draft EIS to state that a detailed native title assessment will be carried out for all properties within the projects footprint in accordance with the native title work procedures.	This issue is noted. A detailed Native Title assessment has been undertaken for the Project, in accordance with the State's native title work procedures. The revised draft EIS has been amended to state that a detailed native title assessment has been carried out, and the results have been outlined in Chapter 8: Land Use and Tenure. ARTC is in the process of engaging with the relevant parties where native title has not been extinguished on land within the Project footprint regarding the process and approach to the surrender or acquisition of the native title rights and interests in question.	Chapter 8: Land Use and Tenure Section 8.4.2 Section 8.5.2 Figure 8.4 Figure 8.8 Appendix E: Consultation Report
149	149.0330	State Agency	Land Resources		Within Chapter 8 it refers to on two occasions Volume 3 Design Drawings. No such reference material could be found in the draft EIS common material.	If Volume 3 Design Drawings has not been provided as part of the common material within this draft EIS, please remove reference to it in Chapter 8 and any other chapters/appendices provided as part of this draft EIS. If the correct reference is now Design Drawing Part 1 and Design Drawings Part 2 articulate this in Chapter 8 and in other relevant parts of the draft EIS.	Design drawings previously attached to the draft EIS as Volume 3 have since been revised and updated according to recent fieldwork and revised studies. These are now attached to the revised draft EIS as Appendix B1: Design Drawings, which is supported by Appendix I: EMR Search Certificates and Soil Laboratory Certificates. The reference has been updated throughout the revised draft EIS.	Appendix B1: Design Drawings Appendix I: EMR Search Certificates and Soil Laboratory Certificates
149	149.0340	State Agency	Land Resources	Mitigation measures	Soil Conservation Guidelines for Queensland, provides recommended maximum velocities for consolidated, bare and vegetated channels: Chapter 9, Waterways, Section 9.3, Design Velocity, Table 9.1, p.910. Table 8.27 fails to include reference to the Soil Conservation Guidelines for Queensland (SCGQ). The following has been included in Table 8.28: The Soil Management Sub-plan will include erosion and sediment controls as a component of the CEMP. The erosion and sediment control measures will be developed by a certified practitioner in erosion and sediment control, in accordance with the Best Practice Erosion and Sediment Control (ICEA, 2008) and with reference to Soil Conservation Guidelines for Queensland (DSIT1, 2015) and will be implemented during construction of the Project While the Soil Conservation Guidelines for Queensland are mentioned in Table 8.28, how the guidelines will be applied is unknown. For example, detail has not been provided demonstrating how each waterway/channel/drain along the entire alignment has been assessed and will adhere to the recommended maximum velocities for consolidated, bare, and vegetated channels that is detailed in the SCGQ, Chapter 9, Waterways, Section 9.3, Design Velocity, Table 9.1, p.910.	Amend Chapter 8, Section 8.7 Mitigation Measures to include an assessment of each channel/waterway/drain in relation to the Soil Conservation Guidelines for Queensland, Table 9.1. In doing this demonstrate that each channel/waterway/drain will comply with the recommended maximum velocities depending on the expected channel conditions. To enable this assessment and understand the conditions appropriate survey of soil type, gradient, vegetation species/cover and scour protection features is required. Recommended Condition - It is recommended the OCG ensure all erosion and sediment control mitigation measures as part of the entire project occur in accordance with the Soil Conservation Guidelines for Queensland while also fulfilling requirements of Department of Transport and Main Roads (DTMR) regarding scour protection.	Assessment of Project impacts on channels/waterways/diversions has been included in Appendix H: Geomorphology Report, which includes an assessment of risk to the existing geomorphic conditions due to the Project based on site specific geomorphic and hydraulic data. Assessment of constructed channels/drains in relation to the Soil Conservation Guidelines for Queensland (2015) Table 9.1 Soil Unit Erosion Threshold Velocities (ETVs) have been derived by SGM (2022) (Appendix T2: Hydrology and Flooding Technical Report - Volume 2) for use outside of watercourses. These are applicable for use for: <ul style="list-style-type: none"> application to new drainage features that discharge to bare soils. i.e. where sheet flow is concentrated by new site drainage, and discharged to a new discharge location application to the design of culverts that do not discharge to watercourses, and constructed channels. <p>Site Erosion threshold velocities have been assessed as part of the geomorphic risk assessment for high risk sites where this information is required (e.g., where the sites are high risk due to increases in flow velocity). These have been established from a combination of laboratory data, existing case hydraulic data, site mapping and site-specific assessment of geomorphic conditions and processes (refer to Section 3.3.2 of Appendix H: Geomorphology Report). These ETVs were undertaken to confirm the risk of erosion, e.g., the site may have an increased design flow but the channel material may have a higher ETV than the design increase and so erosion due to the Project would be unlikely to occur (Section 5.2.1 of Appendix H: Geomorphology Report).</p> <p>The geomorphology risk assessment identified nine initial case high-risk sites, one of which was high-risk due to increased velocity (NC 11). The other eight sites were identified as high risk due to either reductions in flow velocity or the location of the design infrastructure.</p> <p>For natural ground surfaces, flood-impact objective compliance has been assessed against a minimum ETV of 0.5m/s (as per with the FIO requirements), which is commensurate with bare ground conditions, and in line with the findings of the SGM (2022) ETV soil unit assessments for bare ground conditions. As the SGM report is more specific to the Project footprint, the values in that report have been used rather than the maximum velocities recommended in Table 9-1 of Chapter 9: Land Resources. All FIO exceedances are shown and discussed within the flood mapping and reporting respectively, noting the revised reference design has been optimised substantially (but not fully) to mitigate flood impacts. As is normal for Projects of this scale/nature, the design will continue to be refined (i.e. as it progresses to Detailed Design) to mitigate residual flood impacts. Information has been provided in Chapter 14: Flooding and Geomorphology Section 14.9 and the Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 outlining the mitigation philosophy/process, along with mitigation measures/strategies to address any residual flood impacts (which, in the context of this response, would relate to flow velocity).</p> <p>The Erosive Threshold Velocities (ETVs) in Table 9-1 of Chapter 9: Land Resources (Soil Conservation Guidelines for Queensland, 2015) have no link with the existing case conditions and are in direct conflict with allowing existing case fluvial geomorphic processes to continue for the following reasons:</p> <ul style="list-style-type: none"> Fluvial systems are dynamic and natural fluvial processes include certain types of erosion. Imposing bare earth ETV's will reduce flow velocity from the existing case and will impact the sediment transport capacity of Project watercourses negatively. A reduction in the ability of a watercourse to transport sediment can lead to channel bed aggradation, change in channel and landform type and reduced/loss of transport of woody debris. Woody debris has significant ecological importance as it has a role in carbon budgets and nutrient cycling, is a source of energy for aquatic ecosystems, provides habitat for terrestrial and aquatic organisms, and the presence of woody debris on gully floors can also reduce erosion. Areas of high flow velocity do not necessarily correspond to areas of erosion on the ground. Site observations of existing geomorphic processes, such as locations and extents of erosion and deposition provide the best information on potential future impacts and site erosion potential. 	Chapter 9: Land Resources Table 9-1 Chapter 14: Flooding & Geomorphology Section 14.9 Appendix H: Geomorphology Assessment Section 3.3.2 Section 5.2.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
149	149.0350	State Agency	Surface Water	Scour protection	Due to lack of detail provided in the Draft EIS B2G, it is not known if scour protection measures will satisfy state requirements. Therefore, additional scour protection measures may need to be detailed in the EIS, noting they will be subject to further analysis that relies on more detailed investigation of soil types, gradient, vegetation cover, expected velocities etc.	The Department of Resources recommends referring to Department of Transport and Main Roads (DTMR) scour protection guidelines and that this issue be discussed further across all relevant state agencies. The Department of Resources also recommends the OCG be guided by DTMR technical advice in relation to how scour protection measures should be applied across the entire alignment (regardless of if the alignment intersects or runs parallel to DTMR infrastructure). Note, to enable the appropriate application of scour protection mitigation measures in the Draft EIS B2G, further analysis that relies on more detailed investigation of soil types, gradient, vegetation cover, expected velocities etc. is required.	Since the release of the draft EIS a preliminary Erosion Threshold Velocity (ETV) assessment has been undertaken to inform the scour and erosion protection strategy for the Project. The ETV values along the Project for a 50 per cent vegetation cover scenario have been estimated at between 0.9 and 1.2 m/s. An impact assessment was then undertaken against the Flood Impact Objectives (FIO) using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Project footprint. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. Sealed and unsealed surfaces likely to be impacted by a velocity FIO exceedance have been identified and are reported in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 4.2. In addition to initial scour protection requirements identified during the reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design in accordance with Austroads Guide to Road Design Part 5B: Drainage – Open Channels, Culverts and Floodways (Austroads, 2013b) (AGRD). Scour protection measures for culvert outlets have been designed to ensure that the maximum allowable flow velocities in a 1% AEP, as specified in Table 3.1 of AGRD, are not exceeded. The scour protection length and minimum rock size (d50) have been determined from Figure 3.15 and Figure 3.17 in AGRD. All required scour lengths are predicted to fit within the rail corridor.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0360	State Agency	Land Resources	Baseline/backgr ound sampling	Department of Resources has previously advised that extra field work, data collection and laboratory analysis is required for the draft EIS to fully meet the TOR requirements (see below comments for further detail). It is recommended that ARTC amend their EIS to make it clear that extra fieldwork, data collection and analysis is required to fully meet the TOR requirements, and this is being undertaken in parallel with the public consultation period and will be submitted for the final EIS. That way, the proponent is upfront in that they are not releasing something they think meets the TOR. The OCG has advised that there is scope in the review process to request additional information after public notification, and to be publicly notified for a second time. Department of Resources would appreciate the opportunity to review the amended EIS.	The Department of Resources would appreciate the opportunity to review an amended Draft EIS containing extra fieldwork, data collection, analysis, and associated mitigation measures for consistency with the TOR requirements. Recommended condition - The OCG should consider placing a condition on the EIS, if suggested updates to the EIS are found to be inadequate. The Department of Resources recommends the following condition for consideration (pending outcomes of an updated EIS):Prior to construction, a soil survey including soil profile descriptions and laboratory analysis must be completed at a scale, site intensity and maximum distance delineated for linear infrastructure in accordance with Tables 1, 2 and 3 of the Guidelines for Soil Survey along Linear Features, and the Australian Soil and Land Resource Survey Field Handbook (Yellow Book). This must be conducted by a suitably skilled and experienced soil and land resource scientist, preferably one with a CPSS accreditation in soil survey. The management units identified in this soil survey are to be formulated to accommodate construction and rehabilitation activities. This must include:- volumes of soil material available for track formation, and treatment and site rehabilitation;- potential salinity, acidity, sodicity and erosion risks/issues and suitable remediation measures.	A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 3.2, Section 5.0 and Table 5.3. This level of investigation is sufficient to allow determination of the suitability of the soils and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. This enabled the management the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al. , 2008), the <i>Australian soil and land survey field handbook</i> (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015). ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at a 1:10,000 scale in consultation with DoR. The soil investigation report provides detailed soil profile descriptions and laboratory test results. Findings from the detailed soil investigation has been incorporated into Chapter 9: Land Resources, Section 9.4.2. Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Sections 3.2 and 3.3 also presents mitigation measures for soil units present within the Project footprint.	Chapter 9: Land Resources. Section 9.4.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3 Appendix J: Soil Assessment Report - Section 3.2 Section 5.0 Table 5.3
149	149.0370	State Agency	Land Resources	Baseline/backgr ound sampling	The Terms of Reference for 11.88 specifies: 'The assessment of impacts on topography, geology and soils will be in accordance with the Soil Science Guidelines of Australia, Queensland Branch (2015), in conjunction with the DES Information guideline for an environmental impact statement Land and the CSIRO guidelines for surveying soil and land resources and Australian Soil and Land Survey field handbook (refer to Appendix 1). There has been insufficient assessment of the range of soils along the project's corridor. The assessment is not consistent with the requirements of the Soil Science Australia, Queensland Branch (2015), Guidelines for Soil Survey for linear features; and the limited soil survey has not been completed in accordance with the requirements of the Australian Soil and Land Survey, field handbook, and Australian Soil and Land Survey Handbook. Extra field work, data collection and laboratory analysis are required for the draft EIS to fully meet the TOR requirements. The existing description of soils within Chapter 8 Land Resources is not suitable. As advised previously, ARTC continue to misinterpret statements from the Guidelines for Soil Survey along Linear Features. These guidelines do not prescribe or recommend a scale of 1:250 000 for an EIS for a linear feature. In addition, as this linear feature is likely to have a disturbance footprint of around a 100 m width, it would be more logical than not, for the soils along the inland rail corridor to have been described and sampled using the recommendations from the Guidelines for Soil Survey along Linear Features, as was required by the Terms of Reference, not based on a 1:250 000 site density from McKenzie et al 2008 (which actually equates to one site described per square centimetre of map area, or for a larger project area, roughly 16 sites per 100 km2). For a piece of linear infrastructure, it is illogical to map the landscape at a 1:250 000 scale, which is why the Guidelines for Soil Survey along Linear Features were devised to clarify a scale that is fit for purpose for linear features. It is acknowledged that sites from the Qld Government SALI database have been used to increase the site intensity along the route. This is supported. The main problem however is that the sites are not located proportionately along the route. Instead, there is a cluster of sites south of Kingsthorpe, a cluster of sites around Inglewood, and 2 in between. These sites provide a more reliable indication of the soils and their attributes along the route than the Soil Orders which have been downloaded from ASRIS. Contrary to the claims in the draft EIS, Tables 1, 2 and 3 from the Guidelines for Soil Survey along Linear Features are 'directly applicable' to this EIS design stage. As previously advised, the minimal laboratory analysis included in Appendix G Geotechnical Investigation, does not satisfy the requirements for Table 3, let alone the requirement for 25% of soil survey sites having a detailed profile description. Not one detailed soil profile description has been provided in the EIS (even the sites that have been downloaded from SALI do not include a detailed site description this is a basic requirement of the Guidelines for Soil Survey along Linear Features and the TOR.	At a minimum, extra field work, data collection and laboratory analysis should be completed at a scale, site intensity and maximum distance delineated for linear infrastructure that equates to 1:100 000 (See Table1, Table 2 and Table 3 of the Guidelines for Soil Survey along Linear Features, and the Australian Soil and Land Resource Survey Field Handbook (Yellow Book)). In line with this guideline, fully described soil profile descriptions and laboratory analysis need to be included, rather than a map downloaded from ASRIS of Soil Order. Work should be completed by a suitably skilled and experienced soil and land resource scientist with a CPSS accreditation in soil survey. The soil descriptions provided do not provide a suitable representation of the soils along the route, or the impacts from disturbing them. The lumping of the soil chemistry results provides limited insight into the soils along the route. Based on this additional survey work, reassessments should be made in relation to:- volumes of soil material available for track formation, and treatment and site rehabilitation;- potential salinity, acidity, sodicity and erosion risks/issues and suitable remediation measures.	A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 3.2, Section 5.0 and Table 5.3. This level of investigation is sufficient to allow determination of the suitability of the soils and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. This enabled the management the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al. , 2008), the <i>Australian soil and land survey field handbook</i> (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015). ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at a 1:10,000 scale in consultation with DoR. The soil investigation report provides detailed soil profile descriptions and laboratory test results. Findings from the detailed soil investigation has been incorporated into Chapter 9: Land Resources, Section 9.4.2. Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Sections 3.2 and 3.3 also presents mitigation measures for soil units present within the Project footprint.	Chapter 9: Land Resources. Section 9.4.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3 Appendix J: Soil Assessment Report Section 3.2 Section 5.0 Table 5.3
149	149.0380	State Agency	Land Resources		Lithosols do not feature in the Australian Soil Classification groups.	Amend EIS to clarify that Lithosols do not feature as an Australian Soil Classification group.	The term Lithosols within the EIS has been used as a soil association only in the capacity as a description of soils within the Project alignment. The equivalent soil classification according to the Australian Soil Classification (ASC) has been provided for each soil association/description in Section 4.5 of Appendix J: Soil Assessment Report. In the case of Lithosols, the ASC is considered Rudosols or Tenosols. Refer to Section 5.0 in Appendix J: Soil Assessment Report for the assessment methodology and results from the soil surveys completed.	Appendix J: Soil Assessment Report Section 4.5 Section 5.0
149	149.0390	State Agency	Land Resources	Mitigation measures	Land resources mitigation measures, identifies several plans and subplans that are to be prepared to direct proposed mitigation measures, viz: <ul style="list-style-type: none"> Construction Environmental Management Plan (CEMP) Erosion and Sediment Control Plan (ESCP)Rehabilitation and Reinstatement Plan To be able to advise the Coordinator General on their suitability, the Department of Resources would appreciate the opportunity to assess such plans in view of more detailed land resource/soils data being obtained in subsequent studies proposed for the Project. 	Recommendation: The Coordinator General provide an opportunity for the Department of Resources to review the several EMPs and associated sub-plans related to assessing risks and mitigation measures for the land resources impacted by the Project.	All plans and Plans that support development of the Construction Environmental Management Plan and the Operation Environmental Management Plan will be developed by the Contractor during detailed design. Frameworks for which will guide the development of the plans and Plans is detailed in Chapter 24: Draft Outline Environmental Management Plan. ARTC will continue to work with the Office of the Coordinator-General and the Department of Resources in the Detailed Design stage and during the preparation of the required management plans required for both Construction Works and Operations stages. Appendix J: Soil Assessment Report was completed to a scale of 1:10,000 and has identified soil management units to inform appropriate soil management plans (as described in Appendix J: Soil Assessment Report, Section 1.3). Revised mitigation measures are proposed in Section 3, Part B: Soil Management Plan of Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Section 3.ARTC have committed to consultation with potentially affected landowners and other stakeholders, including proponents of non-Inland Rail Projects that interface with the Project, may result in additional mitigation measures of relevance being identified during the detailed design process.	Chapter 24: Draft Outline Environmental Management Plan Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix J: Soil Assessment Report Section 1.3
149	149.0400	State Agency	Land Use and Tenure		The EIS fails to recognise that Petroleum and Gas tenures exist under both the Petroleum and Gas (Production and Safety) Act 2004 and the Petroleum Act 1923.	Amend Chapter 7, 7.5.1.3 to reference both the Petroleum and Gas (Production and Safety) Act 2004 and the Petroleum Act 1923 i.e., please include the following edits in red: Several different authorities for petroleum and gas exploration and production activities in Queensland are granted under the Petroleum and Gas (Production and Safety) Act 2004 and the Petroleum Act 1923.	Chapter 8: Land Use and Tenure, Section 8.2 references the Petroleum and Gas (Production and Safety) Act 2004 as the Project only traverses infrastructure regulated under this Act. Both the Petroleum and Gas (Production and Safety) Act 2004 and the Petroleum Act 1923 (Qld) are noted in Chapter 8: Land Use and Tenure, Section 8.4.2, as having relevance in Queensland. The Petroleum Act 1923 (Qld) continues to regulate petroleum licences granted prior to 1993. All petroleum licences traversed by the Project were granted post 1993.	Chapter 8: Land Use and Tenure Section 8.2 Section 8.4.2
149	149.0410	State Agency	Land Use and Tenure	Directly impacted landowner	Regarding: MDL held where there is a significant mineral occurrence of possible economic potential. The known coal resource area in relation to MDL 299 and the proposed rail alignment is shown on Figure 7.60 Land Use on page 115. The Department is aware that the holder of MDL 299 has conducted additional exploration to establish a JORC Code 2012 resource on the area potentially impacted by the proposed rail alignment. The current holder of MDL 299 has only recently acquired that tenure and they also own the freehold land surrounding the MDL. This coal resource adjoining the current mining lease is a logical extension of the current pits and represents coal that can be mined with an economical strip ratio and transported directly to the power station with existing infrastructure. The resource is understood to represent several years coal supply to the power station that is expected to operate until 2050.	To confirm the currently known extent of the coal resource area the Department suggests contacting the MDL holder regarding the significant mineral occurrence of possible economic potential (Standard: JORC Code 2012 Measured and Indicated status) that has been identified to over part of MDL 299. If warranted after consideration of other factors, future access to the resource could be achieved by moving the rail alignment approximately 1 km to North West over land that is also owned by the MDL 299 Holder.	Chapter 8: Land Use and Tenure, Section 8.6.1 states that where possible, the Project has been aligned to avoid or minimise sterilisation of mineral, coal and petroleum resources; however, in some instances, mineral and petroleum resources could not be avoided by the Project footprint. ARTC will consult with potentially impacted holders of leases, permits or licences over mineral and petroleum resources through the Detailed Design and Pre-Construction Activities and Early Works stages to ensure that the Project and its construction activities are developed in a manner to minimise the extent of such impacts where possible. Chapter 8: Land Use and Tenure, Section 8.5.1 discusses, MDL 299 and MDL 300, located between Inglewood and Millmerran, will be impacted by the Project alignment. The alignment has the capacity to impact on the potential productivity of these leases. Additionally, the Project alignment's impact on the licences will limit the ability of the owners of the lease to profit from any potential minerals located within the licence area. Access to the mineral development licence sites may be impacted as a result of the Project. Consultation with key mineral, coal and petroleum interest stakeholders, including the Commodore Mine and Arrow Energy, has been ongoing since 2018, and ARTC will continue to consult with potentially impacted holders of leases, permits or licences over mineral, coal and petroleum resources through the Detailed Design and Pre-Construction Activities and Early Works stages to ensure the Project and its construction activities are developed in a manner to minimise the extent of such impacts where possible (Appendix E: Consultation Report and Chapter 8: Land Use and Tenure, Section 8.6.1). Where the Project footprint impacts MDL 299 through the severance of the existing lease area, the horizontal alignment of the Project has been optimised to limit the impact on the lease, as well as surrounding land uses. Consultation is currently ongoing with the leaseholder of MDL 299, and minor optimisations of the alignment are being considered to minimise the Project's impact on potentially productive and economically significant mineral deposits. Compensation for the surrender of the lease, and for the acquisition of the land, will be negotiated through DTMR, as the constructing authority, on behalf of ARTC. All landowners who have a lawful claim to the lease and the land will be eligible for compensation (Chapter 8: Land Use and Tenure, Section 8.6.2). Consultation with the Commodore Mine has resulted in a road-over-rail interface to ensure that access to MDL 299 is maintained (proposed road-rail interfaces for the Project, summarised in Chapter 5: Project Description).	Chapter 5: Project Description Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.1 Section 8.6.2 Appendix E: Consultation Report
149	149.0450	State Agency	Land Resources	Mitigation measures	Table 8.28, Aspect: Hazardous material and dangerous goods could be improved by adopting the recommended amendments.	Amend Table 8.28 Land resource mitigation measures, Delivery phase: Construction, Aspect: Hazardous material and dangerous goods by including the following in red: Licensed transporters operating in compliance with Australian Code for the Transport of Dangerous Goods by Road and Rail and Australian Code for the Transport of Explosives by Road and Rail will be used for the transport of dangerous goods and explosives.	Section 9.5.10, Table 9-27 in Chapter 9: Land Resources has been updated with the suggested text as part of the Construction Works stage hazardous material and dangerous goods aspect.	Chapter 9: Land Resources Section 9.5.10 Table 9.30 Table 9-27

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
149	149.0460	State Agency	Hazard and Risk	Construction vibration	Improvements could be made to Section: 19.7.3.3 Explosives use in proximity to the Project (Page 19, 39) by ensuring the suggested solution is incorporated into the text.	It is suggested the following words are incorporated into the Hazard description section: Explosives are hazardous by nature and the incorrect or inappropriate storage, handling, or transport, may result in an unplanned initiation, causing harm to the environment and people. It is suggested the following change is made to the first sentence underpotential impacts Section so to remove reference to blast caps: Blasting explosives (including detonators and boosters) and Security Sensitive Ammonium Nitrate are expected to be required during construction.	Section 21.5.3.3 of Chapter 21: Hazard and risk, explosives hazard description is updated with the wording suggested. Potential impact has been updated with "Blasting explosives (including detonators and boosters) and security sensitive ammonium nitrate are expected to be required during construction to achieve the requisite cutting depth in locations where hard rock is expected to be encountered. "	Chapter 21: Hazard and Risk Section 21.5.3.3
149	149.0470	State Agency	Hazard and Risk	Construction vibration	Potential impacts require further assessment. The Potential Impacts paragraph does not satisfactorily describe hazards or requirements for mitigation.	Amend Potential Impacts Section of EIS 19.7.3.3 to include information that better describes the hazards associated with transport, storage, handling and use of explosives during construction and how these hazards are to be mitigated.	Section 21.5.3 of Chapter 21: Hazard and Risk has been updated with detailed description of the hazards associated with transport, storage, handling and use of explosives during construction. Proposed mitigations for these hazards are discussed in Section 21.6 Table 21-16.	Chapter 21: Hazard and Risk Section 21.5.3 Section 21.6 Table 21-16
149	149.0480	State Agency	Hazard and Risk	Construction vibration	Section 19.7.3.3 - Significant concern exists that security sensitive explosives will not be transported on the Inland Rail network.	Discussion required - It is requested that the Coordinator General and ARTC engaged with stakeholders commence immediate discussions with Resource Safety and Health Queensland (RSHQ) Chief Inspector Explosives, Alex Mandel, ph.0436 611 777, email: alex.mandel@rshq.qld.gov.au.	ARTC engaged with Resource Safety and Health Queensland's (RSHQ) Chief Inspector Explosives on 1st July 2022, as requested by this submission. The key issue of discussion was the transportation of security sensitive explosives on the Inland Rail network in Queensland. It was agreed that ARTC engaged with stakeholders and RSHQ will continue to work together to manage safety, storage and security of explosives during construction, as well as environmental issues relating to noise and vibration from blasting. ARTC engagement with stakeholders has resulted in the commitment that the 'Contractor' will engage with RSHQ when planning any blasts that may be required during construction of the Project (Chapter 21: Hazard and Risk, Section 21.5.3 and Appendix E: Consultation Report). ARTC will manage the Border to Gowrie Section of the Inland Rail network to allow for the transportation of dangerous goods and explosives as nominated by the haulage provider and Explosive Competent Authority. There are no tunnels along this Section of the network. Hazardous chemicals (dangerous goods) will likely make up a significant portion of freight because they include many widely used commodities and products. Products potentially categorised as dangerous goods that are likely to be transported include medical supplies and fuel. These goods are commonly moved on all forms of transport (not limited specifically to rail freight). ARTC cannot provide an exhaustive list of the types and quantities of dangerous goods that will be transported on the network (Chapter 5: Project Description, Section 5.8.3).	Chapter 21: Hazard and Risk Section 21.5.3 and Appendix E: Consultation Report
149	149.0490	State Agency	Hazard and Risk	Mitigation measures	Table 19.12 (Page 19, 58), Aspect Storage and handling chemicals, dot point 3 states that: The Hazardous Materials Management Subplan (refer above) will be implemented as a component of the CEMP. Also, within Table 19.12 (Page 19, 58) it mentions that: Chemicals stored and handled as part of construction activities will be managed in accordance with: <ul style="list-style-type: none"> AS 2187.1: 1998 Explosives Storage (Standards Australia, 1998a) AS 2187.2 2006 Explosives Storage, transport and use, Part 2: Use of explosives (Standards Australia, 2006). Australian Code for the Transport of Explosives by Road and Rail (Commonwealth of Australia, 2018b)These references are incorrect. 	In addition to this 3rd dot point, it is recommended that the following be included: The shottirer or blasting contractor must provide the Hazardous Material Management Sub plan to the Explosive Inspectorate as part of the notification process of blasting activity at least seven days before the proposed blasting activity is carried out. For noting: The sooner the information is supplied to the Inspectorate, the less likely chance of delays with blasting if the Inspectorate has an issue. Within Table 19.12 (Page 19, 59) amend the following to read: Chemicals stored and handled as part of construction activities will be managed in accordance with: AS 2187 Part 2 for explosives use. AS 2187, Part 1: 1998 for explosives storage and Australian Code for the Transport of Explosives by Road and Rail 3rd edition (AEC3 for explosives transport by road and rail).	Section 21.6.2, Table 21-16 of Chapter 21: Hazard and Risk has been updated with the following. "The prescribed shottirer will submit a safe blast design and Blast Management Plan to the Explosives Inspectorate a minimum of seven days before the scheduled blasting event, for assessment against the requirements under the act and AS 2187.2:2006 Explosives—Storage and use (Standards Australia, 2006b)"	Chapter 21: Hazard and Risk Section 21.6.2 Table 21-16
149	149.0500	State Agency	Hazard and Risk	Mitigation measures	Explosives Section on page 19, 58 refers to an appointed licensed blasting contractor. This is not the description of the licensed person(s) contained in the legislation.	Within explosives Section on page 19, 58 ensure that appropriate legislative terminology is used to describe the licensed person undertaking the blasting works. For example, prescribed shottirer under schedule 7 of the Explosives Regulation 2017 means:148 Definitions for division In this division prescribed shottirer means a. the holder of a shottirer licence; or(b a person appointed as a shottirer by: i. for an underground mine, the underground mine manager of the mine; or ii. for another mine, including a quarry the site senior executive for the mine.	Section 21.6.2, Table 21-16 of Chapter 21: Hazard and Risk has been updated with the appropriate terminology. (e.g. "The prescribed shottirer will submit a safe blast design and Blast Management Plan to the Explosives Inspectorate a minimum of seven days before the scheduled blasting event, for assessment against the requirements under the act and AS 2187.2:2006 Explosives—Storage and use (Standards Australia, 2006b). "	Chapter 21: Hazard and Risk Section 21.6.2 Table 21-16
150	150.0001	Private	Flora and Fauna	Koala	Estimate for koala habitat is incorrect. Submitter has seen at least three koalas on their property.	Nil	Section 3.2 of Appendix L: Terrestrial and Aquatic Ecology Technical Report of the draft EIS released in January 2022, outlined that a review of existing literature and previous studies was conducted which included gathering information on species diversity, abundance and distribution. Field surveys were also conducted to verify the presence of threatened species and ecological communities within the impact assessment area. As noted in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report, a species-specific impact assessment approach has been developed to assess impacts on koala populations for the Queensland sections of the Inland Rail project. This approach guided the identification of koala habitat within the Project footprint, refined habitat mapping, key threats and impacts associated with the Project to inform the significant impact assessment for the species. Mitigation measures and controls have been factored into the Project to reduce the impact on the affected species. ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been reviewed by a range of expert consultants, as well as industry and academia sources. The revised data also takes into consideration information sourced from a variety of database sources (i.e. Atlas of Living, EPBC Act Protected Matters Search Tool, WildNet Records, MSES, TRC and GRC Regional Planning Schemes) to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. As a result and as a part of the revised draft EIS, Appendix M: Draft Koala Management Plan has been developed. The revised draft EIS Appendix M: Draft Koala Management Plan includes mitigation measures and controls that will be factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction stage. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial Ecology Technical Report. The Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements.	Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 11.4 Section 11.5 Appendix M: Draft Koala Management Plan Appendix O: Matters of National Environmental Significance Appendix P: Fauna Connectivity Strategy
150	150.0002	Private	Air Quality		Coal dust issues on health and water quality.	nil.	It is not anticipated that coal would be transported along the Border to Gowrie corridor; therefore, coal dust impacts on health and water quality are not expected. However, if coal were transported on the network in future, a Coal Dust Management Plan (CDMP) would be developed in consultation with the relevant regulatory authority. Recommended air quality mitigation measures for the Project are included in Chapter 24: Draft Outline Environmental Management Plan.	Chapter 24: Draft Outline Environmental Management Plan
150	150.0003	Private	Social Impact Assessment	Mitigation measures	Loss of country lifestyle and amenity.	Proponent should be conditioned to provide detail of how they will mitigate the loss of country lifestyle and amenity associated with the excess dust, noise, pollution and loss of privacy.	Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing. Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry. The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement. ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
150	150.0004	Private	Groundwater	Private groundwater bore/s	Concerns of loss of (or access to) existing groundwater bores as these are the only groundwater bores available to water stock and back up house supply during periods of drought.	ARTC should be conditioned to provide exact detail of this impact to affected landowners in consideration of this and come back for public comment. Property specific agreements need to be transparent not just to the property owner but to the broader community.	Section 15.5.4 and 15.7.4 of Chapter 15: Groundwater have been updated accordingly and proposed potential make-good policy and potential measures are detailed in Table 15.20. ARTC will engage with water users/landowners to determine an appropriate make-good mitigation strategy for bores impacted by the rail alignment on a case-by-case basis. These make-good measures will be determined in consultation with the affected landowners to ensure the agreed make-good solution is commensurate with the level of impact anticipated. Registered bore RN66261 has been identified and will be included in the make-good agreement process.	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Table 15-20
150	150.0005	Private	Groundwater	Water quality	ARTC are incorrectly reporting to people around the area about the water quality issues at project site that will occur due to impacts of coal dust.	ARTC need guarantee water quality and quantity for all landowners in not adversely effected.	Revised draft Appendix S: Surface Water Quality Technical Report, Section 6.3 states that a flooding and hydrology study has been undertaken detailing potential impacts to flow. There may be small changes to flow during construction if barriers are placed within watercourses during high flow events, however the potential for this to occur is low. Whilst change to hydraulic regimes may occur (due to new infrastructure) at 1% AEP conditions, changes to base-flow and low-flow conditions are not expected (Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2) and will not significantly impede current surface water resource use. The impact to water plans (supply and conveyance) within the disturbance footprint will be minimal due to limited overland flow interference and minimal diversion of defined watercourses. Hydrological modelling has not indicated significant changes to the current flow regimes and as such, minimal impact is expected to occur from the Project on supply and conveyance. Potential further impact to water plans may be expected due to the requirement for construction water, however this is expected to be regulated by the necessary authorities and will be conducted in accordance with the strategy for sourcing construction water (Appendix S: Surface Water Quality Technical Report, Section 1.4.55). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements. Water quality protection of aquatic ecosystems will confer protection to current existing conditions within the water quality study area, and water users downstream of the alignment. Therefore, identification of potential impact, mitigation measures (Section 7) and resulting impact assessment (Section 7.3) identifies any impact to surface water users (Appendix S: Surface Water Quality Technical Report). Noting this, during construction water sourcing, ARTC will ensure that any existing commercial arrangements for the access to and/or sale of water to other end users can be honoured by water entitlement holders. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).	Appendix B5: Construction Water Requirements Appendix S: Surface Water Quality Technical Report Section 1.4.55 Section 6.3 Section 7 Section 7.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
150	150.0006	Private	Stakeholder engagement	Land acquisition/compensation	ARTC has advised for over 3 years they will seek to acquire the entire property but has not provided a timeframe for when this will occur. This has caused a great deal of stress and uncertainty to the submitter especially whilst trying to run a business from the premises. The submitter cannot progress business plans due to the uncertain time frame and market value price of the acquisition.	ARTC should be conditioned to provide answers to these question not only to affected property owners but to the broader community for transparency.	The Department of Transport and Main Roads (DTMR) is managing the property acquisition process for the Project. ARTC notes that the submitter declined a meeting with DTMR regarding the acquisition process. Where the Project requires the permanent acquisition of properties and compensation is required, this will be undertaken in accordance with the requirements of the Acquisition of Land Act (the Act). As outlined in Chapter 6: Stakeholder Engagement, Section 6.6, ARTC is engaging with directly affected landowners to develop an understanding of each household's circumstances, including those who may need support to adjust to changes brought about by the Project. Some who are affected may have limited socio-economic and/or personal resources to help them adapt to change, and may need specific support, including practical assistance to relocate from their current homes. ARTC has initiated an early acquisition process with landowners who are experiencing hardship in relation to land acquisition. Other mitigation measures detailed within the Social Impact Management Plan include: <ul style="list-style-type: none"> ensuring landowners receive appropriate information about the timing and process for land acquisition working with directly affected landowners to minimise disruptions related to the acquisition finalising compensation agreements for land acquisition under the Act. ARTC acknowledges the uncertainty that Project development creates; however, design is an iterative process and landowners have been provided with information as it becomes available. Appendix X: Social impact assessment details the strategies that ARTC has implemented to support affected residents. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.	Chapter 6: Stakeholder Engagement Section 6.6 Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment

150	150.0007	Private	Social Impact Assessment	Directly impacted landowner	Submitter's home is being resumed and the location of business on the property is also being relocated. Submitter states the current location of their business is ideal and having to move will affect both income, day-to-day operation and ease of running the business. This will impact on them financially for long time.	ARTC need to investigate the economic impacts of the project on transport industry businesses including mechanics, tyre service and spare parts providers.	<p>An assessment of the economic impacts per lot, business or commodity is not in the scope of the EIS as per Section 5.1 and 11.141 of the final Border to Gowrie Terms of Reference, as approved by the Qld Coordinator-General. The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. These outcomes have been summarised in the revised draft EIS.</p> <p>The Department of Transport and Main Roads (DTMR) is managing the property acquisition process for the Project. ARTC notes that the submitter declined a meeting with DTMR regarding the acquisition process. Where the Project requires the permanent or partial acquisition of properties and compensation is required, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (the Act). In relation to compensation matters, DTMR will be responsible for all land acquisition (either partial or whole property) required for the construction of the Project. Property acquisition, whether it be whole or partial, will be determined on a case-by-case basis, with negotiations being led by DTMR. Compensation for loss of land and interests in land will be assessed in accordance with Section 20 of the Act. Compensation for land acquisition may include compensation for disturbance caused by the resumption such as reasonable financial costs incurred as a direct consequence of the resumption of the land (Appendix X: Social Impact Assessment).</p> <p>As outlined in Chapter 6: Stakeholder Engagement, Section 6.6, ARTC is engaging with directly affected landowners to develop an understanding of each household's circumstances, including those who may need support to adjust to changes brought about by the Project. Some who are affected may have limited socio-economic and/or personal resources to help them adapt to change, and may need specific support, including practical assistance to relocate from their current homes. ARTC has initiated an early acquisition process with landowners who are experiencing hardship in relation to land acquisition.</p> <p>Other mitigation measures detailed within the Appendix X: Social impact Assessment, Section 8, Social Impact Management Plan include:</p> <ul style="list-style-type: none">▶ ensuring landowners receive appropriate information about the timing and process for land acquisition▶ working with directly affected landowners to minimise disruptions related to the acquisition▶ finalising compensation agreements for land acquisition under the Act. <p>ARTC acknowledges the uncertainty that project development creates; however, design is an iterative process and landowners have been provided with information as it becomes available. Appendix X: Social impact Assessment details the strategies that ARTC has implemented to support affected residents. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social impact Assessment Section 8
151	151.0002	Community Group	Traffic and Transport		Pedestrian crossing - will be used by children, hearing impairment possible from 115 decibel train to pass by	Install an underpass	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.2 discusses the reference design reviews and updates for the Yelarbon road rail interfaces and the proposed pedestrian crossing facilities. As part of the revised reference design a dedicated active pedestrian level crossing has been added at the existing Cunningham Highway interface location (310-11-E-1) to enable pedestrian movement north/south of the Yelarbon township. ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities, where the need for that facility remains in a Third Party Agreement with local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design.</p> <p>It's noted the submitters preference for underpasses; however, while they are intended to provide a safe and convenient means for pedestrians to cross the rail corridor, they often have several issues that undermine their effectiveness, which is why ARTC have progressed a Pedestrian level crossing at Yelarbon. Firstly, an underpass at Yelarbon would be subject to flooding causing several issues pertaining to drainage, availability and maintenance issues. Secondly, they can be perceived as dark, enclosed spaces, creating a sense of insecurity and fear among pedestrians, particularly during night-time or in isolated areas. This can deter people from using them, forcing them to opt for less safe alternatives such as crossing at surface level. The absence of surveillance or security measures further exacerbates these worries, making underpasses potential hotspots for criminal activities. Overall, while the concept of pedestrian underpasses is well-intentioned, these inherent issues need to be addressed through proper design, maintenance, and inclusion of safety measures to ensure their effectiveness.</p>	Appendix AA: Traffic Impact Assessment Section 3.7.2
152	152.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
152	152.0002	Private - Turallin Workers	Traffic and Transport		<p>a. Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre.</p> <p>b. Increase in traffic on narrow roads that are already heavily traversed.</p> <p>c. Impact on Travel time as it is further from the alignment of the rail project.</p> <p>d. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length.</p> <p>e. Could impact on Millmerran town parking availability.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
152	152.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
152	152.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property, cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community. Appendix E: Consultation Report, Section 5.11.</p>	Chapter 5: Project Description Section 5.6.4 Chapter 17: Social Section 17.5 Appendix E: Consultation Report Section 5.11
152	152.0006	Private - Turallin Workers	Social Impact Assessment		The camp site could have a possible negative Life Style impact on the small rural historic community.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community. Appendix E: Consultation Report, Section 5.11.</p>	Chapter 5: Project Description Section 5.6.4 Chapter 17: Social Section 17.5 Appendix E: Consultation Report Section 5.11
152	152.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	Chapter 5: Project Description Section 5.6.4 Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 20 Section 20.6
152	152.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.	Chapter 5: Project Description Section 5.6.4
						Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).	Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.	
						Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.		
152	152.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.	Chapter 11: Flora and Fauna Section 11.6

153	153.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation facilities, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
153	153.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property, cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
153	153.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.6</p>
154	154.0001	Private	Noise and Vibration	Operational road traffic noise	This EIS refers only to rail noise. No account is made of truck engine or exhaust brake noise decelerating down the incline into the town of Yelarbon. This noise is substantial now and will be exacerbated by the overpass.	The rail to bypass Yelarbon by rerouting the line approximately 1 km north to the edge of the Yelarbon desert soils which is approximately the flood extent limit of the 1956 flood. This would have a secondary benefit of avoiding the desert soils which QR have had ongoing difficulties with rail stability.	<p>During construction, traffic at this road over rail crossing (RRI ID 310-11-E-1) may be impacted, however during operation, traffic movement along the highway at this location is expected to be unimpeded.2038 traffic noise desktop assessment results incorporated assumption of each road to have a 3% gradient. During design, the Project has been aligned to minimise the number of road-rail interfaces.</p> <p>Sensitive receptors in the town of Yelarbon have been included in the construction noise and vibration and operational road traffic noise assessments. Yelarbon is shown in Appendices C, D, and J of Appendix V: Noise and Vibration - Construction Noise and Road Traffic. The receptors have been assessed against the CoP V1 and CoP V2 criteria. The operational road traffic noise assessment results are shown in Section 8, Appendix I, and Appendix J of Appendix V: Noise and Vibration - Construction Noise and Road Traffic. Road traffic noise mitigation for the Project is discussed in Section 8 of Appendix V.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ➤ approvals and stakeholder engagement: 12.5 per cent ➤ technical viability: 17 per cent ➤ safety: 16.5 per cent ➤ constructability: 12.5 per cent ➤ operations: 16.5 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to the Border to Gowrie Project.</p>	<p>Appendix V: Noise and Vibration - Construction Noise and Road Traffic</p> <p>Section 8</p> <p>Appendix C</p> <p>Appendix D</p> <p>Appendix I</p> <p>Appendix J</p> <p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p>
154	154.0002	Private	Social Impact Assessment	Infrastructure crossings/interaction	Proposal divides Yelarbon into 2 part. No allowance has been made for pedestrian or bicycle access across the line.	The rail to bypass Yelarbon by rerouting the line approximately 1 km north to the edge of the Yelarbon desert soils which is approximately the flood extent limit of the 1956 flood. This would have a secondary benefit of avoiding the desert soils which QR have had ongoing difficulties with rail stability.	<p>With the exception of Yelarbon and Brookstead, the Project bypasses the main townships in the region, avoiding impacts on connectivity within towns.</p> <p>In Yelarbon, the existing level crossing will be preserved, and a grade separated crossing (road over rail) will also be provided over Yelarbon Kurumbul Road and connecting to the Cunningham Highway. The crossing design maintains connectivity from the Cunningham Highway to the township. There is currently no pedestrian path across the existing rail line in Yelarbon. As a result of consultation with GRC and the Yelarbon CCC (a community-run committee), the Project's reference design has been revised to include a pedestrian crossing to provide north-south connectivity.</p>	N/A
154	154.0003	Private	Traffic and Transport	Infrastructure crossings/interaction	GrainCorp and Holdfast Timbers require access to Railway Parade and to the Keetah Bridge Road. Road layouts I have seen at information sessions do not address this need.	The rail to bypass Yelarbon by rerouting the line approximately 1 km north to the edge of the Yelarbon desert soils which is approximately the flood extent limit of the 1956 flood. This would have a secondary benefit of avoiding the desert soils which QR have had ongoing difficulties with rail stability.	<p>Stakeholder Engagement occurred with GrainCorp in 2018 to understand their current and proposed operations and requirements. The feedback received from GrainCorp regarding the East Sawmill Rd level crossing noted that there were no issues with closing this level crossing.</p> <p>Access to Railway Parade is maintained via new intersection between the realigned Cunningham Highway/Yelarbon Kurumbul Road and the new intersection between realigned Yelarbon Kurumbul Road/Taloom Street. Access to Yelarbon Keetah Road is via the realigned Cunningham Highway (Taloom Street).</p> <p>Further assessment of the feasibility of the existing road-rail interface between East Sawmill Road and Railway Road has been undertaken. The proposed "no crossing provided" outcome has been retained as a result of:</p> <ul style="list-style-type: none"> ➤ The conflict with proposed GrainCorp siding and turnout interface ➤ The ability for vehicular movements north/south of the rail line to occur via the safer, grade separated Cunningham Highway overpass, which directly connects to Railway Parade ➤ Revised treatment of 310-11-E-1 to retain existing pedestrian movement north/south of the rail line via a pedestrian crossing at the existing Cunningham Highway level crossing ➤ Feedback received from GrainCorp (during consultation in Yelarbon on 9 May 2018 and 6 September 2018) regarding the level crossing noting that there were no issues with the closure of this level crossing. <p>The Project recognises GrainCorp as a key stakeholder and acknowledges the concerns regarding the closure of the level crossing between East Sawmill Road and Railway Road. The Project commits to continuing to work collaboratively with DTMR and GrainCorp to progress potential solutions during detailed design.</p> <p>Appendix AA: Traffic Impact Assessment, Section 3.7.2 discusses the reference design reviews and updates for the Yelarbon road rail interfaces and the proposed pedestrian crossing facilities.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
154	154.0004		Economics		The EIS repeatedly claims economic benefit for the Yelarbon District, yet there is no allowance for local producers to access this freight train.	nil.	<p>The Project is likely to offer opportunities in secondary service and supply industries (e.g. retail, hospitality and other support services) for businesses in close proximity to the construction footprint and non-resident workforce accommodation facilities. The expansion in construction activity has the potential to support additional temporary flow-on demand and additional spending by the construction workforce in the local community, this may lead to increased trading levels for small businesses, such as food and beverage businesses in the impact assessment area.</p> <p>Retail businesses in Millmerran, Inglewood and Goondiwindi have the potential to benefit from opportunities to supply materials and services to the Project's non-resident workforce accommodation facilities. Some local retail businesses may also benefit from increased trade from workers residing in these accommodation facilities (see Chapter 18: Economics, Section 18.9). As identified in Appendix X: Social Impact Assessment, Section 7.5.3, it is likely that some small businesses will need to scale up their current capacity to participate in the Project, particularly for businesses in rural areas along the alignment.</p> <p>All assumptions relating to demand modelling, including the connection to intermodal terminals or other supporting freight infrastructure, are considered in the Inland Rail Programme Business Case (2015). The revised draft EIS reflects the information contained in the Business Case and does not include any new assumptions. As such, considering the development of other infrastructure (e.g. intermodal terminals or supporting freight infrastructure) or Project options is outside the scope of this EIS. There may be opportunities for supporting freight infrastructure in the Yelarbon district; however, these are not captured under the scope of the EIS.</p> <p>The current reference design for the revised draft EIS for the Project, includes connecting the existing sidings at the GrainCorp silos, which will facilitate faster transport of grain to market (see Appendix X: Social Impact Assessment). The Project acknowledges GrainCorp's concerns regarding the closure of East Sawmill Road level crossing in Yelarbon, and will continue to work collaboratively with GrainCorp to progress solutions addressing access to the Yelarbon silos during detailed design.</p> <p>In addition, this does not preclude ARTC or another third party constructing such facilities at a later date. Such facilities would require a specific business case, a review of the operational efficiencies of the Inland Rail alignment, and be subject to further approvals. Discussions with key stakeholders, including major agricultural producers, can occur a later date should there be a future need for such rail infrastructure at these locations.</p>	Chapter 18: Economics Section 18.9 Appendix X: Social Impact Assessment
155	155.0001	Private	Flooding	Increase in peak water levels	The damage caused by poorly built rail lines and the building up of rail line to keep trains out of floods has historically caused more damage than previously, to surrounding areas. I believe that this is a justified concern about flood impacts by people in the floodplain areas where the rail line is proposed to traverse. We hear about these 1 in a hundred year events every couple of years lately so let's get this thing right from the start and give the land holders a fair go. I	Built up rail lines and flood plains don't mix. Listen to the landowners and get this right before anything is started.	<p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Section 14.4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	Chapter 14: Flooding and Geomorphology Section 14.4 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5-17
156	156.0001	Private	Cultural Heritage	Non-Indigenous cultural heritage	The community informed ARTC about the location and significance of Maria Tibb's remains and grave but they have not been considered in the EIS.	nil.	<p>It is acknowledged that ARTC has been aware of the grave since April 2019. In October 2021, ARTC conducted initial investigations at the property with the cultural heritage team and engaged with History Pittsworth, the local historical society, regarding appropriate management measures. Chapter 19: Cultural Heritage Section 19.4 and Table 19.15 have been updated with this information, and the significance of the grave and surrounding Green Hills Hotel site has been assessed in Table 19.17 in Section 19.5. Tables 19-20 and 19-22 make a series of recommendations to manage impacts to this place, including further archaeological assessment, relocation of the grave to the Pittsworth Cemetery, and heritage interpretation. Inland Rail is committed to work with History Pittsworth and the landowner throughout this process, where possible.</p>	Chapter 19: Cultural Heritage Section 19.4 Section 19.5 Table 19-15 Table 19-20 Table 19-22
156	156.0002	Private	Groundwater	Private groundwater bore/s	Proposed 30+ metre cut will cause groundwater drawdown, likely making the submitter's bores inoperable. ARTC has not been able to answer any questions about worst case scenario impacts.	nil.	<p>The predictive groundwater modelling undertaken as part of the EIS indicates that the horizontal extent of drawdown is predicted to only extend a maximum of 10 m to 43 m horizontally from the rail centreline (i.e. from the deepest cuts) and will be wholly contained within the Project footprint (see Chapter 15: Groundwater, Section 15.6.2). This drawdown will be localised around the vicinity of the deep cuts that intersect groundwater only. No impacts to landowner bores are anticipated.</p> <p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project. This bore survey was comprehensive such that all bores with potential to be impacted could be identified. Section 15.5.4 and 15.7.4 of Chapter 15: Groundwater has been updated accordingly with groundwater users, potential make-good process and measures.</p>	Chapter 15: Groundwater Section 15.5.4 Section 15.6.2 Section 15.7.4
156	156.0003	Private	Social Impact Assessment		The project proposes to remove the rose garden built by the submitter, which contains the remains of his parents.	nil.	ARTC has assessed the location of the memorial sites and determined that the Project footprint would not impact them.	Chapter 19: Cultural Heritage
156	156.0004	Private	Social Impact Assessment	Local business and industry procurement	The submitter operates thoroughbred training on his property, which will be impacted by blasting to make the 30+ metre cut for the project. For safety reasons associated with blasting, the submitter will need to shift his thoroughbred training operations to another location and other horses will need to be agisted elsewhere at considerable expense.	nil.	<p>Blasting will be a short term activity. Individual blasts will be coordinated and managed by a specialist blasting contractor that will establish the parameters of each blast to minimise air blast and vibration emissions.</p> <p>Chapter 24: Draft Outline Environmental Management Plan has identified measures with respect to mitigation of blasting impacts including:</p> <ul style="list-style-type: none"> ➤ Vibration impacts from blasting will be assessed by the Contractor once the locations and depths of blasting and the charges to be used are confirmed. This assessment will confirm which receptors at which blasting impacts are expected to exceed the blasting vibration criteria, if any ➤ Where blasting impacts are expected to exceed the vibration limits, a range of measures are recommended where practicable, including consideration of alternative construction methods, ➤ Establishing a blasting timetable through community consultation for example, blasts times negotiated with surrounding sensitive receptors ➤ Residents, occupants and other stakeholders within 2 km radius of a blast location will be notified a minimum of three days in advance of a blast occurring. <p>During detailed design, the construction noise and vibration assessment is to be refined based on a detailed construction methodology, and specific reasonable and practicable construction noise and vibration mitigation measures will be nominated.</p>	Chapter 24: Draft Outline Environmental Management Plan
156	156.0005	Private	Traffic and Transport	Directly impacted landowner	Property access needs to be realigned because of the proposed 30+ metre deep cutting for the project. ARTC proposes to shift the access 600 m from its current location, which would be a considerable inconvenience.	The currently proposed access is unsafe and needs to be reconsidered.	<p>Impacts to private access will continue to be addressed as the design and construction planning progress. Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties (including the realignment specified within the submission). Furthermore, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties (Chapter 8: Land Use and Tenure Section 8.5.1). The agreements outlined in Table 8-51 of Chapter 8: Land Use and Tenure may include:</p> <ul style="list-style-type: none"> ➤ measures to minimise property impacts, including on agricultural operations ➤ specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible ➤ measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities ➤ required adjustments to affected structures. <p>ARTC's approach to considering level crossing options is consistent with relevant Qld and ONRSR level crossing policies. While ONRSR's policy is that no new level crossings be constructed, it recognises that where a new crossing is necessary, safety risks must be eliminated or minimised by designing new infrastructure consistent with rail safety legislation. The Qld and ONRSR level crossing policies suggest that building new level crossings should be avoided wherever possible and all other options should be explored before a new crossing is proposed as per Section 5.8 of Appendix AA: Traffic Impact Assessment.</p> <p>Alternative access, by way of a level crossing and/or access road, may be provided where the proposal would sever the existing access to a public road. This may affect private landowners, with potential effects including increased travel distances and/or changes to the movement of equipment and stock.</p>	Chapter 8: Land Use and Tenure Section 8.5.1 Table 8-51 Appendix AA: Traffic Impact Assessment Section 5.8
157	157.0001	Private	Groundwater	Private groundwater bore/s	ARTC contractor has already put down a Test Hole on Jilba, 100yards from and directly down slope from our windmill operated registered bore No.48387. ARTC has stated they will buy private water from landowners or drill their own bores for the project as required. If they equip this hole, they will pump considerably more water than our normal domestic and stock requirements from the aquifer. There is no other Test Hole known or visible along the route from this site in either direction. As you can imagine this is causing us considerable distress, our concern is that this Test Hole has been put down to drain our aquifer and degrade our bore prior to testing.	We were told that your Jilba Test Bore conveniently located 150 paces downslope from our Stock Bore would not affect our Bore. We were told ARTC would eventually test our Bore and assess its current performance then base any claim for loss on those results. Propose that an independent private company should assess our bore if necessary and also check your Test Bore through the fence to assess any draining of our aquifer. Of courses this drought does not help but the longer your process drags out the more likely it is that our bore will fail through a combination of leakage and/or short term Construction shocks or long term Vibration. Either way we consider ARTC should be held directly responsible for any changes since the date of the test bore installation.	<p>A Project bore, BH2352, is located in proximity to RN48387 and is constructed for baseline groundwater monitoring purposes only. As can be observed at the ARTC bore, there are no sheds, storage tanks or any other infrastructure that indicates the bore is extracting water.</p> <p>As part of ARTC's construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. The use of groundwater for construction water is not a preferred water source for the Project where other sources are available (i.e. recycled water). Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20). In the instance where other preferable construction water supplies are not feasible and purchasing of extracted groundwater from existing entitlements is not available, a temporary permit may be warranted during construction. Any temporary permit would only be within the allowable extraction limit for the relevant water plan. Chapter 5: Project Description, Section 5.6.24 of the revised draft EIS details the findings of the current construction water procurement process.</p> <p>A water/groundwater bore survey has been issued to landowners to confirm the location/presence of water supplies that may be impacted by the Project. Where necessary make-good measures will be developed on case-by-case basis in consultation with the landowner. Details of the proposed potential make-good measures detailed in Section 15.7.4 and Table 15-20 of Chapter 15: Groundwater of the revised draft EIS. However, the measures developed for each impacted water storage feature/bore will be unique and commensurate with the level of impact realised, therefore specific details cannot be provided at this time.</p>	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Section 15.7.4 Table 15-20 Appendix B5: Construction Water Requirements Report
157	157.0002	Private	Land Use and Tenure	Land acquisition/compensation	ARTC are cutting a diagonal route across the north/west corner of my neighbours property Jilba and this will result in a remnant parcel of land of insufficient size for Toowoomba Regional Council (TRC) to normally approve for subdivision. (Lot 3 AG3669 & Lot 3 RP124408 will have the North Western corners trimmed off. This parcel will be invisible from the Jilba homestead, and will require vehicle and water pipe access across/under the Rail Line if it remains part of Jilba. This pasture already suffers from weed infestation and neglect. Any new owner/business would need to immediately drill a bore down slope of our existing bore and thus put unwarranted pressure on the aquifer in these increasingly dry times.	We propose current landholder be compensated for loss of land and that the remnant north/west areas bordering Rosemount* be offered to us and joined into our Lot 205, after due process. ARTC saves the costs for the design/building of private vehicle access, and a water pipe route under/over the track. Future maintenance costs and fence security concerns/inspections are also saved forever. This will adhere/agree with the ARTC's Sustainability, No Harm, Reducing Ground Water Demand and Social Issues approach.	<p>This issue is noted. ARTC will continue to consult with affected landowner on mitigation measures and solutions.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.3, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis using the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of:</p> <ul style="list-style-type: none"> ➤ Landowners' needs regarding access to the properties and the closure of private roads ➤ Property infrastructure such as fences, water storages, groundwater bores and irrigation infrastructure that would be affected and need to be considered in compensation arrangements for the property ➤ The potential for changes in access to natural resources, such as groundwater and overland flow. 	Chapter 8: Land Use and Tenure Section 8.6.2 Section 8.6.3
157	157.0003	Private	Stakeholder engagement	Directly impacted landowner	Whilst ARTC have a right to make profits from the Project; they have no right to impose themselves on the existing and adjacent land owners without a fair compensation agreement. The fear of losing water access will have a detrimental impact on our ability to sustainability manage our own property. In the Project Rationale Section (p27) ARTC cite as a direct benefit 'Improved Sustainability and Amenity for the Community'.	We request an onsite visit by someone with authority to see and understand the problems and concerns we have and address them collaboratively.	<p>As detailed in Appendix E: Consultation Report, Section 5, ARTC has carried out additional engagement with landowners regarding water as part of the consultation for the revised draft EIS. ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>ARTC confirms that it held a face-to-face meeting with the submitter in October 2021 and have had a number of ongoing conversations.</p>	Appendix E: Consultation Report Section 5

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
157	157.0004	Private	Noise and Vibration	Operational vibration	We are concerned that long term Train Vibration and short term Construction shocks will affect our buildings and Stock & Domestic Bore. We were verbally advised this was no problem but no paper work has been sighted to confirm.	We request an onsite visit by someone with authority to see and understand the problems and concerns we have and address them collaboratively.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). Operational noise and vibration mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>The construction blasting assessment within the draft revised EIS, has assessed blasting and has been assessed separately to construction airborne noise and ground borne vibration (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). This is because aircraft overpressure and blasting ground borne vibration are assessed against specific blasting criteria. Blasting impacts have been assessed in accordance with DTMR's CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2.</p> <p>Ground-borne vibration from train passbys has been assessed in Section 13 of Appendix W: Noise and Vibration Assessment - Railway Operations. It has identified that any receivers with 12 metres from the alignment has potential to exceed the human comfort criteria. Further assessment of these impact is recommended during the Detailed Design stage to verify the screening assessment outcomes.</p> <p>If blasting is deemed necessary for construction, appropriately trained and licenced shot firers will be engaged to undertake the blasting activities in accordance with QLD's regulatory requirements. In addition, ARTC will provide regular updates to the local community to ensure that residents are kept informed when basting activities will be carried out. In relation to blasting activities, the following measures to mitigate blasting impacts are suggested where practicable (Section 16.10 of Chapter 16: Noise and Vibration):</p> <ul style="list-style-type: none"> ➤ Reducing the charge size by use of delays and reduced charge masses ➤ Ensuring adequate blast confinement to minimise the amount of overpressure ➤ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. ➤ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ➤ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. ➤ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 13</p> <p>Section 17</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>
157	157.0005	Private	Social Impact Assessment	Directly impacted landowner	Be difficult to continue as a Horse Agistment operation as there will be no direct observation of stock or easy access possible from "Jillba". This is important for any property used for Horse agistment. And especially critical and dangerous if moving fractious horses under the track and a train rumbles overhead	We request an onsite visit by someone with authority to see and understand the problems and concerns we have and address them collaboratively.	As outlined in Chapter 6: Stakeholder Engagement, Section 6.6, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in its detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or impacted structures as required and where relevant, agreed noise mitigation measures. ARTC has met with the submitter at their property to discuss their concerns. ARTC will continue to keep the submitter updated as the Project progresses.	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.6</p>
157	157.0006	Private	Stakeholder engagement	Local business and industry procurement	Finally should your company not consider these ideas useful , then to prevent a public relations media/shock jock campaign just buy us out for a good price and we will be happy because without water any block is worthless.	We would prefer to settle these matters in the same tone that we have had dealing with Willow, David, Andrew & Crystal, staff of your firm , however, we have no intention of sitting back and waiting only to see the Project kicked off with silver shovels and much fanfare while we are still left adversely affected not only now but into the future by the direct actions of the ARTC project.	<p>The Department of Transport and Main Roads (DTMR) is managing the property acquisition process for the Inland Rail Project in Queensland. With regard to this submission, and the severance on the adjoining property, it will be treated in line with the Acquisition of Land Act, determined and managed by the Department of Transport and Main Roads.</p> <p>ARTC notes that subsequent to this submission, it has met with the submitter to discuss the Project and property acquisition process. Meetings regarding groundwater and the ground water monitoring bore have also been offered.</p> <p>The reference design is an iterative process, and stakeholder engagement is ongoing. As noted in Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
158	158.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
158	158.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. Could impact on Millmerran town parking availability. 	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
158	158.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

158	158.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property, cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community. 158	158.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the Contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 20 Section 20.6
158	158.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.	Chapter 5: Project Description Section 5.6.4
						Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).	Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.	
						Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.		
158	158.0009	Private - Turallin Workers	Flora and Fauna	Aquatic fauna	Chance of Flora & Fauna displacement	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.	Chapter 11: Flora and Fauna Section 11.6
159	159.0001	Local Government	Approvals/ conditions/ recommend-ations		Project to be conditioned to include: 1. Financial allocation to GRC over the life of the project to engage a dedicated resource to act as an EIS Coordinator for Council and a single point of contact for the proponent. ; and 2. Reference and regard to the Master Inland Rail Development Agreement (Contract no 9000-0373) between ARTC and GRC, which sets out roles and responsibilities of the parties in dealing with project activities in order to minimise any damage to or interface with the operation and use of assets and third party utility infrastructure and ancillary works and encroachments,. These two matters represent the most significant priorities for Council and would, in Council's view, help facilitate the most beneficial outcomes for local communities, the ARTC, and GRC.	nil.	This issue is noted. Submission to be considered by The Office of the Coordinator-General.	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0002	Local Government	Project scope		Chapter 2 describes the rational for the project (including study of alternative options, benefits, planning context etc).	Adequately addresses Section 6.7 and 10.1 (e) of the Terms of Reference (TOR).	ARTC note Goondiwindi Regional Council's support of the EIS adequately addressing Section 6.7 and 10.1 (e) of the Terms of Reference.	N/A
159	159.0003	Local Government	Approvals/ conditions/ recommend-ations		Chapter 3 describes legislation, policies and plans required for the construction of the project	Adequately addresses TOR, legislation and policies up to date.	This issue is noted. Chapter 3: Legislation and Project Approvals Process has been updated to meet the Coordinator-General Terms of Compliance (Appendix A2: Terms of Reference - Cross Reference Table).	Chapter 3: Legislation and Project Approvals Process Appendix A2: Terms of Reference Cross Reference Table
159	159.0004	Local Government	Project scope		Chapter 6 provides summary of sustainability consideration in relation to design, construction and operation of the Inland Rail B2G.	Adequate sustainability considerations are in place.	ARTC notes the acknowledgement that adequate sustainability considerations are in place as per Chapter 6: Stakeholder Engagement of the revised draft EIS.	Chapter 6: Stakeholder Engagement
159	159.0005	Local Government	Land Use and Tenure	Land acquisition/com-pensation	The Proponent proposes to manage the impact through assessment on an individual case-by-case basis in consultation with landowners.	This case-by-case approach can be divisive in the community without a consistent and transparent approach. While there may be no practical alternative approach it is proposed that development of clear guidelines and fact sheets be undertaken for the community to understand the approach.	<p>As identified within the Social Impact Management Plan (refer to Appendix X: Social Impact Assessment, Section 8.2.2, Table 8.7), an engagement mechanism for the remainder of the EIS stage is to: Provide communications collateral (website updates and fact sheet) and opportunities for engagement (community information sessions, Council briefings and CCC meetings) to encourage access to the draft EIS and community participation in the public submission process. Consultation with directly affected landowners and the community will continue through the Detailed Design stage.</p> <p>The approach is further detailed in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.6.2, for clarity:</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p>	Chapter 8: Land Use and Tenure Section 8.6.2 Appendix X: Social Impact Assessment Section 8.2.2 Table 8.7
159	159.0006	Local Government	Land Use and Tenure	Mitigation measures	The Project interfaces with the State stock route network, which consists of stock routes and reserves, in 11 locations. In each instance, the reference design has been developed to provide continued connectivity along each stock route.	The use of stock routes in the traditional sense may be intermittent and in some cases many years apart due to climate impacts. The continuity of stock routes for the traversing of stock should be addressed through community consideration as well as with the controlling authority.	<p>The Project fencing strategy is described in Chapter 5: Project Description, Section 5.4.12. Section 5.4.12 Pest exclusion fencing states that there are three types of barrier fences that are identified in the <i>Biosecurity Act 2014</i> (Qld) for the management of pest animals. These are the wild dog barrier fence, wild dog check fence and the rabbit proof fence. The Project intersects the wild dog check fence and the rabbit proof fence. The wild dog check fence and rabbit-proof fence will need to be reinstated as shown in Table 5-19 Fencing Strategy by chainage and land use</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.1 (Alterations to barrier fences) reports that ARTC have commenced consultation with the Goondiwindi Regional Council (GRC) to determine fencing requirements and solutions for reinstatement of the wild dog check fence. Consultation has also commenced with the Darling Downs–Moreton Rabbit Board (DDMRB) to determine fencing requirements for replacement of the rabbit proof fence. Refer to Appendix E: Consultation Report. Detailed design drawings of ARTC's nominated fencing solution for reinstatement of these fences will be submitted to GRC and DDMRB for acceptance prior to construction works commencing. Where severance of a biosecurity fence is required, it is anticipated that fence realignment and reconstruction will be undertaken as an Early Works package prior to the construction of rail infrastructure commencing.</p> <p>Chapter 8: Land Use and Tenure, Table 8-51 includes a commitment for further consultation with DAF and local governments and relevant stakeholders for the realignment or reinstatement of barrier fencing where the Project interfaces or severs fencing in accordance with Section S91(3) of the <i>Biosecurity Act 2014</i>. Further detail for barrier fencing is outlined in Chapter 5: Project Description Section 5.4.12 and Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p>	Chapter 5: Project Description Section 5.4.12 Table 5.19 Chapter 8: Land Use and Tenure Section 8.6.1 Table 8-51 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix B2: Stock Routes Figures 1 - 26 Appendix E: Consultation Report Section 4.1.5 Table E-12
159	159.0007	Local Government	Land Use and Tenure	Infrastructure crossings/ interaction	The Project interfaces with the State stock route network, which consists of stock routes and reserves, in 11 locations. In each instance, the reference design has been developed to provide continued connectivity along each stock route.	The use of stock routes in the traditional sense may be intermittent and in some cases many years apart due to climate impacts. The continuity of stock routes for the traversing of stock should be addressed through community consideration as well as with the controlling authority.	<p>Chapter 8: Land Use and Tenure, Section 8.4.1 (Alterations to stock routes) states that the Project interfaces with the State stock route network, which consists of stock routes and reserves, in 11 locations. In each instance, the reference design has been developed to provide continued connectivity along each stock route. The stock route interface treatments that have been included in the reference design are summarised in Chapter 8: Land Use and Tenure, Section 8.5.1 (Table 8-35). ARTC will continue to consult with DoR, GRC and TRC through the detailed design process to ensure that the proposed stock route interface treatments are suitable for future useability purposes.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.1 (Alterations to stock routes) reports that consultation has taken place between ARTC, DoR, and GRC with respect to redesign and management of stock routes following the construction of the Project. Refer to Appendix E: Consultation Report. Where the existing stock route crossings are impacted by the Project, at-grade, then level crossings will be provided. All level crossings will be designed to meet the current Australian, ARTC and road managers standards. Design features include, minimum 7.3 m stock crossing width, compliant sighting distances, crossing panels, warning signage, fencing and gates across the road approaches, but not across the tracks. Where the alignment is proposing to run linearly through an existing stock route, allowances have been made to widen the remaining route appropriately to ensure a corridor that is fit for the purpose of transport livestock.</p> <p>The revised reference design for the Project has endeavoured to maintain the integrity (connectivity and functionality) of the stock route network. In circumstances where the Project has the potential to impact on existing stock routes, ARTC has consulted with DoR, GRC and TRC to identify potential solutions for the treatment of rail and stock route interfaces. Outcomes of the several engagements have been summarised in Appendix E: Consultation Report and Appendix B2: Stock Routes.</p> <p>In the event that private stock routes are identified through consultation with landowners, a means of continued stock movement connectivity will be included in the detailed design. Where disruption to private stock movements may occur during construction, appropriate temporary connectivity solutions will be agreed in advance with the relevant landowner (Chapter 8: Land Use and Tenure, Section 8.6.1).</p>	Chapter 8: Land Use and Tenure Section 8.4.1 Section 8.5.1 Section 8.6.1 Table 8-35 Appendix B2: Stock Routes Figures 1 - 26 Appendix E: Consultation Report Section 5.5.3
159	159.0008	Local Government	Land Use and Tenure	Mitigation measures	The Project will result in the severance of driveways and informal private access roads to individual properties. ARTC will continue to consult with potentially impacted landowners through the detailed design and construction planning process to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of: Landowners needs regarding access to the properties and the closure of private roads Property infrastructure such as fences, water storages, groundwater bores and irrigation infrastructure that would be affected and need to be considered in compensation arrangements for the property The potential for changes in access to natural resources, such as groundwater and overland flow. Comment: Goondiwindi Regional Council (GRC) is concerned that the solutions offered by ARTC may not provide satisfactory outcomes. GRC propose that EIS conditions should provide adequate support to property owners in negotiating reasonable solutions without cost imposition.	As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will typically be provided according to ARTC fencing procedure, Boundary Fencing ETM-17-02 (available on the ARTC Extranet: extranet.artc.com.au). Where superior fencing is required (for example where tracks are in close proximity to roads and/or communities, or where trespass is anticipated to occur) a 1.8 m chain link boundary fence may be provided. Where existing property fencing is constructed to a different functional standard than proposed by the EIS requirement, fencing should be replaced in a like for like standard. For example, where properties are currently fenced with exclusion fencing or fencing specific to a stock type such as sheep, replacement fencing needs to meet the same specification.	<p>As identified within the Social Impact Management Plan (refer to Appendix X: Social Impact Assessment, Section 8.2.2, Table 8.7), an engagement mechanism for the remainder of the EIS stage is to: Provide communications collateral (website updates and fact sheet) and opportunities for engagement (community information sessions, Council briefings and CCC meetings) to encourage access to the draft EIS and community participation in the public submission process. Consultation with directly affected landowners and the community will continue through the Detailed Design stage.</p> <p>The approach is further detailed in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.6.2, for clarity:</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p>	Chapter 8: Land Use and Tenure Section 8.6.2 Appendix X: Social Impact Assessment Section 8.2.2 Table 8.7
159	159.0009	Local Government	Land Use and Tenure		As the Project has been declared a coordinated Project, the provisions of local government planning schemes do not apply and therefore assessment of the Projects consistency with the planning schemes is not required. The temporary footprint allows for a minimum 5 m footprint beyond the permanent footprint for site fencing and temporary drainage structures, erosion and sediment control, movement of plant and utilities connections. The temporary footprint provides for the roadworks associated with the construction of the railway, permanent realignments and new roads. Where existing land use and tenure arrangement or potential impacts have been discussed, these are presented in the context of the permanent footprint, the temporary footprint or the Project footprint (both of the previous footprints combined).	GRC is concerned from this statement in regards to works associated with the project beyond the combined permanent and temporary project footprint that are not be subject to planning scheme requirements under the declared project arrangements. Land dealings such as reconfiguration of lots and other land use such as temporary camps beyond the footprint should be subject to planning scheme requirements which will control the impact and outcomes. In particular, severance of lots should take into account GRC planning scheme requirements. This issue must be made clear for the negotiating authority on land resumption.	<p>Land use and zoning, as identified under the relevant local government planning schemes, is discussed in Chapter 8: Land Use and Tenure, Section 8.4.1. Section 8.5.1 discusses in detail, potential impacts between potential impacts to land uses and the proposed rail infrastructure. Section 8.5.4 also presents a compliance impact assessment and considered the consistency of the Project with the Goondiwindi Regional Planning Scheme 2018. The strategic framework, zones, and overlays have been explored to provide a local understanding of the area and assessment of the Project's compatibility with the local government's plans and vision for the region</p> <p>As discussed in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.3.3, the approvals to build and operate non-resident workforce accommodation facilities will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing. The locations of the two non-resident workforce accommodation facilities (in Yelarbon and Inglewood) have been identified and have been contained to rural land uses. The proposed locations are detailed in Table 8-44, Chapter 8: Land Use and Tenure.</p> <p>As stated in Chapter 5: Project Description, Section 5.6.4, the location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation facilities will be undertaken during detailed design.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6 states, it is acknowledged that the construction of the Project alignment will cause lot severance, and result in a reconfiguration of existing property boundaries. Discussion regarding works beyond the Project footprint are further detailed in Appendix AD: Borrow pits and Appendix AE: Whetstone Material Distribution Centre.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.3.3 Section 3.4.5 Chapter 5: Project Description Section 5.6.4 Chapter 8: Land Use and Tenure Section 8.4.1 Section 8.5.1 Section 8.5.4 Section 8.6 Table 8-44 Appendix AD: Borrow Pits: Technical Supporting Information Appendix AE: Whetstone Material Distribution Centre: Technical Supporting Information
159	159.0010	Local Government	Land Resources	Overland flow/diversion	The rail alignment crosses multiple soil conservation plans that may or may not be active. The approach is to modify and revegetate.	The disruption to existing soil conservation plans, whether they are active or in suspended state, will require detail review for local catchment runoff given the possible impact to road assets. Any change to the overland flow paths will require consultation with GRC should the change impact the road network.	<p>Where available, SCPs have been reviewed as part of the reference design and cross drainage aligned to ensure consistency within hydraulic modelling (refer to Chapter 14: Flooding and Geomorphology, Section 14.6.3 and Section 14.9.1).</p> <p>ARTC has liaised with the Department of Resources on requirements around existing SCPs with mitigation measures to be developed by a suitably qualified Certified Professional Soil Scientist.</p> <p>Detailed design will involve a review of all available Soil Conservation Plans (SCPs) (including all those listed in Chapter 9: Land Resources, Section 9.4.4), and engagement with affected stakeholders. SCPs have been reviewed and incorporation in drainage design for the revised draft EIS reference design.</p> <p>ARTC will review and consider these within the Detailed Design stage of cross drainage infrastructure. Ongoing consultation with impacted landowners and the Department of Resources will occur to further align cross drainage design with existing conditions (refer to Section 6.7 of Chapter 6: Stakeholder Engagement).</p> <p>Representative drawings of cross drainage infrastructure are provided in Appendix B1: Design Drawings.</p>	Chapter 6: Stakeholder Engagement Section 6.7 Chapter 9: Land Resources Section 9.4.4 Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.9.1 Appendix B1: Design Drawings

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0011	Local Government	Waste and Resource Management	Spoil management	The construction of the alignment will aim for balanced cut and fill however it is noted that the project will create a spoil requirement. The mitigation approach is to minimise the volume of spoil and reuse spoil.	Given the soil types along the alignment, there is a very high chance of the need to dispose of spoil. The Proponent proposes that the Spoil Management Strategy will be used to manage the spoil. Changes in ground height may trigger an Operational Works Development Application. Alternatively, if there is no formal mechanism for spoil control, GRC should be consulted if the stormwater flow paths have been changed. The draft EIS should be conditioned to include GRC in the review of the Spoil Management Strategy implementation.	<p>As per Chapter 22: Waste and Resource Management, Section 22.6, mitigation measures pertaining to waste management have been developed for the Project in accordance with relevant legislative requirements, aligning with the 2018 National Waste Policy and the <i>Waste Reduction and Recycling Act 2011</i> (Qld) hierarchy.</p> <p>As per Chapter 22: Waste and Resource Management, Section 22.5.2 Generation of waste materials, unsuitable material will be reused within the Project footprint through treatment, amelioration or drying where practicable. Offsite reuse options may also be considered, subject to:</p> <ul style="list-style-type: none"> Compliance with relevant legislation and policy framework Demonstration of the material as clean Written agreement with the receiver. <p>Material that cannot be treated for appropriate reuse may be disposed offsite; however, offsite disposal to landfill will only occur as a last resort, if the material is considered unsuitable for other uses (e.g. due to geotechnical or contamination reasons).</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides overarching principles to guide the storage, treatment, reuse or disposal of material generated during construction of the Project and will be finalised prior to commencement of construction, in consultation with Toowoomba Regional Council, Goondiwindi Regional Council and other relevant stakeholders.</p>	Chapter 22: Waste and Resource Management Section 22.5.2 Section 22.6 Appendix AB: Earthworks Strategy and Draft Soil Management Plan
159	159.0012	Local Government	Landscape and Visual Amenity		The assessment of the impact to the township of Yelarbon (Viewpoint 2) is considered to have moderate sensitivity. The project will remove existing rest area from use during construction then reinstate. The construction of the Cunningham Highway on the western side of town has been identified as a high magnitude of change.	<p>The impact to the township of Yelarbon will be considerable as the rest area is used on a daily basis. While it is noted that it is of a temporary impact, the time taken to establish a similar visual aspect could be a number of years. Consideration should be given to undertake a fast-tracked approach to establish an ascetic background. A decision on the level of treatment to the embankment should ensure the town community has an input into the visual treatment of the large embankment. The draft EIS should include local community involvement in the redevelopment of the Yelarbon rest area. The GRC is also concerned on the visual impact that may have on the effectiveness of Council's tourism strategy. In particular the grain silos provide attractive backdrops for rural scenic values. The overall impact of the project on the tourist visitation is a concern and should be addressed in the EIS.</p>	<p>The fieldwork for the revised draft EIS took place from 2018-2022. During initial site visits in 2018 the GrainCorp silos at Yelarbon were not part of the artwork trail and no viewing area was present. At this time, a viewpoint was taken in the direction of the silos from the corner of the Cunningham Highway and Wyemo Street, however, was not included in the assessment as the number of permanent visual receptors in the vicinity of Viewpoint 3 (the selected viewpoint) was considered to be much higher.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 3: Yelarbon rest area has been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>An additional site visit was undertaken in October 2021, to assess the potential impact of views from the GrainCorp silo artwork viewing area (which had not been constructed at the time of undertaking the initial field investigation). As a result, an additional viewpoint assessment (Viewpoint 4) has been included within Appendix K: Landscape and Visual Impact Assessment, Section 8.2.4 and Section 9.1.4. This viewpoint assessment includes a visualisation showing the potential impact of noise walls and other Project infrastructure in this location. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p> <p>ARTC is investigating the design for the noise walls to determine whether satisfactory noise mitigation can be achieved without obscuring views to the silos. If views to the Yelarbon silos were affected by noise walls, ARTC would facilitate provision of mitigation measures e.g. a complementary mural on the noise wall, in consultation with the Yelarbon community and the Goondiwindi Regional Council.</p>	Appendix K: Landscape and Visual Impact Assessment Section 8.2.4 Section 9.1.4
159	159.0013	Local Government	Flora and Fauna		Chapter 10 identifies ecological values within the impact assessment area, assess the potential impacts and identify mitigation measures.	<p>Clearing will directly impact:</p> <ul style="list-style-type: none"> populations of threatened flora (Homopholis belsonii, Digitaria porrecta and Picis barbarorum) several of concern and endangered regional ecosystems Potential Threatened Ecological Communities (TECs) in the project area were not mapped during field surveys. The proposed Construction Environmental Management Plan (CEMP) will include measures for weed surveillance and treatment during construction and rehabilitation activities, reducing the potential impacts from biosecurity risks to adjoining land and agricultural properties. The Proponent should ensure these programs are sufficient at reducing weed incursions across the project area, in particular on access roads adjoining the rail corridor. A Biosecurity Management Sub Plan will be developed as a component of the CEMP. As weeds are common, it is suggested that the Proponent has input from land holders on weeds that will impact farming etc. Direct impact of wildlife though vehicle strikes etc., due to increased traffic and road construction: The EIS has recommended fauna fencing to mitigate this, potential for further mitigation measures (e.g., reduction of speed limits and fauna signs to be implemented). Fauna fencing details will be developed during the detail design phase. The Proponent should clarify type of fencing, location and ensure impact to residents is minimised, appropriate consultation required. The project alignment intersects the wild dog check fence (which GRC maintains) at four (4) locations. The EIS has stated the fence will be reinstated on the northwest side of the rail corridor in accordance with the design solution agreed with GRC through the detail design process. Communication between the Proponent and GRC will be required to achieve appropriate mitigation measures. Where the Project crosses the Darling Downs Moreton Rabbit Board (DDMRB) fence at chainage Ch 120.2 km, the fence will be reinstated and a rabbit trap will be established in accordance with the design solution developed in consultation with DDMRB through the detail design process. The EIS has stated that a complaint hotline for the Project will be established and advertised to enable members of the public to notify ARTC of issues, including concerns regarding weeds and pests. Translocation of specimens to be undertaken where appropriate for a species and where there is documented record of previous translocation. Trials/schemes, Phytophthora cinnamomic and Austropuccinia psidii have been identified as potential pathogens on site, therefore a potential for works to spread other pathogens. The draft EIS should ensure any concerns for pathogen spread is addressed by the Proponent. The EIS has stated that a Project Offset Plan will be developed in order to provide for the staged delivery of offsets ahead of relevant clearing work and the location of these areas need to be identified. Draft EIS conditions should include a requirement for GRC to be engaged in both the Biosecurity Management Sub Plan and Project Offset Plan. Issues relative to pests and weeds that are raised in the complaint hotline should also be referred to GRC for its data base and future monitoring. 	<p>A detailed assessment on potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. In addition, displacement of threatened flora and fauna by invasion of weeds, pathogens and pest species is discussed.</p> <p>Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project alignment. These are outlined in Chapter 11: Flora and Fauna, with a detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction, Construction Works and Operations stages. These measures include the development of a Biosecurity Management Plan to be developed as a component of the CEMP for the Project that would address impacts from weeds, pests and pathogens. In addition the auditing, monitoring and reporting requirements for the Project are also detailed.</p> <p>The CEMP, which is further detailed in Chapter 24: Draft Outline Environmental Management Plan, establishes the procedures, timeframes, measurable performance objectives, responsibilities for monitoring the success of rehabilitation and/or reinstatement/stabilisation areas and proposed corrective actions if the outcomes of rehabilitation and/or reinstatement/stabilisation are not achieved.</p> <p>Chapter 24: Draft Outline Environmental Management Plan states that a Biosecurity Management Plan will be developed as a component of the CEMP to provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens. It will also include weed surveillance and treatment during construction and rehabilitation activities such as:</p> <ul style="list-style-type: none"> Vehicle and plant washdown requirements for fleet moving from low-risk areas to high-risk areas Weed certification requirements for vehicles, plant and materials arriving onto the construction site. <p>A fauna movement provision and fencing strategy has also been prepared for the Project (see Appendix P: Fauna Connectivity Strategy) which identifies the location of proposed fauna crossing opportunities for species such as Koala. This strategy also considers the interaction of the Project with existing fencing including the Wild Dog Check Fence.</p>	Chapter 11: Flora and Fauna Chapter 24: Draft Outline Environmental Management Plan Appendix P: Fauna Connectivity Strategy
159	159.0014	Local Government	Approvals/ conditions/ recommendations	Aquatic fauna	Chapter 11 provides an assessment of the impacts on the environmental values of air and subsequent impacts on sensitive receptors.	Sensitive receptors were identified via a desktop review of aerial imagery and no site verification was undertaken. The Proponent is to conduct field verification of this. There is potential to implement constant monitoring of rainwater tanks to measure the impacts of dust deposition on nearby residences. The Proponent should ensure stockpiles are located at an appropriate distance from any residences. The draft EIS should be reviewed in order to address these issues above.	<p>A review of satellite imagery was completed to determine sensitive receptor locations along the Project corridor. This included visual identification of structures that could potentially be residential dwellings within a 1 km distance of the alignment (Chapter 12: Air Quality, Section 12.32). It is possible that some of these structures identified would not be residential dwellings and instead be unoccupied buildings such as sheds or farm buildings. As all identified sensitive receptors (residential dwellings or otherwise) have been included within the air quality impact assessment, based on this conservative approach, ground truthing of identified sensitive receptors is not required.</p> <p>In addition to assessing impacts on air quality at households, the assessment also investigated potential impacts to tank water quality during the operation of the Project (Section 12.33 and Section 12.52 of Chapter 12: Air Quality). This assessment was completed by predicting the deposition of pollutants on the rooves of residential dwellings within the study area. The concentration of pollutants in a residential water tank was then estimated assuming that all deposited matter was washed from a roof into a water tank. This assessment showed that tank water quality impacts from the Project would be negligible with pollutant concentrations well below the concentrations prescribed by the Australian Drinking Water Guidelines (National Health and Medical Research Council and National Resource Management Ministerial Council). Therefore, no treatment or mitigation measures, such as first flush systems or constant water quality monitoring, are required for rainwater tanks.</p>	Chapter 12: Air Quality Section 12.32 Section 12.52
159	159.0015	Local Government	Surface Water	Monitoring	Chapter 11 provides an assessment of the impacts of the proposed project of surface water resources and water quality.	The Proponent should provide a plan for monitoring surface water quality during construction and operation phases. This monitoring plan should be included in the draft EIS.	<p>The locations, frequency and parameters of interest for water quality sampling during construction will be subject to confirmation as part of the CEMP. The frequency and location of surface water sampling during construction of the Project will be established with consideration for:</p> <ul style="list-style-type: none"> Construction activities with potential to impact water quality Seasonality Sensitivity of receiving watercourse. <p>Water quality monitoring requirements will be developed in consultation with DRDMW and DES, to be reviewed and accepted by the Environmental Monitor. This is documented in Section 13.6.3 of Chapter 13: Surface Water and Section 24.9.6 of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Mitigation measures and procedures during the Operations stage of the Project in response to spills will be implemented in accordance with the hazardous material management Plan in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>ARTC does not foresee a need for regular water quality monitoring during operation of the Project, once the landform has stabilised after rehabilitation works. However, water quality monitoring may be conducted as part of the response to spills or other discharge events e.g. train derailment)</p>	Chapter 13: Surface Water Section 13.6.3 Chapter 24: Draft Outline Environmental Management Plan
159	159.0016	Local Government	Surface Water	Construction water supply	ARTC recognises water sourcing and availability is critical to supporting the construction program for the Project. Sources of construction water will be finalised as the construction approach is refined during the detail design phase of the Project (post-EIS). Through this process, detailed water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.	Recent experiences of high frequency of longer drought periods is a concern for water security of urban water supply. Water security is a high priority for GRC and therefore so is the use of water for construction purposes. The possibility of an exemption for the Proponent to use water is a concern as there may be no ability for the Council to object to this accessing of water within the source of the urban supply and its catchments. The conditions of approval must acknowledge GRC concerns and ensure the security of the urban water supplies are not compromised.	<p>ARTC recognises water sourcing and availability is critical to supporting the construction program for the Project. Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply become unavailable.</p> <p>Appendix S: Surface Water Quality Technical Report, Section 1.4.55 states:</p> <p>*ARTC recognises that water sourcing and availability is critical to supporting the construction program for the Project. Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan, developed in consultation with local and state government representatives, as well as potential water suppliers. Further detail regarding water sources for the Project is outlined in Appendix B5: Construction Water Requirements. *</p> <p>An assessment of the suitability of each source will need to be made for each construction activity requiring water, based on the following considerations as outlined in Section 1.4.56 of Appendix S: Surface Water Technical Report:</p> <ul style="list-style-type: none"> Available volume from identified source Legal access Volumetric requirement for the activity Water quality requirement for the activity Source location relative to the location of need. 	Appendix B5: Construction Water Requirements Report Appendix S: Surface Water Quality Technical Report Section 1.4.55 Section 1.4.56

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0017	Local Government	Groundwater		Chapter 13 addresses the potential impacts of the project on groundwater resources.	Impacts of groundwater have been considered; however, the Proponent should ensure the following is addressed in the draft EIS: Updated bore reports should be obtained prior to construction to ensure no new bores are impacted; Groundwater quality may be affected by spills and leaks from heavy machinery, drill rigs; Ensure a Groundwater Management and Monitoring Program (GMMMP) and Hazardous Materials Management Sub-Plan are followed.	Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 to 15.4.4). Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset. The baseline water quality dataset, in addition to regular groundwater quality monitoring, will allow for trend analysis and the early detection of possible water quality changes, such as mixing of water types resulting from dewatering. Contamination to groundwater is considered to be at most risk during construction of the Project. Identified risks include possible machinery fuel and oils spills and leaks (Chapter 15: Groundwater, Table 15-17). The Construction Environmental Management Plan (CEMP) will include measures to prevent pollution of groundwater from construction of the Project (Chapter 15: Groundwater, Table 15-20). Relevant examples of commitments from ARTC include: <ul style="list-style-type: none"> ▶ Vehicle and plant - regular maintenance will be undertaken in suitably bunded hardstand areas ▶ Chemical and dangerous goods storage areas will be located in appropriately designed facilities, such as bunded areas, sealed or lined surfaces, hardstand areas, or storage within containers. Storage of chemicals, oils, fluids and other hazardous substances will be in accordance with the appropriate safety data sheets and relevant Australian Standards. ▶ Imported fill material will be clean, certified contaminant free and be required to comply with regulatory guidelines for the intended use. ▶ Appropriate quantities and types of rapid spill/leak clean-up spill kits will be maintained onsite Potential contamination to groundwater during the Operations stage can occur as a result of standard operations and maintenance of the railroad, e.g. refuelling, rail grinding (Chapter 15: Groundwater, Section 15.6.4). The groundwater management and monitoring program (GMMMP) has been updated as part of the revised draft EIS in Chapter 15: Groundwater Section 15.7.3 and Appendix U: Groundwater Technical Report, Section 8.3.Chapter 24: Draft Outline Environmental Management Plan presents an indicative outline for the Environmental Management Plan (EMP) and includes a waste management subplan. The Draft Outline EMP is considered to be adopted for the CEMP.	Chapter 15: Groundwater Section 15.4.2 Section 15.4.4 Section 15.6.4 Section 15.7.4 Table 15-17 Table 15-20 Chapter 24: Draft Outline Environmental Management Plan Appendix U: Groundwater Technical Report Section 8.3
159	159.0018	Local Government	Noise and Vibration	Operational rail noise	Provides an assessment of the potential noise and vibration impacts of the project and subsequent impacts on sensitive receptors.	GRC has overall concerns about the operational noise and vibration impacts on the individual properties along the rail line and expects the Proponent will provide specific mitigation to these properties. It is requested that the EIS conditions assist the property owners in the negotiations with the Proponent in achieving a satisfactory outcome. GRC has specific concerns with the noise and vibration within the township of Yelarbon. Mitigation should address the social impacts of the additional and accumulated noise of the road and rail adjacent to the town. To monitor the effectiveness of the mitigation GRC, requests permanent noise monitoring to be installed and remotely monitored so that the community can raise substantiated concerns of breach of the conditions by the operations of the project The Proponent should identify where controlled blasting will follow the results of the geotechnical report.	The revised draft EIS has been updated to address potential impacts from operational noise and vibration to sensitive receptors along the Border to Gowrie alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations). Appendix W: Noise and Vibration Assessment - Railway operations, Section 17, and Chapter 16: Noise and Vibration, Section 16.10 of the revised draft EIS provide specific noise mitigation measures proposed to control noise at residences. These measures include physical mitigation (noise barriers) and property upgrades to existing residences. Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. Compliance noise and vibration monitoring will be undertaken within 6 months of Project opening to ensure that mitigation measures are adequate (refer to Section 16.10 of Chapter 16: Noise and Vibration). If the results of monitoring indicate additional exceedances of the operational noise and vibration criteria, then additional reasonable and practicable mitigation will be implemented in consultation with affected property owners.	Chapter 16: Noise and Vibration Section 16.6 Section 16.10 Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17 Section 17.4
159	159.0019	Local Government	Social Impact Assessment		Chapter 17 describes the results of the Social Impact Assessment (SIA), which under the Project's Terms of Reference (TOR), must assess the type, level and significance of the Project's social impacts (both negative and positive) throughout the Project's lifecycle.	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	ARTC welcomes the opportunity for continued engagement and cooperation with Goondiwindi Regional Council. ARTC partnered with Goondiwindi Regional Council to support a "Local Employment Roadmap" which aims to attract skilled workers to the region. Appendix X: Social Impact Assessment, Section 8.3.2 has been updated in this regard.	Appendix X: Social Impact Assessment Section 8.3.2
159	159.0020	Local Government	Social Impact Assessment	Aquatic fauna	The SIMP notes that there is a role for Council in SIMP implementation and monitoring including: <ul style="list-style-type: none"> ▶ Involvement in development of the Community Wellbeing Plan and draft Accommodation Management Plan ▶ Cooperation in joint initiatives with ARTC ▶ Provision of six-monthly feedback during construction on: <ul style="list-style-type: none"> ▶ Results of initiatives to offset impacts on amenity, character and cohesion Project use of housing short term accommodation ▶ Local procurement outcomes ▶ Review of annual SIMP reports ▶ Participation in annual SIMP reviews ▶ Participation in independent review of the SIMP at the end of Year 1, prior to commissioning and during Year 3 operations. Additionally, the draft EIS points to the comprehensive 'Engagement' Strategy that will be undertaken: <ul style="list-style-type: none"> ▶ Pre-approval ▶ Post approval ▶ During operations and supported by a: <ul style="list-style-type: none"> a. Community Reference Groups b. Community Liaison Officers c. Community Relations Monitor; and d. Complaints and Feedback Procedure 	Specific engagement initiatives with GRC are outlined in Table 15.21 and are comprehensive. Whilst the Proponent's engagement schedule with Council is positive, it points to a resourcing issue for GRC. As such, it is requested that the project be conditioned to provide a financial allocation to GRC over the life of the project to engage a dedicated resource to act as an EIS Coordinator on behalf of Council and a single point of contact for the Proponent.	ARTC acknowledges the time and commitment invested by GRC councillors and staff in responding to issues associated with the project. ARTC is unable to fund a dedicated resources on behalf of Council, but will continue its engagement with Council to the agreed schedule.	N/A
159	159.0021	Local Government	Social Impact Assessment	Workforce accommodation village	Temporary non-resident workforce accommodation locations are proposed in the vicinity of Millmerran (Turallin), Inglewood and Yelarbon, accommodating up to 300 workers at peak, with potential impacts on demand for health services and concerns about community safety, resulting from large numbers of non-local personnel being around small communities and homes.	The draft EIS highlights that GRC's preference is for non-resident workforce accommodation to be located at Inglewood and Goondiwindi, with the latter being the preferred location to Yelarbon. Despite Council's preference, the draft EIS states that it is not possible to locate a facility at Goondiwindi due to travel time and issues associated with fatigue management. The draft EIS describes that the workforce accommodation will be self-contained and supported by ancillary infrastructure. Notwithstanding these infrastructure provisions, there is still the potential that the workforce accommodations will have impacts (both material and marginal) on GRC infrastructure and services. It is requested that the supporting infrastructure associated with the workforce accommodation also include and give consideration to: Design requirements and building materials of structures Landscaping and aesthetics requirements Boundary fencing Lighting Emergency services arrangements, such as fire Internal road standards Waste disposal – use of council waste and transfer facilities Road frontage and intersection standards with the local road network Signage Transportation provisions to and from the site Liquor licensing Removal of structures and rehabilitation of the site	The Accommodation Management Plan (AMP) to be prepared by the Project will address Council's submission. Revised draft EIS Appendix X: Social Impact Assessment, Section 8.4.4 has been updated with more detail regarding the AMP scope. Appendix X: Social Impact Assessment, Section 8.4.4 provides that the Contractor will consult GRC, TRC, DHPW, Queensland Health and QPS regarding the scope and management measures to be provided in the AMP. Further community engagement regarding the Project's accommodation strategies will be undertaken in 2023, including identification of business or employment opportunities relating to the accommodation facilities and identify specific issues to be addressed as part of the AMP. Appendix X: Social Impact Assessment, Section 8.4.4 has been revised to reflect Council's submission regarding mitigation of impacts on GRC infrastructure and services.	Appendix X: Social Impact Assessment Section 8.4.4
159	159.0022	Local Government	Social Impact Assessment	Indigenous cultural heritage	Characteristics of local communities that may be affected by the project.	Characteristics of local communities that may be affected by the project. Comment: No discussion of who the identified Aboriginal Parties are, how many Indigenous people live in the community, or any of the conditions that they live under. This should be addressed in the draft EIS	Revised draft EIS Appendix X: Social Impact Assessment, Section 7.1.1 includes a detailed description of Traditional Owner interests in the SIA study area. The aforementioned description has been added to Chapter 17: Social, Section 17.4. Appendix X: Social Impact Assessment, Section 5.2.3 describes Indigenous populations in potentially impacted communities, and Appendix X: Social Impact Assessment, Section 5.7.5 describes Indigenous health.	Chapter 17: Social Section 17.4 Appendix X: Social Impact Assessment Section 5.2.3 Section 5.7.5 Section 7.1.1
159	159.0023	Local Government	Social Impact Assessment	Indigenous cultural heritage	A summary of Indigenous communities.	This should be included in with the previous headings. It is unclear which Traditional Owners belong to which localities. This should be addressed in the draft EIS.	Revised draft EIS Appendix X: Social Impact Assessment, Section 7.1.1 includes a detailed description of Traditional Owner interests in the SIA study area. The aforementioned description has been added to Chapter 17: Social, Section 17.4. Appendix X: Social Impact Assessment, Section 5.2.3 describes Indigenous populations in potentially impacted communities, and Appendix X: Social Impact Assessment, Section 5.7.5 describes Indigenous health. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0024	Local Government	Social Impact Assessment		An Economic Impact Assessment (EIA) has been prepared to identify the potential economic impacts of the proposed Inland Rail – Border to Gowrie Project on the local and regional area as well as the State. It does this through undertaking an: <ul style="list-style-type: none"> ➤ Evaluation of the Existing Economic Environment ➤ Economic Benefits Assessment ➤ Regional Impact Analysis ➤ Local Economic Impact Assessment; and ➤ Cumulative Impact Assessment 	Whilst the results of the economic benefits assessment are positive, the draft EIS also highlights that the project will cause disruption to the agriculture and tourism industries by reducing the productive capacity of some farms and reducing tourist numbers to the region due to changes in amenity, connectivity and access to local landscape attractions. These disruptions combined with the consequences of land acquisitions may affect property values and local incomes, which has the potential to affect GRC's own source revenues. At the same time, it is likely that GRC's budget allocation for infrastructure projects may be impacted as a result of work associated with road and level crossing infrastructure upgrades/augmentation. Whilst the project offers significant regional and state level economic benefits, impacts on GRC's financial sustainability should be considered in light of potential loss of own source revenues coupled with impact due to road and level crossing infrastructure upgrades.	ARTC will continue to cooperate with GRC to find satisfactory solutions which address changes affecting the agricultural and tourism industries.	N/A
159	159.0025	Local Government	Cultural Heritage	Baseline/backgroud sampling	Informed by relevant Indigenous and non-Indigenous values or conditions, informed by desktop research and field investigations.	Table 17.12 Why was the search area for 1 km for Indigenous values and only 50 m for non-Indigenous values? The draft EIS should include a wider search area in consultation with GRC and local communities.	As outlined in Chapter 19: Cultural Heritage, Section 19.3, locations of potential heritage interest have been identified within a 1 km radius of the Project footprint for both Indigenous and non-Indigenous (historical) heritage. Impacts have then been assessed for historical heritage places within 50 m of the Project footprint. This 50 m radius allows for potential direct and indirect impacts to heritage places to be considered. Impact assessment for Indigenous heritage places is being managed under the Cultural Heritage Management Plan.	Chapter 19: Cultural Heritage Section 19.3
159	159.0026	Local Government	Cultural Heritage	Aquatic fauna	Potential impacts that may occur to heritage places or sites as a consequence of Project activities.	Section 17.6.1 Unsure of impacts that have been identified due to only specifying within the Cultural Heritage Management Plan (CHMP) and not listing in this document. Table 17.18 Poor word choice for heading significance perhaps should be register. Those listed as none may not have been assessed and this needs to be specified. Section 17.6.2.2 There are only two (2) categories direct OR indirect impacts. There should be a third, being direct AND indirect impacts. These above sections should be reviewed in the draft EIS.	Cultural Heritage Management Plans are confidential documents and cannot be made publicly available. The identification of Indigenous cultural heritage and assessment of potential impacts is occurring in consultation with the relevant Aboriginal Parties and in accordance with the approved CHMPs for the Project which forms the basis for tangible and intangible Indigenous heritage considerations. The approved CHMPs for the Project are confidential and do not allow details on their content to be disclosed without following due consideration to the relevant Aboriginal Parties. The broad activity types defined in the ACH Act Duty of Care Guidelines provides general guidance on the potential for harm to be caused to Aboriginal cultural heritage. The Duty of Care Guidelines recognise that it is unlikely that Indigenous cultural heritage will be harmed where: <ul style="list-style-type: none"> ➤ The proposed activity is on an area previously subject to significant ground disturbance and the activity will impact only on the area subject to the previous disturbance; or ➤ The impact of the proposed activity is unlikely to cause any additional harm to Indigenous cultural heritage than that which has already occurred. Section 19.5 1 of Chapter 19: Cultural Heritage provides detail on the process of the identification of Indigenous cultural heritage and assessment of potential impacts in consultation with the relevant Aboriginal Parties and in accordance with the approved CHMPs for the Project. The approved CHMPs for the Project are currently confidential and sensitive in nature and therefore, pursuant to the Aboriginal Cultural Heritage Act 2003, no further details on their content can be provided in the revised draft EIS. Details regarding consultation with relevant Aboriginal Parties are provided in Section 19.3.5 of Chapter 19: Cultural Heritage and Appendix E: Consultation Report. In regards to-Table 19-15), the Table lists the assessed significance of sites, not entry within a heritage register, and hence the heading is appropriate. Those sites listed as 'none' have been assessed as part of the EIS (Table 19-14) and found to be of no significance. In regards to classification of impacts, most heritage places that are directly impacted will also be indirectly impacted to some extent. The direct impact will cause the greatest magnitude of change, and so is the most relevant type of impact for the assessment. However, mitigations are provided for both direct and indirect impacts as relevant (see Table 19-22 of Chapter 19: Cultural Heritage).	Chapter 19: Cultural Heritage Section 19.3.5 Section 19.45.1 Table 19-14 Table 19-15 Table 19-22 Appendix E: Consultation Report
159	159.0027	Local Government	Cultural Heritage	Aquatic fauna	Cultural heritage Conclusions	Should the CHMP cover maintenance of the existing rail corridor? The assertion that the assessment of the Indigenous heritage values and impacts has been undertaken by a team of appropriately qualified heritage specialists and has used a combination of register searches, historical and archival research to identify areas of high cultural heritage potential within 1 km of the Project is overstated, as some searches were only conducted within 50 m of the project. This should be reviewed in the draft EIS.	Scope of Cultural Heritage Management Plan clarified in Chapter 19: Cultural Heritage, Section 19.1. As outlined in Chapter 19: Cultural Heritage, Section 19.3, locations of potential heritage interest have been identified within a 1 km radius of the Project footprint for both Indigenous and non-Indigenous (historical) heritage. Impacts have then been assessed for historical heritage places within 50 m of the Project footprint. This 50 m radius allows for potential direct and indirect impacts to heritage places to be considered.	Chapter 19: Cultural Heritage Section 19.1 Section 19.3
159	159.0028	Local Government	Traffic and Transport		The Guideline to Traffic Impact Assessment (GTIA) has been used as a point of reference for the traffic and transport assessment, as it relates to roads and intersections affected by the construction and operation of the Project. GTIA provides information about the processes involved to assess road impacts triggered by a proposed development. While it is not mandatory, the GTIA provides a basis for the assessment of road impacts and has been adopted for the preliminary assessment on traffic and pavement impacts by the Project.	The use of the Guideline to Traffic Impact Assessment focuses on the impacts of level of service in terms of road volume capacity rather than structural capacity and consumption of useful life of pavement, with an increased number of Equivalent Standard Axles (ESA's). A local government local road impact assessment should be based on an asset management approach, rather than a just a service volume approach. Therefore, an additional method of assessment other than just traffic volume impacts on local government roads is required. It is suggested that in the circumstance of low volume unsealed roads, the use of Dilapidation Reports, which involves before and after pavement assessment, be undertaken in order to assess damage, required repairs and compensation paid where necessary. This option does not preclude an initial pavement strengthening where necessary as identified by Council, however, condition of the road network utilised during rail construction of the B2G Section will require monitoring and rectification at no cost to Council. Regardless of the work undertaken on roads, the Proponent should be required to repair damage associated with construction activity prior to commissioning or pay compensation to GRC to rectify the damage. Clearly, there would be a requirement for an independent assessor and arbitrator for determination of the outcome from the Dilapidation Report. The Master Inland Rail Development Agreement (MIRDA) has been drafted to address Council assets that will be impacted by the project. The draft EIS should acknowledge the MIRDA and the EIS conditioned in order to ensure that contract arrangements will address the impacts to assets.	Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts and highlighting mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. As a result, ARTC is in ongoing discussions with the submitter and Road Manager, Goondwindi Regional Council (GRC), on pavement impact and road maintenance arrangements. Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.	Appendix AA: Traffic Impact Assessment Section 5.6
159	159.0029	Local Government	Traffic and Transport		It is worth noting that the determination of the final construction and heavy vehicle (HV) routes will be subject to consultation between DTMR, the local government authority and the Principal Contractor during the next phase of the Project and may involve the construction of temporary work and/or amendments to the permanent road network.	Deferral of the final construction detail to construction phase exposes local government to an assessment process to determine a solution, without the support of legal processes to manage the impact to community infrastructure. The Proponent controls the contractual outcomes for the project through the specification of deliverables. For contract and asset management certainty, both the contractor and GRC would require the outcome to be defined prior to the tender process. The cost impact to GRC to undertake these assessments should not be borne by the local community. The MIRDA process and outcomes should be acknowledged in the draft EIS as the mechanism to address impacts on construction routes.	Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are assidered. The relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan, Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority. For further detail see Section 5.7 of Appendix AA: Traffic Impact Assessment. Requirements for roads upgrades to be finalised during Detailed Design stage as well as updating during the Construction Works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2 of Appendix AA: Traffic Impact Assessment. Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include: <ul style="list-style-type: none"> ➤ ARTC will draft and finalise a Road Use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ➤ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ➤ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	Appendix AA: Traffic Impact Assessment Section 5.2 Section 5.7 Section 6.2
159	159.0030	Local Government	Traffic and Transport		It is expected that the number of vehicle movements during operation of the Project will be very low relative to overall regional traffic volumes.	It should be noted that the life of the project is undefined and therefore there may be future impacts such as natural disaster recovery works and major replacement works over the life of the asset. The Proponent has understated potential impacts of the operational phase of the proposal. Therefore, it may not be accurate in dismissing operational impact. This issue should be reviewed in order to acknowledge future impacts that may be outside the control of the Proponent; however, the cost of operational impact should not be borne by the local community. The draft EIS and its proposed approval conditions should acknowledge possible future asset impacts over the entire life of the project.	Disaster recovery will be carried out in accordance with ARTC's Emergency Management Procedure (RLS-PR-004) which provides a work procedure for managing recovery from, and investigation of, emergencies requiring a significant and co-ordinated response on the ARTC Network. This procedure's objective is to ensure that ARTC and Rail Operators have established an integrated strategy for the response to the management of rail emergencies on the ARTC Network. This procedure includes the development of Incident Management Plans to address incidents such as; derailment and collision, fire and life safety, bomb threat, equipment, rollingstock or infrastructure failure, environmental issues, dangerous goods spill and natural disasters. The plans take into consideration; provision of resources, response in remote or difficult access locations, interfaces with other organisations and interfaces with relevant State DISPLAN related to incident management. With regard to the impact of recovery works on traffic and transport, specifically regarding the number of vehicles: Section 4.1 of Appendix AA: Traffic Impact Assessment discusses the development traffic within the Operations stage of the project. It is anticipated that the ongoing operation and maintenance of the Project will require a workforce of approximately 10 to 15 FTE. The operational workforce will be based at provisioning centres outside the immediate vicinity of the Project. It is assumed that minimal new trips will be generated as existing trips would be accounted for and the dispersed nature of these trips across the road network would have a minimal impact on road network operational performance. Therefore, a detailed analysis was not considered necessary as part of Appendix AA: Traffic Impact Assessment. During the Operations stage of the Project, it is anticipated that occasional access to and from the corridor will be required to conduct routine inspection and maintenance works. The existing road network will be used by maintenance crews to travel to the rail corridor, the RMAR incorporated into the design of the Project will be used in preference to the existing road network for Project maintenance activities. These activities are likely to be infrequent and the related traffic volumes are likely to be minimal with no envisaged impact to operational conditions of the surrounding road network. These traffic volumes are envisaged not to exceed 5 per cent of base conditions. Therefore, a detailed analysis was not considered necessary as part of Appendix AA: Traffic Impact Assessment.	Appendix AA: Traffic Impact Assessment Section 4.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0031	Local Government	Traffic and Transport	Level crossing	The ONRSR has undertaken a detailed audit of the reference design for the Project against the Rail Safety National Law (Queensland) Act 2017 (Qld) and the intent of the ONRSR Policy: Level Crossings (ONRSR, 2019a). This audit concluded that the reference design complies with the Rail Safety National Law and that the design minimises safety risks SFARIP. The Proponent has conducted, and will continue to undertake, consultation with DTMR and local governments in relation to the preferred road rail interface treatments for each location.	ARTC has identified that Kildonan Road and Millmerran Inglewood Road should have active level crossings installed, rather than an anticipated grade separation. It is noted that Millmerran Inglewood road is crossed three times and two of these crossings are grade separated. The crossing at reference point 31024-P-2 is an active crossing. GRC is not in agreement with this proposal and considers that consistency should reflect the State Government's Queensland Level Crossing Safety Strategy, Transport and Main Roads, July 2012 which has a key action Seek alternatives to the building of new level crossings. GRC requires the draft EIS to acknowledge that these two (2) roads interfaces, as a minimum, be Grade separated in accordance with the above State Government strategy. GRC requests alternative design consideration be given to reducing the three crossings of Millmerran Inglewood Road to a single crossing.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none">▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019)▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides the Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none">▶ Fewest farms affected mid-block▶ Fewest farm operations/dwellings within 200 metres of alignment▶ No direct impacts to feedlots▶ Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringallily State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none">▶ Restriction of access▶ Loss of flora and fauna▶ Changes to bushfire management▶ Weeds and pests▶ Changes to drainage and minimising sediment and erosion▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Appendix BT
159	159.0032	Local Government	Traffic and Transport		In consultation through the development of the reference design, DTMR requested that separation distances be sufficient to allow for storage of two 42.5 m A-triple vehicles. As discussed above, assessment of the existing road network indicates that 42.5 m A-triple vehicles do not use roads in proximity to the Project alignment; therefore, ARTC has retained a minimum separation distance of 49.5 m for the purpose of the reference design.	The issue of short stacking on local government roads should, to some degree, reflect the requirements of that of DTMR. While there is currently little demand on some of the GRC roads, future development of properties should not be restricted by the Proponent's proposed solution. Once the physical locations of alignment road and rail relative to each other are determined and constructed there is potentially no opportunity to rectify the situation into the future. The type of development on many of these roads will rely upon the use of productivity improvements in the heavy vehicle industry. Therefore, provision of short stacking should be further considered regarding its impact on local government roads. Without a definitive assessment, it is proposed that the short stacking distance in the draft EIS be the same as adopted for the DTMR network to avoid any restrictions of possible property developments into the future.	<p>The revised reference design has been developed to prevent short stacking issues with the Project's alignment. Short stacking occurs when a long vehicle does not have enough space to completely clear a rail crossing and stops while part of the vehicle is still within the rail corridor. Short stacking issues have been avoided through development of the revised reference design by maintaining a minimum separation distance between the outer rail of the Project alignment and the centreline of the nearest parallel road, in accordance with Section 5.4 of AS 1742.7:2016 and with the Manual of Uniform Traffic Control Devices Part 7: Railway Crossings (DTMR, 2019b).</p> <p>Short stacking will continue to be assessed during design development. Where short stacking is not considered sufficient, the safety assessment in Section 5.2 of Appendix AA: Traffic Impact Assessment has recommended the designs be revisited during the Detailed Design stage. Design drawings showing available clearances can be provided to all road managers to demonstrate compliance with relevant standards, at the appropriate design review milestone.</p> <p>Through the greenfield sections of the Project the design caters for future provision of oversized vehicles such as the PBS2B (42m) vehicle. All brownfield corridors have a minimum of 36.5 m short stacking for formed public roads (not including stock route road reserves).</p> <p>Further consultation with DTMR, GRC, TRC and the local community will confirm the location and preferred treatment for each road–rail interface. The consultation strategy for the Project is described in Appendix E: Consultation Report of the revised draft EIS.</p>	Appendix AA: Traffic Impact Assessment Section 5.2 Appendix E: Consultation Report
159	159.0033	Local Government	Traffic and Transport		Although there is a change in the operational LOS for the above-mentioned roads, the expected operational LOS B and LOS C are considered acceptable given the short duration of the construction activities. The operational performance of each road would be expected to return to base conditions after construction is complete; therefore, based on the LOS comparison, it is expected that the Project would not generate the need to upgrade the road network for such a short duration of impact. Comment: The use of a level of service (LOS) methodology on low traffic rural roads with	The use of a level of service (LOS) methodology on low traffic rural roads with narrow and non-structural pavements does not predict the need to upgrade specific roads which will be used by heavy vehicles. Damage to the pavement may be substantial, particularly if the traffic movement coincided with wet weather. It is very likely that this circumstance may result in a one pass failure of the road pavement. The MIRDA is the mechanism to manage impacts to low traffic rural roads through the dilapidation assessment process.	<p>The Level of Service (LOS) is a measure of the functionality of the road segment and does not take into consideration damage to the road. The metric is used to determine whether an upgrade to the road is required due to a failure to accommodate the volume of traffic that will use the road with a reasonable to delay to vehicles. In this case the road segments remain within acceptable limits of delay for road vehicles.</p> <p>With regard to pavement damage Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts and highlighting mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. As a result, ARTC is in ongoing discussions with the submitter and Road Manager, Goondiwindi Regional Council (GRC), on pavement impact and road maintenance arrangements. The agreed arrangements to deal with impacted pavements as a result of construction will be agreed between GRC and ARTC.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user facilities.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	Appendix AA: Traffic Impact Assessment Section 5.6
159	159.0034	Local Government	Traffic and Transport		These upgrades are required only temporarily for construction traffic; therefore, discussions will be required with DTMR and local governments during the detail design phase to determine the permanence of such upgrades. Given the short duration of construction-related traffic, traffic management strategies may be introduced as an alternative to more permanent treatments in order to mitigate construction related traffic impacts at intersections.	GRC will require input to the projects traffic management strategies on an ongoing basis. Many of the intersections on the GRC road network that connect to the DTMR network have not been constructed to a standard that could accommodate the traffic type intended, however, the TMR/local government protocol for road management responsibility identifies the extent of intersection managed by DTMR as being to the tangent point on a local government road. GRC propose that the draft EIS should note the controlling authority on intersections and traffic management strategies; however, any damage to intersections should be rectified in accordance with the MIRDA principles.	<p>Appendix AA: Traffic Impact Assessment, Section 5.4 and Section 5.5 discuss mitigation measures and make the commitment to ongoing discussion with both DTMR and local council depending on the governing road authority. However, prior to any mitigation measures being applied, it is recommended that the intersection delay and turn warrant assessments be revisited during the Detailed Design and Pre-Construction Activities and Early Works stages, when the contractors' construction program and construction routes are finalised. The agreed arrangements to manage the impacted infrastructure as a result of agreements between GRC and ARTC.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC commits that these mitigation measures will be further discussed and agreed with the relevant road authorities in an agreement with GRC. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user facilities.</p>	Appendix AA: Traffic Impact Assessment Section 5.4 Section 5.5
159	159.0035	Local Government	Traffic and Transport		An increase in the total vehicle and heavy vehicle movements on the existing road network has the potential to result in the accelerated degradation of the trafficable surface.	Pavement assessment was limited to state-controlled roads. Local government road network has narrow low strength pavements and are more likely to have adverse pavement impacts and should be mitigated. Depending on weather impacts it is possible to sustain a one pass pavement failure. Therefore, the local government road pavement impact should be addressed as well as state controlled roads. Dilapidation reporting mechanisms should be considered in order to assess the before and after impact to pavements in order to assess damage and the compensation to rectify that damage. Should the Proponent elect to contract the damage liability to the Principal Contractor, GRC will be exposed to the risk of negotiation therefore, GRC consider that the Proponent should be held ultimately responsible for the damage. As stated previously, an arbitration process is necessary in order to resolve disputes with the Proponent on resolution of these issues. The MIRDA mechanism should be acknowledged in the draft EIS as the process to undertake mitigation of traffic impacts.	<p>Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts and highlighting mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. In the case of DTMR roads where marginal cost data was able to be provided, a further assessment of contributions was completed. In the case of Goondiwindi Regional Council (GRC) road, where suitable marginal data to assess required contributions could not be provided, ARTC is instead in ongoing discussions with the Road Manager, GRC, on pavement impact and road maintenance arrangements. The agreed arrangements to deal with impacted pavements as a result of agreements between GRC and ARTC.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC commits that these mitigation measures will be further discussed and agreed with the relevant road authorities and include as part of third party agreements. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user facilities.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	Appendix AA: Traffic Impact Assessment Section 5.6
159	159.0036	Local Government	Traffic and Transport		The increase in construction traffic, particularly heavy vehicle traffic, has the potential to impact the journey time and safety of school bus routes.	The draft EIS has not identified the impact to the student bus transfers at the Yelarbon rest area. As it is proposed the rest area be utilised for a laydown area this issue will require a mitigation solution in the EIS.	<p>Section 5.10.4 of the Appendix AA: Traffic Impact Assessment discusses the impacts on school bus services. The potential impacts to school bus services due to the upgrade of existing, or introduction of new road-rail intersection for the Project are discussed in Table 5.114.</p> <p>Most significantly, it is no longer proposed to use the Yelarbon rest area as a laydown area for Project construction activities, therefore mitigating the impacts associated with student bus transfers at this location. ARTC also commits to maintaining existing bus stops during the Project construction. Where these require alteration, this will be agreed with the relevant service provider. The school bus routes identified in Appendix AA: Traffic Impact Assessment Table 5.114 and the bus stops and pedestrian access to these stops must be maintained during construction of the development. Accordingly, if any temporary bus stop and pedestrian access arrangements or alternative bus routes are required when construction routes are finalised, the contractor must reach agreement on suitable arrangements with the DTMR TransLink Division (bus_stops@translink.com.au or on 3851 8700) and/or bus operator (whichever is relevant) prior to any construction or works commencing.</p>	Appendix AA: Traffic Impact Assessment Section 5.10.4 Table 5.114
159	159.0037	Local Government	Traffic and Transport		Some of the proposed construction routes are aligned through areas of moderate-to-high pedestrian activity through the areas surrounding the towns of Yelarbon, Inglewood, Millmerran, Brookstead, Pittsworth and Toowoomba. Significant increases in heavy vehicle movements through these locations may adversely impact pedestrian movements; however, most of these routes are currently facilitating a high proportion of heavy vehicle movements (refer Table 18.27). Therefore, the addition of construction traffic to these routes is unlikely to result in a significant increase in risk to pedestrians	The construction activity and resulting heavy vehicle movements in and around Yelarbon is significant in comparison to the current level of heavy vehicle movements. The use of the rest area as a laydown area and the construction of the high embankment for the grade separated crossing and the modification to the levee will require additional bulk haulage. The EIS should identify mitigation measures to avoid the impacts to pedestrians in the Township of Yelarbon. Similarly, reference designs do not provide a solution for a pedestrian crossing of the alignment within Yelarbon and GRC requests the Proponent be conditioned to provide a compliant solution for a pedestrian crossing within Yelarbon.	<p>In response to consultation, it is no longer proposed to use the Yelarbon rest area as a laydown area for Project construction activities. As addressed in Appendix AA: Traffic Impact Assessment, Section 2.16, it is acknowledged that a number of the proposed construction routes currently traverse through areas of moderate to high pedestrian activity through Toowoomba, Millmerran, Inglewood and Yelarbon. The roads in these areas already currently facilitate a high proportion of HV movements. The pathway network for Goondiwindi Region has been provided by GRC for the purpose of the Project. This pathway network is adjacent to roads used by construction routes through Yelarbon and Inglewood, in the following locations:</p> <ul style="list-style-type: none">▶ Cunningham Highway through Yelarbon, between Wyemo Street and Wondalli Street▶ Gore Highway through Inglewood, between Macintyre Brook and Inglewood Multipurpose Health Service▶ Elizabeth Street through Inglewood, between Gore Highway and Great Road Street <p>Importantly, as outlined in Appendix AA: Traffic Impact Assessment, Section 5.2, construction traffic on routes with significant cyclist or pedestrian activity will be restricted to only essential movements during peak active transport periods. Further measures may include measures such as signage or protection on construction routes with a high proportion of cyclists or pedestrians, employing contractor driver briefings on safe driving to avoid active transport users and community notifications. Once a construction contractor is appointed, construction routes and vehicle numbers are finalised, specific measures to mitigate impacts to active transport users will be required to be developed for the construction routes on a case-by-case basis. This is to minimise construction vehicles through areas of higher pedestrian or cyclists' activity, such as schools or town centres, in peak periods will reduce the impact and potential safety issues.</p> <p>With regard to pedestrian facilities, a dedicated active pedestrian level crossing has been added at the existing Cunningham Highway interface location (310-11-E-1) to enable pedestrian movement north/south of the Yelarbon township. ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities. Consultation will continue with local councils regarding pedestrian crossing options during detailed design.</p>	Appendix AA: Traffic Impact Assessment Section 2.16 Section 5.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0039	Local Government	Traffic and Transport		During construction and operation, response times for emergency services may be delayed if they encounter significant roadworks or passing trains at level crossings. ARTC will work with the relevant emergency services agencies (e.g. Queensland Fire and Emergency Service (QFES), Queensland Ambulance Service (QAS) and Queensland Police Service (QPS)) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required.	The closure of a road either temporarily or permanently is a high risk for emergency response. Consideration should be given to utilising both Council and TMR road closure internet systems for notifications such as the QLD Traffic App. The draft EIS should include road authorities in the road closure arrangements with emergency services.	<p>An assessment of potential delays to road traffic at level crossing was undertaken as detailed in EIS Appendix AA: Traffic Impact Assessment, Section 5.8 and 5.9. The modelling undertaken within this assessment provides an accurate representation of the impacts to vehicles, using traffic vehicle numbers and the calculated wait times for specific level crossings.</p> <p>All active level crossings have been analysed in the peak periods, accounting for the individually calculated wait times, in order to determine queue lengths and resultant impacts to traffic. Table 5.69 in Appendix AA: Traffic Impact Assessment provides the individual wait times for the level crossing locations along the alignment. The wait times determined for each individual level crossing were calculated based on;</p> <ul style="list-style-type: none"> ▶ Level crossing specific operating speeds (up to maximum design speed of 115 km/hr). The operating speed is impacted by topography and curvature of the alignment ▶ Time taken for the train to cross the level crossing ▶ Distance from train crossing loops and hence time taken for the train to accelerate from standstill. ▶ Train length ▶ Boom gate and signal operating times <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed. ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution and any road closures either permanently or temporarily. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Appendix AA: Traffic Impact Assessment Section 5.8 Section 5.9
159	159.0040	Local Government	Traffic and Transport		<p>Grade-separated crossings of existing roads have been adopted instead of level crossings, where possible. The specific design treatment at each road-rail interface has been selected based on a combination of factors, which include:</p> <ul style="list-style-type: none"> ▶ Topography ▶ Road classification ▶ Rail geometry ▶ Road geometry ▶ Community and stakeholder feedback through consultation 	GRC consider the rail road interface at Kildonan Road and Millmerran Inglewood Road should provide grade separation as per the above mitigation measure. These roads are considered to be highest order components of the road network within the Goondiwindi Region. Given the expectation of the community that the road network should be fit for future purpose upon completion of works, the grade separated outcome should be provided as part of this project. The draft EIS should have a clear mechanism for assessment of the road rail interface and require grade separation at interfaces on Kildonan Road and Millmerran Inglewood Road.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments. The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>Regarding the level crossing at Millmerran Inglewood Road:</p> <p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewest farms affected mid-block ▶ Fewest farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringally State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Appendix AA: Traffic Impact Assessment Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to affect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR and local council as detailed design progresses regarding the proposed level crossing design solution.</p> <p>Regarding the level crossing at Kildonan Road:</p> <ul style="list-style-type: none"> ▶ Appendix AA: Traffic Impact Assessment, Section 3.7.7 discusses the reference design reviews and updates at the proposed Kildonan Road at grade active level crossing. ARTC have worked closely with GRC as part of the design process, particularly regarding inputs into the assessment. GRC provided their own traffic count information which formed the baseline of the assessment. From a future proofing perspective, ARTC use 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by council and factor in the known developments in this area. ▶ The traffic and transport assessment showed that even if Kildonan Road peak hourly volumes were doubled, it would remain as a LOS A (see definition in Section 5.5.1). This is also a reflection of the relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. ▶ ARTC, in collaboration with GRC, explored other design options for Kildonan Road including grade separation. This location did not meet the automatic grade separation criteria detailed in the Public Level Crossing Treatment Methodology (provided in Appendix BT), including topography-based criteria, nor any other metrics triggering an automatic grade separation. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope, as the cost to grade separate is grossly disproportionate to the benefits. ▶ The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the AS1742.7-2016. All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. ▶ ARTC will continue to work collaboratively with GRC as detailed design progresses regarding the proposed level crossing design solution. 	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 3.7.7 Section 5.5.1 Section 5.8 Section 5.9 Appendix BT
159	159.0041	Local Government	Traffic and Transport	Road safety	A Traffic Management Sub-plan will be prepared prior to the commencement of construction, as a component of the CEMP, as a joint effort between the Principal Contractor, ARTC, DTMR, QR, local governments and an accredited road safety auditor once preferred construction routes are confirmed.	GRC notes that the Principal Contractor will be a party to the Traffic Management Sub Plan and while this is appropriate, the heads of agreement in delivering the project should remain between ARTC and GRC. The MIRDA has a mechanism for transferring local government requirements to the principal contractor and the draft EIS should acknowledge this process.	<p>Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts and highlights mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. In the case of DTMR roads where marginal cost data was able to be provided, a further assessment of contributions was completed. In the case of Goondiwindi Regional Council (GRC) road, where suitable marginal data to assess required contributions could not be provided, ARTC is instead in ongoing discussions with the Road Manager, GRC, on pavement impact and road maintenance arrangements. The agreed arrangements to deal with impacted pavements as a result of construction will be contained within agreements between GRC and ARTC.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC commits that these mitigation measures will be further discussed and agreed with the relevant road authorities and include as part of the road manager agreements. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user facilities.</p> <p>Further, Appendix AA: Traffic Impact Assessment Section 5.12.3 details ARTC commitments to a Construction Environmental Management Plan and Traffic Management Plan. A CEMP will be prepared prior to construction commencing by the construction contractor. The CEMP will include a TMP, attached as an Appendix to the CEMP. The TMP will reflect the finalised TIA, undertaken once a construction contractor has been appointed and construction routes are finalised. It will be developed in consultation with DTMR, the relevant LGA, Department of Education, affected stakeholders and an accredited road safety auditor. The plan will also take into account communications received and will be aligned with the Construction Community and Stakeholder Management Plan. The TMP will identify the impacts that construction traffic is likely to have on the transport infrastructure and detail ameliorative measures required to mitigate all identified impacts of the Project. This may include potential temporary or permanent intersection works. The TMP will detail measures to:</p> <ul style="list-style-type: none"> ▶ Safely manage traffic when undertaking works in the road reserve ▶ Minimise traffic delays resulting from the development/construction ▶ Manage construction vehicles entering and exiting the site ▶ Maintain satisfactory property access ▶ Minimise disruption to adjacent properties ▶ Minimise disturbance to the environment ▶ Meet the requirements of legislation and codes of practice regarding traffic management ▶ Cater for special events <p>Finally, ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services and school services) through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	Appendix AA: Traffic Impact Assessment Section 5.6 Section 5.12.3
159	159.0042	Local Government	Traffic and Transport	Construction traffic	Identify secondary, alternative construction routes, in the event of the primary route is blocked off by an emergency/accident.	Any use of alternative construction routes should be agreed with GRC prior to the Traffic Management Sub Plan being agreed to and duration of use of the alternative to be limited. The same conditions should apply to alternative routes as to the agreed construction routes. The draft EIS should reference consultation with local government on possible alternative routes in order to avoid an emergency situation where the alternative route may not be suitable under specific circumstances.	<p>Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	Appendix AA: Traffic Impact Assessment Section 6.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0043	Local Government	Traffic and Transport		A Road Use Management Plan (RUMP) will be prepared for the Project in accordance with the GTIA to support works to the existing road network (refer Figure 18.5). The purpose of developing the RUMP for the Project will be to: Identify, where required, appropriate traffic and transport management strategies for the use of the State-controlled roads and local government roads for each of the construction stages of the Project Minimise the impact on the efficiency of road networks	As commented above the GTIA does not have relevance to lower order local government roads. The preparation of a RUMP is supported, provided there is a relevant mechanism to reflect on impacts to local government roads. While the RUMP will assist in mitigation of road impacts, GRC has concerns with the geometrical design of the State controlled road on the approaches to Yelarbon. The horizontal alignment on the eastern approach results in a frequent truck roll over crashes. Constructing the same arrangements on the western approach potentially creates the same issue. While this is a matter for the Department of Transport and Main Roads, Council is concerned for the safety of the local community and the impact on the local Emergency Services. The draft EIS should acknowledge the integration of the RUMP with the MIRDA.	<p>Whilst it is acknowledged that the submission references the non-applicability of the GTIA to lower order council roads it is key to note that every road section, intersection, road-rail interface and access used for construction routes has been analysed for functionality (Appendix AA: Traffic Impact Assessment Section 5.3, 5.4, 5.5, 5.8, 5.9), for safety impacts (Appendix AA: Traffic Impact Assessment Section 5.2, 5.3, 5.4, 5.8, 5.9) and for road damage (Appendix AA: Traffic Impact Assessment Section 5.6, 5.7), with mitigation measures provided in each case. With specific regard to safety, on each road section, the road horizontal and vertical alignment has been checked against governing requirements and sight distance checks, crash analysis, queuing analysis, turn warrant assessments, and site visits have been completed.</p> <p>As mentioned in the submission, in Appendix AA: Traffic Impact Assessment, Section 6.2, ARTC has committed to:</p> <ul style="list-style-type: none"> ▶ Draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ Consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. <p>With specific regard to the safety of the eastern approach on the Cunningham Highway entry into Yelarbon, there are no recorded crashes, or any record of truck roll over crashes on this Section of road. All road design arrangements have been designed in accordance with relevant road design guidelines and standards (Austroads, DTMR, Australian Standards) where required.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2</p> <p>Section 5.3</p> <p>Section 5.4</p> <p>Section 5.5</p> <p>Section 5.6</p> <p>Section 5.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Section 6.2</p>
159	159.0044	Local Government	Traffic and Transport		For sealed local government roads, a condition assessment will be conducted (e.g. National Association of Australian State Road Authorities (roughness count) prior and post construction activities, as well as at annual intervals during construction For unsealed local government roads, a visual condition will be conducted (either manual or vehicle mounted high speed condition survey) prior to and post construction activities. The scope for pavement assessments of unsealed local government roads will be agreed with relevant local governments before construction commences. The scope and frequency of pavement condition assessments that are to be required during the construction period will be documented in the RUMP.	This mitigation measure supports the failure of the GTIA process and to reflect the need for management of impacts to lower order local government roads. GRC supports the approach, provided there is an arbitration process should a dispute occur over both the damage incurred and the level of compensation. This mitigation measure is referenced in the MIRDA and therefore the draft EIS should acknowledge the process.	<p>The Level of Service (LOS) is a measure of the functionality of the road segment and does not take into consideration damage to the road. The metric is used to determine whether an upgrade to the road is required due to a failure to accommodate the volume of traffic that will use the road with a reasonable to delay to vehicles. In this case the road segments remain within acceptable limits of delay for road vehicles.</p> <p>With regard to pavement damage Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts highlights mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. As a result, ARTC is in ongoing discussions with the submitter and Road Manager, Goondiwindi Regional Council (GRC), on pavement impact and road maintenance arrangements. The agreed arrangements to deal with impacted pavements as a result of construction will be within the agreement between GRC and ARTC.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC commits that these mitigation measures will be further discussed and agreed with the relevant road authorities and include as part of agreements. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user facilities.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.6</p>
159	159.0045	Local Government	Traffic and Transport		Construction works cannot commence within a State-controlled road corridor without written approval from DTMR. This will be required to be obtained through consultation with DTMR during the detail design phase of the Project.	This requirement should also apply to local government roads. GRC has a permit system that will apply to works within a road reservation. The draft EIS should acknowledge the same requirement for local government approval processes.	<p>The revised draft EIS has incorporated additional wording for local government roads in Appendix AA: Traffic Impact Assessment Table 5.11 and 5.52. The amended wording now reads:</p> <p>"Construction works cannot commence within a SCR corridor without written approval from DTMR, or within a Local-government road corridor without necessary approvals from the relevant local council. These will be required to be obtained through consultation with DTMR and the relevant local councils during the Detailed Design stage of the Project. "</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Table 5.11</p> <p>Table 5.52</p>
159	159.0046	Local Government	Traffic and Transport		There is potential for construction traffic for both projects to use roads on the Queensland side of the Macintyre River (e.g. Kildonan Road, Wondall-Kurumbul Road).	The material supply to both the NS2B and B2G will have an environmental impact. The material supply to the B2G will be supplied by the same supplier in Goondiwindi, then adverse impacts to the road network should be considered based on the cumulative impact from the overall inland rail project and not two (2) single projects. Therefore, it is likely that the Proponent should pay compensation to GRC for asset life impacts of the road network. The MIRDA includes the NS2B Section that is located in Queensland, however, material supply into New South Wales for the balance of this NS2B Section will have a cumulative impact in terms of road asset consumption. This issue should be addressed in the draft EIS.	<p>The revised draft EIS Appendix AA: Traffic Impact Assessment Section 5.11, address cumulative impacts, including the cross over between multiple Inland Rail packages. To enable stakeholders to make informed decisions, consideration has been given to the potential impacts of other major projects in the area to ensure that the combined impacts of the Project are accounted for. It is a requirement of the ToR for this Project that the potential for cumulative impacts be considered. Projects with spatial and/or temporal overlap can result in cumulative impacts. A quantitative cumulative impact assessment has been undertaken considering the complete Inland Rail construction from North Star to Border to Kagaru to Acacia Ridge/Bromelton. The study area considers the overlap of other Inland Rail packages with the proposed the Project construction routes across the complete construction timeframe over the 6 packages.</p> <p>Key assessments influenced by volumes have been reassessed as part of the cumulative impact assessment, including the:</p> <ul style="list-style-type: none"> ▶ Road safety assessment ▶ Intersection assessment ▶ Road link capacity assessment ▶ Pavement assessment. <p>For the safety, intersection, and road link capacity assessments, analysis was undertaken where peak hour volumes experienced a change. All road links and intersections with no volume change are considered to be assessed in the 'Project only' assessment covered in the previous sections of the Appendix AA: Traffic Impact Assessment. This was considered appropriate as without a change in peak hour volumes between 'Project only' and the cumulative assessment, the intersections and road links impacts are considered identical.</p> <p>Regarding the overlap on GRC roads between the Border to Gowrie construction routes and North Star to NSW/QLD border construction routes:</p> <p>There is no longer any overlap between the construction routes of the two packages. If, in the Detailed Design stage, the construction routes change from either of the two projects such there is a cumulative impact on the road network of any governing authority then all assessments on those roads will be recompleted with cumulative volumes.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC commits that these mitigation measures will be further discussed and agreed with the relevant road authorities. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user facilities.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.11</p>
159	159.0047	Local Government	Traffic and Transport	Level crossing	Grade separated crossings of existing roads have been adopted instead of level crossings, where feasible. The specific design treatment at each road-rail interface has been selected based on a combination of factors, which include: Topography Road classification Rail geometry Road geometry Community and stakeholder feedback through consultation.	The statement noting where feasible is not accurate. Grade separation crossings are physically feasible in some cases however, the Proponent has elected to provide level crossings based clearly on project economics almost entirely. The draft EIS should acknowledge this issue of road and rail interfaces in order to clearly state the Proponent's intention on grade separation, grade crossings and their potential risk.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>For more information, please also refer to IR Level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Appendix BT</p>
159	159.0048	Local Government	Hazard and Risk	Flood immunity	Modification of the existing Yelarbon levee may be the preferred design solution to avoid worsening of hydrological conditions in the Yelarbon area. If this solution is confirmed as preferred through detail design, the design requirements for modifying the existing Yelarbon levee will be confirmed through further consultation with GRC. It is anticipated that the modified levee would be considered a Category 2 levee (Schedule 10 of the Water Regulation 2016), and a waterway barrier, requiring a development approval under the Planning Act 2016 (Qld).	GRC have concerns on the assessment of the categorisation of the modifications. Council has assessed the levee as category 3 due to the population at risk. EIS conditions should include this requirement in any approval in order for the Proponent to undertake modification in accordance with requirements.	<p>This issue is noted. Chapter 3: Legislation and Project Approvals Process has been amended to ensure levee modification is referred to as a Category 3 activity (Section 3.435, Chapter 3: Legislation and Project Approvals Process).</p> <p>Development approval for the modification of Yelarbon Levee will be obtained prior to commencement of construction and any modification works (Section 14.9.1, Table 14-121 of Chapter 14: Flooding and Geomorphology).</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.435</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.9.1</p> <p>Table 14-121</p>
159	159.0049	Local Government	Flooding	Flood immunity	Construction tasks will be scheduled to avoid, where possible, bulk earthwork activities within the 1% AEP during periods of elevated flood risk. Where works cannot be scheduled outside of this time period, activity-specific flood readiness and response planning will be required. This planning will be developed in consultation with the relevant local government and QFES. ARTC will engage with the local disaster management groups for Toowoomba and Goondiwindi to coordinate appropriate incident management and response procedures for natural disasters, including flooding.	It is noted that the Proponent will engage with local disaster management groups on readiness and response. Given that construction activity will increase the risk of flooding impact, engagement should be during preconstruction phase and procedures should be referenced in construction contracts. Any damages should be included in the liability in the contract. The draft EIS should be modified to ensure that engagement with local disaster management groups occurs at the preconstruction phase. Further response to natural flooding concerns will be provided in addition to this submission.	<p>Chapter 24: Draft Outline Environmental Management Plan has been updated to state:</p> <p>"ARTC will engage with the local disaster management groups for Toowoomba and Goondiwindi to coordinate appropriate incident management response procedures for natural disasters, including flooding" as a pre-construction measure."</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
159	159.0050	Local Government	Flooding		Inspections will be carried out during operations to identify defects and conditions that may affect waterway and drainage system capacity or indicate increased risk of flooding, such as: Scour Blockages due to debris build up Indication of floods overtopping a structure Culvert or drain damage or collapse. Where defects are identified and corrective actions are required, these works will be completed in accordance with the Operation EMP for the Project Asset inspections will be completed as soon as safe access can be achieved following a flood event	Culvert design should include an allowance for a partial blockage of the structure. Failure to inspect and maintain the waterway area, which may cause impact, should be considered as a breach of EIS conditions and the Proponent be subject to compensation for any damages caused by lack of operational neglect. EIS conditions should enforce that the Proponent meets design capacity of the culverts including blockage in accordance with industry standards.	<p>An allowance for blockage was included in the reference design and revised draft EIS for all culverts with an assumed 25% blockage factor, following an assessment that was undertaken in line with Australian Rainfall and Runoff guidelines. In addition, a sensitivity analysis was undertaken with 0% and 50% blockage to gain an understanding of potential impacts on Flood Sensitive Receptors for these additional blockage scenarios (detailed for each catchment section, Sections 5 to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>With respect to ongoing maintenance of culverts ARTC, as the operator of Inland Rail will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf), Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed design subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 5-17</p>
159	159.0051	Local Government	Hazard and Risk		Procedures for the management of hazardous chemical spills and leaks will be developed and incorporated into the Operation EMP for the Project	The Proponent should consult with local disaster management groups on procedures and their response to high impact hazardous material incidents which may require activation of the group following an incident. This requirement should be included in the revised draft EIS.	<p>Commitments to consultation with relevant local disaster management groups is provided in Section 21.6.2 Table 21-16 and Section 21.6.2.1 of Chapter 21: Hazard and Risk of the revised draft EIS.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.6.2.1</p> <p>Section 21.6.2</p> <p>Table 21-16</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0052	Local Government	Hazard and Risk	Level crossing	The risk assessment has been assessed in the Operation phase in terms of Likelihood/consequences "Risk for accidents on road/rail interfaces as: Likely/major "Very High and after mitigation Possible/Major" Medium.	The risk assessment has been assessed in the operation phase in terms of Likelihood/consequences "Risk for accidents on road/rail interfaces as: Likely/major: "Very High and after mitigation Possible/Major" Medium.	<p>The revised draft EIS and reference design has been updated since the submission of the draft EIS. The main overarching principles that were applied in positioning the alignment for the revised reference design include:</p> <ul style="list-style-type: none"> Alignment shift to reduce the number of road-rail interfaces. Maximise the use of existing rail corridors Outside of existing rail corridors, seek to maximise co-location with existing linear transport infrastructure Minimising severance to properties in greenfield areas Lessening impact to landowners, businesses and existing infrastructure <p>As outlined in Table 21-15 (Section 21.6.1) Chapter 21: Hazard and Risk, grade separated crossings of existing roads have been adopted instead of level crossings, where feasible. The specific design treatment at each road–rail interface has been selected based on a combination of factors outlined in Appendix AA: Transport Impact Assessment (Appendix BT: Inland Rail Road Rail Interface Methodology). Where grade separation has not been feasible, the design has been developed in accordance with ARTC standard Section 12: Level Crossings (ARTC, 2023). Additional physical controls at level crossings such as boom gates and warning lights are provided in accordance with the code of practice. Level crossings have been subject to safe design studies and risk assessments in accordance with the Australian Level Crossing Assessment Model (ALCAM, 2016) to identify and reduce, as far as practicable, the potential risks associated with these crossings.</p> <p>As outlined in Table 21-16 (Section 21.6.2) Chapter 21: Hazard and Risk, mitigation measures incorporated into design may include active controls (e.g. flashing lights and boom gates) and/or passive controls or treatments (e.g. signage and pavement marking) in accordance with the Guide to Development in a Transport Environment: Rail (DTMR, 2015) and AS 1742.7—Manual of uniform traffic control devices, Part 7: Railway crossings (Standards Australia, 2016) to reduce the likelihood and impact of road–rail collisions. Such measures will be implemented in conjunction with the road asset owner (i.e. DTMR and private owners). Also included in detailed design is appropriate exclusion fencing which is required near roads or where trespass is likely to occur, to reduce the likelihood of trespasser injury or death from rail collision. Specific fencing requirements are to be agreed through discussion with adjoining landowners and asset owners through the design development. The general fencing strategy for the Project is provided in Section 5.4.12 of Chapter 5: Project Description.</p> <p>The risk likelihoods have been re-assessed for the revised draft EIS according to changes in revised reference design. Chapter 21: Hazard and Risk Table 21-17 (Section 21.7) details the impact assessment for risk likelihood of road accidents on road-rail interfaces. For pre-construction and early works and construction works, the initial risk Likelihood/Risk of Possible/High which is reduced to Unlikely/Medium with the implementation of safety and mitigation measures.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.12</p> <p>Chapter 21: Hazard and Risk</p> <p>Section 21.6.1</p> <p>Table 21-15</p> <p>Section 21.6.2</p> <p>Table 21-16</p> <p>Section 21.7</p> <p>Table 21-17</p> <p>Appendix AA: Transport Impact Assessment</p> <p>Appendix BT</p>
159	159.0053	Local Government	Hazard and Risk	Level crossing	The residual risk of the road/rail interface remains at medium level.	This is not considered correct as the likelihood is possible and the consequences remain major, therefore, the risk is high. The risk treatment should be readdressed. The revised draft EIS should address this error in the risk assessment and consider an appropriate risk treatment and control.	<p>The residual risk of accidents at road-rail interfaces has been reassessed for the revised draft EIS. As an outcome of this reassessment, the likelihood of occurrence of an accident at a road-rail interface has been reduced from 'possible' (every 1-5 years) to 'unlikely' (every 5-20 years) in Section 21.7 (Table 21-17) of Chapter 21: Hazard and Risk.</p> <p>This reduction in likelihood of occurrence has been made on the basis that the number of level crossings has been reduced from 37 in the reference design to 27 in the revised reference design (Table 21-8). As part of this reduction, the number of passive level crossings has been reduced from 20 in the reference design to 7 in revised reference design.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.7</p> <p>Table 21-17</p> <p>Table 21-8</p>
159	159.0055	Local Government	Waste and Resource Management	Aquatic fauna	Describes baseline conditions of the impact assessment area and assesses potential waste impacts associated with the B2G project.	<p>Waste facilities within the proximity of the project area within GRC boundaries include:</p> <ol style="list-style-type: none"> Goondiwindi Transfer Facility and Landfill Yelarbon Landfill Inglewood Landfill <p>It should be noted that Yelarbon and Inglewood are transfer stations and not landfills with the exception that commercial waste is accepted at Inglewood one day per week. This should be amended in the draft EIS. No waste facilities have been specifically identified as potential spoil disposal sites for the Project and it is expected that soil will be reused on site, the Proponent should identify facilities that can take soil as a contingency plan if soil disposal is required. It is anticipated that waste volumes generated during construction will not be significant, therefore traffic impacts have not been assessed. The Proponent should keep accurate records of waste volumes to ensure that volumes remain within accepted standards. The draft EIS has stated that consultation with owners and operators of existing waste management facilities has commenced. It is understood this is not the case for facilities within GRC. Waste disposal by the proponent to Council waste sites requires approval of GRC. Any large volumes of waste may be redirected to alternative sites so as to not impact on waste management sites. Payment of applicable disposal fees should be made to GRC by the Proponent and its contractors for waste accepted at the GRC waste facilities. The Spoil Management Strategy will be finalised prior to the commencement of construction and this should be reviewed by interested parties. The draft EIS has stated that a Waste Management Sub-plan will be developed as a component of the Construction Environmental Management Plan (CEMP), it is to be ensured that this is made available for review by GRC. The draft EIS states that cleared vegetation will be re-used on site. The Proponent should ensure that any restricted weed material is separated and disposed of accordingly. Restricted materials should not be reused on site. These above waste facility matters should be reviewed in the draft EIS.</p>	<p>Chapter 22: Waste and Resource Management, outlines the ability of waste management facilities listed in Table 22-3 to receive wastes generated by the Project. This has been determined based on initial consultation with select operators, a review of environmental authority licencing under the EP Act and consideration of the Project's contribution to the regional waste management network. A summary of the waste management facility consultation can be found in Section 22.4.2 of Chapter 22: Waste and Resource Management and Appendix E: Consultation Report. Table 22-9 Mitigation Measures for Waste Management details the further engagement that will be undertaken with owners and operators of licenced waste disposal facilities and licenced waste carriers in the Detailed Design stage when more detailed information of waste streams is available.</p> <p>Chapter 11: Flora and Fauna, Project Impact Mitigation Measures details that a Biosecurity Management Plan will be developed as a component of the Construction Environmental Management Plan (CEMP). This will include property-specific weed hygiene requirements developed in consultation with the relevant landowners/operators prior to pre-construction/construction activities occurring on that property. Protocols, where agreed, will be documented in individual property management agreements.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.6.7</p> <p>Chapter 22: Waste and Resource Management</p> <p>Section 22.4.2</p> <p>Table 22-3</p> <p>Table 22-9</p> <p>Appendix E: Consultation Report</p>
159	159.0056	Local Government	Approvals/ conditions/ recommend-ations	Cumulative impacts	This Chapter provides a summary of the cumulative impact assessment undertaken for the Project. Projects with spatial and/or temporal overlap can result in cumulative impacts.	Adequately addresses cumulative impacts based on current knowledge of surrounding projects. This Chapter should be updated if new information arises	The issue is noted. Chapter 23: Cumulative Impacts has been updated within the revised draft EIS.	Chapter 23: Cumulative Impacts
159	159.0057	Local Government	Outline EMP		This Chapter provides an environmental management framework to enable the identified environmental and social outcomes to be achieved.	This plan is in a draft stage and should be amended when new information arises.	The Draft Outline Environmental Management plan will be further refined in detailed design and must be reviewed and endorsed by the Environmental Monitor.	Chapter 24: Draft Outline Environmental Management Plan
159	159.0057	Local Government	Flora and Fauna		Field surveys were taken during drought conditions and therefore may not be a representative of periods of average or above average rainfall. Aquatic samples sites are all located within a 2 km buffer of the proposed alignment, further sampling will be required if access tracks/construction camps extend beyond this alignment. The Proponent should ensure that mitigation measures to prevent the spread of aquatic weeds are implemented and accurately detailed in the CEMP. Sediment runoff into water courses and introduction of contaminants into waterways has the potential to impact landowners in the surrounding areas. Proponent should ensure that mitigation measures are appropriately implemented. These above aquatic ecology matters should be reviewed in the draft EIS.	This technical report has been prepared to document aquatic ecology and surface water quality investigation for the project.	<p>Additional fieldwork to ground-truth the Project disturbance footprint has been undertaken to document the extent of significant ecological receptors, including aquatic values since the draft EIS was released for public notification. This includes areas not previously subject to field validation in the draft EIS and the use of an eDNA assessment. This data has been incorporated into the revised draft EIS and will inform the final impact assessment. See Chapter 11: Flora and Fauna. The survey reports for these fieldworks are available in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 7</p> <p>Appendix A</p>
159	159.0058	Local Government	MNES		The report adequately addresses MNES. Additional surveys to verify TECs, etc. , will be implemented during the design phase.	n/a	<p>ARTC acknowledges Goondiwindi Regional Council's acceptance for the adequacy of Appendix O: Matters of National Environmental Significance Report.</p> <p>Additional Fieldwork has been undertaken across the entire project footprint to inform the revised draft EIS and their reports are presented in Appendix O: Matters of National Environmental Significance Report.</p> <p>Chapter 11: Flora and Fauna, and Appendix O: Matters of National Environmental Significance Report, have been updated to reflect the outcomes of the most recent fieldwork. The impact assessment and mitigation measures presented in the reports have been informed by this work and specific management measures have been developed for impacted environmental values.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Appendix O: Matters of National Environmental Significance Report</p>
159	159.0058	Local Government	Flora and Fauna		This technical report (APP J) describes the terrestrial ecological values of the impact assessment area an identifies potential impacts to sensitive environmental receptors	<p>BioCondition assessments were omitted from the surveys due to drought conditions, therefore certain habitat and vegetation condition data cannot be obtained. Report does not clearly state whether the Regional Ecosystems (REs) were ground truthed or not (Table 3.2 only states that REs were identified). Further ecological surveys will be undertaken during the detail design phase of the Project as the disturbance footprint is refined to reflect the detail design and adopted construction methodology. The Project is likely to cause a significant residual impact on Cyperus clarus, Digitaria Porrecta and Picris barbarorum. These have not been identified in the offsets strategy (Appendix N). The Proponent should provide detail of the types and scale of proposed ecological surveys of the Project footprint during development of detailed design. These above terrestrial ecological matters should be reviewed in the draft EIS.</p>	<p>ARTC acknowledges Goondiwindi Regional Council's acceptance for the adequacy of Appendix O: Matters of National Environmental Significance Report.</p> <p>Additional Fieldwork has been undertaken across the entire project footprint to inform the revised draft EIS and their reports are presented in Appendix O: Matters of National Environmental Significance Report.</p> <p>Chapter 11: Flora and Fauna, and Appendix O: Matters of National Environmental Significance Report, have been updated to reflect the outcomes of the most recent fieldwork. The impact assessment and mitigation measures presented in the reports have been informed by this work and specific management measures have been developed for impacted environmental values.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Appendix O: Matters of National Environmental Significance Report</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
159	159.0059	Local Government	Flora and Fauna		Adequately addresses fauna fencing and additional landowner consultation requirements such as stock route crossings and the impacts to private fencing.	This Chapter identifies fauna corridors that the Project crosses and nominates the optimal locations for fauna.	<p>In terms of fencing design, for interfaces along the alignment, Chapter 21: Hazard and Risk Section 21.6.2 Table 21-16 notes that 'Specific fencing requirements are to be agreed through discussion with adjoining landowners and asset owners through the design development.' There are various types of fencing that will be required. ARTC has standard drawings for the various types of fences. These eleven standards can be found on the ARTC website at extranet.artc.com.au/eng_track-civil_drawings.html.</p> <p>As there are various standards depending on the type of fence, it is not proposed to list these standards. Typically not all design standards have been listed.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix P: Fauna Connectivity Strategy to support the revised draft EIS. This document will be standalone Appendix for the revised draft EIS and was developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the Detailed Design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the Detailed Design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g., revegetation). These scenarios will be used to inform design workshops and community consultation at the Detailed Design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010 respectfully). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the Detailed Design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p> <p>In the revised reference design ARTC have updated stock route interface designs to accommodate requirements identified by Department of Resources (DoR) and local councils. The design requirements highlight below have been developed to ensure mitigations measures at each interface facilitate a safe crossing passage for cattle and drovers in an operational context. These include:</p> <ul style="list-style-type: none"> ▶ 10 m wide crossings at road rail interface locations to reduce cattle pressure and crossing times. ▶ Implementing holding yards where appropriate. ▶ Use of cattle grids at the rail tracks to avoid cattle entering the corridor. · Fences and gates consistent with the published guideline for 7.3 m openings: Guideline: Fences on stock routes SLM/2019/5152 Version 1.01 20/10/2022 ▶ New stock corridor widths consistent with DoR Operational Policy: Land dealings affecting the stock route network: SLM/2013/363 Land Dealings affecting the stock route network (resources. qld. gov. au) ▶ A draft "Call Train Control Process" where drovers would contact ARTC network control in advance and obtain information on suitable windows between trains when they can cross their stock. This will account for train frequencies and stock volumes. ▶ During construction, should cattle move along the stock route/road corridor, communication will occur between Council and ARTC notifying them of the permit. Traffic management will be in place to ensure there is no conflict between stock and construction activities. The timing between construction laydown requirements and the use of the holding yards for the operational rail environment does not create any conflict. Noting the site-specific interface solutions are detailed within Appendix B2: Stock Routes. 	<p>Chapter 21: Hazard and Risk Section 21.6.2</p> <p>Table 21-16</p> <p>Appendix B2: Stock Routes</p> <p>Figure 1 - 26</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Section 6</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix P: Fauna Connectivity Strategy</p>
159	159.0060	Local Government	Air Quality		Technical report that details information addressed in Chapter 12.	Refer to Chapter 12 comments as further analysis may be required should the current project scope change.	<p>A review of satellite imagery was completed to determine sensitive receptor locations along the Project corridor. This included visual identification of structures that could potentially be residential dwellings within a 1 kilometre distance from the alignment (Chapter 12: Air Quality, Section 12.32). It is possible that some of these structures identified would not be residential dwellings and instead be unoccupied buildings such as sheds or farm buildings. All identified sensitive receptors (residential dwellings or otherwise) have been included within the air quality impact assessment. Based on this conservative approach, ground truthing of identified sensitive receptors is not required.</p> <p>In addition to assessing impacts on air quality at households, the assessment also investigated potential impacts to tank water quality during the Operations stage of the Project (Section 12.33 and 12.5.2 of Chapter 12: Air Quality). This assessment was completed by predicting the deposition of pollutants of the rooves of residential dwellings within the study area. The concentration of pollutants in a residential water tank was then estimated assuming that all deposited matter was washed from the roof into a water tank. This assessment showed that tank water quality impacts from the Project would be negligible as pollutant concentrations would be well below the concentrations prescribed by the Australian Drinking Water Guidelines (National Health and Medical Research Council and National Resource Management Ministerial Council). Therefore, no treatment or mitigation measures such as first flush systems or constant water quality monitoring are required for rainwater tanks.</p> <p>Dust mitigation measures have been proposed for material stockpiling such as watering, physical covers where appropriate, and visual dust monitoring. The mitigation measures recommended for the Construction Works stage are presented in Section 12.6 and 12.7.2 of Chapter 12: Air Quality. The recommended mitigation and management strategies will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.33</p> <p>Section 12.52</p> <p>Section 12.6</p> <p>Section 12.7.2</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
159	159.0061	Local Government	Cultural Heritage		Appendix W outlines scope of heritage assessment: to identify, assess significance, assess potential impacts, recommendations.	Is 50 m enough of a buffer around the project area for impacts to heritage places? For example, historic heritage listed places need to be included, as well as the lot next to them. The draft EIS should be reviewed for the buffer to be increased to at least 100 m for all heritage places and include historic heritage up to 500 m for example.	<p>The historical heritage survey and impact assessment area is based on a 50 m offset buffer around the construction disturbance footprint. This survey extent was informed by German Standard DIN 4150-3, which provides guideline vibration levels to minimise the risk of structural damage to property and buildings. The assessment area purposely targeted the zone where the highest potential levels of vibration may be experienced to ascertain typical worst-case impacts and use this information to develop reasonable and practicable measures to mitigate possible impacts.</p> <p>Basing the assessment on the worst-case outcomes ensures the required management and mitigation measures would be commensurate should heritage sites be identified further than 50 m from vibration activities and, as a function of this increased separation, experience vibration levels lower than the assumed worst-case.</p> <p>Mitigations to be contained in the Outline EMP are considered commensurate to the potential worst-case impact based on current information. This approach to identifying potential indirect heritage impacts was previously deemed appropriate by DES (submission to draft EIS #238.0031).</p> <p>Once the location and methodologies for construction works are confirmed, vibration modelling will be updated and the heritage assessment expanded as required to encompass areas where vibration is predicted to exceed acceptable thresholds at distances greater than 50 m from the works. This assessment will occur prior to the commencement of vibration generating construction.</p> <p>Further assessment of ground borne vibration will also be undertaken prior to construction commencement to validate the actual works and the site-specific conditions for the propagation of vibration outside of the construction footprint area. Assessment works can include vibration measurement trials with the actual plant and equipment in use to enable verification of vibration propagation calculations through the development of site-specific acoustic correction factors. Similarly, blasting contractors will undertake trial blasts to optimise the configuration of each blast to avoid vibration induced impacts to surrounding sensitive structures and receptors.</p> <p>Details regarding the additional survey requirements, and process for the revised impact assessment and management/mitigations based on the outcomes, are contained in the revised draft EIS Chapter 24: Draft Outline Environmental Management Plan. Commensurate vibration management measures will be included in the Construction Noise and Vibration Management Plan prior to the commencement of construction.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
159	159.0062	Local Government	Cultural Heritage		Heritage Registers.	WWII and memorial registers should be taken into account here.	Chapter 19: Cultural Heritage, Section 19.3.4 amended to clarify that searches of WWII databases and Monument Australia have been completed. There are no places listed on either register within the Project Study Area.	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.3.4</p>
159	159.0063	Local Government	Cultural Heritage		Historical Landscape Impacts	WWII and memorial registers should be taken into account here.	Chapter 19: Cultural Heritage, Section 19.3.4 amended to clarify that searches of WWII databases and Monument Australia have been completed. There are no places listed on either register within the Project Study Area.	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.3.4</p>
159	159.0064	Local Government	Cultural Heritage		Potential impacts on heritage values.	It is unclear why world heritage levels of culture heritage sensitivity are used here after defining levels ranging between world and local and impacts between world and local? Sensitivity should be assessed within their relevant level.	As outlined in Chapter 19, Section 19.2 Table 19-1, the International Council on Monument and Sites (ICOMOS) system represents international best practice, and provides a graduated scale for assessing heritage significance and impact from world down to local. The appropriate categories have been used to assess the places potentially impacted by the Inland Rail Project.	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.2</p> <p>Table 19-1</p>
159	159.0065	Local Government	Cultural Heritage		Places the proposed works within its historical setting.	Although focused on built heritage, this Chapter should have begun with (a brief summation of) Aboriginal history as it still contributes to the context and toponomy of the place.	Aboriginal ethnohistorical context added as Section 4.1 of Appendix Z: Non-Indigenous Cultural Heritage Survey Report.	<p>Appendix Z: Non-Indigenous Cultural Heritage Survey Report</p> <p>Section 4.1</p>
159	159.0066	Local Government	Cultural Heritage		Frontier Era (Appendix W)	Too much general background here. Moreton Bay is not relevant.	Moreton Bay is mentioned in the first paragraph of Section 4.2 (Appendix Z: Non-Indigenous Cultural Heritage Survey Report) as the location of the penal colony. The remainder of the Section focusses on the settlement of the Downs and the development of the railway.	<p>Appendix Z: Non-Indigenous Cultural Heritage Survey Report</p> <p>Section 4.2</p>
159	159.0067	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Specific Historical Sites: Kurumbal Station (South Western Line) Gibinbell Siding (South Western Line)Yelarbon Station (South Western Line)Whetstone Siding (South Western Line)Yandilla Station (Millmerran Branch Line)Pampas Station (Millmerran Branch Line) Cecilvale Station (Millmerran Branch Line) Yarranlea Station (Millmerran Branch Line) Murlaggan Station (Millmerran Branch Line)	Including a specific spatial reference in relation to the works area would be advantageous here, i.e.45 m away from site. Additionally, the current condition of the place.	<p>The history of Inland Rail included in Section 4.4, Appendix Z: Non-Indigenous Cultural Heritage Survey Report, is not intended to be a comprehensive review of the project, but rather a brief summary to contextualise of the Protest Public Art (B2G-19-H22) and inform an understanding of its heritage values (Table 6.22).</p> <p>Details of the reference design have been updated in response to public submissions from the draft EIS as well as additional information requests from the Coordinator-General, January 2022. These updates are now reflected in the revised reference design, detailed in Appendix B1: Design Drawings and Appendix B3: Changes to Reference Design since Draft EIS.</p>	<p>Appendix B1: Design Drawings</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p> <p>Appendix Z: Non-Indigenous Cultural Heritage Survey Report</p> <p>Section 4.4</p> <p>Table 6.22</p>
159	159.0068	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Historical background on the Inland Rail project.	The 2006 Study for Melbourne-Brisbane railway; 2010 study preferred route via Albury, Parkes, Moree and Toowoomba 2015 study; recommends Inland Rail proceed and confirms the preferred route; 2016 Route options assessed; 2018 construction commenced (inlandrail.artc.com.au/where-wego/route-history). There is more focus on negative community response than history and it does not consider the positive community response weeklytimesnow.com.au/news/national/budget-2017-inland-rail-funding-of-84-billion-promised/news-story/9eda254632ecfda93e0e0ad873dc93e4 . It does not consider early history of Inland rail (trove.nla.gov.au/newspaper/article/1499515).	<p>Chapter 2: Project Rationale discusses the Project alignment options and the history of the Project and of Inland Rail, Melbourne to South Queensland rail alignment. The '2020 Inland Rail History: 2006-2019 report' used to support Chapter 2: Project Rationale includes discussion regarding history of the Project and Inland Rail Melbourne to South Queensland rail alignment.</p> <p>Section 2.8 of Chapter 2: Project Rationale provides a discussion of the strategic option assessments for Inland Rail, from 2006 to 2015, and for the Project, from 2016 to 2017 for the draft EIS and amendments for the revised draft EIS submitted in 2023.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p>
159	159.0069	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Brannock & Associates 2010 Toowoomba Regional Council Heritage and Urban Character Study and Blake, Thom 2011 Goondiwindi Regional Council Heritage Survey	Short summary. Needs more critique of the report.	The EIS does not rely solely on local heritage reports, but rather treats them as one source among many for information on 'known' sites. Other sources of information include primary and secondary histories, and the detailed analysis of historical maps and aerial imagery. Further information on cultural heritage assessment methodology adopted is described in Chapter 19: Cultural Heritage, Section 19.3 Methodology and Appendix Z: Non-Indigenous Cultural Heritage Survey Report, Section 3 Methodology.	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.3</p> <p>Appendix Z: Non-Indigenous Cultural Heritage Survey Report</p>
159	159.0070	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Explanation of historical map review.	Why is the percentage of sites included? A justification for this methodology should be included and explanatory figures could also be included here.	Section 3.1.2 of Appendix Z: Non-Indigenous Cultural Heritage Survey Report discusses the methodology for analysis of historical mapping. The percentage of sites provided in Appendix Z: Non-Indigenous Cultural Heritage Survey Report, Table 5.4 shows the percentage of each category against the total number of sites. For example, nine of the sites of interest were bridges, which equates to 3.8% of 234 sites of interest. Further information about the map review is provided in the methodology Section of Appendix Z: Non-Indigenous Cultural Heritage Survey Report, Section 3.1.2.	<p>Appendix Z: Non-Indigenous Cultural Heritage Survey Report</p> <p>Section 3.1.2</p> <p>Table 5.4</p>

159	159.0071	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Direct and indirect impacts definition.	There are only two (2) categories direct OR indirect impacts. There should be a third, being direct AND indirect impacts.	Most heritage places that are directly impacted will also be indirectly impacted to some extent. The direct impact will cause the greatest magnitude of change, and so is the most relevant type of impact for the assessment. However, mitigations are provided for both direct and indirect impacts as relevant (see Chapter 19: Cultural Heritage Section 19.6.2, Table 19-22).	Chapter 19: Cultural Heritage Section 19.6.2 Table 19-22
159	159.0072	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Details identification and assessment of cumulative impacts on non-Indigenous heritage.	Why have only state significant heritage sites been considered and not local? What is the justification for this and what is the ToR requirement?	The assessment included searches of all relevant statutory and non-statutory registers, from Commonwealth to local level (Chapter 19: Cultural Heritage, Section 19.3). Furthermore, a number of new sites of local significance were identified (Chapter 19: Cultural Heritage, Section 19.4).	Chapter 19: Cultural Heritage Section 19.3 Section 19.4
159	159.0073	Local Government	Cultural Heritage	Cumulative impacts	Cumulative potential impact to non-Indigenous heritage sites.	Why the 50 m buffer for impact again? This needs to be explicitly defined and justified.	<p>The historical heritage survey and impact assessment area is based on a 50 m offset buffer around the construction disturbance footprint. This survey extent was informed by German Standard DIN 4150-3, which provides guideline vibration levels to minimise the risk of structural damage to property and buildings. The assessment area purposely targeted the zone where the highest potential levels of vibration may be experienced to ascertain typical worst-case impacts and use this information to develop reasonable and practicable measures to mitigate possible impacts.</p> <p>Basing the assessment on the worst-case outcomes ensures the required management and mitigation measures would be commensurate should heritage sites be identified further than 50 m from vibration activities and, as a function of this increased separation, experience vibration levels lower than the assumed worst-case.</p> <p>Mitigations to be contained in the Draft Outline EMP are considered commensurate to the potential worst-case impact based on current information. This approach to identifying potential indirect heritage impacts was previously deemed appropriate by DES (submission to draft EIS #238.0031).</p> <p>Once the location and methodologies for construction works are confirmed, vibration modelling will be updated and the heritage assessment expanded as required to encompass areas where vibration is predicted to exceed acceptable thresholds at distances greater than 50 m from the works. This assessment will occur prior to the commencement of vibration generating construction.</p> <p>Further assessment of ground borne vibration will also be undertaken prior to construction commencement to validate the actual works and the site-specific conditions for the propagation of vibration outside of the construction footprint area. Assessment works can include vibration measurement trials with the actual plant and equipment in use to enable verification of vibration propagation calculations through the development of site-specific acoustic correction factors. Similarly, blasting contractors will undertake trial blasts to optimise the configuration of each blast to avoid vibration induced impacts to surrounding sensitive structures and receptors.</p> <p>Details regarding the additional survey requirements, and process for the revised impact assessment and management/mitigations based on the outcomes, are contained in the revised draft EIS Chapter 24: Draft Outline Environmental Management Plan. Commensurate vibration management measures will be included in the Construction Noise and Vibration Management Plan prior to the commencement of construction.</p> <p>Cumulative impact methodology has been updated, as described in Appendix Z: Non-Indigenous Cultural Heritage Survey Report Section 11, and Chapter 19: Cultural Heritage Section 19.7.</p>	Chapter 19: Cultural Heritage Section 19.7 Chapter 24: Draft Outline Environmental Management Plan Appendix Z: Non-Indigenous Cultural Heritage Survey Report Section 11
159	159.0074	Local Government	Traffic and Transport		This technical report (app X) has been prepared to document traffic impact assessment.	Details from Appendix X have been addressed in Chapter 18 - Traffic, Transport and Access. Comments regarding proposals from the traffic assessment are included in the review of Chapter 18 above. The main concern in Appendix X is regarding relevance of the level of Service for the road network on local government roads. An increase in traffic above the 5% target in the level of service approach on low trafficked roads, will generally disqualify the requirement to address volume impact. However, heavy impacts on low structural strength pavements requires alternative methods of impact assessment.	<p>The Level of Service (LOS) is a measure of the functionality of the road segment and does not take into consideration damage to the road. The metric is used to determine whether an upgrade to the road is required due to a failure to accommodate the volume of traffic that will use the road with a reasonable to delay to vehicles. In this case the road segments remain within acceptable limits of delay for road vehicles.</p> <p>With regard to pavement damage Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts and highlights mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. As a result, ARTC is in ongoing discussions with the submitter and Road Manager, Goondiwindi Regional Council (GRC), on pavement impact and road maintenance arrangements. The agreed arrangements to deal with impacted pavements as a result of construction will be contained in the agreements between GRC and ARTC.</p> <p>ARTC will consult with relevant stakeholders (including directly affected landowners) during the Detailed Design stage on mitigation measures to ensure structural capacities are maintained and agreement on the minimum design life of returned works, as well as agreed contribution towards the consumption of pavement design life by construction related vehicles. Once the Contractor has prepared further plans and chosen their preferred design vehicle, these swept path assessments will be revisited to determine any temporary or permanent changes to the existing layout which may be required to accommodate construction traffic movements, such as road upgrades, localised lane widening, geometric improvements or removal of signage and lighting. ARTC commits that these mitigation measures will be further discussed and agreed with the relevant road authorities. ARTC has also committed to maintaining connectivity of existing on and off road pedestrian/shared user.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	Appendix AA: Traffic Impact Assessment Section 5.6
159	159.0075	Local Government	Flooding	Modelling	Summary of document titled: Independent Review of Flood Modelling Undertaken for the Macintyre River Floodplain, Inland Rail Project, Border to Gowrie. Prepared by WRM Water and Environment Pty Ltd (Sharmil Markar) WRM conducted a desktop review on the adequacy, accuracy and robustness of the flood modelling undertaken and modelling results produced for the reference design. Summary of Finding: <ul style="list-style-type: none">▶ The adopted models are appropriate for flood modelling undertaken. Technical short comings observed in the URBS and TURFLOW model configurations. These shortcomings are in all aspects of the modelling undertaken including hydrologic and hydraulic modelling approaches, model configurations, model calibrations, flood frequency analyses and design event analyses.▶ Configurations are not sufficient to accurately assess the existing and modelled design events up to the PMF.▶ Focal point has not been used correctly. Results in inappropriate model inputs for design rainfalls, rainfall temporal patterns, rainfall aerial reduction factors and rainfall losses. (magnitude of inaccuracy is unknown, but could potentially be significant.)▶ Interactions between local creeks not adequately considered when configuring Macintyre River model (result in inaccurate representation of large flood events).▶ Local inflows not accounted for downstream of Macintyre Brook (Booba Sands), Dumaresq River (Beebo), Macintyre River (holdfast), Outlets Creek (Macintyre River confluence).▶ Inflows from local creeks not incorporated into TURFLOW model. Design inflows not consistent with URBS model outputs.▶ TURFLOW model inflow boundaries poorly represent upstream and local inflows. Waterway flows input into incorrect locations.▶ TURFLOW model has been calibrated with lower than actual inflows to the modelled area.30 m grid size too coarse to represent some channels and drainage features.▶ Sensitivity analysis 15 m grid shows about 50 mm lower peak flood levels.▶ The adopted model calibration and adopted calibration methodology is not consistent with current industry best practice. FJV should have used the same URBS models with a common set of model parameters for all three calibration events. This has not been done for the NS2B/B2G flood modelling.▶ Log Pearson III frequency distribution provides better fit to record peak discharges at the stations.▶ Design discharges used for the Reference Design and the flood impact assessment are not based on FFJV's latest calibrated models and the Reference Design has been undertaken with preliminary (not the latest) design discharges.▶ FFJV have undertaken design event modelling using an approach that is not consistent with the ARR guidelines. As a consequence, the design event analyses have been undertaken using inappropriate design rainfalls, rainfall aerial reduction factors, rainfall temporal patterns and rainfall losses. <p>The cumulative impact of all the individual shortcomings that were identified could potentially be significant but is currently unknown. However, it is possible to say that, as a result of the identified shortcomings, there is considerable uncertainty on the accuracy, reliability and robustness of the flood modelling and modelling results that have been presented in the B2G EIS for both Existing Conditions and Developed Conditions. As a result, there is considerable uncertainty regarding the predicted flood impacts as well.</p>	nil.	<p>The revised draft EIS includes additional hydrologic and hydraulic modelling work that was conducted as part of the North Star to NSW/QLD border Project at the request of NSW DPIE. The Macintyre River sections of the revised draft EIS has been updated, refer to Section 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
160	160.0001	Private	Land Use and Tenure	Severance of agricultural land	Failure to recognise that it is proposing the destruction of prime agricultural land; Failure to even consider that the protection of quality farm land is an environmental factor;	Failure of ARTC to consider the correctly proposed forestry route as an environmentally more sustainable corridor. It seems ARTC has used its own hotch-potch of a forestry route which was easier for it to criticise	<p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided. The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none">➤ 0.02 per cent of Class A land,➤ 0.02 per cent of Class B land, and➤ 0.01 per cent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none">➤ 0.17 per cent of Class A land,➤ 0.22 per cent of Class B land, and,➤ 0.19 per cent of IAA land <p>Chapter 8: Land Use and Tenure, Table 8-46 (Section 8.5.4), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none">➤ Landowners' needs regarding access to the properties and the closure of private roads➤ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority➤ The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>ARTC has conducted an alignment options analysis provided in Chapter 8: Land Use and Tenure, Section 8.5, outlining the assessment of route options undertaken which resulted in State forest revocation being the best option. The other proposed alignments that avoided the State forests were discounted as they impacted the existing flood plain associated with the Macintyre Brook which would have resulted in additional hydrological impacts during a flooding event. Other considerations included that the other alignments represented a significant increase in the length of the alignment, meaning an increase in land take and therefore additional impacts on agricultural land. As such, the alignment which included the revocation of land within the Bringalily and Whetstone State forests was selected.</p> <p>Whilst the Project will require the revocation of a portion of State forest, the alignment has been collocated with existing rail infrastructure where traversing Bringalily State forest, and runs alongside a minor road that bisects the Whetstone State forest. As such, the alignment will not result in new fragmentation of land within the State forests.</p> <p>Chapter 2: Project Rationale, Section 2.8, further details the Projects alignment alternatives and justification process.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Table 8-46
160	160.0002	Private	Project alignment	Modelling	Failure to compare like with like when it rejected the potential forestry route, and the associated rejection of the forestry route by consultants in the Deputy Prime Ministers office in what some suggest was a political opportunity to knock-out any attempt to consider the real facts of the forestry route	nil.	<p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p>	N/A
160	160.0003	Private	Flooding - Condamine River	Survey effort/field investigation data	Failure to correctly and realistically assess the Condamine flood plain crossing between Millmerran and Yarranlea, and compare it to the more technically correct and realistic crossing of the Condamine flood plain at Cecil Plains, which is at the northern end of the forestry section;	Further details in supplied articles Page 6 and 7 of submission: "ARTC flood plain corridor 60 years behind the times" 'A Condamine Flood Study NOT considered by ARTC'	<p>The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned the Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	Chapter 2: Project Rationale Section 2.9.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 7.6
160	160.0004	Private	Project alignment	Modelling	Failure to minimise the number of landowners affected by the rail corridor between Yelarbon to Gowrie. The ARTC route truncates, dissects, destroys and touches about 260 properties. The alternate FORESTRYCORRIDOR through Cecil Plains and Mt Tyson, Wellcamp to Charlton and Gowrie affects about 60 properties.	Further details in supplied article Page 5 of submission: "ARTC affects 260 land areas - Forestry route just 60" (NOTE : Article directly reports on the number of reported impacts of various properties and locations not the alternative "Forest Corridor" proposal.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">➤ ability to enhance the Inland Rail service offering➤ construction and operating costs➤ the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)➤ approvals and stakeholder engagement: 12.5 per cent➤ technical viability: 17 per cent➤ safety: 16.5 per cent➤ constructability: 12.5 per cent➤ operations: 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none">➤ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson➤ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton➤ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton➤ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through the Project phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced in Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to Border to Gowrie and Appendix 4 (pp.109-116) provide a detailed history of routes via Warwick that have been considered over time.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report

160	160.0007	Private	Land Use and Tenure	Baseline/background sampling	One page article : ARTC EIS fails to preserve good agricultural land The ARTC EIS fails to recognise it is destroying the farming environment	The ARTC rail corridor (B2G) will isolate and destroy almost 2000 ha of prime cropping and pasture land. Australia can no longer afford this destruction. ARTC fails to acknowledge that prime farming soil is an environmental asset. Article identifies that good productive land is about 4% of Australia's landmass and the land ARTC has selected for its Border to Gowrie rail line, is in the 4% category.	<p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided. The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none">▶ 0.02 per cent of Class A land,▶ 0.19 per cent of Class B land, and▶ 0.01 per cent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none">▶ 0.17 per cent of Class A land,▶ 0.22 per cent of Class B land, and,▶ 0.19 per cent of IAA land <p>Chapter 8: Land Use and Tenure, Section 8.5.1 and Table 8-29 provide an assessment of impacts on strategic cropping areas. The permanent footprint of the Project will affect approximately 2,506.62 ha of mapped strategic cropping areas within the Darling Downs regional planning area, which is representative of 0.02 per cent of strategic cropping areas within the region. The permanent footprint will also impact 52.94 ha of strategic cropping areas within the South East Queensland regional planning area, which represents less than 0.01 per cent of these areas within the region. RPI Act Statutory Guideline 03/14 – Carrying out resource activities in the strategic cropping area prescribes a 2 per cent threshold of permanent impact to strategic cropping area on an individual property to determine whether a resource activity will result in a material impact. The Project will impact significantly less than 2 per cent of mapped strategic cropping areas within either of the relevant regional planning areas, and accordingly does not have a material impact on strategic cropping areas. .</p> <p>Chapter 8: Land Use and Tenure, Table 8-46 (Section 8.5.4), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. 161	161.0001	State Agency	Social Impact Assessment	Mitigation measures	As identified in the EIS the potential social impacts to emergency services during construction and operation are confirmed, including but not limited to: <ul style="list-style-type: none"> Increased demand for police and emergency services Increased emergency response delays. The QLD Police Service strong supports the mitigation measures identified in Appendix X to address impacts to health, emergency services and facilities, during detailed design, preconstruction and operation. See submission for list of mitigation measures. 	Measures identified within the EIS are supported. During Detailed Design: consultation with QPS to ensure appropriate access and egress solutions are incorporated into detailed design to enable movements across the rail corridor (p.189). <ul style="list-style-type: none"> Provision of early advice, workforce ramp-up estimates, construction schedule and the like to QPS to assist with forward planning for any service adjustments that may be required (p.222, 255). Preparation of a Community Well-being Plan in cooperation with QPS. Pre-Construction to Construction: Provision of a forward schedule for construction activities requiring over-sized vehicle escorts to police services and all emergency services bases (p.190,255). Early engagement with emergency service providers to develop protocols for emergency responses (p.190,255) Regular liaison meetings with QPS from pre-construction to project operation (p.190). Operation: Co-operation with QPS, defining appropriate and coordinated responses and communication in the event of accidents and other emergencies. Ready access to train schedules and alternate route options (p.190) 	The submitter's support of SIMP measures in place with QPS is noted.	N/A
161	161.0002	State Agency	Traffic and Transport	Mitigation measures	The potential traffic, transport and access impacts to the emergency services identified in the EIS are confirmed. The QLD Police Service strong supports the mitigation measures identified in the EIS to address the traffic impact to the emergency services during detailed design and construction. See submission for list of mitigation measures.	Proposed measured within the EIS are supported to address traffic impacts to emergency services including but not limited to. <p>Detailed Design:</p> <ul style="list-style-type: none"> Consultation with QPS to address safety concerns and ensure appropriate access and egress solutions are incorporated into detailed design to enable movements across the rail corridor. <p>Provision of construction management plans to QPS. Construction:</p> <ul style="list-style-type: none"> Notifying relevant emergency services of temporary permanent changes to the road network and construction activities that may affect emergency responses times, and prior to the movement of all hazardous or oversize construction material and equipment. It is further recommended that construction management plan and/or traffic management plan account for emergency services. 	Appendix AA: Traffic Impact Assessment Section 5.10.1 and Section 6.1.9 address the traffic impacts on emergency services. As noted in the submission, as part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS (submitter) and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS (submitter) will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track. <p>Consultation with the community and relevant government agencies (including emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p> <p>The Construction Traffic Management Plan will identify and include secondary/alternative construction routes which can be used by construction traffic in the event that a primary construction route is blocked by an accident or emergency situation. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority. In all of these cases, the QFES, QAS and QPS will be updated and informed of changes by the Contractor.</p>	Appendix AA: Traffic Impact Assessment Section 5.10.1 Section 6.1.9
161	161.0003	State Agency	Stakeholder engagement		The police are satisfied with the processes that have been developed and undertaken by ARTC in terms of their consultation with stakeholders including the direct engagement with local police.	nil.	ARTC notes the submission and will continue to engage with emergency services throughout reference design and detailed design. Agency engagement will continue, with QFES, QPS, and local police stations along the alignment to better understand emergency access and hazard management. One-on-one engagement will continue with the Regional Director of Policing and ARTC will continue to attend the District Disaster Management Group to present Project updates regularly to increase dialogue about the impact of the alignment on emergency services. In 2023, ARTC proposed a quarterly Border to Gowrie Emergency Management Working Group, comprising senior members from QAS, QFES and QPS. ARTC will continue to liaise with these stakeholders and schedule regular engagement. The framework for emergency management across the Project alignment, including operational communication protocols within each agency will also be established as part of this process.	Chapter 6: Stakeholder Engagement Appendix E: Consultation Report
161	161.0004	State Agency	Stakeholder engagement		Police members have been involved in the agency briefings, and relevant parties have had access to the draft EIS. It is noted there will be impacts on policing as a consequence of this infrastructure development including access, transport issues, accommodation camps, policing responses required for potential protest activity and community unrest leading up to and during construction phases. Additionally, demand for police escort services for excess dimension loads. Community impacts are also of concern including persons affected by the construction, route and impact on their mental health. There are active action groups in a number of communities along the route and have expressed concern in relation to changes in flood patterns on farms, agricultural land, land acquisitions, property values and rural amenity.	No specific comment of suggested changes to EIS.	ARTC notes the submission and will continue to engage with emergency services throughout reference design and detailed design. Agency engagement will continue, with QFES, QPS, and local police stations along the alignment to better understand emergency access and hazard management. One-on-one engagement will continue with the Regional Director of Policing and ARTC will continue to attend the District Disaster Management Group to present Project updates regularly to increase dialogue about the impact of the alignment on emergency services. ARTC are in the process of establishing an Emergency Management Working Group between emergency services and Inland Rail to oversee and ensure ongoing regular communication from Q3 2023 onwards.	Chapter 6: Stakeholder Engagement Appendix E: Consultation Report
162	162.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included: <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4.</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
162	162.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in. Could impact on Millmerran town parking availability. 	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
162	162.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
162	162.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property, cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community. 162	162.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Eilerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the Contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20</p> <p>Section 20.6</p>
162	162.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
162	162.0009	Private - Turrallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons: a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed. f. Emergency service would be more readily available if required.	A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7
163	163.0001	Private	Stakeholder engagement	Construction traffic	I am concerned about where the corridor is going and alignment is subject to change and access for contractors vehicles entering my property due to black soil and I would not like trucks and other heavy vehicles wrecking road and the dust produced by vehicles driving needs to be kept to a minimum.	Suggest that the other corridors be considered, and if this goes ahead the roads around the farm be gravelled and maintained if access is needed in both wet and dry weather. Also that if the vehicles create dust that the roads they need access to, need to be watered.	ARTC acknowledges landowner concerns regarding the potential impact of the Project on property operations. This is detailed in Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report of the revised draft EIS. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.	Chapter 6: Stakeholder Engagement Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report
163	163.0002	Private	Stakeholder engagement	Directly impacted landowner	Disruptions to cattle and cropping areas are a concern if they have to moved from paddock to paddock to allow access for feeding and planting.	I suggest cattle not be disturbed too much and the planted paddock not be disturbed either	ARTC acknowledges landowner concerns regarding the potential impact of the Project on property operations. This is detailed in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.5 and Section 6.6. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.	Chapter 6: Stakeholder Engagement Section 6.5 Section 6.6 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 5.1
163	163.0003	Private	Land Use and Tenure	Private groundwater bore/s	Underground water is a concern if inland rail pumps out of aquifers and our water levels go down	Underground water needs to be checked for levels and monitored so bores aren't pumped dry during construction if it goes ahead.	Chapter 8: Land Use and Tenure, Section 8.6.2, states that ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of: <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences, water storages, groundwater bores and irrigation infrastructure that would be affected and need to be considered in compensation arrangements for the property The potential for changes in access to natural resources, such as groundwater and overland flow. Chapter 8: Land Use and Tenure Section 8.6.1 discusses measures in relation to impacts to groundwater bores and other agricultural infrastructure. Where possible, the Project has been aligned such that it avoids or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties (Chapter 8: Land Use and Tenure, Section 8.6.1). Where disruption to water supply occurs, crossing points will be provided or the relocation of dams or irrigation systems will be undertaken in consultation with landowners. Where a groundwater bore is expected to be decommissioned or have access/usage be disrupted as a result of the Project, 'make-good' measures will be agreed in consultation with the impacted landowners, refer Appendix U: Groundwater Technical Report, Section 8.3.4 for further detail regarding the 'make-good' process. Appendix U: Groundwater Technical Report discusses loss or damage to existing groundwater bores, including restriction of access during construction (Section 7.1) and operation (Section 7.2). Proposed mitigation measures are described in Section 8.2, Table 8.2 (Appendix U: Groundwater Technical Report).	Chapter 8: Land Use and Tenure Section 8.6.1 Section 8.6.2 Appendix U: Groundwater Technical Report Section 7.1 Section 7.2 Section 8.2 Table 8.2
163	163.0004	Private	Stakeholder engagement	Construction traffic	Creek crossing needs to be suitable for heavy vehicles entering property.	I suggest the creek crossing be up graded and made wider for heavy vehicles	ARTC notes this submission and stakeholder's concern. As denoted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.	Chapter 24: Draft Outline Environmental Management Plan
164	164.0001	Private	Social Impact Assessment	Infrastructure crossings/ interaction	Community Connectivity Stop the town being divided. Properties , houses, local businesses , historical sights. With no access to the north of the rail line it would be approximately three kilometre's from one side to the other. This would make it difficult for those unable to drive e.g. the elderly and the young to access local business, houses and historical sights.	1. An underpass from Talion St to Railway Parade Yelarbon 4388 with pumps to remove any water issues. 2. A train operated gate system similar to the boom gates with security fencing either side of the gates to prevent people crossing when the trains are approaching	With the exception of Yelarbon and Brookstead, the Project bypasses the main townships in the region, avoiding impacts on connectivity within towns. Appendix X: Social Impact Assessment, Section 7.1.5 notes that Yelarbon's amenity would be affected by intensification of the rail corridor along Yelarbon's northern border, with increases in rail noise and changes to scenic character of the area near the Project footprint. ARTC has committed to continued engagement with the Yelarbon community and GRC to plan and implement community projects to offset impacts on the amenity and character of Yelarbon. In Yelarbon, the existing level crossing will be preserved, and a grade separated crossing (road over rail) will also be provided over Yelarbon Kurumbul Road and connecting to the Cunningham Highway. The crossing design maintains connectivity from the Cunningham Highway to the township. There is currently no pedestrian path across the existing rail line in Yelarbon. As a result of consultation with GRC and the Yelarbon CCC (a community-run committee), the Project's reference design has been revised to include a pedestrian crossing to provide north-south connectivity (Appendix X: Social Impact Assessment, Section 7.1.7).	Appendix X: Social Impact Assessment Section 7.1.5 Section 7.1.7
165	165.0001	Private	Land Use and Tenure	Directly impacted landowner	The project will resume a quarter of the submitter's property, and leave a large cutting the dissects the property with no access to severed land.	1. Adequate compensation for loss of land 2. New fencing required for existing livestock 3. Viability of grazing on reduced acreage.	As stated in Chapter 8: Land Use and Tenure, Section 8.6.1, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices (Chapter 8: Land Use and Tenure, Section 8.6.2). Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties. Where disruption to water supply occurs, crossing points will be provided or the relocation of dams or irrigation systems will be undertaken in consultation with landowners. ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of: <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads. Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority. The potential for changes to groundwater access. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis using the market value of the land as at the date of resumption As stated in Chapter 8: Land Use and Tenure, Section 8.6.2, assessment of compensation is undertaken in accordance with Section 20 of the AL Act. Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance. Costs attributable to Compensation for disturbance caused by the resumption may include: <ul style="list-style-type: none"> Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation Costs related to the purchase of replacement comparable land Storage and removal costs Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. 	Chapter 8: Land Use and Tenure Section 8.6.1 Section 8.6.2
165	165.0002	Private	Flora and Fauna	Koala	Project will divide an existing koala habitat, which is significant to the species survival. The existing koala community could be a rare gene pool as found in other nearby areas - DNA tests pending. All shade trees will be taken by ARTC from the back of the submitter's property by compulsory land acquisition.	1. No rail dividing koala habitat 2. require mature trees to be planted and watered until established to replace existing tree loss or compensation for costs to establish more mature trees.	Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS. Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. Appendix P: Fauna Connectivity Strategy identify the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingelwood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy) In addition, ARTC has commenced two key research initiatives relating the koala (<i>Phascolarctos cinereus</i>) to better understand populations, potential impacts and to develop targeted mitigation and management measures. Regarding the proposed solution, ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study koala genetics that focusses on population genetics and dietary analysis for koalas across eight of the Inland Rail Projects. The purpose of this study to: <ul style="list-style-type: none"> Increase baseline data on koala population resilience and restoration requirements. Informs koala conservation controls as required in conditions of approval. Informs fauna connectivity plans. Informs koala offset management decisions. Contribute to Infrastructure Sustainability Council credits. The expected completion date for these studies is June 2023. In instances where a significant residual impact has been identified as per the EPBC Act Significant Assessment Criteria, biodiversity offsets will be secured. ARTC has prepared a revised Environmental Offset Delivery Strategy (Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie) that outlines the properties that make up the Border to Gowrie Project offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES. Appendix Q: Environmental Offset Delivery Strategy includes a summary of how the proposed offset portfolio will acquit the anticipated offset requirements for the koala to achieve no net loss. ARTC has prepared a revised Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie that outlines the properties that make up the Border to Gowrie Project offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie includes a summary of how the proposed offset portfolio will acquit the anticipated offset requirements for the koala to achieve no net loss.	Appendix E: Consultation Report Section 4.2 Section 5.0 Section 5.11 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix P: Fauna Connectivity Strategy Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
165	165.0003	Private	Air Quality		Concerns during construction and operational phase e.g. gas emissions from diesel train exhausts. Decrease in air quality due to earth works and operation of machinery Dust and air pollution from train cargo and moving wagons Nearby proposed concrete plant.	<ol style="list-style-type: none"> 1. Home hermetically sealed to manage exacerbation of existing allergies due to the above. 2. Compensation for increased medical costs associated with the above. 3. Adequate dust suppression 	<p>The assessment of the Construction Works and Operations stages has determined that the Project will result in air emissions, however the impact to sensitive receptors (i.e., impacts to health and nuisance/amenity) as a result of these emissions will not be significant with the inclusion of recommended mitigation measures.</p> <p>In the dispersion model developed for the assessment of the Operations stage in Appendix F of Appendix R: Air Quality Technical Report, the landholder's dwelling has been represented by the sensitive receptor R769. Based on the predicted maximum cumulative pollutant concentrations at receptor R769 for the Operations stage, significant impacts are not expected at the submitter's residence. On this basis, neither compensation for medical expenses nor mitigation measures and/or treatments to individual dwellings are expected to be required.</p> <p>The assessment of construction has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households). Construction dust emissions have been assessed for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust). As discussed in Section 12.32 of Chapter 12: Air Quality, gaseous emissions (fumes) from construction vehicles and construction equipment are unlikely to present risk of significant impact.</p> <p>Recommended mitigation measures include that the locations of construction facilities such as concrete batching plants be positioned as far as practicable from neighbouring sensitive receptor locations, within the confines of the construction footprint (Appendix R: Air Quality Technical Report, Section 8.3). With the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts for impacts to health and nuisance/amenity will be low or negligible.</p> <p>The air quality assessment of the Operations stage determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in Section 12.4.5 in Chapter 12: Air Quality) within the study area for the Project.</p> <p>Further information on the results of the construction and operation assessment on impacts to air quality are presented in Section 12.5 and Section 12.6 of Chapter 12: Air Quality. The recommended mitigation measures to reduce emissions and minimise the potential for significant impacts are discussed in Section 12.6 of Chapter 12: Air Quality and Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 12: Air Quality Section 12.32 Section 12.4.5 Section 12.5 Section 12.6 Chapter 24: Draft Outline Environmental Management Plan Appendix R: Air Quality Technical Report Section 8.3 Appendix F</p>
165	165.0005	Private	Groundwater		Water for project impacting on ground water supply EIS report states ground water will be affected due to the fractured nature of the aquifer which can result in loss and damage to existing bores. EIS states they expect a 60 metre draw down effect which will cause shallow bores to go dry. Shallow bores and deep cuts nearby will affect the ground and surface water flow	<ol style="list-style-type: none"> 1. New bore that equals the existing supply. 2. Adequate compensation if the above measure fails. 	<p>As part of the revised draft EIS, predicative groundwater models were developed to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts (Chapter 15: Groundwater, Section 15.6.2). The indicative cuts were selected as best representing the local geological conditions and worst-case potential impacts (cuts most likely to intersect groundwater). The revised modelling results indicate that the horizontal extent of drawdown is predicted to extend a maximum of 10 m to 43 m horizontally from the rail centreline (from the deepest cuts). The model was updated to reflect the refined alignment and design as part of the revised draft EIS and the results are presented in Chapter 15: Groundwater, Section 15.6 and Appendix U: Groundwater Technical Report, Figures 6.14-6.20 provided in Section 6.3 visually demarcate the anticipated extent of drawdown.</p> <p>A water/groundwater bore survey has been issued to landowners to confirm the location/presence of water supplies that may be impacted by the Project. Where necessary make-good measures will be developed on case-by-case basis in consultation with the landowner. Details of the proposed potential make-good measures detailed in Section 15.7.4 and Table 15-20 of Chapter 15: Groundwater. However, the measures developed for each impacted water storage feature/bore will be unique and commensurate with the level of impact realised, therefore specific details cannot be provided at this time.</p>	<p>Chapter 15: Groundwater Section 15.6 Section 15.6.2 Section 15.7.4 Table 15-20 Appendix U: Groundwater Technical Report Section 6.3 Figure 6.14-6.20</p>
165	165.0006	Private	Surface Water		Water quality and quantity impacted by the project. Greatly reduced catchment area for existing dam.	<ol style="list-style-type: none"> 1. Supply water to property at the cost to ARTC. 2. Compensation for loss of catchment area which will result in a massive decrease in existing dam water supply. 	<p>The flooding and hydrology study presented in Appendix T1 and T2: Hydrology and Flooding Technical Report - Volumes 1 and 2 of the revised draft EIS have assessed impacts to existing overland flow as a consequence of the Project. Whilst change to hydraulic regimes may occur (due to new infrastructure) at 1% AEP conditions, hydrological modelling indicates that no significant changes are expected to base-flow and low-flow conditions and that access to surface water resources will not be affected.</p> <p>As stated in Table 13-16 of Chapter 13: Surface Water, the detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).</p>	<p>Chapter 13: Surface Water Table 13-16 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
165	165.0007	Private	Social Impact Assessment	Directly impacted landowner	Lack of valid information in regard to project. Answers from ARTC not consistent, e.g. we have a loop on our property however ARTC stated that was not the case. The EIS shows the loop and a maintenance loop. ARTC states no one will be disadvantaged. This has been my home for 23 years. Quality improvements added to this property. NO opportunity to acquire a similar property locally.	<ol style="list-style-type: none"> 1. Costs of legal fees if we are disadvantaged by ARTC 2. Moving costs if we are unable to reside in our home due to the above and rail impacts. 3. Provide compensation to enable us to acquire a similar property if we are forced to relocate due to the above. 	<p>Property acquisitions will be undertaken by DTMR as the Acquiring Authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967. This includes compensation for reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs and other reasonable financial costs incurred that are a direct consequence of the resumption of the land (Appendix X: Social Impact Assessment, Section 7.1.7).</p> <p>There is no legislative requirement to pay compensation for a loss in value unless land is acquired from a property.</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 8.5.3 acknowledges that the Project has resulted in stress and anxiety for some landowners and residents. In addition to the ongoing community engagement process which aims to provide information and enable consideration of landowners' concerns, ARTC has invested in a mental health partnership to enable people affected by the proposed Project to access mental health support services.</p> <p>ARTC will also provide supporting information for people who need to relocate, including referral to DCHDE housing support programs where necessary.</p>	<p>Appendix X: Social Impact Assessment Section 7.1.7 Section 8.5.3</p>
165	165.0008	Private	Stakeholder engagement	Directly impacted landowner	Consulting with ARTC at Pittsworth town hall recently, inappropriate and unprofessional comments made by employee of ARTC. e.g. We don't pay for emotions was stated by a person standing by. Name can be supplied.	nil.	<p>ARTC acknowledges the submitter's concerns and does not condone this type of behaviour. ARTC notes that it has made direct contact with the submitter and designated an alternative person within the team to manage the relationship.</p>	N/A
165	165.0009	Private	Social Impact Assessment	Property Devaluation	Stress dealing with local real estate. A verbal valuation was supplied for the land resumed and when requested to put this on paper the value was reduced by \$100,000.00. Devaluation of property with rail nearby and not receiving adequate compensation. ARTC supplying conflicting information in regard to distance rail would be from home. Increased stress and exacerbation of existing health conditions due to all the above mentioned issues. High legal costs to fight for appropriate and adequate compensation.	<ol style="list-style-type: none"> 1. Costs of legal fees if we are disadvantaged by ARTC 2. Moving costs if we are unable to reside in our home due to the above and rail impacts. 3. Provide compensation to enable us to acquire a similar property if we are forced to relocate due to the above. 4. Compensation for devaluation of property due to rail nearby. 	<p>Property acquisitions will be undertaken by DTMR as the Acquiring Authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967. This includes compensation for reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs and other reasonable financial costs incurred that are a direct consequence of the resumption of the land (Appendix X: Social Impact Assessment, Section 7.1.7).</p> <p>There is no legislative requirement to pay compensation for a loss in value unless land is acquired from a property.</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 8.5.3 acknowledges that the Project has resulted in stress and anxiety for some landowners and residents. In addition to the ongoing community engagement process which aims to provide information and enable consideration of landowners' concerns, ARTC has invested in a mental health partnership to enable people affected by the proposed Project to access mental health support services.</p> <p>ARTC will also provide supporting information for people who need to relocate, including referral to DCHDE housing support programs where necessary.</p>	<p>Appendix X: Social Impact Assessment Section 7.1.7 Section 8.5.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
166	166.0001	Private	Editorial		EIS is so voluminous and presented in such a way that it is very difficult for affected landowners to identify all important issues such as social and economic impacts, lack of effective stakeholder engagement, ongoing effects of noise and vibration, and a lack of acknowledgement and understanding of farming operations.	<ol style="list-style-type: none">1. ARTC should be more transparent, and receptive to critical evaluation of issues such as the route chosen and the effects on landowners livelihoods and lifestyles.2. Landowners need to be reassured that they will be adequately and fairly compensated for their properties/land being compulsorily acquired, which acknowledges the severe effects on property productivity and value.3. Meaningful and individual consultation with those landowners whose residences are sensitive receptors of noise and vibration.4. Specialist rural consultants with experience in both farming and livestock activities should be appointed to community engagement teams.	<p>The revised draft EIS is necessarily extensive to provide an appropriate and comprehensive response to the Terms of Reference (ToR). The division of the revised draft EIS into chapters and appendices is intended to assist readers and stakeholders to locate the information of relevance to them.</p> <p>Chapter 17: Social describes the results of the social impact assessment (SIA) that was undertaken as part of the revised draft Environmental Impact Statement (EIS) for the Inland Rail—Border to Gowrie Project.</p> <p>Chapter 18: Economics reports on the Economic Impact Assessment developed for the Project. The Economic Impact Assessment has been developed according to the Coordinator-General's Economic Impact Assessment guideline. The approach adopted is consistent with recognised industry methods and represents a whole-of-life approach, comprising an evaluation of the economic impacts and benefits generated by the Project across both the Construction Works and Operations stages.</p> <p>Chapter 6: Stakeholder Engagement reports on the stakeholder engagement process undertaken in the preparation of the revised draft EIS, including the development of an SIA for the Project. Community and stakeholder feedback has been considered by multi-disciplinary technical study teams as part of defining the Project's reference design and preparing the revised draft EIS. Consultation is ongoing and stakeholder engagement will continue as the Project progresses.</p> <p>ARTC is committed to building long-term, mutually beneficial relationships with stakeholders and the community openly and in a collaborative manner. The aim of the Project's stakeholder engagement program is to create a two-way dialogue by actively listening to stakeholders and providing opportunities for communities to raise concerns and form partnerships to resolve potential issues. This is discussed further in Chapter 6: Stakeholder Engagement, Section 6.2.</p> <p>A Consultation Report has been prepared for the Project, which is included in Appendix E: Consultation report. This report details the consultation activities undertaken to support the development of the revised draft EIS, and the materials used to support consultation activities. This consultation has informed the revised draft EIS by identifying areas of stakeholder concern, as well as informing technical solutions, reference design and identifying mitigation measures, where appropriate.</p> <p>Chapter 16: Noise and Vibration provides a summary of the potential noise and vibration impacts of the Project during its construction and operation. The purpose of the noise and vibration assessment is to identify how noise and vibration from the construction and operation of the Project may impact the sensitive land uses and receptors within the surrounding environment. Based on the identified impacts, the assessment proposes measures to reduce and control noise and vibration levels and provide a reasonable and practicable mitigation of potential impacts.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.1 identifies potential impacts of the Project on farming operations. Chapter 9: Land Resources, Section 9.5 identifies important agricultural areas and identifies the potential impacts of the Project on these communities and resources. The revised reference design has been modified to further reduce impacts on valued agricultural land and impacts on communities. The reference design is co-located with existing road and rail infrastructure farm property boundaries where possible to reduce potential fragmentation and sterilisation of land. The reference design has also been developed to avoid impacts to Commodore Mine, intensive livestock operations and the obstacle limitation surface associated with Toowoomba Wellcamp Airport within Chapter 9: Land Resources.</p> <p>Acquisition will be undertaken in consultation with landowners on a case-by-case basis, in accordance with Appendix E: Consultation Report and Chapter 6: Stakeholder Engagement. Where acquisition is required, the Department of Transport and Main Roads (DTMR), as the constructing authority for the Project, will manage the compulsory land acquisition process in accordance with the provisions of the Acquisition of Land Act 1967 (Qld) for land required for the Project that is not State land.</p> <p>The route that has been selected and assessed in the revised draft EIS is the product of extensive investigation and review.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.7) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14 and described in Chapter 2: Project Rationale, Section 2.7. The design development process used a combination of technical assessments and the ARTC MCA tool, which was used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">▶ environmental impacts:12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)▶ approvals and stakeholder engagement: 12.5 per cent▶ technical viability: 17 per cent▶ safety: 16.5 per cent▶ constructability: 12.5 per cent▶ operations: 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for the Project in 2017, the Australian Government announced a two-kilometre-wide study area based on the alignment via Wellcamp Charlton was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced in Chapter 2: Project Rationale of the revised draft EIS which describes the route+IB selection process for the proposal, both before and after confirmation of the study area.</p> <p>In May 2020 and subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications engaged an independent consultant (GTA Consultants) to conduct a review which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The broader Inland Rail route analysis is documented in the Melbourne to Brisbane Inland Rail Route History 2006-2019 document, where pages 92 to 103 relate specifically to the Project and Appendix 4 (pp.118-126) providing a detailed history of routes via Warwick that have been considered over time (refer inlandrail.wpenginepowered.com/wp-content/uploads/2020/05/route-history-2006-2021-may-22.pdf).</p>	<p>Chapter 2</p> <p>Section 2.7</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Chapter 9: Land Resources</p> <p>Section 9.5</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Chapter 18: Economics</p> <p>Section 18.3</p> <p>Section 18.9</p> <p>Appendix E: Consultation Report</p>
166	166.0002	Private	Land Use and Tenure		EIS does not identify or acknowledge that a large amount of land traversed by the project is strategic cropping land.	<p>The Queensland government should decide that the Inland Rail activities are "regulated activities" under the Regional Interests Planning Act, which acknowledges the Strategic Cropping Land classification.</p>	<p>As discussed in Chapter 8: Land Use and Tenure, Section 8.2. The Regional Planning Interests Act 2014 (Qld) regulates areas of regional interest and requires a resource activity or regulated activity proposed to be located in an area of regional interest to obtain a regional interests development approval. As the Project is not a resource activity nor a regulated activity under the Regional Planning Interests Act 2014 (Qld), the Act does not apply. As such, the Regional Planning Interests Act 2014 (Qld), and the alignment's impact on the matters protected under Regional Planning Interests Act 2014 (Qld), do not have a bearing on the EIS process, nor is the approval of the EIS contingent on the assessment of the Project's impact on areas of regional interest. Notwithstanding this, the Project's impact on areas of regional interest protected under the Regional Planning Interests Act 2014 (Qld) has been assessed to provide a comprehensive assessment of the Project's impact on agricultural, environmental and societal values present within both the temporary and permanent disturbance footprints of the alignment.</p> <p>To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9, which provides a total of areas of regional interest in relation to the Project footprint. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations.</p> <p>Chapter 8: Land Use and Tenure, Table 8-46 (Section 8.5.4), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible. A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners (Chapter 8: Land Use and Tenure, Section 8.6.2). The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Section 8.6.2 of Chapter 8: Land Use and Tenure).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.2</p> <p>Section 8.5.4</p> <p>Section 8.6.2</p> <p>Table 8-46</p>
167	167.0002	Private	Air Quality		Dust and air pollution	<p>Have Paint Mine Road upgraded to bitumen surface to Lot 15 entry</p>	<p>The assessment of the Construction Works and Operations stages has determined that the Project will result in air emissions, however the impact to sensitive receptors as a result of these emissions will not be significant with the inclusion of recommended mitigation measures.</p> <p>Construction dust emissions have been assessed qualitatively for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust). As discussed in Section 12.32 of Chapter 12: Air Quality, gaseous emissions (fumes) from construction vehicles are unlikely to present risk of significant impact.</p> <p>The assessment of the Construction Works stage has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts.</p> <p>With the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts on human health and nuisance/amenity will be low or negligible. Further information on the results of the assessment of the Construction Works stage are presented in Section 12.51 of Chapter 12: Air Quality.</p> <p>Mitigation measures recommended for the Project are presented in Section 12.6 of Chapter 12: Air Quality. There are a number of mitigation measures related to haul routes including proper planning of haulage routes, restricting vehicle speeds on unsealed haul roads, appropriate surface treatments for the predicted construction traffic movements, and visual monitoring of the effectiveness of dust controls.</p> <p>The assessment of the Operations stage determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in the Chapter 12: Air Quality, Section 12.4.5) within the study area for the Project. Further information on the results of the operational assessment on impacts to air quality are presented in Section 12.52 of Chapter 12: Air Quality.</p> <p>Bitumen sealing is not considered to be required as Paint Mine Road is not expected to carry heavy project-related traffic during the Construction Works stage, and the recommended mitigations provided for the Construction Works stage of the Project (Section 12.6, Chapter 12: Air Quality) are expected to effectively mitigate the potential for significant impacts to air quality. These mitigation measures will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.32</p> <p>Section 12.4.5</p> <p>Section 12.51</p> <p>Section 12.52</p> <p>Section 12.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
167	167.0003	Private	Project scope		Boundary fence ascetics	To maintain consistency of fencing on Lot 1 when gate and fence is interrupted due to construction of rail the entirety of Lot 1 Paint Mine Road to be fully upgraded.	<p>ARTC note that the issue relates to boundary fence aesthetics.</p> <p>In Queensland, most of the land required to deliver Inland Rail will be compulsorily acquired (resumed) by the Department of Transport and Main Roads (DTMR) on behalf of the Queensland Government. The resumption process will be carried out in accordance with the <i>Acquisition of Land Act 1967</i> (Qld). This legislation sets out the process for acquisition, landowner rights and the assessment of compensation. Issues relating to gates and fences will be addressed by this process and on a case by case basis.</p> <p>Details regarding land acquisition and consultation processes for the Project are outlined in Chapter 8: Land Use and Tenure and Appendix E: Consultation Report.</p>	Chapter 8: Land Use and Tenure Appendix E: Consultation Report
167	167.0004	Private	Land Use and Tenure		Loss of farming land	To be dually compensated and have opportunity for land swap.	<p>Chapter 8: Land Use and Tenure, Section 8.6.2 states that where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld) (refer of the EIS). Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance.</p> <p>Costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation. Costs related to the purchase of replacement comparable land. Storage and removal costs. Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. 	Chapter 8: Land Use and Tenure Section 8.6.2
167	167.0005	Private	Landscape and Visual Amenity		Noise and visual pollution	nil.	<p>As summarised in Chapter 24: Draft outline Environmental Management Plan, the following mitigations in response to dust, noise and visual potential impacts include:</p> <p>Development of an Air Quality and Dust Management Plan prior to construction commencing (Chapter 24: Draft Outline Environmental Management Plan). The Plan will include the following measures, tailored to be specific to the construction methodology, once confirmed:</p> <ul style="list-style-type: none"> Minimise major dust-generating activities, e.g. blasting or material loading/unloading, during high wind speeds where practicable and unwatered Routing roads away from sensitive receptors wherever practically possible Restricting vehicle speeds on unsealed haul roads to reduce dust generation, e.g. to sign-posted speeds on public roads or to construction site speed limits on construction tracks (nominally 40 km/hr—to be determined through consultation with the relevant local government and documented in the Traffic Management Plan within the CEMP. <p>Landowners will be notified in advance of the commencement of maintenance activities in an area proximal to them. This notification will be in accordance with community notification procedures established for the Project and will provide information on the types of activities that will occur, indicative scheduling and the potential impacts that may be experienced (e.g. generation of dust).</p> <p>Regarding noise and vibration potential impacts, in circumstances where mitigation within the rail corridor is not found to be feasible, and all other mitigation options are exhausted, property controls will be investigated and implemented (Chapter 24: Draft Outline Environmental Management Plan):</p> <ul style="list-style-type: none"> The implementation of architectural treatments and other measures to private property would likely be subject to the agreement of commercial and legal terms between ARTC and the property owner Property noise-control measures may include: Architectural property and construction treatments subject to an inspection of each individual property to confirm its suitability for the implementation of noise control treatments Upgrading existing property fencing subject to landowner agreement Relocation of property assessed on a case-by-case basis, subject to assessment, to ensure there would be a notable improvement to the noise environment at the relocation site. <p>During Construction, visual values will be mitigated through (Chapter 24: Draft Outline Environmental Management Plan):</p> <ul style="list-style-type: none"> Minimising the height of all stockpiles to the greatest extent possible to reduce their visual impact. Temporary treatments (such as hoardings and screens) to site compounds and non-resident workforce accommodation will be considered to assist in reducing visual impacts of temporary infrastructure and sun glare within close proximity of sensitive receptors (particularly townships including Yelarbon, Brookstead, Pampas and Pittsworth, and road networks). These include opportunities to use features on temporary fencing/hoarding. This will include art-based treatments to assist with screening the works from the public and using information boards (or similar) to educate the public about the construction works <p>During Operation, in response to legitimate complaints, consider additional control measures, such as screening of sensitive receptors.</p> <p>As summarised in Chapter 24: Draft Outline Environmental Management Plan, ARTC commits to continue to consult with potentially impacted landowners through the Detailed Design and Construction Works stages and agree on outcomes to minimise property access impacts. This includes where property access adjoins state and local government roads.</p> <p>During operation, the rail maintenance access roads will be available for use by emergency vehicles in the event of an incident.</p> <p>Where legal access to a property is permanently affected and a property has no other legal means of access, alternative access to and from a public road will be provided to an equivalent standard, where feasible and practicable.</p> <p>The suitable design treatment for interfaces between the Project and private accesses will be developed in consultation with the relevant landholder, on a case-by case basis (Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan
167	167.0006	Private	Traffic and Transport		Highway access	To have Paint Mine Road upgraded to bitumen surface to Lot 15 entry.	<p>ARTC note the preference for a bitumen surface on the existing gravel road. Paint Mine road is a Toowoomba Regional Council road, where the technical standards for the design and construction of this road will be as per TRC planning policy. Changes to road use is managed through TRC infrastructure team. ARTC is in consultation with TRC regarding the impact on local council roads. Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts and highlights mitigation measures for pavement damages to local government roads. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings (not volumes), of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. This is the case for Paint Mine Road and as a result, ARTC is in ongoing discussions TRC on pavement impact and road maintenance arrangements.</p>	Appendix AA: Traffic Impact Assessment Section 5.6
168	168.0001	Private	Surface Water	Flood immunity	The submitter is concerned about the Section 142.6 to 146 km between the Condamine River and Yandilla. He highlights that a 1.8 km long rail bridge foundation across Hall Road (138 km to 142 km) and 46 group of culverts at almost 3 km long in the Section 139.37 km to 142.58 km can cause changes in peak water levels, direction and velocity of flood waters, changes in duration of inundation, flood flow distribution, block water flow as a result of debris accumulation and intensify soil erosion. Th submitter is concerned that in this scenario plenty of debris and weeds run into our land Lot 1 DY492, Lot 2 DY492 and Lot 38 DY853 comparing to existing hydrologic history. The situation will become worst if heavy rainfall occurs. Additionally gravels used in rail lines will flow into the surrounding paddocks in an event of flooding, damaging agricultural machinery and creating other operational issues. He also feels that existing design on number of culverts may be far away from enough to handle flood water break out at Condamine and Grass Tree Creek.	Install screens on culverts to filter debris and weeds. Culverts clean up management and execution plan should be built, but the submitter doubts its efficiency during flooding. Possibly Rail Bridge will be the best option all the way across Condamine Flood Plain. The submitter also want an opportunity to comment on the finalised report of the international flood expert panel, Senate Inquiry and other drafts to the EIS.	<p>Bridge and culvert numbers and openings have been designed to pass a 1% AEP flood, in line with Australian industry guidelines and best practise.</p> <p>With respect to ongoing maintenance of culverts, ARTC as the operator of Inland Rail, will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf). Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages. ETG-10-01 (Flooding) considers that blockage or partial blockage of waterway > 20% loss of area due to debris, rubbish or siltation is a defect. The required response time is within 28 days to repair/restore.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as detailed in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4
168	168.0002	Private	Groundwater	Directly impacted landowner	The submitter talks about the Section between 143 to 146 km between the Condamine River and Pampas. The submitter is concerned about the drilling impacts of foundation structures intercepting the shallow aquifers supplying water to Millmerran, Pittsworth, Brookstead & Southbrook townships and their surrounds, various localities including Pampas and surrounding areas, and on agricultural irrigation, stock water and domestic use.	nil.	<p>The drilling of foundation pilings associated with bridges is unlikely to cause any permanent impacts to groundwater other than temporary impacts during the Construction Works stage. Pilings will be of a sufficient spacing to prevent permanent impact to groundwater flow and will be constructed using cured in place (CIP) technique in which concrete slurry is pumped through a hollow stem auger concurrently as soil/rock is brought to the surface (Chapter 15: Groundwater, Section 15.6.3). Only minor volumes of groundwater are anticipated to be brought to surface using the CIP method (e.g.5 to 10 litres per 20 m deep auger hole). No active dewatering is anticipated. The spacing of the pilings is such that impediment of groundwater flow is unlikely and not expected.</p> <p>Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 to 15.4.4). Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset. The baseline groundwater dataset, in addition to regular groundwater monitoring during the Construction Works and Operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting from aspects of the Project (see the proposed groundwater management and monitoring program (GMMP) in the revised draft EIS, Chapter 15: Groundwater, Section 15.7.3 for a detailed approach to monitoring for impacts during construction).</p>	Chapter 15: Groundwater Section 15.4.2 Section 15.4.4 Section 15.6.3 Section 15.7.3
168	168.0003	Private	Traffic and Transport	Directly impacted landowner	The interference to farming operations due to increased traffic frequency and deteriorating condition of Hall Road during the construction phase of the project.	nil.	<p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties Chapter 8: Land Use and Tenure, Section 8.5.1 and Table 8-51. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 8: Land Use and Tenure Section 8.5.1 Table 8-51
168	168.0005	Private	Flooding	Directly impacted landowner	Change in flood flow distribution, velocity of flood water and intensify soil erosion result in decrease of our cropping production and significant devaluation of our properties.	nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report – Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their draft report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>In order to support this, additional mapping has been generated by ARTC to provide further information and justification to the Expert Flood Panel. This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report – Volume 2 and the online digital platform.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Appendix T2: Hydrology and Flooding Technical Report - Volume 2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
169	169.0002	Private	Traffic and Transport		Impacts on contractor movements during constructions including disruption to livestock and dust suppression.	To co-ordinate works in consultation with landowner and to ensure dust suppression is used. To ensure the quality of the access track is maintained throughout and after completion of construction works.	<p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>Further, revised draft EIS Appendix AA: Traffic Impact Assessment Section 5.12.3 details ARTC commitments to a Construction Environmental Management Plan and Traffic Management Plan. A CEMP will be prepared prior to construction commencing by the construction contractor. The CEMP will include a TMP, attached as an Appendix to the CEMP. The TMP will reflect the finalised TIA, undertaken once a construction contractor has been appointed and construction routes are finalised. It will be developed in consultation with DTMR, the relevant LGA, Department of Education, affected stakeholders and an accredited road safety auditor. The plan will also take into account communications received and will be aligned with the Construction Community and Stakeholder Management Plan. The TMP will identify the impacts that construction traffic is likely to have on the transport infrastructure and detail ameliorative measures required to mitigate all identified impacts of the Project. This may include potential temporary or permanent intersection works. The TMP will detail measures to:</p> <ul style="list-style-type: none"> Safely manage traffic when undertaking works in the road reserve Minimise traffic delays resulting from the development/construction Manage construction vehicles entering and exiting the site Maintain satisfactory property access Minimise disruption to adjacent properties Minimise disturbance to the environment Meet the requirements of legislation and codes of practice regarding traffic management Cater for special events <p>Finally, ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services and school services) through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	Appendix AA: Traffic Impact Assessment Section 5.12.3
169	169.0004	Private	Traffic and Transport		Access into private property to access rail alignment	To ensure all impacts the contractor causes during construction be repaired and negotiated prior to construction completing.	<p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>Further, revised draft EIS Appendix AA: Traffic Impact Assessment Section 5.12.3 details ARTC commitments to a Construction Environmental Management Plan and Traffic Management Plan. A CEMP will be prepared prior to construction commencing by the construction contractor. The CEMP will include a TMP, attached as an Appendix to the CEMP. The TMP will reflect the finalised TIA, undertaken once a construction contractor has been appointed and construction routes are finalised. It will be developed in consultation with DTMR, the relevant LGA, Department of Education, affected stakeholders and an accredited road safety auditor. The plan will also take into account communications received and will be aligned with the Construction Community and Stakeholder Management Plan. The TMP will identify the impacts that construction traffic is likely to have on the transport infrastructure and detail ameliorative measures required to mitigate all identified impacts of the Project. This may include potential temporary or permanent intersection works. The TMP will detail measures to:</p> <ul style="list-style-type: none"> Safely manage traffic when undertaking works in the road reserve Minimise traffic delays resulting from the development/construction Manage construction vehicles entering and exiting the site Maintain satisfactory property access Minimise disruption to adjacent properties Minimise disturbance to the environment Meet the requirements of legislation and codes of practice regarding traffic management Cater for special events <p>Finally, ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services and school services) through the Detailed Design and Construction Works stage to ensure that safety concerns and issues are addressed.</p>	Appendix AA: Traffic Impact Assessment Section 5.12.3
169	169.0005	Private	Air Quality	Aquatic fauna	Dust during construction as a result of cuttings within close proximity of house	Regular house and work shed wash downs, tank cleaning, internal cleaning and cleaning of the roof as required. Where required, air conditioning installed to minimise requirement for windows to be opened.	<p>Dust is generated by earthworks activities, such as cuttings and changing of ground levels. However, construction dust mitigation measures are available and have been recommended to minimise emissions and reduce the potential for impact at the submitter's residence (Chapter 12: Air Quality, Section 12.6).</p> <p>Construction dust emissions have been assessed for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust). The assessment of construction has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households) (Chapter 12: Air Quality, Section 12.51).</p> <p>The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. With the inclusion of the recommended mitigation measures, including mitigation measures for earthworks (water sprays, etc) (refer Section 12.6 in Chapter 12: Air Quality), it is expected that the significance of construction dust impacts on human health and nuisance/amenity will be low or negligible.</p> <p>Further information on the assessment of construction dust impacts for the Project is available in Section 12.32 and Section 12.51 of Chapter 12: Air Quality. Section 12.6 of Chapter 12: Air Quality presents the mitigation measures which have been recommended for the Construction Works stage of the Project. The recommended mitigation and management strategies are included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Based on the results of the air quality assessment for the Construction Works stage, it is expected that the significance of construction dust impacts on human health and nuisance/amenity will be low or negligible with the inclusion of recommended mitigation measures. On this basis, cleaning of individual dwellings and sheds, and the installation of air conditioning is not considered to be required to mitigate air quality impacts.</p>	Chapter 12: Air Quality Section 12.32 Section 12.51 Section 12.6 Chapter 24: Draft Outline Environmental Management Plan
169	169.0006	Private	Project scope		Concerns about decrease to breeding and feeding capabilities as a result of train line.	Study into impacts on livestock.	<p>ARTC acknowledges impacts to rural properties and their operations, which will continue to be addressed through the Detailed Design stage.</p> <p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. During the property acquisition process, ARTC would seek to secure agreements with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties (Chapter 8: Land Use and Tenure Section 8.5.1 and 8.6.2). The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. 	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2
169	169.0007	Private	Project scope		Fencing.	Exclusion fences. Or a Gate into the train line.	<p>ARTC note that the issue relates to fencing. Fencing standards and ARTC's approach to fencing, to a reference design level, are provided in Chapter 5: Project Description, Section 5.4.12.</p> <p>In Queensland, most of the land required to deliver Inland Rail will be compulsorily acquired (resumed) by the Department of Transport and Main Roads (DTMR) on behalf of the Queensland Government. The resumption process will be carried out in accordance with the Acquisition of Land Act 1967. This legislation sets out the process for acquisition, landowner rights and the assessment of compensation. Issues relating to gates and fences will be addressed by this process and on a case by case basis.</p>	Chapter 5: Project Description Section 5.4.12
170	170.0001	Private	Hazard and Risk		There are shade lines on our land, government roads and neighbours land that act as a chemical drift barrier. Our neighbours to the south and south west grow cotton so we are restricted to what chemicals we can use through their growing season. We can't use 24D chemicals but other contact chemicals are used. We need a safety barrier in case of sudden wind change during spraying. Removing trees will restrict the ability to control certain weeds costing us more money and less cropping options.	Don't remove trees, Plant new trees.	<p>Vegetation that is within the Project footprint will only be removed if it is necessary to enable the safe construction and operation of the Project. The railway corridor is required to be kept free of mature vegetation for operational safety reasons. However, vegetation that is within the Project footprint, but outside of the railway corridor, will be retained where possible. Landowners are encouraged to notify ARTC engaged with stakeholders of property-specific requirements, such as retention of screening trees, via:</p> <p>Community-Related Enquiries Ph: 1300 550 402 E: enviroline@artc.com.au</p> <p>ARTC engaged with stakeholders is committed to rehabilitating land within the Project footprint that is disturbed during construction. For land outside of the railway corridor, this rehabilitation will include the selective planting of trees. The 'Contractor' will be required to develop a Rehabilitation and Landscaping Management Plan as part of the Construction Environmental Management Plan (CEMP) to guide rehabilitation works for the Project. This is specified throughout Chapter 24: Draft Outline Environmental Management Plan. The Rehabilitation and Landscaping Management Plan will be developed in consultation with all affected landowners to ensure that property specific landscaping requirements, such as the need to replace or augment screening trees, are reflected in the plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
170	170.0002	Private	Traffic and Transport		We work in with neighbours and socialise with neighbours so would like access over railway track to remain as already indicated on flyover.	Leave plans as are.	<p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.2. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. 	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2
170	170.0003	Private	Land Use and Tenure	Directly impacted landowner	We run cattle on cropping country during dry periods or when rotations allow us to. The construction areas cut off access to shelter and existing watering points so animals will not get water or have shade. Cattle may not feed near work carried out costing additional money.	Compensation along with moving water points.	<p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.1, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties. Where disruption to water supply occurs, crossing points will be provided or the relocation of dams or irrigation systems will be undertaken in consultation with landowners.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.2, states that where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.2 of the revised draft EIS for further detail.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads. Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority. The potential for changes to groundwater access. 	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.1 Section 8.6.2
170	170.0004	Private	Traffic and Transport	Directly impacted landowner	Our front gateway is down as a working area which will give us no access to our farmhouse as it blocks our road in.	Leave front gateway clear or alternative Access.	<p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.2. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. 	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
170	170.0005	Private	Air Quality	Directly impacted landowner	Dust from traffic during construction can contaminate crops such as chickpeas meaning they will have to be graded before sale.	Compensation for any losses.	<p>The Construction Works stage of the Project will generate dust emissions. However, construction dust emissions will be short-term, temporary and transient, as works progress along the length of the alignment. As works will be transient along the length of the Project, construction dust will not be generated along the entire alignment for the duration of the construction program (Chapter 12: Air Quality, Section 12.51).</p> <p>However, to minimise the potential for significant dust impacts, mitigation measures have been recommended for the Construction Works stage of the Project as presented in Section 12.6 of Chapter 12: Air Quality. Proper application of these recommended mitigation measures at the source of construction activity is expected to significantly reduce dust emissions and effectively manage air quality impacts, including at agricultural land uses. A number of mitigation measures are recommended to reduce dust emissions from vehicle travel, including planning of haul routes, and the application of water sprays to unsealed road sections.</p> <p>Section 12.6 of Chapter 12:Air Quality presents the mitigation measures which have been recommended for the Construction Works stage of the Project. These mitigation measures will be included in the Construction Environmental Management Plan (CEMP) as described in Chapter 24: Draft Outline Environmental Management Plan for the Project. A number of mitigation measures are recommended to reduce dust emissions from vehicle travel, including planning of haul routes, and the application of water sprays to unsealed road sections. With the implementation of the recommended mitigation measures, significant impacts to crops are not expected due to dust from vehicle traffic and financial compensation is not expected to be required.</p>	Chapter 12: Air Quality Section 12.51 Section 12.6 Chapter 24: Draft Outline Environmental Management Plan
170	170.0006	Private	Hazard and Risk	Directly impacted landowner	Some jobs like spraying only have a small timeframe in which they have to be done. What period do we have to give contractors to spray chemicals on croplands?	Flexibility to carry out farm work during construction.	There will be no restrictions on a landholder's ability to conduct activities, including farm work, on private property outside of the Project footprint during construction.	N/A
170	170.0007	Private	Traffic and Transport	Level crossing	Kildonan Road is one road that I believe needs to have a rail over road of a level crossing. I do realise that studies have been done as to the amount of vehicles on road but this has been done through one of the biggest droughts in recorded history. Cotton growers have been working on less then 10% production and grain farms like myself have not produced crops for 3 years. With all our produce now looking like it will come back into full swing along with the local feedlot looking at doubling from 20000 head of cattle to 40000 head of cattle, the road could have 5 times more traffic on it in the coming years. I don't think this has been taken into consideration.	Rail over road or road over rail.	<p>ARTC have worked closely with GRC as part of the design process, particularly regarding inputs into the assessment. GRC provided their own traffic count information which formed the baseline of the assessment. From a future proofing perspective, ARTC use 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by council and factor in the known developments in this area.</p> <p>The traffic and transport assessment showed that even if Kildonan Road peak hourly volumes were doubled, it would remain as a LOS A (see definition in Section 5.5.2 of Appendix AA: Traffic Impact Assessment). This is also a reflection of the relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040.</p> <p>ARTC, in collaboration with GRC, explored other design options for Kildonan Road including grade separation. This location did not meet the automatic grade separation criteria detailed in the Public Level Crossing Treatment Methodology (provided in Appendix BT), including topography-based criteria, nor any other metrics triggering an automatic grade separation. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope, as the cost to grade separate is grossly disproportionate to the benefits.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the AS1742.7-2016. All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>It is acknowledged the submission estimates '5 times more traffic' in the coming years, as the region emerges from a drought. ARTC will continue to work collaboratively with GRC as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 5.5.2
170	170.0008	Private	Traffic and Transport	Road safety	This road is a gravel road and becomes very dangerous when there is additional traffic on it. There will be additional traffic along it for the construction process as it runs all the way along the railway track for approx.25 km, This road will become very dangerous for local residents along with contract workers, especially at peak times like harvest.	Bitumen Road	<p>Appendix AA: Traffic Impact Assessment , Section 5.6 discusses pavement impacts and highlights mitigation measures for pavement damages to local government roads. It is noted that residents have raised concern regarding maintenance of Yelarbon Kurumbul Road during construction works.</p> <p>The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. In the case of Yelarbon Kurumbul Road, EIS assumptions suggest this threshold will be reached during construction. As a result, ARTC has had ongoing discussions with the Road Manager, Goondiwindi Regional Council (GRC) on pavement impact and road maintenance arrangements. The agreed arrangements to deal with impacted pavements as a result of construction will be in agreement between GRC and ARTC.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p> <p>Appendix AA: Traffic Impact Assessment , Section 5.2 discusses the road safety impact assessment completed on all roads, whereby conditions such as a gravel surface are considered with mitigation measures provided. It is noted that only parts of Yelarbon Kurumbul Road are gravel with both ends of the road being bitumen. Further Appendix AO of revised draft EIS Appendix AA: Traffic Impact Assessment provided the full road link safety assessment completed for each construction route used within the Project and includes greater detail of proposed mitigation measures. This is given below:</p> <p>*Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. If no sealing is warranted, road should be designed and formalised to a suitable gravel road standard. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standard design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during Detailed Design stage as well as updated during the Construction Works stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification 'MRTS02 – Provision for traffic' requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.</p>	Appendix AA: Traffic Impact Assessment Section 5.2 Section 5.6 Appendix AO
170	170.0009	Private	Social Impact Assessment		Yelarbon Silo Art has been voted the best silo art in the country. Will noise barrier walls effect the tourist and local aspect of the silo art that the community has invested in?	Unsure of way around it.	<p>Revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations, Section 16.4, provided as part of the draft EIS proposed a concept noise barrier in Yelarbon to mitigate railway noise impacts on homes and businesses. The noise wall design in Yelarbon will be progressed during detailed design with consideration of the silo art, hydrology and pedestrian connectivity.</p> <p>Depending on its location, height, materials and length, a noise wall could affect views to the Yelarbon silo art from the viewing platform on the other side of the rail line. Noise mitigation impacts will need to be balanced against potential impacts on views to the Yelarbon silos art which is a recent enhancement to Yelarbon's character and a tourism attraction.</p> <p>Detailed design for a noise wall in Yelarbon would involve consultation with Yelarbon stakeholders and as a first preference, would avoid impacts on views to the silos. If this would compromise noise mitigation, alternative mitigations for discussion with the Yelarbon community may include architectural treatment to sensitive receptors that would experience noise impacts, or moving the viewing platform.</p>	Appendix W: Noise and Vibration Assessment - Railway Operations Section 16.4
171	171.0001	Community Group	Stakeholder engagement		The consultation process did not provide an appropriate forum where concerns were acknowledged and addressed. Of concern, is the way in which the ARTC undertook community meetings. It was observed that these meetings were undertaken in a perfunctory manner, with little consideration to the concerns being raised by the community and regularly marking large changes (including to routes) without any consultation or consideration of community opinion/expertise. Of great concern, was the committee's tendency to ignore viable alternate routes and regularly denying due process by holding meetings in locations that did not allow for appropriate community consultation.	nil.	<p>During preparation of the Project reference design and EIS, it was not within ARTC's scope to investigate alternative routes outside the study area that was set by the Australian Government following its review of the four alternative routes in the Yelarbon to Gowrie Corridor Options Report (DIRD 2016). Subsequent to the submission of the EIS to the Coordinator-General, at the request of the Deputy Prime Minister, in 2020, ARTC prepared the Inland Rail Information Paper, which considered alternative Project alignments via Whetstone State Forest and Cecil Plains.</p> <p>It concluded that the alternative alignment would result in a longer distance and transit time, increased costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The methodologies employed in the Information Paper were reviewed by GTA Consultants and were found to be suitable. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details.</p> <p>The area covered by the Inner Darling Downs CCC is aligned with the Groom Federal Electorate. Meetings were hosted by different townships within the electorate - Brookstead, Southbrook, Pittsworth, Gowrie Junction - to ensure that different community members have the opportunity to attend the meeting as observers.</p> <p>Community Consultative Committee meetings are run by an independent chair. Committee members have the opportunity to nominate agenda items for discussion at the meetings. In accordance with the committee charter, ARTC provides updates on the various components of the Project, which can be technical in nature. ARTC prepares detailed minutes of the meetings and slides, which are available on the Inland Rail website following endorsement by the members, and, where requested, provides the slide packs to members for their further consideration. Committee members also have the opportunity to ask questions and seek clarification on any points during the meeting or via phone or email after the meeting.</p>	Appendix E: Consultation Report
171	171.0002	Community Group	Flooding	Aquatic fauna	The Multi Criteria Analysis Framework that put forward by ARTC is fundamentally flawed and is based on miscalculations and a subjective methodology. The Independent Expert Panel has ignored local knowledge and previous Independent experts.	nil.	<p>As described in Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken in Section 2.8.The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of good quality agricultural land that cannot be avoided.</p> <p>Where changes to flooding and geomorphology are identified, nominated Flood Impact Objectives (FIO) have been developed to provide guidance and consideration to indirect impacts on particular land uses (Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 14: Flooding and Geomorphology). The FIOs applied to assess the Project impacts including erosion and scouring potentials are presented in Chapter 14: Flooding and Geomorphology, Table 14-4, Section 14.6.3. The Project will target achieving the FIOs for events up to and including the 1% AEP for land, receptors, and/or infrastructure, and where the FIOs are met, it is reasonable to assume there will be no adverse impacts from flooding on the use of land.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted Flood Impact Objectives (FIOs) to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case by case basis, including through consultation with stakeholders and landowners. This is also further discussed in the revised draft EIS, Chapter 8: Land Use and Tenure, Section 8.5.1.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 8: Land Use and Tenure Section 8.5.1 Chapter 14: Flooding and Geomorphology Section 14.6.3 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
171	171.0004	Community Group	Noise and Vibration	Operational noise	According to the ARTC, Australia has adopted the FRA guidelines for rail safety regulations and standards in Australia. ARTC also advised that Train Horns will generate 130 Dcb when sounded. This is at odds with the FRA regulations that state 115Dcb is the maximum allowed.	nil.	<p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline Operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS, Section 12.2 of Appendix W: Noise and Vibration Assessment - Railway Operations. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns, refer to Section 16.10 of Chapter 16: Noise and Vibration and Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 12.2 Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
171	171.0005	Community Group	Project alignment		ARTC have failed to appropriately consider alternate route options. Various stakeholders (referenced in submission) have provided significant evidence and data that supports that the ARTC have not undertaken appropriate due diligence in route selection and consideration. Whilst it is acknowledged that an inquiry was ordered due to increasing public pressure, it is noted that the enquiry did not appear to be independent as it relied completely on ARTC input and used no external expertise.	nil.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ ability to enhance the Inland Rail service offering ▶ construction and operating costs ▶ the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ▶ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ▶ approvals and stakeholder engagement: 12.5 per cent ▶ technical viability: 17 per cent ▶ safety: 16.5 per cent ▶ constructability: 12.5 per cent ▶ operations: 16.5 per cent. 	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
171	171.0006	Community Group	Social Impact Assessment		The project is causing undue stress to many in our community taking a toll on their health and wellbeing. Adding to this stress is the fact that the Social Impact Assessment to be provided in the EIS is being conducted by FFJV. Given the misleading information that FFJV have provided to this community over the past three years, it is difficult to imagine that the Social Impact Assessment they will provide within the EIS will be a true and correct account of the current community concerns and social impact.	nil.	<p>Appendix X: Social Impact Assessment, Section 8.5.3 acknowledges that the Project has resulted in stress and anxiety for some landowners and residents. In addition to the ongoing community engagement process which aims to provide information and enable consideration of landowners concerns, ARTC has invested in a mental health partnership to enable people affected by the proposed Project to access local and independent mental health support services.</p> <p>The Social Impact Assessment has been conducted by a Social Impact Assessment specialist with more than 35 years' experience. ARTC is not aware of any incidences of misleading information being provided by FFJV.</p>	Appendix X: Social Impact Assessment Section 8.5.3
171	171.0007	Community Group	Flora and Fauna	Koala	The literature is clear as to the nexus between rail projects and the death of local wildlife, including koalas. There is an abundance of koala colonies along the route proposed by ARTC. Despite being listed by the Federal Government as a threatened species under the Environmental Protection and Biodiversity Conversation Act, the ARTC have proposed a route that would have disastrous consequences for the local koala population and its habitat. History has shown that koala relocation is not successful (as evidenced by the recent Coomera Town Centre development.) and should not be considered as an appropriate solution.	nil.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan (DKMP). The DKMP proposes specific management and mitigation measures for koalas during both construction and railway operations.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ Ability to enhance the Inland Rail service offering ▶ Construction and operating costs ▶ Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken in Section 2.8.The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>In consideration of increased train movements and risk of collision, recent studies have demonstrated that a very small proportion of injuries to koalas is caused by trains (1.3%) (Henning et al. , 2015). Therefore, the increase in train movements to along the Project alignment presents a relatively low risk and is unlikely to significantly impact the species.</p> <p>(Reference source: Henning, J. , Hannon, C. , McKinnon. , Larkin, R. & Allavena, R.2015.
