

APPENDIX A1

Response to draft EIS Submissions

BORDER TO GOWRIE REVISED DRAFT ENVIRONMENTAL IMPACT STATEMENT

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
1	1.0001	Private	Project alignment		The submitter asks why does the inland rail need to deviate from any existing corridor once it links into the QLD network east of Goondwindi? If it has linked into the QLD network why does it not follow the existing corridor to Warwick and then cut across to Bromelton. This would at least 60 kms shorter and the majority of the line on existing corridor. The submitter asks why the rail line does not follow the Warwick line to Toowoomba if Toowoomba needs to be linked in. The submitter thinks that there is a political agenda behind this decision-making.	A route predominately on existing state owed land should be seriously considered without the political overlay.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one to Brisbane via Toowoomba and the other via Warwick and Rathdowney (see Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it also became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>In 2015, the Inland Rail Implementation Group (IRIG) endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick. <p>The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Australian Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017 (see Chapter 2: Project Rationale, Section 2.9.3).</p> <p>Following completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the Base Case via Wellcamp-Charlton alignment was to be progressed through phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced in Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the Project.</p>	Chapter 2: Project Rationale Section 2.8.2 Section 2.9.3
001a	1.0002	Private	Flooding		Inadequate hydrology assessment for smaller creeks (i.e. Westbrook and Gowrie). The rail line cannot cross these creeks due to flooding impacts.	Change route to run adjacent to Gowrie Creek. Route should use West Moreton Line joining from. Route should join Cecil Plains line at Cecil Plains or join the West Morton line at Dalby. The route options would stop flooding impacts. The line cannot cross these creeks at right angles due to flooding impacts.	<p>The chosen rail alignment does not cross Gowrie Creek, but instead it runs adjacent to Gowrie Creek. Where the rail alignment crosses Westbrook Creek and Dry Creek, sufficient bridge openings and culverts have been allowed for flood water to pass underneath and through the rail alignment.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The revised draft EIS has assessed the chosen alignment selected by the Australian Government. The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, that are detailed in Section 2.8.2 of Chapter 2: Project Rationale. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment</p>	Chapter 2: Project Rationale Section 2.8.2 Section 2.9.3 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
001a	1.0003	Private	Flooding	Cumulative impacts	ARTC have not included approved development applications (DA) and there is no cumulative impact assessment of these DAs, in relation to flooding (further detail in submission 1b).	Change route to run adjacent to Gowrie Creek. Route should use West Moreton Line joining from. Route should join Cecil Plains line at Cecil Plains or join the West Morton line at Dalby. The route options would stop flooding impacts. The line cannot cross these creeks at right angles due to flooding impacts.	<p>Development applications are considered by the relevant planning authority, in the case of the cannabis farm/motorsport testing facility/entertainment precinct developments. Toowoomba Regional Council (TRC) is the relevant determining authority. As part of any development application located in a flood-affected area, and in accordance with TRC's Flood Hazard Overlay Code, developers are required to carry out a flood risk assessment for the new development to demonstrate that no adverse flood impacts will be caused elsewhere as a result of the development or that impacts would be suitably mitigated.</p> <p>ARTC does not have control over the timing of new developments as determined by TRC, and it is therefore considered unreasonable for ARTC to include proposed developments in their flood modelling to support a reference design and revised draft EIS process. As part of the detailed design of Inland Rail, significant new developments, with development approval, that are likely to affect the local hydrology and floodplain behaviour, and that is likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
001b	1.0004	Private	Flooding	Flood immunity	The extent of flood issues at Westbrook Creek have not been adequately captured. ARTC has used not validated data in flood modelling. Selected flood mapping/data underestimates water flow and velocity in order to understate the impacts of Inland Rail. The selected flood mapping/data has been selected to ensure the EIS is approved. This approach is unacceptable and will cause greater environmental and safety issues once the Project is built.	Nil	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. The flood mapping is based on a new model specifically developed for the Inland Rail Project reference design and EIS. Flood modelling has been conducted for a range of design events or AEPs (Annual Exceedance Probabilities) and tested for potential blockage, climate change and extreme event scenarios.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Westbrook Creek and Dry Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 6.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>Flood mapping has been provided in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the Digital Platform for each of the Flood Impact Objectives including (but not limited to):</p> <ul style="list-style-type: none"> Change in peak water levels Change in peak velocity Change in time of inundation Change in hazard Change in velocity (with FIO cut-off's applied) Change in hazard (with FIO cut-off's applied) Change in time of inundation (with FIO cut-off's applied). <p>The web-based Digital Platform will be publicly available at the same time as the revised draft EIS is available for public consultation and will remain available post-consultation of the revised draft EIS. The Digital Platform includes local and regional catchments for the Existing Case, Developed Case, Change Mapping and Exceedances aligned with the mapping requirements, for all events as indicated in the Coordinator-General's letter dated 30-September-2022.</p> <p>The PDF mapping in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 includes local and regional catchments for the Existing Case, Developed Case, Change Mapping and Exceedances aligned with the mapping requirements, for the 1% and 20% AEP events. The PDF mapping includes the sensitivity runs and calibration events.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 6.6 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
001b	1.0005	Private	Flooding	Modelling	The Toowoomba Regional Council (TRC) flood mapping is used for Wellcamp Airport/Westbrook Creek contradicts the DNRME flood modelling. The extent of the TRC flood mapping is only in dry and spring creeks (according to a TRC Planning Officer), with no data collected for the Inland Rail proposal area. TRC has marked the proposal area as overflow and with no provided flood volumes or flow data. The DNRME flood mapping shows substantial deep-water flows in the proposal area, prior to building of the airport. The TRC model was chosen to have the EIS approved.	Nil	<p>The Westbrook Creek and Dry Creek flood modelling is not based on the Toowoomba Regional Council (TRC) mapping. New hydrologic and hydraulic models were developed by ARTC specifically for the Inland Rail Project reference design and the EIS, in accordance with industry guidelines and standard modelling practices.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Westbrook and Dry Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 6.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 6.6
001b	1.0006	Private	Flooding	Cumulative impacts	ARTC have not considered cumulative flooding impacts of proposed development sites in proximity of the rail line. These proposed developments include: <ul style="list-style-type: none"> Medical Cannabis Farm within Westbrook Creek flood zone (Figure 1) Motorsport Testing Facility at Wellcamp Airport (Figure 6) Wellcamp Entertainment Precinct. These developments will further exacerbate the flooding impacts caused by Inland Rail and should be considered in flood modelling.	The impacts of the proposed developments in the catchment need to be considered in terms of cumulative impact and incorporated in the flood modelling.	<p>Development applications are considered by the relevant planning authority, in the case of the cannabis farm/motorsport testing facility/entertainment precinct developments. Toowoomba Regional Council (TRC) is the relevant determining authority. As part of any development application located in a flood-affected area, and in accordance with TRC's Flood Hazard Overlay Code, developers are required to carry out a flood risk assessment for the new development to demonstrate that no adverse flood impacts will be caused elsewhere as a result of the development or that impacts would be suitably mitigated.</p> <p>ARTC does not have control over the timing of new developments as determined by TRC, and it is therefore considered unreasonable for ARTC to include proposed developments in their flood modelling to support a reference design and revised draft EIS process. As part of the detailed design of Inland Rail, significant new developments, with development approval, that are likely to affect the local hydrology and floodplain behaviour, and that is likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
001b	1.0007	Private	Flooding	Modelling	ARTC have limited impact assessment only to properties dissected by the propose rail line, as per B2G Map 2 - Potentially Impact Land (Westbrook Creek) (Figure 4, Submission 1b). Concerns that Figure 4, which was presented to CCC Inner Downs, suggests that flooding ceases at the lot boundary of the properties affected by flooding.	Nil	<p>The ARTC flood assessment has considered all lots within the hydraulic model domain, as shown on Figure 14-3a-e of the revised draft EIS, Chapter 14: Flooding and Geomorphology. The impacted lots shown in Figure 14-4a-d of the Submitter's submission were lots that had been identified to potentially experience flood impacts (not existing flooding) in a 1% AEP event, at a specific point in time during the reference design development, as presented in one of the community consultation update sessions. Areas that are currently at risk of flooding (i.e. pre-Inland Rail) and areas that are expected to be impacted by the Inland Rail Project from a flooding perspective are described and discussed in Sections 14.7.4 (Existing environment - Existing flooding regime) and Section 14.9.1 (Impact Assessment Summary - Flooding impact assessment) of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>It is noted that only flood impacts outside of the proposed rail corridor and exceeding the Flood Impact Objectives (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology) are reported in Section 14.9.1 of Chapter 14: Flooding and Geomorphology. However, all flood impacts for the range of modelled AEP events are presented in Appendix T1 and T2: Hydrology and Flooding Technical Report - Volumes 1 and 2 of the revised draft EIS, Chapter 14: Flooding and Geomorphology for completeness.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Chapter 14: Flooding and Geomorphology Section 14.7.4 Section 14.9.1 Figure 14-3a-e Figure 14-4a-d Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
001b	1.0008	Private	Flooding	Cumulative impacts	The Toowoomba Regional Council have planned for major developments at the township of Westbrook, which ARTC have not taken into consideration. The developments will increase run off and volume of flows in both Spring and Westbrook Creeks, which converge at Wellcamp Airport. These developments will increase the flooding impacts of Inland Rail. The developments, pattern of urban settlement, land use and key placemaking features of concerns are detailed in West Toowoomba Land Use Investigations Structure Plan (Figure 5, Submission 1b).	Nil	<p>Development applications are considered by Toowoomba Regional Council (TRC) as the relevant planning authority. As part of any development application located in a flood-affected area, and in accordance with TRC's Flood Hazard Overlay Code, developers are required to carry out a flood risk assessment for the new development to demonstrate that no adverse flood impacts will be caused elsewhere as a result of the development or that impacts would be suitably mitigated.</p> <p>In addition, ARTC has no control over the timing of new developments as determined by TRC, and it is therefore considered unreasonable to expect ARTC to include proposed developments in their flood modelling to support a Reference Design and EIS process.</p> <p>As part of the detailed design of Inland Rail, significant new developments, with a development approval, that are likely to affect the local hydrology and floodplain behaviour, and that are likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority.</p>	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
001b	1.0009	Private	Flooding	Modelling	No flood modelling has been collected since the completion of the levee bank around the Wellcamp airport. The levee bank will contribute to flooding by pushing flows west over the rail corridor (refer to Figure 1, page 1, submission 1b).	Nil	<p>The levee bank between Wellcamp Airport and Westbrook Creek is represented in the ARTC flood models, based on engineering information provided by Wellcamp Airport during the reference design, draft EIS, and revised draft EIS process.</p> <p>The Submitter has indicated an area of infill (highlighted in yellow) that occupies the majority of the Westbrook Creek channel, and floodplain, to the southwest of Wellcamp Airport. The Submitter claims that the highlighted area is water which now cannot flow where it used to due to the levee bank. There is also no evidence of such extensive infill developments evident on recent satellite images and aerial photography And ARTC considers it unlikely that Wellcamp Airport would have been filled.</p> <p>In addition, ARTC has no control over the timing of new developments as determined by TRC, and it is therefore considered unreasonable to expect ARTC to include proposed developments in their flood modelling to support a reference design and EIS process.</p> <p>As part of the detailed design of Inland Rail, significant new developments, with a development approval, that are likely to affect the local hydrology and floodplain behaviour, and that are likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority.</p>	N/A
001b	1.0010	Private	Flooding	Modelling	<p>ARTC claims: No changes to the flood extent outside of Project corridor</p> <p>Submitters response: The Project corridor is 2 km wide it would not be reasonable to think that there would be flooding outside this corridor.</p>	Nil	<p>ARTC has assumed that the Submitter in this instance meant to say 'It would not be reasonable to think that there would not be flooding outside of the corridor'. Assuming this assumption is correct, ARTC provides the following response:</p> <p>The Project Study Corridor is 2 km wide, however, the Project Corridor refers to the operational rail corridor (approximately 40-80 m wide) ARTC is proposing to acquire.</p> <p>The statement 'No changes to the flood extent' means that the area of inundation currently experienced outside of the Project Corridor is expected to remain relatively unchanged, as per the modelling, for the range of AEP events modelled, and noting the nominated FIO thresholds.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001b	1.0011	Private	Flooding	Increase in velocities	ARTC claim: No changes to velocities outside the Project corridor Submitters response: This does not seem to be defensible the velocity of water must increase downstream as the inland rail structure constrains the volumes between the 15 m high structure and the existing rail line on the other side of the creek.	Nil	<p>Potential changes in velocity have been assessed in accordance with the Flood Impact Objectives and is discussed in Section 14.9.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.9.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001b	1.0012	Private	Flooding	Increase in flows	<p>ARTC claim: No changes to flow direction</p> <p>Submitter response: The water flow must change as there is a barrier across where it naturally flows and the creek. The flow direction used are already incorrect as they have not accounted for the development at the airport, nor the development that have been approved adjacent to the rail line.</p>	Nil	<p>Potential changes in velocity have been assessed in accordance with the Flood Impact Objectives and is discussed in Section 14.9.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.9.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001b	1.0013	Private	Flooding	Modelling	<p>ARTC claims: Afflux contained mostly in Project corridor</p> <p>Submitted response: This is inconsistent with the statements about the flood extent made above. How can the water flow be mostly contained in the Project corridor, when ARTC have already stated that the flood extent is contained?</p>	Nil	<p>The existing and design case water flow is not contained in the Project Corridor, and this is not something ARTC has stated anywhere (note: the Project Corridor is typically approximately 40-80 m wide, whereas the Study Corridor is 2 km wide). The existing water flow and flood extent (i.e. pre-Inland Rail) are discussed and visually presented in Section 14.7 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>Afflux and changes in flood extent are measures used to assess potential flood impacts as a result of the Inland Rail Project. ARTC has not claimed that the water flow is mostly contained in the Project Corridor, nor has ARTC claimed that the flood extent is contained in the Project Corridor. The flood impacts associated with the Inland Rail Project are discussed in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001b	1.0014	Private	Flooding - Westbrook and Dry Creek	Directly impacted landowner	<p>ARTC claim: Afflux affects 11 lots owned by 5 landowners</p> <p>Submitted response: This will affect many lots down and upstream as well and these have been deliberately excluded from the ARTC study.</p>	Nil	<p>The properties that are expected to experience flood impacts outside the Flood Impact Objectives, as a result of Inland Rail, are reported and discussed in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology. The impacted lots, referred to in the Submitter's submission, were lots that had been identified to potentially experience afflux in a 1% AEP event at a specific point in time during the Reference Design development, as presented in one of the community consultation update sessions (i.e. prior to the draft EIS release). No properties were deliberately excluded from ARTCs assessment as claimed by the Submitter. The model domain has been set in line with industry guidelines and standard practice.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>It should be noted that the Flood Impact Objectives have been amended in consultation with the Expert Flood Panel. The updated Flood Impact Objectives are presented in Table 14-4 of Chapter 14: Flooding and Geomorphology. The flood impact assessment results presented in the revised draft EIS will therefore be different in some areas, compared to what was presented in the draft EIS.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6</p> <p>Section 14.8.1</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001b	1.0015	Private	Flooding - Westbrook and Dry Creek	Increase in peak water levels	<p>ARTC Claim: Max. afflux of 300 mm outside of the project corridor in discrete pockets, but generally between 50 and 150 mm Submitter</p> <p>Response: This is a considerable increase in water level. ARTC cannot limit their flood modelling to just where the rail line goes the upstream and downstream effects need to be included.</p>	Nil	<p>The flood modelling conducted by ARTC considers upstream and downstream impacts as well as impacts around the proposed rail alignment. Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (refer to Table 14-4 of Chapter 14: Hydrology and Geomorphology of the revised draft EIS). During the Reference Design development process, ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section (Sections 5 through to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.8.1 of Chapter 14: Flooding and Geomorphology.</p> <p>Additional mapping has been generated by ARTC to provide further information and justification to the Expert Flood Panel. This mapping included within the revised draft EIS provides more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. As per ARTC's Mitigation Framework, ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p> <p>Section 5 - 17</p>
001b	1.0016	Private	Flooding - Westbrook and Dry Creek	Flood immunity	<p>ARTC claim: No buildings affected by any changes in flood behaviour.</p> <p>Submitter response: ARTC need to undertake downstream modelling to make this statement. Increasing a flood event by 30cm could have dire consequences for the houses and buildings downstream not to mention the threat to people's lives.</p>	Nil	<p>The flood modelling domain (or extent) has been determined in line with industry guidelines and standard practices. Based on the revised draft EIS modelling around Westbrook and Dry Creeks, no buildings are affected by any changes in flood behaviour for events up to and including the 1% AEP event, as required by the ToR.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001c	1.0017	Private	Flooding - Gowrie Creek	Modelling	There is no correlation between the flood modelling used by ARTC (Figure A3-b in EIS used as an example (B2G - Gowrie Creek 10% AEP Peak Water Level - Existing Case) or Figure 1, Submission 1c) and that developed by Toowoomba Regional Council, depicted by the Toowoomba Region - Flood Risk Information Portal (Figure 3, Submission 1c)	<p>The route will need to change so the rail runs parallel to Gowrie Creek. This would mean it needs to come in from Oakay on the West Moreton Line. The line cannot cross these creeks at right angles as planned due to flooding impacts. The line would need to join the existing Cecil Plains line at Cecil Plains or join the West Moreton line at Dalby - both these options stop the flooding impacts.</p>	<p>The Submitter has presented an extract from the ARTC 10% AEP event, in comparison to Toowoomba Regional Council's flood risk category flood mapping. These datasets are not directly comparable as they represent floods of different magnitudes. In addition, the Toowoomba Regional Council flood risk information portal provides indicative flood mapping for planning and development control purposes and tends to have a regional focus. If a development application site falls within a TRC flood risk zone Council typically requires the developer to undertake a detailed, site-specific Flood Risk Assessment in support of the development application.</p> <p>ARTC have developed new site-specific and Project-specific flood models for Gowrie Creek, based on industry guidelines and standard modelling practices.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
001c	1.0018	Private	Flooding - Gowrie Creek	Directly impacted landowner	ARTC claim: Afflux affects nine lots owned by six landowners Submitter response: This will affect many lots down and upstream as well and these have been deliberately excluded from the ARTC study.	<p>The route will need to change so the rail runs parallel to Gowrie Creek. This would mean it needs to come in from Oakay on the West Moreton Line. The line cannot cross these creeks at right angles as planned due to flooding impacts. The line would need to join the existing Cecil Plains line at Cecil Plains or join the West Moreton line at Dalby - both these options stop the flooding impacts.</p>	<p>The properties that are expected to experience flood impacts outside the Flood Impact Objectives, as a result of Inland Rail, are reported and discussed in Section 14.8.1 of the draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The impacted lots, referred to in the Submitter's submission, were lots that had been identified to potentially experience afflux in a 1% AEP event at a specific point in time during the Reference Design development, as presented in one of the community consultation update sessions (i.e. prior to the draft EIS release). No properties were deliberately excluded from ARTCs assessment as claimed by the Submitter. The model domain has been set in line with industry guidelines and standard practice.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>It should be noted that the Flood Impact Objectives have been amended in consultation with the Expert Flood Panel. The updated Flood Impact Objectives are presented in Table 14-4 of Chapter 14: Flooding and Geomorphology. The flood impact assessment results presented in the revised draft EIS will therefore be different in some areas, compared to what was presented in the draft EIS.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.9.1</p> <p>Table 14-4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
001c	1.0019	Private	Flooding - Gowrie Creek	Increase in peak water levels	<p>ARTC claim: 350 mm increase on one private access (further design and mitigation required)</p> <p>Submitted response: ARTC have claimed a maximum afflux of 300 mm and now they state it is 350 mm. This provides evidence that the data and statements made by ARTC are not valid and should not be relied upon as a basis on which to build a rail line.</p>	<p>The route will need to change so the rail runs parallel to Gowrie Creek. This would mean it needs to come in from Oakley on the West Moreton Line. The line cannot cross these creeks at right angles as planned due to flooding impacts. The line would need to join the existing Cecil Plains line at Cecil Plains or join the West Moreton line at Dalby - both these options stop the flooding impacts.</p>	<p>The context for this submitter issue raised was a presentation to the Inner Darling Downs Community Consultative Committee (CCC), at a specific point in time during the Reference Design development and prior to finalisation of the revised Reference Design and revised draft EIS. Some of the impacts would have changed during the revised Reference design development process, given the iterative nature of design development, and considering community and stakeholder feedback that's been considered as part of the design development.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>It should be noted that the Flood Impact Objectives have been amended in consultation with the Expert Flood Panel. The updated Flood Impact Objectives are presented in Table 14-4 of Chapter 14: Flooding and Geomorphology. The flood impact assessment results presented in the revised draft EIS will therefore be different in some areas, compared to what was presented in the draft EIS.</p>	<p>Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2</p>
001c	1.0020	Private	Flooding - Gowrie Creek	Modelling	<p>B2G Project fly-through video (Figures 4 -7 Submission 1c) shows the rail line is 15 meters high and has limited culverts, none of which are shown in the schematic/digital modelling.</p>	<p>The route will need to change so the rail runs parallel to Gowrie Creek. This would mean it needs to come in from Oakley on the West Moreton Line. The line cannot cross these creeks at right angles as planned due to flooding impacts. The line would need to join the existing Cecil Plains line at Cecil Plains or join the West Moreton line at Dalby - both these options stop the flooding impacts.</p>	<p>Individual local culverts have not been shown on the ARTC Project animation/fly-through video; however, major bridges have been shown. All proposed bridges and culverts are shown on the Floodplain and Drainage Structure figures in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology. Figure 14.18a-e shows the proposed culverts and bridges within the Gowrie Creek floodplain, which has been positioned and sized based on flood modelling investigations and community/stakeholder feedback. The proposed floodplain culverts within the Gowrie Creek floodplain are described in Table 14-51 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale, Section 2.8-2.10 of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts - 12.5% (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impacts - 12.5% (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) Approvals and stakeholder engagement - 12.5% Technical viability - 17% Safety - 16.5% Constructability -12.5% Operations - 16.5%. 	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Chapter 14: Flooding and Geomorphology Section 14.8.1 Figure 14.18a-e Table 14-51</p>
001c	1.0021	Private	Flooding - Gowrie Creek	Modelling	<p>The current flood model is concentrated to land parcels only which are dissected by Inland Rail corridor. The scope of the flood study should be expanded to include the Gowrie Creek catchment. Flooding goes beyond properties boundaries. Flood impacts at Gowrie Creek has no credibility and the modelling should be subject to intense scrutiny of the expert panel.</p>	<p>The route will need to change so the rail runs parallel to Gowrie Creek. This would mean it needs to come in from Oakley on the West Moreton Line. The line cannot cross these creeks at right angles as planned due to flooding impacts. The line would need to join the existing Cecil Plains line at Cecil Plains or join the West Moreton line at Dalby - both these options stop the flooding impacts.</p>	<p>The flood modelling conducted by ARTC considers upstream and downstream impacts as well as impacts around the proposed rail alignment. All land parcels within the Gowrie Creek hydraulic model domain (refer Sub-Appendix A-D of Appendix T2: Hydrology and Flooding Technical Report - Volume 2 of the revised draft EIS) have been considered as part of the flood impact assessment.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and the revised Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Appendix T2: Hydrology and Flooding Technical Report - Volume 2 Appendix A-D</p>
001c	1.0022	Private	Project alignment	Flood immunity	<p>ARTC should examine alternative route options including the original and existing Queensland Rail line on the northern side of Gowrie Creek. The flood modelling for the existing alignment is accurate given the line has been operating since 1865. Flood panel should consider this route as it's brownfield and already has flood mitigation strategies. Instead of connecting the Inland Rail line to the QR Line at Gowrie, it should instead join at Oakley to avoid flooding disaster (Figure 8, Submission 1c).</p>	<p>The route will need to change so the rail runs parallel to Gowrie Creek. This would mean it needs to come in from Oakley on the West Moreton Line. The line cannot cross these creeks at right angles as planned due to flooding impacts. The line would need to join the existing Cecil Plains line at Cecil Plains or join the West Moreton line at Dalby - both these options stop the flooding impacts.</p>	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs The outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts - 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impact - 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) Approvals and stakeholder engagement - 12.5 per cent Technical viability -17 per cent Safety -16.5 per cent Constructability - 12.5 per cent Operations - 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney (Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick. <p>The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020 (Chapter 2: Project Rationale, Section 2.9.3). Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details: inlandrail.gov.au/understanding-inland-rail/publications-and-reports.</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to the Project and Appendix 4 (pp. 109-116) provide a detailed history of routes via Warwick that have been considered over time.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.8.2 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report</p>
001c	1.0023	Private	Flooding - Gowrie Creek	Modelling	<p>ARTC claims no changes to the flood extent outside of project corridor. However, the project corridor is 2 km wide it would not be reasonable to think that there would be flooding outside this corridor.</p>	<p>Scope of this flood study to be extended to the Gowrie Creek Catchment. It is not sensible for ARTC to conduct a flood model survey of just the lots of land that are dissected by the Inland Rail structure. ARTC have not displayed any credibility by providing this evidence of the flood effects at Gowrie Creek, and as such the modelling should be subjected to the intense scrutiny of this expert panel. The Council should ask ARTC to examine alternative options including the original Inland Rail route which is the existing Queensland Rail line on the northern side of Gowrie Creek. The flood mapping for this is accurate as this rail line has been in existence since 1865 and the line is still in use so the flood interface with the line is well known. The Queensland Rail line further west departs from this corridor, and despite it being the best option as far as mitigating flood effects would currently be excluded from consideration due to the constraint of the staying within the current EIS corridor.</p>	<p>ARTC has assumed that the Submitter in this instance meant to say 'It would not be reasonable to think that there would not be flooding outside of the corridor'. Assuming this assumption is correct, ARTC provides the following response:</p> <p>The Project Study Corridor is 2 km wide, however, the Project Corridor refers to the operational rail corridor (approximately 40-80 m wide) ARTC is proposing to acquire.</p> <p>The statement 'No changes to the flood extent' means that the area of inundation currently experienced outside of the Project Corridor is expected to remain unchanged, as per the modelling, for the range of AEP events modelled.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
001c	1.0024	Private	Flooding - Gowrie Creek	Modelling	ARTC claims no changes to velocities outside the project corridor. However, this does not seem to be defensible the velocity of water must increase down stream as the inland rail structure constrains the volumes between the 15 m high structure and the exiting rail line on the other side of the creek.	Scope of this flood study to be extended to the Gowrie Creek Catchment. It is not sensible for ARTC to conduct a flood model survey of just the lots of land that are dissected by the Inland Rail structure. ARTC have not displayed any credibility by providing this evidence of the flood effects at Gowrie Creek, and as such the modelling should be subjected to the intense scrutiny of this expert panel. The Council should ask ARTC to examine alternative options including the original Inland Rail route which is the existing Queensland Rail line on the northern side of Gowrie Creek. The flood mapping for this is accurate as this rail line has been in existence since 1865 and the line is still in use so the flood interface with the line is well known. The Queensland Rail line further west departs from this corridor, and despite it being the best option as far as mitigating flood effects would currently be excluded from consideration due to the constraint of the staying within the current EIS corridor.	<p>Potential changes in velocity have been assessed in accordance with the Flood Impact Objectives and is discussed in Section 14.9.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. 001c	1.0025	Private	Flooding - Gowrie Creek	Modelling	ARTC claims no changes to flow direction. However, the water flow must change as there is a barrier across where it naturally flows and the creek. The water will follow the barrier downhill and cause erosion and flooding on the upside of this structure.	Scope of this flood study to be extended to the Gowrie Creek Catchment. It is not sensible for ARTC to conduct a flood model survey of just the lots of land that are dissected by the Inland Rail structure. ARTC have not displayed any credibility by providing this evidence of the flood effects at Gowrie Creek, and as such the modelling should be subjected to the intense scrutiny of this expert panel. The Council should ask ARTC to examine alternative options including the original Inland Rail route which is the existing Queensland Rail line on the northern side of Gowrie Creek. The flood mapping for this is accurate as this rail line has been in existence since 1865 and the line is still in use so the flood interface with the line is well known. The Queensland Rail line further west departs from this corridor, and despite it being the best option as far as mitigating flood effects would currently be excluded from consideration due to the constraint of the staying within the current EIS corridor.	<p>Potential changes in velocity have been assessed in accordance with the Flood Impact Objectives and is discussed in Section 14.9.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.9.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2</p>
001c	1.0026	Private	Flooding - Gowrie Creek	Modelling	ARTC claims afflux contained mostly in Project corridor. However, this is inconsistent with the statements about the flood extent made above. How can the water flow be mostly contained in the Project corridor, when ARTC have already stated that the flood extent is contained?	Scope of this flood study to be extended to the Gowrie Creek Catchment. It is not sensible for ARTC to conduct a flood model survey of just the lots of land that are dissected by the Inland Rail structure. ARTC have not displayed any credibility by providing this evidence of the flood effects at Gowrie Creek, and as such the modelling should be subjected to the intense scrutiny of this expert panel. The Council should ask ARTC to examine alternative options including the original Inland Rail route which is the existing Queensland Rail line on the northern side of Gowrie Creek. The flood mapping for this is accurate as this rail line has been in existence since 1865 and the line is still in use so the flood interface with the line is well known. The Queensland Rail line further west departs from this corridor, and despite it being the best option as far as mitigating flood effects would currently be excluded from consideration due to the constraint of the staying within the current EIS corridor.	<p>The existing and design case water flow is not contained in the Project Corridor, and this is not something ARTC has stated anywhere (note: the Project Corridor is typically approx. 40-80 m wide, whereas the Study Corridor is 2 km wide). The existing water flow and flood extent (i.e. pre-Inland Rail) are discussed and visually presented in Section 14.7 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>Afflux and changes in flood extent are measures used to assess flood impacts as a result of the Inland Rail Project. ARTC has not claimed that the water flow is mostly contained in the Project Corridor, nor has ARTC claimed that the flood extent is contained in the Project Corridor. The flood impacts associated with the Inland Rail Project are discussed in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.7 Section 14.8.1</p> <p>Appendix T1: Flooding & Hydrology Technical Report - Volume 1 Section 2</p>
001c	1.0027	Private	Flooding - Gowrie Creek	Modelling	ARTC claims max. Afflux of 300 mm outside of the project corridor in discrete pockets, but generally between 50 and 150 mm. However, this is a considerable increase in water level. ARTC can not limit their flood modelling to just where the rail line goes the upstream and downstream effects need to be included.	Scope of this flood study to be extended to the Gowrie Creek Catchment. It is not sensible for ARTC to conduct a flood model survey of just the lots of land that are dissected by the Inland Rail structure. ARTC have not displayed any credibility by providing this evidence of the flood effects at Gowrie Creek, and as such the modelling should be subjected to the intense scrutiny of this expert panel. The Council should ask ARTC to examine alternative options including the original Inland Rail route which is the existing Queensland Rail line on the northern side of Gowrie Creek. The flood mapping for this is accurate as this rail line has been in existence since 1865 and the line is still in use so the flood interface with the line is well known. The Queensland Rail line further west departs from this corridor, and despite it being the best option as far as mitigating flood effects would currently be excluded from consideration due to the constraint of the staying within the current EIS corridor.	<p>The flood modelling conducted by ARTC considers upstream and downstream impacts as well as impacts around the proposed rail alignment. Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (refer to Table 14-4 of Chapter 14: Hydrology and Geomorphology of the revised draft EIS). During the Reference Design development process, ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section (Section 5 through to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Additional mapping has been generated by ARTC to provide further information and justification to the Expert Flood Panel. This mapping included within the revised draft EIS provides more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results and further discussion of results. As per ARTC's Mitigation Framework, ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.11 Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 5 - 17</p>
001d	1.0028	Private	Approvals/ conditions/ recommendations		Questioned how the EIS can be approved with the Senate Inquiry into ARTC management of the Project still outstanding/on-going.	Put the project on hold until this is addressed.	<p>On 17 September 2019, the Senate announced an inquiry to consider the management of the Inland Rail program by the Australian Rail Track Corporation and the Australian Government.</p> <p>The Senate Inquiry was undertaken by the Rural and Regional Affairs and Transport References Committee and their findings released on 11 August 2021. The Australian Government supported 15 of the 26 recommendations made in the Committee's report, ensuring their continued commitment to the project.</p> <p>Since that time, Inland Rail has been subject to a separate Independent Review with findings released on 6 April 2023. The Independent Review recommended a revised delivery program and further assessment of the scope and cost of individual segments of Inland Rail. At the time of preparing the EIS document, the outcomes of the recommendations were not available, and therefore have not been quantified or considered in the social, economic and environmental assessments. The EIS is based on assumptions current at the time of assessment (2022). From a preliminary consideration of the findings of the Independent Review, it is unlikely the outcomes and conclusions presented in the EIS will change.</p>	N/A
001d	1.0029	Private	Approvals/ conditions/ recommendations		Questioned how the EIS can be approved with the outcomes of the expert flood panel outstanding. Submitter understands that ARTC are relying on flood report to inform the EIS. Questioned how the EIS can be released for public exhibition without all the facts.	Put the project on hold until this is addressed.	<p>As discussed in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1, the hydrology assessment outcomes conducted for the Project were reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The flood impact objectives were incorporated into the revised draft EIS. ARTC has incorporated Expert Flood Panel recommendations by addressing critical matters to further strengthen the flood models for detailed design. Following completion of relevant environmental aspects impact assessments for the Project, the Project's EIS will be submitted to the Office of the Coordinator-General for review and approval (Chapter 3: Legislation and Approvals Process, Section 3.2).</p>	<p>Chapter 3: Legislation and Approvals Process Section 3.2</p> <p>Appendix O: Matters of National Environmental Significance Technical Report - Volume 1 Section 1.4</p>
001e	1.0030	Private	Stakeholder engagement		The Pittsworth and surrounding districts local paper, the Pittsworth Sentinel, closed prior to Christmas 2020. As a result, the residents of these areas who relied on the local paper circulation weren't adequately informed of the EIS public exhibition period. The community had requested at the CCC Inner Downs Meeting that ARTC undertake a letter drop in these areas. However this was rejected by ARTC on the basis that the communication strategy was approved by the OCG. It is assumed that the communication strategy was approved by the OCG while the Pittsworth Sentinel was still in operation.	Amend ARTC communication strategy. Undertake a letter box drop for communities in post codes 4356,4401,4346 and 4363, which includes a flyer on the EIS public exhibition and a submission form for residents to respond.	<p>The public notification of the draft EIS exhibition was carried out in accordance with the requirements of the SDPWO Act and as per the directive from the Coordinator-General. ARTC ran public information sessions to provide stakeholders the opportunity to ask questions about the draft EIS and submission process. Newspaper advertising of these information sessions was only one of the communication methods used to notify communities of the public display process.</p> <p>ARTC carried out a program of engagement between 23 January 2021 and 4 May 2021 to support the public notification period, including:</p> <ul style="list-style-type: none"> ▶ Sending 238 registered post letters to landowners within the EIS footprint and making follow up phone calls ▶ Providing 238 landowners with a hardcopy submission form and a fact sheet, with a 'Have-your-say' form and offer to provide the draft EIS on a USB ▶ Communicating the public exhibition process through the ARTC website and social media ▶ Offering one-on-one meetings to all interested stakeholders and directly impacted landowners ▶ Providing hard copies of the full EIS to nine libraries to have available for interested stakeholders to read ▶ Providing hard copies of the full EIS to both the Toowoomba and Goondiwindi Inland Rail offices to have available for interested stakeholders to read ▶ Providing literacy support and translation services for culturally and linguistically diverse stakeholders ▶ Hosting presentations to the SDDCCC (January 2021) and the IDDDCC (February 2021) on the draft EIS and how to make a submission ▶ Briefing state agencies and local councils and their representatives on the EIS process ▶ Ran nine community drop-in information sessions with a range of subject matter experts across the alignment at Toowoomba, Gowrie, Southbrook, Pittsworth, Brookstead, Millmerran, Inglewood, Yelarbon and Goondiwindi. It should be noted that there were several public notice advertisements that ran in the Toowoomba Chronicle, which covers the Pittsworth area. The Pittsworth Sentinel reopened during the EIS submission period, and an advertisement was placed informing the community of the extension to the submission date. <p>ARTC will undertake engagement activities to support the public exhibition of the revised draft EIS, including public information sessions. These sessions will be advertised through all communication methods, including newspaper advertisements, social media, email and through the CCCs. ARTC will continue to use a mix of digital and traditional communication channels to reach a broad audience, and work with the Coordinator-General to widely promote the public exhibition process. Further details are outlined in Chapter 6: Stakeholder Engagement, Section 6.7 Future Consultation.</p>	<p>Chapter 6: Stakeholder Engagement Section 6.7</p>
3	3.0002	Private	Flora and Fauna	Fauna passage	Fauna crossing structure/path to allow Koalas to cross safely.	Concern for the safety of the Koalas which are known to cross several times a year from where the rail line is proposed to the submitters property.	<p>Since the draft EIS was released for public submission ARTC has undertaken additional ecology surveys in accordance with industry standards. The basis on this survey was used to avoid and reduce Project impacts to ecological values through design refinement as shown in Appendix B3: Changes to Reference Design since Draft EIS. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible.</p> <p>Mitigation measures have been developed based on the outcomes of field verified ecological survey. A fauna connectivity strategy (see Appendix P: Fauna Connectivity Strategy) has been prepared for the Project which identifies opportunities for proposed fauna crossing opportunities for species such as the Koala. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, during both the Construction Works and Operations stages.</p>	<p>Appendix B3: Changes to Reference Design since Draft EIS</p> <p>Appendix O: Matters of National Environmental Significance Technical Report Section 8</p> <p>Appendix P: Fauna Connectivity Strategy</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
4	4.0001	Private	Project alignment		Questioned whether the Defence Force had been consulted on the most the suitable location for Inland Rail connection so that main habitation areas are not comprised and main transport connections are in close proximity.	Nil	<p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment as the preferred concept alignment for the Project. The Corridor Options Report, the preparation of which was overseen by a Project Reference Group appointed by the Australian Government and chaired by Mr Bruce Wilson AM, was made publicly available by the Australian Government on 21 September 2017. The estimate of quantities used in cost estimates contained in the report was subject to an independent review by RPS in August 2017, with no shortcomings identified.</p> <p>The base case via Wellcamp Charlton alignment formed the centreline of a two-kilometre-wide study area to be progressed through ARTCs phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. Chapter 2: Project Rationale Section 2.8 of the draft EIS describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) Approvals and stakeholder engagement: 12.5 per cent Technical viability: 17 per cent Safety: 16.5 per cent Constructability: 12.5 per cent Operations: 16.5 per cent. 	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
4	4.0002	Private	Project alignment		<p>Submitter was hoping and would have welcomed the Inland Rail hub coming to the township of Miles. The rail connection between Wandoan and Theodore would mean that coal did not have to be transported through Toowoomba. Use of existing rail locations/lines:</p> <ul style="list-style-type: none"> Limit wildlife impact Only require enhancement/upgrading Limit impacts to farming land Limit flood impacts are the existing line is known to not be majority flood affected. 	Nil	<p>The vast majority of freight carried on Inland Rail (on a net tonne kilometre basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout SEQ. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> Reduce demand to use IR by 50 per cent Reduce IR revenue by 60 per cent Reduce the Inland Rail Benefit Cost Ratio by 80 per cent. <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs The outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts:12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) Approvals and stakeholder engagement: 12.5 per cent Technical viability: 17 per cent Safety: 16.5 per cent Constructability: 12.5 per cent Operations: 16.5 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:- 2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
5	5.0001	Private	Flora and Fauna		The ARTC should be conditioned to also overlay their mapping with Local Government Environmental receptors. They should overlay their map with any Landcare regional mapping and local governmental maps that are available to ensure that all sensitive items in the area are covered.	EIS Section 10.4.3.1 - My neighbours and myself live in an area that is classified as "essential habitat " on one map for the area. This fact has been ignored by the ARTC.	<p>Ecological impact assessment of the Project footprint uses available state, regional and local mapping resources and previous ecological investigations to identify potential ecological values within the impact assessment area. A summary of data sources accessed for the assessment is provided in Chapter 11: Flora and Fauna.</p> <p>Essential habitat has been examined on a species-by-species basis and was included in the habitat mapping for the Project to ensure all habitat areas were covered. Significant residual impacts to essential habitat has also been assessed as a Matter of State Environmental Significance.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.4</p>
5	5.0002	Private	Flora and Fauna	Koala	Concern about koala impacts and offsets.	Koala offsets should be mapped and explained in detail. Not one Koala tree should be destroyed during construction of the line. It is unacceptable to just pay money for the offsets areas. Trees should be planted and nurtured so they can sustain Koalas and they should be available for the Koala population before the line is bulldozed, not years after. The ARTC should be conditioned to have pre-prepared areas for the koalas adjacent to the track should any trees have to be cleared.	<p>Appendix O: Matters of National Environmental Significance Technical Report outlines the assessment undertaken to determine the degree of significance of impacts on Koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 Matters of National Environmental Significance. In instances where uncertainty existed, a worst-case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offsets for this species will be required in order to comply with Commonwealth legislative requirements.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed following direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Following the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan (DKMP).</p> <p>Noise impacts to listed threatened species that are associated with both construction and railway operations have been assessed in the revised draft EIS (see Chapter 11: Flora and Fauna). Specific management and mitigation measures for Koala during both construction and railway operations have been proposed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>The preferred location for the proposed rail corridor was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA). <p>As described in Section 2.8-2.10 of Chapter 2: Project Rationale, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 24: Draft Outline environmental Management Plan</p> <p>Section 24.9</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix O: Matters of National Environmental Significance Technical Report</p>
5	5.0003	Private	Flora and Fauna	Baseline/ background sampling	11.25 of Table 10.1 - The ARTC have not included all the animals that frequent this area of which a few will be rare, including tortoises, which have been observed at this property.	Include animals missed, including tortoises.	Detailed desktop assessments and field surveys were conducted to identify threatened species and habitats present within the proposed alignment and further details can be found in Chapter 11: Flora and Fauna, Section 11.3. The revised draft EIS has included species that have been identified through a review of available literature and that are likely affected by the impact assessment area, in addition to the listed threatened species which includes the Bell's turtle (Wollumbinia belli) (see TOR 11.29 of Appendix A2: Terms of Reference Cross-Reference Table). All species may not have been captured at this stage, but these areas will continue to be investigated as the Project progresses.	<p>Appendix A2: Terms of Reference Cross Reference Table</p> <p>TOR 11.29</p>
5	5.0004	Private	Flora and Fauna	Mitigation measures	11.11 of Table 10.1 - The ARTC should be conditioned to provide detail of all fencing that they are using and this should be available for public scrutiny and comment prior to approval. Section 10.1. Table 11.11 - the ARTC should be conditioned to investigate many more passage routes should be constructed and the plans should put out for public comment prior to approval of the EIS.	11.11 of Table 10.1 - It is noted there is 60 km zone where there is only one safe passage for animals this will wipe out huge areas adjacent to the track for any animal that needs to migrate across the area for different reasons this is unacceptable Also the fencing along the full length of the track and may become a danger to some of the animals should they get stuck between them.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be stand alone appendices for the revised draft EIS and were developed following direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and written submissions received on the draft EIS, as part of the EIS public notification process. Further details are in Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Appendix P: Fauna Connectivity Strategy, identifies the location of proposed fauna crossing opportunities for species such as Koala. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines, and DTMR's Fauna Sensitive Transport Infrastructure Delivery manual (2024).</p> <p>The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, a range of different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.6</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p> <p>Section 5</p> <p>Section 7</p>
5	5.0005	Private	Flooding - Condamine River	Modelling	Section 10.10.1 - The crossing of the Condamine flood plain is a danger to the locals of the area lives will be lost due to flooding. The flood levels from history show much higher water levels than the ARTC are working with.	Section 10.10.1 The plans for the crossing have been studied by an independent body and found to be inadequate. The ARTC should be conditioned to draw up a new set of plans using the correct water figures these plans should be put forward for public scrutiny prior to approval. Or choose another route.	<p>The EIS is focussed on the chosen alignment selected by the Australian Government.</p> <p>The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale Section 2.8. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9.3</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
5	5.0006	Private	Flora and Fauna	Mitigation measures	Section 10.10.3 - There is no evidence to support the claim that the project has been aligned to minimize impacts social or threatened species. Note: Submission references 10.10.3, which does not exist in the EIS. Assumedly this may referencing Section 10.10.1 which discusses reference design mitigations.	10.10.3 - The ARTC should be conditioned to show how and where they have changed the route to lessen impacts. The ARTC have stated that the line must go straight from "A" to "B". If you draw a straight line from Brookstead to Toowoomba or Millmerran to Toowoomba, the line does not go near either Pittsworth or Southbrook but was chosen to be adjacent to the highway. At no other portion of the line was it necessary to be adjacent to the highway you can see this from the mapping of the track. This issue should be revisited and the track realigned to go straight. Note: Submission references 10.10.3, which does not exist in the EIS. Assumedly this may referencing Section 10.10.1 which discusses reference design mitigations.	The Project footprint has been subject to historical disturbance and clearing, with one third of the alignment length located within brownfield areas (e.g. areas already subject to previous development). The remaining greenfield portions of the Project area extend largely through areas subject to agricultural land uses. The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross drainage and rail maintenance access roads. Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report, provides strategies that have been used to minimise impacts through the design stage of the Project to avoid habitat of threatened species wherever possible. As the Project moves into the detailed design and construction stages, more focused and comprehensive ecological surveys will be undertaken. Along with informing the design and construction, these will include specific measures to avoid, mitigate, minimise impacts on Koala, along with ongoing monitoring activities (see Appendix L: Terrestrial and Aquatic Ecology Technical Report). Opportunities for the provision of fauna movement solutions have been identified in Appendix P: Fauna Connectivity Strategy. These include fencing strategies to guide species such as Koala to safe movement opportunities and will be refined through the detailed design process.	Chapter 11: Flora and Fauna Section 11.6 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix P: Fauna Connectivity Strategy Section 5 and 7
5	5.0007	Private	Flora and Fauna	Terrestrial flora	Submission notes that there is a suitable area to the rear that will not have to clear 100 m of trees.	Section 10.10.3. - Concern that the project will be built in the area that submitter lives which is classified as essential habitat that is dense in gum trees. Submission notes that this will involve cutting 100 m wide swathe of trees.	Clearing of vegetation will be restricted to the minimum required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross drainage and rail maintenance access roads. Habitat for threatened species (including the Condamine earless dragon) has been avoided wherever possible (see Appendix L: Terrestrial and Aquatic Ecology Technical Report). Where impacts to threatened species habitat cannot be avoided, mitigation and management measures will be implemented. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, during both the construction works and operations stages. Impact mitigation will include pre-clearance surveys prior to disturbance. Management and mitigation measures to protect vulnerable and endangered species are proposed in Chapter 24: Draft Outline Environmental Management Plan. In instances where a significant residual impact occurs, as identified by the relevant EPBC Act and NC Act significant assessment criteria, biodiversity offsets will be secured (see Appendix L: Terrestrial and Aquatic Ecology Technical Report). ARTC will provide biodiversity offsets in accordance with the relevant state or commonwealth legislation and guidelines. ARTC's approach to delivering environmental offset requirements is outlined in Appendix Q: Environmental Offset Delivery Strategy.	Chapter 11: Flora and Fauna Section 11.6 and 11.7 Chapter 24: Draft Outline Environmental Management Plan Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 5 and 7 Appendix Q: Environmental Offset Delivery Strategy
5	5.0008	Private	Stakeholder engagement		Concern about proximity of the project to submitters house as well as 3 other family homes, rendering them unbearable to live in. Submission notes that they have informed the ARTC of this impact, however no changes in ARTC plans have been made. Submission notes ARTC have lost all the confidence of the public for good reason with their deceit they have shown and the total disregard and contempt for the families and lifestyles they are ruining hence the fact that Richard Wankmuller has stepped down before it becomes too obvious that he has been running a circus.	Submitter has informed the ARTC where the track would make less of an impact on both families and fauna but the ARTC said they can not travel out of the 2K zone despite 1 k of the zone being south of the highway and making it impossible to be used as the track is on the north side.	Chapter 2: Project Rationale Section 2.10.13 details the challenges associated with the Southbrook to Athol Section of Inland Rail including the topography and geotechnical conditions, major existing linear infrastructure (Gore Highway and Millmerran Branch Line) and multiple freehold properties of a non-uniform shape. The overarching design principle for this Section of the alignment was to run in parallel to the Gore Highway as much as possible to form a multi-modal transport corridor to minimise the extent of severance to freehold properties and impact to the environment. Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report outlines the engagement undertaken with landowners in the study area, including letters, phone calls, one-on-one meetings, as well as broad-scale community engagement activities such as community information sessions and CCC meetings. Where a request was made to review the alignment at Southbrook, a detailed assessment was completed by the Project's design team and determined that the alternative alignment was not a viable option. ARTC acknowledges the uncertainty that Project development creates; however, design is an iterative process and landowners have been provided with information as it becomes available. Appendix X: Social Impact Assessment (SIA), Section 7 details the strategies that ARTC has implemented to support affected residents. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners through detailed design and construction to mitigate impacts, accommodate the continuation of current property management activities and access, where possible. Individual property treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required and if possible.	Chapter 2: Project Rationale Section 2.10.13 Chapter 6: Stakeholder Engagement Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Appendix X: Social Impact Assessment Section 7
5	5.0009	Private	Cultural Heritage	Non-Indigenous cultural heritage	Concerned that track will be built over a very sensitive area i. e. a Grave of one of the Pioneers of the area and taking past a Cobb and Co historic building. Claims ARTC have already been informed of these matters.	Submitter has informed the ARTC where the track would make less of an impact on both families and fauna but the ARTC said they can not travel out of the 2K zone despite 1 k of the zone being south of the highway and making it impossible to be used as the track is on the north side.	In October 2021, ARTC conducted initial investigations at the property identified by the submitter with the cultural heritage team and engaged with History Pittsworth, the local historical society, regarding appropriate management measures. Chapter 19: Cultural Heritage Section 19.4 and Table 19-15 have been updated with this information, and the significance of the grave and surrounding Green Hills Hotel site has been assessed in Table 19-17 in Section 19.5.2. Tables 19-21 and 19-22 make a series of recommendations to manage impacts to this place, including further archaeological assessment, relocation of the grave to the Pittsworth Cemetery, and heritage interpretation.	Chapter 19: Cultural Heritage Section 19.4 Section 19.5.2 Table 19-15 Table 19-17 Table 19-21 Table 19-22
6	6.0001	Private	Groundwater	Contaminated land	Submission references Chapter 13 Groundwater and provides solution regarding contaminated land sites.	ARTC should be conditioned to include all contaminated land sites including Wellcamp Airport and surrounding lands, power stations, sewage.	The ongoing baseline groundwater monitoring will be used to develop a representative baseline dataset, which will be used for comparison to assess any potential deterioration of water quality impacts resulting from the Project. The baseline water quality dataset, in addition to regular groundwater quality monitoring, will allow for trend analysis and the early detection of possible water quality changes, such as mixing of water types resulting from dewatering (see Chapter 15: Groundwater, Section 15.4). The ongoing baseline monitoring program has considered the contaminated assessment in the revised draft EIS Chapter 9: Land Resources, Section 9.3.2, to include additional analytes to identify existing impacts on groundwater prior to commencement of construction. Revised draft EIS Chapter 9: Land Resources includes more detail around, and references to, the contaminated land (see Section 9.4.5) and relevance to groundwater (see Section 9.4 and Table 9-27).	Chapter 15: Groundwater Section 15.4 Chapter 9: Land Resources Section 9.3.2 Section 9.4.5 Table 9-27
6	6.0002	Private	Groundwater	Water quality	Submission references Chapter 13 Groundwater and suggests monitoring of surface water, pipeline and waste water in solution.	Water monitoring in Gowrie creek and Wetalla pipeline and waste water in consideration of waste land.	The Wetalla pipeline is subject to meet criteria prior to release into Gowrie Creek. Each environmental aspect has undertaken a cumulative impact assessment outlined in Chapter 23: Cumulative Impacts. Through these assessments, the Wetalla Pipeline is not anticipated to be impacted by the Project. The maximum overall cumulative impact significance of each specific matter on surrounding projects is detailed in Section 23.3 and Table 23-8 of Chapter 23: Cumulative Impacts. This Table indicates that the only environmental aspect predicted to have impact on the Wetalla Pipeline is Flora and Fauna, the significance level for this being assessed as "Low".	Chapter 23: Cumulative Impacts Section 23.3 Table 23-8
6	6.0003	Private	Stakeholder engagement	Water quality	Submission references Chapter 13 Groundwater and suggests monitoring of surface water, pipeline and waste water in solution.	Results of monitoring to be made available for public comment.	ARTC will seek to maximise onsite reuse of wastewater generated by non-resident workforce accommodation, to avoid water required to be carted offsite for treatment and discharged. Where industrial or trade waste may be generated by construction activities, the resultant wastewater will be captured and, where possible, recycled. Where recycling is not feasible, the captured wastewater will be collected by a licenced contractor and taken offsite for disposal at an appropriately licenced wastewater facility (see Chapter 13: Surface Water, Section 13.5.1). A detailed discussion of ARTC's approach to construction wastewater is outlined in Appendix B5: Construction Water Requirements Report. ARTC has commenced a surface water monitoring program for the Project (Section 13.6.3 of Chapter 13: Surface Water). This Program consists of baseline surface water monitoring (commenced to inform the EIS) and construction surface water monitoring. Surface water quality monitoring requirements will be developed in consultation with DRDMW and DES, to be reviewed and accepted by the Environmental Monitor. Baseline groundwater monitoring is currently ongoing at Project bores along the Border to Gowrie alignment, in accordance with recognised groundwater sampling guidelines such as <i>Monitoring and Sampling Manual</i> (DES, 2018a) and <i>Groundwater Sampling and Analysis: A Field Guide</i> (Sundaram et. al., 2009). Section 15.4.4. and 15.7.3 of Chapter 15: Groundwater. Section 15.7.3 details the proposed groundwater management and monitoring program (GMMP) for each Project stage and was updated as part of the revised draft EIS to reflect the ongoing groundwater monitoring program. Chapter 24: Draft Outline Environmental Management Plan states that construction compliance reports will be prepared periodically by ARTC. Such reporting will be posted on the Project website once validated.	Chapter 13: Surface Water Section 13.5.1 Section 13.6.3 Chapter 15: Groundwater Section 15.4.4 Section 15.7.3 Chapter 24: Draft Outline Environmental Management Plan Appendix B5: Construction Water Requirements Report
7	7.0001	Private	Traffic and Transport	Operational traffic	ARTC is diverting Dalman Road onto the Oakey Road, which is a main road which comes off the Gore Highway. Concerns are if vehicles (e.g. Road Trains) are turning right on the diverted road while waiting for through traffic, this will cause a backlog of traffic back up the Gore Highway.	ARTC needs to ensure slip lanes are put along the Oakey Road at the Dalman Road diversion intersection to maintain free flowing traffic. Submission has included a diagram to depict the solution.	The configuration of the priority intersections between Gore Highway/Oakey Pittsworth Road and Oakey Pittsworth Road/Quibet Road and the requirement for new turning lanes will be confirmed during the Detailed Design stage. Any proposed changes to local roads will be subject to ongoing discussions with TMR and TRC. However, in Appendix AA: Traffic Impact Assessment, Section 5.4.3, a turn warrant assessment has been completed at the Gore Highway/Oakey Pittsworth Road intersection to determine the necessity of upgraded turning lane treatments. The results of this assessment show that there is no upgrade required to manage either the development volumes or the volumes created by the diversion from Quibet Road. Further, in Appendix AA: Traffic Impact Assessment, Section 5.4.5, a delay assessment of the intersection has been completed to determine the functionality of the intersection under Project conditions. This assessment demonstrates an increase in average intersection delay by only one second due to development. The relevant more detailed outputs of this assessment are shown in Appendix AV of the revised draft EIS Appendix AA: Traffic Impact Assessment, which indicate an approximate one second increased delay on the Oakey Pittsworth Road approach. The Oakey Pittsworth Road/Quibet Road intersection, development vehicles do not use Quibet Road and, as a result, the volumes turning out of, or into Quibet Road are very minimal. A turn warrant assessment and a delay assessment have been completed in Appendix AA: Traffic Impact Assessment, Section 5.9.4. The assessments demonstrate that no upgraded turn warrant treatments are required to manage the increased traffic from the diversion and that the intersection has a maximum delay of five seconds and has no queuing back in any direction.	Appendix AA: Traffic Impact Assessment Section 5.4.3 Section 5.4.5 Section 5.9.4 Appendix AV
7	7.0002	Private	Traffic and Transport	Road safety	ARTC is diverting Dalman Road onto the Oakey Road, which is a main road which comes off the Gore Highway. Concerns are if vehicles (e.g. Road Trains) are turning right on the diverted road while waiting for through traffic, this will cause a backlog of traffic back up the Gore Highway (possibility of an accident)	ARTC needs to ensure slip lanes are put along the Oakey Road at the Dalman Road diversion intersection to maintain free flowing traffic. Submission has included a diagram to depict the solution.	The configuration of the priority intersections between Gore Highway/Oakey Pittsworth Road and Oakey Pittsworth Road/Quibet Road and the requirement for new turning lanes will be confirmed during the Detailed Design stage. Any proposed changes to local roads will be subject to ongoing discussion with TMR and TRC. However, in Appendix AA: Traffic Impact Assessment, Section 5.4.3, a turn warrant assessment has been completed at the Gore Highway/Oakey Pittsworth Road intersection to determine the necessity of upgraded turning lane treatments. The results of this assessment show that there is no upgrade required to manage either the development volumes or the volumes created by the diversion from Quibet Road. Further, in Appendix AA: Traffic Impact Assessment, Section 5.4.5, a delay assessment of the intersection has been completed to determine the functionality of the intersection under Project conditions. This assessment demonstrates an increase in average intersection delay by only one second due to development. Further detailed outputs of this assessment are shown in Appendix AV of the Appendix AA: Traffic Impact Assessment, which indicate an approximate one second increased delay on the Oakey Pittsworth Road approach. The Oakey Pittsworth Road/Quibet Road intersection, development vehicles do not use Quibet Road and, as a result, the volumes turning out of, or into Quibet Road are very minimal. A turn warrant assessment and a delay assessment have been completed in Appendix AA: Traffic Impact Assessment, Section 5.9.4. The assessments demonstrate that no upgraded turn warrant treatments are required to manage the increased traffic from the diversion and that the intersection has a maximum delay of five seconds and has no queuing back in any direction.	Appendix AA: Traffic Impact Assessment Section 5.4.3 Section 5.4.5 Section 5.9.4 Appendix AV
8	8.0001	Private	Noise and Vibration	Operational rail noise	ARTC admits residences within 1 km of the rail may experience noise at night above 49dB (Chapter 14 page 35 draft EIS) The evidence for increased rates of hypertension and myocardial infarction is strong when maximum night noise is above 50dB (Night Noise Guideline for Europe, WHO, 2009) with other long term effects likely but not yet proven.	It should be a condition of the EIS that every residence within 1 km of the rail is offered sound mitigation including where possible (but not limited to) rail dampers, track lubrication, noise barriers, earth mounds, insulation, double glazed windows and air conditioners or any combination of these that will bring the night noise below a LAmax of 49. This should be at the proponents expense, and built by the proponent or its contractors prior to the Border to Gowrie Section of Inland Rail becoming operational.	The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations). The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, <i>The Health Effects of Environmental Noise, 2018</i> ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014. Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland. Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense. ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 11 Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
8	8.0002	Private	Traffic and Transport	Level crossing	The Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities.	The EIS should be conditional upon no new level crossings being built over state or council roads.	<p>ARTC recognises the complex decision-making process surrounding public road–rail interfaces. ARTC also notes the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021. <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring a consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and is one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the community with further transparency on the design process undertaken to date and the understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Project alignment. Many road–rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023, the Office of the National Rail Safety Regulator (ONRSR) undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focusing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings has been applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessments and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on the road-rail interfaces performance under operational traffic conditions. This includes queue analysis for a short-stacking condition assessment, and a road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to Inland Rail Level Crossing Factsheet at: inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
9	9.0001	Private	Landscape and Visual Amenity		Concern that the project will obstruct views of the Yelarbon Silos, which are a huge attraction and recognised as amongst the best rural art in the country. In particular, the project will limit views from a specifically built viewing area. Submission notes that if Viewpoint 2 were shown facing the opposite direction, this faux pa would be glaringly obvious. Further, not committing to the type of noise and scenic mitigation measures to be constructed at Yelarbon prior to the detailed design phase is insulting to the whole community.	A perfect solution here would be to commit to the absolutely necessary noise mitigation design in such a way that a second mural was commissioned to increase rather than destroy the outlook from the specially constructed viewing area and for all traffic passing through.	<p>The fieldwork in Yelarbon for Landscape and Visual Impact Assessment for the revised draft EIS took place from 2018-2022. During initial site visits in 2018 the GrainCorp silos at Yelarbon were not part of the artwork trail and no viewing area was present. At this time, a viewpoint was taken in the direction of the silos from the corner of the Cunningham Hwy and Wyerno Street, however was not included in the assessment as the number of permanent visual receptors in the vicinity of Viewpoint 3 (the selected viewpoint) was considered to be much higher.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 3: Yelarbon rest area has been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>An additional site visit was undertaken in October 2021 to assess the potential impact of views from the GrainCorp silo artwork viewing area. As a result, an additional viewpoint assessment (Viewpoint 4) has been included within Appendix K: Landscape and Visual Assessment, Section 8.2.4 and Section 9.1.4. This viewpoint assessment includes a visualisation showing the potential impact of noise walls and other Project infrastructure in this location. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and the Goondiwindi Regional Council.</p> <p>ARTC is investigating the design for the noise walls to determine whether satisfactory noise mitigation can be achieved without obscuring views to the silos. If views to the Yelarbon silos are affected by noise walls, ARTC would facilitate provision of mitigation measures e.g. a complementary mural on the noise wall and/or roadside landscaping, in consultation with the Yelarbon community and Goondiwindi Shire Council.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2.4</p> <p>Section 9.1.4</p>
9	9.0004	Private	Noise and Vibration	Operational rail noise	Concern about noise and vibration impacts to the Yelarbon School, and impacts to health on residents and school age children. Submission notes that their nephew is currently being schooled here. Many studies show Intermittent noise affects the performance of both auditory and non-auditory tasks and short term memory (submission includes link to a study about this). This noise effect is amplified in children. Table 14.20 of Chapter 14 of the EIS lists the maximum noise for schools and childcare centres as 40dB when a new rail line is built. The projected noise at Yelarbon School of 44dB inside and 51dB outside during the day is well above the guidelines for undisrupted learning, and even after mitigation ARTC says the indoor limit of 40dB will be exceeded.	Commit to specific mitigation measures intended to be deployed prior to the draft EIS being accepted.	<p>The revised draft EIS has been updated to address potential impacts from operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration. The noise assessment criteria, adopted from the Interim Guideline are designed to manage impacts to amenity and annoyance.</p> <p>The applicable DTMR operational rail noise criteria for both residential and educational receivers are same: Single Event Maximum ≤82 dB(A), $L_{Aeq,24hr} \leq 60$ dB(A) (Section 16.8 of Chapter 16: Noise and Vibration). Where these criteria are exceeded, feasible and practicable noise mitigation measures (e.g. noise barriers, at-property treatments) will be further investigated during the Detailed Design stage and installed prior to Inland Rail operations commencing (see Section 16.10 of Chapter 16: Noise and Vibration, Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations).</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 17</p>
10	10.0001	Private	Approvals/ conditions/ recommendations	Mitigation measures	ARTC should list all MSES, MNES and the MLES for public consultation and allow amendments from the public before final submission.	This should be an enforceable condition of the approval.	<p>All relevant ecological assessment outcomes are detailed in Chapter 11: Flora and Fauna, Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report.</p> <p>All stakeholders, interested organisations, and the public are invited to have their say during the public notification period. These reports were updated for the revised draft EIS. The Matters of Local Environmental Significance (MLES) will not be incorporated into the offset requirements of the Project, as the only relevant matters in line with regulatory requirements are MNES and Matters of State Environmental Significance (MSES).</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.4</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 4.10, 4.11 and 5</p> <p>Appendix O: Matters of National Environmental Significance Report</p>
10	10.0002	Private	Approvals/ conditions/ recommendations	Offsets	ARTC should list all offsets, in layman's English, describing what, where and how the offsets are an improvement to the environment. Stakeholder agreement on offsets, because the stakeholders are feeling impact in their backyards.	Stakeholder engagement and agreeance on the offsets. This should be an enforceable condition of the approval.	<p>Offsets will be managed in accordance with Australian Government and State Government requirements. Chapter 11: Flora and Fauna, Section 12.8 summarises Biodiversity Offsets requirements. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie details how the Inland Rail Program will deliver a strategic, primarily land-based, offset portfolio that will seek to deliver a conservation outcome that improves or maintains the viability of impacted MNES and/or MSES.</p> <p>To date, Inland Rail has acquired four of the anticipated six properties required to meet the Project's offset obligation based on the predicted Significant Residual Impacts identified in Chapter 11: Flora and Fauna, Section 12.8. Of the remaining properties, one property is under advanced negotiations while the remaining outstanding property is at the preliminary stages of the offset property dealing process. Section 6 of Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie outlines matter (e.g. MNES/MSES) specific management intent according to each offset property outlined in the Environmental Offset Delivery Strategy (EODS). As part of public exhibition, the EODS will disclose the offset property details of four ARTC-acquired offset properties, while the other two will be redacted due to privacy and confidentiality restrictions.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.8</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie Section 6</p>
10	10.0003	Private	Approvals/ conditions/ recommendations	Offsets	Paid offsets shouldn't occur. Process doesn't seem transparent.	OCG should provide quarterly report to community in the newspaper on offset approvals, to inform and hold ARTC accountable when offset agreements are not met.	<p>Offsets will be managed in accordance with Australian Government and State Government requirements. Chapter 11: Flora and Fauna, Section 12.8 summarises Biodiversity Offsets requirements. Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie details how the Inland Rail Program will deliver a strategic, primarily land-based, offset portfolio that will seek to deliver a conservation outcome that improves or maintains the viability of impacted MNES and/or MSES. Direct land-based offsets will be delivered for all impacted MNES and most MSES; however, at this stage Inland Rail can not rule out monetising a small proportion of residual MSES in accordance with the Queensland Environmental Offsets Policy (v1.16).</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.8</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p> <p>Section 6</p>
10	10.0004	Private	Flora and Fauna	Koala	Koala sustaining trees should have the rail deviate around. Koalas are already stressed due to climate and forest problems from Ingleswood to Gowrie. The ARTC should be conditioned to not remove one tree that does or could assist will the living or feeding of Koalas whilst the track is being built they must deviate the track around these precious areas.	Any rural properties acquisitioned could have planting of Koala sustaining mature trees of at least 10 years age, and maintained by ARTC by means such as watering, weed control. Wildlife carers should be able to access these areas to harvest leaves for Koalas in their care.	<p>The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross-drainage and rail maintenance access roads. Habitat for threatened species has been avoided wherever possible, as outlined in Appendix L: Terrestrial and Aquatic Ecology Technical Report, Section 5.2.</p> <p>Following the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix M: Draft Koala Management Plan. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koala, during the construction stage. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, and operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>In instances where a significant residual impact has been identified, as per the EPBC Act Significant Assessment Criteria, biodiversity offsets will be secured. ARTC has prepared a revised Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie (see Section 6.3-Section 6.8), that outlines the properties that make up the Project offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 5.2</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p> <p>Section 6.3 - 6.8</p>
11	11.0001	Private	Social Impact Assessment	Local business and industry procurement	The location of the alignment will ruin the Millmerran Ingleswood Road BnB and camping grounds that are very peaceful. Hospitality business will be impacted. State owned land should be sought, rather than farmland and private property.	ARTC should explain why farm land and not state owned land is chosen when it will impact business of people. Alternative routes should be sought. ARTC should contribute financially to tourism campaign to mitigate impact to business. Cash grants to business to diversify business plan.	<p>The Project alignment has been designed to minimise the number of properties affected by land acquisition. Where noise levels resulting from the Project exceed noise criteria, noise mitigation measures will be provided.</p> <p>The revised draft EIS was required to assess the Project alignment as indicated by the reference design. Appendix X: Social Impact Assessment, Section 7.5.2 notes that when the Project's Detailed Design stage is confirmed, ARTC will consult with tourism-related businesses located within five km of the Project and will develop a strategy, working with local Chambers of Commerce, tourist information centres and the Goondiwindi and Toowoomba Regional Councils, to ensure that any potential impacts on tourism visitation are mitigated. This could include support for tourism marketing campaigns targeting potentially impacted communities.</p> <p>It is not within ARTC's legal remit to provide cash grants to businesses.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.5.2</p>
11	11.0002	Private	Land Resources	Modelling	Concerned for the maintenance cost and the ongoing safety of trainline by installing it on eroded land at the Canning Creek. ARTC should have modelled the effect of erosion on the banks of Canning Creek. ARTC should have considered the running cost of building on sandy ridge, or explored alternative route next to the roadway.	Model the effect of erosion on the Canning Creek banks. Seek alternative route next to roadway.	<p>The revised draft EIS is focussed on the chosen alignment selected by the Australian Government. The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Section 2.8 Chapter 2: Project Rationale. Section 2.9.3 detail the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment</p> <p>A review of the Flood Impact Objectives (FIOs) has been undertaken in consultation with the Expert Flood Panel to consider the NSW Quantitative Design Limits with revised FIOs detailed in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. ARTC has incorporated the revised quantitative FIOs developed in consultation with the Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section (Section 5 through to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Scour protection requirements for culverts during Reference Design were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the allowable soil velocities shown in Table 3.1 of AGRD. An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the reference design. A representative and conservative average bare soil erosive threshold velocity (ETV) value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection was allowed for within the revised reference design.</p> <p>Scour and erosion protection measures (including the need for flow spreaders and/or dissipators) will be reviewed and confirmed during detailed design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available (Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.3).</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9.3</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.10.1</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p> <p>Section 4.2</p> <p>Section 5 - 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
11	11.0003	Private	Economics	Local business and industry procurement	Tourism to the area will suffer because of a freight line.	Consider alternative route.	<p>The purpose of the Investment Case (Inland Rail Programme Business Case 2015) was to inform the Commonwealth's decision on whether or not to invest in the progression of the Inland Rail Project. It evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution (Chapter 2: Project Rationale, Section 2.8.4). Once the financial (investment) decision had been made to proceed with the Project, the statutory approval process commenced. Inland Rail, as a State significant Project in Queensland, is required to respond to the Terms of Reference (ToR) with an Environmental Impact Statement (EIS), as required under the <i>State Development and Public Works Organisation Act 1971</i>. The purpose of the EIS process is to inform decision-makers and the public of the environmental consequences of implementing a proposed Project. The Economic Impact Assessment (EIA) identifies, predicts, and analyses impacts on the physical environment, as well as social, cultural, economic and health impacts. The proponent is required to produce documentation describing the proposal, the potential environmental impacts and how these impacts would be managed. The economic analysis provided in the EIS response is tailored to consider these impacts and appropriate mitigation measures. Employment results at the industry level (movement of workers between industries and regions) are outlined in the economic technical report. Under slack labour market conditions during construction, the results indicate there will be an expansion of employment in retail within the Darling Downs Maranoa Region which forms part of the tourism sector.</p> <p>During construction, there is potential for road works bridge construction, the visual impact of laydown areas, and the accommodation of non-residential workers to affect tourists' experience and travel times. This impact is anticipated to be small and will be temporary whilst construction activities are undertaken in particular areas. Following construction, the buildings and infrastructure established for the non-resident workforce accommodation facilities may be left for community use. This may enhance access to local facilities, with the potential to support tourism, such as in Millmerran. During consultation undertaken by ARTC, the Toowoomba Regional Council identified the location of a non-resident workforce accommodation facilities near Millmerran as having the potential to provide legacy benefits to support regional tourism. ARTC plans further consultation with Toowoomba Regional Council as potential accommodation non-resident workforce accommodation facilities sites are identified.</p> <p>During operation, there is potential for reduced scenic amenity due to the Project's location within the rural and regional landscape. It is likely that some visitors will see the proposal as diminishing rural character while others will find interest in the proposal structure. According to Appendix X: Social Impact Assessment, this is not expected to have a significant impact on tourism visitation.</p> <p>The preferred location for the proposed rail corridor (as presented in Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA). <p>In response to public notification of the draft EIS, ARTC has refined the Project alignment. Refer to Appendix B3: Changes to Reference Design since Draft EIS.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.8.4</p> <p>Section 2.9</p> <p>Chapter 18: Economics</p> <p>Section 18.6</p> <p>Section 18.7</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p> <p>Appendix E: Consultation Report</p> <p>Section 5.12</p>
11	11.0004	Private	Land Resources	Erosion	The rail alignment is proposed to come very close to Canning Creek. It is a bushwalking area, and prone to erosion. This could cause extra noise and even derailment, given it will increase chance of rails moving.	Seek alternative more suitable route.	<p>Erosion at Canning Creek has been investigated and is not considered to be high risk after changes to the design (see Section 14.7.8, Chapter 14: Flooding and Geomorphology).</p> <p>The EIS is focussed on the chosen alignment selected by the Australian Government. The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale Section 2.8. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9.3</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.7.8</p>
12	12.0001	Private	Noise and Vibration	Operational rail noise	There are health impacts including hypertension, myocardial infarction when night noise is above 50dBA. ARTC admits residences within 1 km of the rail will have exposure to 49dB.	Every residence within 1 km of rail should have sound mitigation offered such as noise barriers, earth mounds, insulation, double glazed windows paid for by ARTC prior to construction.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, <i>The Health Effects of Environmental Noise, 2018</i> ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
12	12.0002	Private	Traffic and Transport	Level crossing	Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities. EIS should be conditional upon no new level crossings being built over state or council roads.	EIS should be conditional upon no new level crossings being built over state or council roads.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring a consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and is one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken to date and the understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 the Office of the National Rail Safety Regulator (ONRSR) undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings has been applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
12	12.0003	Private	Traffic and Transport	Level crossing	The proposed crossing across highway near farm of Woodspring is not safe, and prone to accident due to families, stock, native animals using the crossing.	Grade separation crossings only.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include factors such as sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7.6</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
13	13.0001	Private	Noise and Vibration	Operational rail noise	A night time noise above 50dB has health risks of hypertension and myocardial infarction. ARTC proposes that residences within 1 km will have a night-time noise above 49dB.	Every house within 1 km should have sound mitigation installed by ARTC before operation of trains including insulation, earth mounds, double glazing and air conditioners.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, <i>The Health Effects of Environmental Noise, 2018</i> ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq, night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 11</p> <p>Section 17</p>

14	14.0001	Private	Groundwater	Construction water supply	Directly impacted landowner within 1 km of ARTC. Concerned by Rail construction impacts on water bores for the supply of water for stock and domestic use. Need more information from ARTC regarding any impact on our property this infrastructure will cause.	Impact on water bores needs further public comment and consultation by contacting directly impacted owners.	<p>Predictive groundwater modelling was undertaken to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts. The indicative cuts were selected as best representing the local geological conditions and worst-case potential impacts (i.e. cuts most likely to intersect groundwater). The revised draft modelling results indicated that the extent of drawdown is predicted to extend 10 m to 43 m from the centre of the Project alignment (from the deepest cuts) during the Construction Works stage. The modelling was updated and further refined as part of the revised draft EIS, see Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.</p> <p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project (see Chapter 15: Groundwater, Section 15.5.4). This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging. Real properties (tot(plan) to be intersected by the Project footprint were targeted and landowners were provided an opportunity to be identified via this survey. Revised draft EIS Section 15.5.4 and Section 15.7.4 of Chapter 15: Groundwater have been updated with groundwater users, potential make-good policy and measures. Details of the proposed make-good measures are detailed in Table 15.20 and Section 15.7.4 of Chapter 15: Groundwater. However, the measures developed for each impacted bore will be unique and commensurate with the level of impact realised, therefore specific details cannot be provided at this time.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.5.4</p> <p>Section 15.6.2</p> <p>Section 15.7.4</p> <p>Table 15.20</p> <p>Appendix U: Groundwater Technical Report</p> <p>Section 6.3</p>
15	15.0001	Private	Groundwater	Water quality	The impact of the cuts from ARTC are in the EIS as assessed as site specific. The seepage values are quantified as "low" bases on the average of site specific data. More information is required in wet weather events on the proposed track, local residents and property impacts.	Analysis of seepage on property impacts due to weather and cuts.	<p>As part of the revised draft EIS, predicative groundwater models were developed to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts. The indicative cuts were selected as best representing the cuts most likely to intersect groundwater, local geological conditions and worst-case potential impacts. The revised modelling results indicate that the horizontal extent of drawdown is to extend a maximum of 10 m to 43 m horizontally from the rail centreline from the deepest cuts. The model was updated to reflect the refined alignment and design as part of the revised draft EIS and the results are presented in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.5. Figures 6.14-6.16 provided in Section 6.3.5 visually demarcate the anticipated extent of drawdown.</p> <p>To account for seasonal/wet weather events, the modelling adopted various assumptions (e.g. increased hydraulic conductivity and doubled rainfall estimates) to identify conservative potential impacts of additional rainfall/recharge to the cuts during construction (see Appendix U: Groundwater Technical Report, Section 7.3).</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.6.2</p> <p>Appendix U: Groundwater Technical Report</p> <p>Section 6.3.5</p> <p>Section 7.3</p> <p>Figure 6.14</p> <p>Figure 6.15</p> <p>Figure 6.16</p>
15	15.0002	Private	Groundwater	Mitigation measures	The alternative seepage control measures appears unproven. What are the measures? Information on the alternative measures should be known.	Publish the alternative seepage control measures.	<p>Seepage from deep cutting faces will be managed in accordance with Queensland Rail Civil Engineering Standard QR-CTS-Part 35 – Stone and Concrete Slope Protection (QR, 2010). It is noted that these engineering controls are installed to relieve groundwater pressure in colluviums, residual soil, weathered rock or along joints in the rock mass and are not specifically designed as seepage control measures. Deep cuts will be drained in perpetuity, as required to prevent groundwater pressure build-up and maintain the structural integrity of the cutting faces.</p> <p>Further detail regarding seepage control measures is provided in Chapter 13: Surface Water Section 13.5.1, Chapter 15: Groundwater Section 15.7.1 and Table 15-20, and Appendix U: Groundwater Technical Report Section Table 8-1 and 8-2. A review of selected seepage control measures will be conducted as part of the Detailed Design stage.</p>	<p>Chapter 13: Surface Water</p> <p>Section 13.5.1</p> <p>Chapter 15: Groundwater</p> <p>Section 15.7.1</p> <p>Table 15-20</p> <p>Appendix U: Groundwater Technical Report</p> <p>Table 8.1</p> <p>Table 8.2</p>
15	15.0003	Private	Groundwater	Modelling	The language within the EIS needs clarity. What area is the "eastern portions" - is this inclusive of Black Soil Plains? How deep are the volcanic basalt aquifers and will the black soil plains be protected?	Nil	<p>The 'eastern portion' refers to the Project footprint which is underlain by the Clarence-Moreton basin to the east of the Kumbarella ridge. The volcanic basalt aquifers of the Main Range Volcanics has the thickness up to 150 m below ground level (mBGL) and does not intersect surface soil horizons. Section 9.4.1 of Chapter 9: Land Resources covers potential impact to soils.</p>	<p>Chapter 9: Land Resources</p> <p>Section 9.4.1</p>
15	15.0004	Private	Groundwater	Survey effort/field investigation data	How is the baseline groundwater sampling conducted, when and where? Concerned about impact to the Great Artesian Basin by the project.	ARTC must ensure that no damage occurs to the Great Artesian Basin, the impact of any downgrade or damage across the Artesian Basin area would be a national disaster. ARTC must obtain scientific advice and research on this issue.	<p>Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (see Chapter 15: Groundwater, Section 15.4.4). Section 15.7.3 describes the proposed groundwater management and monitoring program (GMMP) for each Project stage and has been updated as part of the revised draft EIS to reflect the ongoing groundwater monitoring program.</p> <p>The predicted impacts on groundwater resources are limited in extent to the vicinity of deep cuts that are likely to intersect groundwater. The Great Artesian Basin underlies the impact assessment area, and some Great Artesian Basin units have the potential to be sensitive to impacts from Project activities, including the WCM and the Kumbarella Beds. While the Marburg Subgroup (the equivalent of Hutton Sandstone in the Surat Basin) is a regionally significant aquifer, and a small area is mapped as an outcrop in the groundwater impact assessment area near Ingleswood, no impacts on this unit are predicted. Otherwise, the Hutton Sandstone is below the depth of interest for the Project (i.e.90 m; maximum design depth is 21 m BGL) and is not considered to be susceptible to impacts by the Project (see Chapter 15: Groundwater, Table 15-6). Other than limited and isolated minor impacts related to deep cuts likely to intersect groundwater of GAB units, regional impacts to the Great Artesian Basin are not expected nor predicted to occur.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.4.4</p> <p>Section 15.7.3</p> <p>Table 15-6</p>
15	15.0005	Private	Groundwater	Survey effort/field investigation data	The EIS says 3 of 5 locations expected to have drawdowns between Border to Gowrie and groundwater disturbances due to cuttings. More information on how the modelling was conducted and by who is sought, and impact to farmland outlined.	Mitigation measures to impact to drawdown, bores and arrangement for decommissioning. ARTC must identify the locations between the "Border to Gowrie" and advise what organisation modelled these locations?	<p>Details of the predictive groundwater model are provided in Appendix U: Groundwater Technical Report, Section 6.3. Details and the rationale of the cuts selected, model inputs and assumptions, boundary conditions and results are provided. Further, potential impacts as a result of loss or damage to existing groundwater bores and drawdown due to seepage are detailed in Appendix U: Groundwater Technical Report, Section 7.1.1 and Section 7.2.1.</p> <p>It is noted that the revised draft EIS indicates no anticipated impacts to registered bores outside the construction footprint as a result of groundwater drawdown. A water/groundwater bore survey has been issued to landowners to confirm the location/presence of water supplies that may be impacted by the Project. Where necessary, make-good measures will be developed on case-by-case basis in consultation with the landowner. Details of the proposed potential make-good measures are detailed in Table 15.20 and Section 15.7.4 of Chapter 15: Groundwater. However, the measures developed for each impacted bore will be unique and commensurate with the level of impact realised, therefore specific details cannot be provided at this time.</p>	<p>Chapter 15: Groundwater</p> <p>Section 7.3.4</p> <p>Table 15-20</p> <p>Appendix U: Groundwater Technical Report</p> <p>Section 6.3</p> <p>Section 7.1.1</p> <p>Section 7.2.1</p>
15	15.0006	Private	Groundwater	Groundwater drawdown	The impact of the drawdown on groundwater and absence of mitigation measures proposed in the EIS shows that ARTC do not care for farming communities. The number of stock and household bores stated in the EIS (30) is not correct.	Full independent review of water usage by the project.	<p>The Project footprint (temporary footprint required to enable the Project and permanent footprint that remains after construction) is wholly contained within the groundwater impact assessment area (1-km radius from rail centreline). Chapter 15: Groundwater, Section 15.5.4 details the breakdown for registered and unregistered bores within the impact assessment area, and how that information was utilised to develop the revised draft EIS. The predictive modelling does not indicate impact to any bore (registered or not) from predicted Project groundwater impacts. Project-specific monitoring bores were installed, as detailed in Section 15.4. A total of 48 Project bores comprise the revised groundwater monitoring network and can form the basis of the groundwater management and monitoring plan (GMMP) (Table 15-21, Chapter 15: Groundwater).</p> <p>The groundwater predictive modelling undertaken as part of the revised draft EIS indicates that the horizontal extent of drawdown will to only extend a maximum of 10 m to 43 m horizontally from the rail centreline (from the deepest cuts). This drawdown will be localised around the vicinity of the deep cuts that intersect groundwater only and no regional groundwater drawdown/wider impact on the aquifer is anticipated. Currently no bores are anticipated to be impacted by groundwater drawdown from the Project. Revised draft EIS Section 15.5.4 and 15.7.4 of Chapter 15: Groundwater and Appendix U: Groundwater Technical Report, Section 4.7.5, 8.2 and 8.3.4 have been updated accordingly with groundwater users, the 'make-good' strategy and proposed measures.</p> <p>As part of ARTCs construction water planning process, construction water procurement studies are ongoing including options analysis. As part of these works, estimates of water usage are being calculated. Detailed discussion of ARTCs approach for construction water is outlined in Appendix B5: Construction Water Requirements Report.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.5.4</p> <p>Section 15.7.4</p> <p>Table 15-21</p> <p>Appendix B5: Construction Water Requirements</p> <p>Appendix U: Groundwater Technical Report</p> <p>Section 4.7.5</p> <p>Section 8.2</p> <p>Section 8.3.4</p>
15	15.0007	Private	Groundwater	Groundwater drawdown	The estimated water used during construction phase and water requirements to maintain structural stability of infrastructure such as high banks and track foundations needs to be known. The submitter highlights the importance of water to the towns and farming communities and hence the amount of water to be consumed by the IR project needs to be analysed so as to ensure that adequate water is available for farms and towns along the proposed line.	A full independent review is required on the total water usage required to maintain the tracks in a safe and stable condition and ensure the viable supply of adequate water for farms and towns along the proposed line.	<p>As part of ARTC's construction water planning process, construction water procurement studies are ongoing including options analysis (see Chapter 5: Project Description, Section 5.6.24). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water. As part of these works, estimates of water usage are being calculated. Currently the hierarchy of options for construction water supply prioritises non-potable sources to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, it would be secured through private agreement through trading or purchasing of existing allocated entitlements, and the licenced capacity of existing bores will not be exceeded as described in Table 15-17 and 15-20 and Table 8-2 of Appendix U: Groundwater Technical Report.</p> <p>It is anticipated that groundwater will not be required post Construction Works stage for the ongoing track stability during the Operations stage of the Project.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.24</p> <p>Chapter 15: Groundwater</p> <p>Table 15-17</p> <p>Table 15-20</p> <p>Appendix B5: Construction Water Requirements</p> <p>Appendix U: Groundwater Technical Report</p> <p>Table 8.2</p>
16	16.0001	State Agency	Approvals/ conditions/ recommendations		No issues.	Nil	<p>ARTC note that Queensland Ambulance Service, Darling Downs Local Ambulance Service Network advised that there were no issues with the draft EIS. Consultation with the Queensland Ambulance Service and Office of the Minister for Health and Minister for Ambulance Services is outlined in Table E-18 and Section 4.2.3.1 of Appendix E: Consultation Report.</p>	

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
17	17.0001	Private	Traffic and Transport	Level crossing	The area near Millmerran Road is prone to fire risk with drought, farms, community and forestry. The delay to the arrival of Millmerran auxiliary fire brigade and other emergency services due to the proposed level crossing and train flow is a dangerous risk.	Relocate the train to the other side of the road as to not interrupt traffic on Millmerran Road.	<p>The Border to Gowrie alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine (Chapter 2: Project Rationale). ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewer farms affected mid-block ▶ Fewer farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringally State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. aparies permits, grazing leases and timber values with the forest. <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at-grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services) through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	Chapter 2 Project Rationale Section 2.7 Appendix AA: Traffic Impact Assessment Section 3.7.6
18	18.0002	Private	Traffic and Transport	Level crossing	Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities. No new level crossings being built over state or council roads.	Alternatives to level crossings.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings: one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken to date and the understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations across the Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
18	18.0010	Private	Noise and Vibration	Operational rail noise	Rates of hypertension and myocardial infarction are increased when maximum night noise is above 50dB. ARTC has stated residences within 1 km of the project will experience a night time noise of above 49dB.	Residences within 1 km of the rail should have sound mitigation paid for by ARTC noise barriers, earth mounds, insulation, double glazed windows and air conditioners or any combination of these that will bring the night noise below a L_{Amax} of 49.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 11 Section 17
19	19.0001	Private	Noise and Vibration	Operational rail noise	Rates of hypertension and myocardial infarction are increased when maximum night noise is above 50dB. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 11 Section 17</p>
20	20.0002	Private	Traffic and Transport	Level crossing	Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities. No new level crossings being built over state or council roads.	Alternatives to level crossings. The EIS should be conditional upon no new level crossings being built over state or council roads.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings: one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken to date and the understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations across the Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT</p>
21	21.0001	Private	Stakeholder engagement	Directly impacted landowner	We are a family of 11 kids, and lease a property impacted by the rail. No clear advice for specific property and impacts to lease arrangements, particularly regarding animals. The submitter wants to know after changes in land ownership who the new owners will be and will her family be allowed to rent further, as well as will there be any reduction in rent owing to the repercussions from the construction and its aftermath.	ARTC should update website with a FAQ for tenants and make property impact information available to landlords.	<p>ARTC has engaged with all directly impacted landowners along the Project alignment. Engagement with interest holders, including tenants, has been at the discretion of the landowners, and this process is ongoing in conjunction with Department of Transport and Main Roads (DTMR) (the acquiring authority). Each scenario of acquisition will be on a case-by-case basis and determined by DTMR.</p> <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners through detailed design and construction to mitigate impacts, accommodate the continuation of current property management activities and access, where possible. Individual property treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required and if possible.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 5.1</p>
21	21.0003	Private	Noise and Vibration	Operational rail noise	The operational rail noise will prevent children from hearing if I called out if something happened. The environmental noise levels at my house will result in 13% being "highly annoyed" and 23% of having sleep disturbance. This level of noise expected at the house is linked in heart disease.	ARTC should construct noise mitigation barrier at location.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 11 Section 17</p>
21	21.0005	Private	Land Use and Tenure	Mitigation measures	The land I lease will be impacted by the project. The EIS says there will be 1.8 m chain link fencing that will be provided close to roads and communities. I need assurance that the fence will be provided on my property as I have animals and are near Gore Highway. The submitter needs reassurance about fencing to keep away her children and animals from the rail.	Provide chain link fence at 202 Purcell Road Umbiram	<p>This issue is noted. Adjustments may be made during the Detailed Design stage of the Project to consider at-property treatments by the appointed contractor.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.3, fencing will be provided for the majority of the rail corridor and its primary purpose is to limit access to the railway. Fencing will act to protect adjoining lands from trespass and to prevent stock on adjoining land from gaining access to the railway. Fencing is to extend between the corridor and landowners or occupiers adjoining the railway, with any specific requirements to be designed in consultation with the adjoining landowner.</p> <p>As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will be provided according to ARTC fencing procedure, Boundary Fencing ETM-17-02 (available on the ARTC Extranet: extranet.artc.com.au). Further information about the Project's fencing strategy is provided in Chapter 5: Project Description, Section 5.4.12). Where superior fencing is required (e.g. where tracks are in close proximity to roads and/or communities, or where trespass is anticipated) a 1.8 m chain link boundary fence may be provided.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises (see Chapter 8: Land Use and Tenure, Section 8.6.2). This has included the identification of:</p> <ul style="list-style-type: none"> ▶ Landowners property access needs and the closure of private roads ▶ Affected property infrastructure such as fences and dams ▶ The potential for changes to groundwater access. 	<p>Chapter 5: Project Description Section 5.4.12 Chapter 8: Land Use and Tenure Section 8.6.2 Section 8.6.3</p>
21	21.0006	Private	Land Use and Tenure	Directly impacted landowner	We have been told that some or all of the land we live on is being taken for the construction of the new rail corridor but nobody has explained which land or what it will mean for our lease. Who will become the new owner of the block? Will we be able to enter into a lease agreement with them? Will the rent be cheaper because the block is louder and smaller? Will the fencing be fixed so that we can continue to keep animals? OR will we be asked to leave? And how long will we be given to find somewhere to go?	ARTC should update website with a FAQ for tenants and make property impact information available to landlords.	<p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.3, Table 8-51, ARTC will carry out detailed design to further refine the Project footprint identified and assessed in the EIS, to that which is required to safely construct, operate and maintain the Project. This will minimise property acquisition requirements, property severance and disruption to land use and transport networks.</p> <p>Where property acquisitions are required, these will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld). Compensation will be provided where the Project requires the acquisition of properties in accordance with the requirements of the Acquisition of Land Act 1967 (Qld).</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.2, ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> ▶ Landowners needs regarding access to the properties and the closure of private roads. ▶ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority. ▶ The potential for changes to groundwater access. <p>ARTC works directly with the landholder regarding impacts to property. Department of Transport and Main Roads, as the controlling authority for the land acquisition process, also work directly with the landholder. Tenants should direct questions to the property owner or their property manager.</p>	<p>Chapter 8: Land Use and Tenure Section 8.6.2 Section 8.6.3 Table 8-51</p>
22	22.0001	Private	Traffic and Transport	Level crossing	The level crossings at Cunningham Highway and Yelarbon Rail yard are currently used and a proposed to be removed in the EIS. Pedestrian access across the rail line at Yelarbon is essential for sawmill employees, Grain Corp workers accessing town during lunch breaks, walking tour of town, and access to the northside of the tracks generally. Not all residents have a vehicle to drive around via road over rail overpass west of Yelarbon a trip over 3 km to the shops, and no public transports are available.	Solution to pedestrian access north and south of rail line Yelarbon. Proposed location 154-100 km west end as there is only one track to go under Construct a Pedestrian under pass below rail line using concrete culverts size height width as determined by the project Engineers with storm water diversion/s in place and water catchment location in the event water did enter the underpass it then could be pumped out with water pumps. with safety fencing to stop people from encroaching the railway line this would be a viable option that would allow people to cross from either side of town, this type of pedestrian walkway is used under roads e.g.; under the Cunningham Highway by pass Goondwindi.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.2 discusses the reference design reviews and updates for the Yelarbon road rail interfaces and the proposed pedestrian crossing facilities.</p> <p>As part of the revised reference design a dedicated active pedestrian level crossing has been added at the existing Cunningham Highway interface location (310-11-E-1) to enable pedestrian movement north/south of the Yelarbon township.</p> <p>ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities, where the need for that facility remains in a Third Party Agreement with local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design.</p>	<p>Appendix AA: Traffic Impact Assessment Section 3.7.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
22	22.0002	Private	Land Use and Tenure	Mitigation measures	Pedestrian connectivity between north Yelarbon and the town centre will be severed without pedestrian underpass. This will impact the attractiveness of land available for housing on the north side of town.	Solution to pedestrian access north and south of rail line Yelarbon, Proposed location 154-100 km west end as there is only one track to go under Construct a Pedestrian under pass below rail line using concrete culverts size height width as determined by the project Engineers with storm water diversion/s in place and water catchment location in the event water did enter the underpass it then could be pumped out with water pumps. with safety fencing to stop people from encroaching the railway line this would be a viable option that would allow people to cross from either side of town, this type of pedestrian walkway is used under roads e.g.; under the Cunningham Highway by pass Goondiwindi.	<p>It is proposed to provide an active pedestrian level crossing in Yelarbon as described in Chapter 20: Traffic, Transport and Access (see Table 20-27) and Chapter 5: Project Description (see Table 5-15) included in the revised reference design. The proposed pedestrian crossing nominal location is shown Appendix B3: Changes to Reference Design since Draft EIS.</p> <p>ARTC suggests that any informal pedestrian routes crossing the existing Queensland Rail tracks, inclusive of GrainCorp siding, are unapproved and present a safety risk to pedestrian users.</p> <p>Consultation will continue with Goondiwindi Regional Council regarding pedestrian crossing options during detailed design. The Project will also consult with directly affected landowners to understand Project related impacts and consider mitigation measures including property-based solutions where appropriate.</p> <p>Chapter 20: Traffic, Transport and Access (see Section 20.5.1) states that for public crossings, ARTC will continue to undertake necessary consultation with Department of Transport and Main Roads and local governments through the Detailed Design stage in relation to the preferred road–rail interface treatments for each location. Part of this process is to work with the relevant road manager to understand the local environment and gather information on future development plans, which can be used to inform the design. In all instances, the design and safety principles introduced in Chapter 5: Project Description and Chapter 20: Traffic, Transport and Access will be used to guide the design decision-making process.</p> <p>Where level crossings and road diversions are proposed, these were determined based on a number of factors, including the nature of existing access to properties, potential traffic levels, existing land use, location of nearby interfaces, adjoining properties and the vertical geometry of the rail alignment (see Chapter 20: Traffic, Transport and Access, Section 20.3). Vehicle wait time at level crossings, as well as the anticipated change travel time and distance from road diversions, have also been considered when determining appropriate crossings at road-rail interfaces.</p>	<p>Chapter 5: Project Description</p> <p>Table 5-15</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.3</p> <p>Section 20.5.1</p> <p>Table 20-27</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p>
23	23.0002	Private	Traffic and Transport	Level crossing	Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities. No new level crossings being built over state or council roads.	<p>Alternatives to level crossings. EIS should be conditional upon no new level crossings being built over state or council roads.</p>	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings: one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken to date and the understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations across the Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
24	24.0001	Private	Traffic and Transport	Level crossing	The EIS proposed level crossing at 'Woodspring' crossing the Millmerran Road 8 km north of Inglewood. For public safety do not have a level crossing at Woodspring. Any rail crossing of the Millmerran Road must be a flyover for either road traffic or rail traffic. There are three proposed rail crossings between Inglewood and Millmerran, this will be the only a level crossing in the area. The submitter has seen many fatalities in the Woodspring area and fears that it will increase with the rail project.	<p>Rail alignment should be on the western side of the Millmerran Road and as alternative, have just one crossing near Millmerran. This will help save lives as the level crossing is prone to accidents. It will also save money and traffic disruptions.</p>	<p>The Border to Gowrie alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewer farms affected mid-block ▶ Fewer farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringallly State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7.6</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
25	25.0001	Private	Project scope	Infrastructure crossings/interaction	For the future, ARTC should construct passenger platforms at Toowoomba and Goondiwindi for XPT services.	<p>Build passenger platforms at Toowoomba and Goondiwindi for XPT services.</p>	<p>The industry and freight customers have been consistent in expressing their priorities throughout this process and these remain at the core of the service offering. They highlighted the need for flexibility, interoperability, the importance of terminals and clearly stating the target for reliability.</p> <p>Passenger platforms are not within the scope of the project, however Inland Rail will be open for any accredited operator to run a train along the rail line, once operational. The Business Case is based upon operators transporting freight (domestic goods) across a range of sectors to our cities, such as fresh food, packaged goods, hardware, white goods, and bulk goods.</p> <p>Inland Rail is freight infrastructure, however, the decision to run passenger services will be a matter for each State Government or for private operators. ARTC, the operators of Inland Rail, have a long history of working with Government and private operators to ensure passenger trains have access to the national rail network. This will continue to be the case for Inland Rail.</p>	N/A
26	26.0001	Private	Approvals/conditions/recommendations	Baseline/background sampling	The EIS has sections that are not of adequate detail or depth.	Redo the MCA	<p>All EIS chapters and reports have been updated following submission of the draft EIS and a review of the proposed Project alignment.</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ Ability to enhance the Inland Rail service offering ▶ Construction and operating costs ▶ Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Appendix E: Consultation Report</p>
26	26.0002	Private	Social Impact Assessment	Cumulative impacts	Cumulative impact of the rail alignment through township of Pittsworth does not bring prosperity to the town with a population of 3,294. Liveability of towns impacted was not weighted in the multi-criteria analysis.	<p>Seek alternative route via Cecil Plains and Mount Tyson. Even if this route adds extra time to the overall travelling time, it would still only be an additional 20 minutes via Cecil Plains, and will still keep the time below the upper limit of 24 hours.</p>	<p>Appendix X: Social Impact Assessment, Section 1.2 notes the Project alignment diverts from the existing rail line to travel to the north of the Pittsworth township, reducing impacts on the town.</p> <p>The Border to Gowrie Project Terms of Reference require that the selected alignment is assessed. The MCA was a separate process to the EIS.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 1.2</p>
26	26.0003	Private	Noise and Vibration	Operational rail noise	The rail noise will cause sleep loss for Pittsworth residents, all 3294 of them.	Seek alternative route via Cecil Plans and Mount Tyson	<p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment and impact to sleep. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Border to Gowrie Project alignment as per the Department of Transport and Main Roads' Interim Guideline - Operational Railway Noise and Vibration. Sleep disturbance has been assessed using the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 (enHEALTH 2018) (refer to Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations)</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale in the revised draft EIS, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties. Section 2.9.3 of Chapter 2: Project Rationale explores the Cecil Plains and Mount Tyson alternative route, specifying why the route was discounted.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
26	26.0004	Private	Social Impact Assessment	Property Devaluation	The route multi-assessment criteria does not consider liveability. The alignment through town of Pittsworth will result in property devaluation.	Reconsider alignment through Pittstown. Choose route through Cecil Plains and Mount Tyson	<p>Appendix X: Social Impact Assessment, Section 1.2 notes the Project alignment diverts from the existing rail line to travel to the north of the Pittsworth township, reducing impacts on the town.</p> <p>The revised draft EIS Terms of Reference require that the selected alignment is assessed. The MCA was a separate process to the EIS.</p> <p>The submission indicates concern about the effects of noise on property values in Pittsworth.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.4 notes that at the townships of Brookstead and Pittsworth, the predicted noise levels and location of the nearby sensitive receptors triggered an investigation of rail noise barriers.</p> <p>Property owners' concerns about the potential for impacts on the value of their properties is acknowledged in Appendix X: Social Impact Assessment, Section 7.1. As noted, property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres. All relevant research the EIS team could identify is presented within Appendix X: Social Impact Assessment.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 1.2</p> <p>Section 7.1.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
26	26.0005	Private	Land Resources	Severance of agricultural land	The multi-criteria analysis did not capture the impact on prime agricultural land in Pittsworth when selecting the proposed alignment. This will result in loss of strategic cropping land.	Seek alternative route through Mt Tyson and Cecil Plains.	<p>The Project has been aligned to be co-located with existing rail and road infrastructure, where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. However, for several reasons, including topography and operational design parameters, a portion of the alignment has to traverse agricultural land. Chapter 8: Land Use and Tenure, Section 8.5.1, has been updated for the revised draft EIS, detailing land to be sterilised due to the revised alignment. As described in Chapter 2: Project Rationale Section 2.8-2.10, of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that there will be a loss of agricultural land that cannot be avoided. The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondwindi, the permanent disturbance footprint traverses:</p> <ul style="list-style-type: none"> 0.02 percent of Class A land, 0.19 percent of Class B land, and 0.01 percent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately:</p> <ul style="list-style-type: none"> 0.17 percent of Class A land, 0.22 percent of Class B land, and, 0.19 percent of IAA land <p>Where the loss of agricultural land was unable to be avoided, refinement of the horizontal alignment was considered (among other environmental, social, cultural, economic and technical constraints), and placement of the rail corridor such that it traverses around or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided Chapter 8: Land Use and Tenure, Section 8.5.4).</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed based on these over-arching factors; therefore, a like-for-like replacement for the loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint cannot avoid the severance of agricultural land and enterprises due to the partial property acquisition, the acquisition will be investigated in consultation with landowners (Chapter 8: Land Use and Tenure, Section 8.5.2 and 8.6.2). The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design in accordance with the <i>Acquisition of Land Act 1967</i> (Qld).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. 	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 8: Land use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.5.2</p> <p>Section 8.5.4</p> <p>Section 8.6.2</p>
26	26.0006	Private	Project alignment	Baseline/backgr ound sampling	The multi-criteria analysis was too skewed to minimising capital expenditure and minimising transit time that it doesn't adequately weight towards the impact for townships it passes through. Additionally, given the positive CSIRO study on ARTC business case findings being much stronger, and ABC speculating more funds will be available, a new MCA should be conducted. More appropriate weighting given to public nuisances from noise, number of families impacted, safety and preservation of prime agricultural land. Route should travel an extra 20 minutes via Cecil Plains and bypass Brookstead and Pittsworth townships.	Re-do MCA with more weighting toward impact to people in townships.	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the multi-criteria analysis (MCA). <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020 (Chapter 2: Project Rationale, Section 2.9.3). Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Chapter 2: Project Rationale, Section 2.9.3 and 2.10.12, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.9.3</p> <p>Section 2.10</p> <p>Section 2.10.12</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
26	26.0007	Private	Flooding		The current route via Pittstown has the rail crossing the floodplain. There are flooding concerns.	Redo the MCA. Re-route via Cecil Plains and Mount Tyson to avoid crossing the floodplain.	<p>The revised draft EIS is focused on the chosen alignment selected by the Australian Government.</p> <p>The chosen alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale Section 2.8.</p> <p>Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9.3</p>
27	27.0001	State Agency	Land Use and Tenure		Property access is impacted to Yarranlea T010 zone substation site is described as Lot 1 on RP120604 Toowoomba Regional Council and is Freehold tenure of approximately 3.2ha in area. It is critical to EQL maintaining all-weather access to this important zone substation. While a small levy was constructed within the rail corridor the inadequate design and subsequent maintenance led to silt deposits on the substation access, preventing vehicle access to the substation at critical times. EQL has since undertaken mitigation works on the substation Lot to manage this issue however please note Queensland Rail's obligations under the plan.	ARTC and Railway investigate Registered Soil Conservation Plan SC300986 and access to Substation at Yarranlea	<p>ARTC and their hydrology specialists have consulted with Energy Queensland on this matter, following preliminary flood modelling and investigations into this submission. Energy Queensland have advised they are satisfied with actions undertaken to date and ARTC will continue consultations during detailed design.</p> <p>ARTC have reviewed SC300986 as part of their investigation into this matter and consultation has occurred with Energy Queensland on access to the substation at Yarranlea. Consultation will continue during detailed design.</p> <p>In addition, the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.6.3 (Table 8-51), states that the utility interface solutions that have been included in the reference design have been discussed with individual utility owners and are presented in Section 8.5.1. The exact methodology for utility modification, upgrade, diversion or realignment will be subject to confirmation once the Project's design is finalised and will be determined through further consultation with the affected utility owners. Details on consultation undertaken through the reference design process is provided within Appendix E: Consultation Report. Further geotechnical and soils investigations has been completed to inform the development of the detailed design. This additional information will provide details on the geotechnical condition of materials in proximity to key underground utility infrastructure within the Project footprint.</p> <p>Specific outcomes included methodologies for treating impacted utilities, providing indications of construction timeframes and the current status of the rail design. The methodology for mitigating the impact of the interface between utilities and the alignment include modification to the utilities, upgrade of the utilities, and diversion or realignment of the rail. Specific methodologies for individual utilities will be finalised through further consultation with providers and integrated into the design of the alignment in detailed design. ARTC will continue to liaise with Energy Queensland to address interface requirements between the Project and electricity infrastructure to avoid any impacts to the local electricity network (Chapter 8: Land Use and Tenure, Table 8-51). The consultation approach is further detailed in Chapter 6: Stakeholder Engagement.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.3</p> <p>Table 8-51</p>
27	27.0002	State Agency	Groundwater	Flood immunity	Soil Conservation Plan SC300986 was counter-signed by Queensland Electricity Corporation (QEC) and Queensland Railways in 1986. The plan covers country on the southern side of the rail line however it impacts on Yarranlea T010 by allowing delivery of stormwater close to the site. With requirement that the Railway Department installs a suitable culvert under the railway that a levy bank be constructed on the QEC property to direct any flow of water from this culvert away from the substation. The levy was constructed within rail corridor was inadequately maintained and now silt deposits are across the access route preventing cars from traveling.	It is QR's obligation to maintain levy under the agreement. ARTC should review the Soil Conservation Plan.	<p>Detailed design will involve a review of all relevant Sediment Control Plans (i.e. those detailed in Chapter 9: Land Resources, Section 9.4.4 and Section 9.5.5, Chapter 9: Land Resources), as well as engagement with affected stakeholders and all requirements of the plans will be incorporated in drainage design. SC300986 is located near Ch 163-164 km and is an approximately 50 ha contour-banked catchment to farm dam near culvert at Ch 161.5 km of the Project alignment that has the potential to direct corridor drain into contour banks away from fill (see Table 9-23).</p> <p>According to Chapter 13: Surface Water, Table 13-15, there is a known sediment basin around this location (sediment basin ID 8 at Ch 164.3 km).</p> <p>Appendix B1: Design Drawings and Chapter 5: Project Description (Table 5-11) outline that a road-over-rail bridge is proposed to be developed to ensure the QR line remains and maintenance can be maintained in accordance with QR and Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 5: Project Description Table 5-11</p> <p>Chapter 9: Land Resources</p> <p>Section 9.4.4</p> <p>Section 9.5.5</p> <p>Table 9-23</p> <p>Chapter 13: Surface Water</p> <p>Table 13-15</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
28	28.0001	Private	Economics		The business case for Inland Rail will never break even financially, and is dependent on \$6.5 billion in taxpayer funded subsidies, including \$1 billion in subsidies for coal mining.	ARTC needs to make it carbon neutral or do not proceed with project.	<p>All assumptions relating to demand modelling, including the connection to the Port of Brisbane and intermodal terminals, and revenue are considered in the Inland Rail Programme Business Case (2015). As such the revised draft EIS reflects the information contained in the Business Case and does not include any new assumptions. In regards to coal, for the purposes of the economic benefit assessments contained within the Inland Rail EIS', freight movements from coal demand have been excluded. This approach is consistent with the cost benefit analysis completed for the ARTC Inland Rail Programme Business Case (2015). With specific reference to the cost benefit analysis results for the scenarios "No Western Line Upgrade", extracted from the Inland Rail Programme Business Case (2015) Chapter 9. Economic Analysis, where coal benefits are equal to zero (0).</p> <p>The reference design for the Project has an engineering design life of 100 years and it is based on industry best practice. ARTC commits to using the latest version of the IS rating tool or another equivalent tool to assess performance and aims to deliver performance that is equivalent to the 'Excellent' level as measured by the IS v1.2 rating tool and has developed an Environment and Sustainability Policy (ARTC, 2021a) which is provided in Appendix C: Corporate Policies. The sustainability commitments embedded into the Environment and Sustainability Policy (ARTC, 2021a) guide the Project's approach to sustainability and are supported by identified targets for Inland Rail Projects as part of the Program-wide Sustainability Strategy (Chapter 7: Sustainability, Section 7.4). This strategy will inform the Sustainability Management Plan that will be prepared by the Contractor for the Project and will guide the identification of Project-specific initiatives (Chapter 7: Sustainability, Section 7.5).</p>	<p>Chapter 7: Sustainability</p> <p>Section 7.4</p> <p>Section 7.5</p> <p>Appendix C: Corporate Policies</p>
28	28.0002	Private	Social Impact Assessment	Local business and industry procurement	The project will receive \$1 billion in subsidies for coal mining and will be a catalyst for increased thermal coal mining in South East Queensland. This is not safe for Australians.	If its not carbon neutral, IR should not proceed.	<p>ARTC is looking to create long-term value and deliver Inland Rail with the best possible outcomes for local communities, the economy and the natural environment. It should be noted, one 1,800 m double-stacked freight train can carry the same amount of freight as 110 B-Double trucks. By sharing the freight load, ARTC will reduce congestion on our roads and lower carbon emissions.</p>	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
28	28.0003	Private	Hazard and Risk		The project does is not a carbon neutral project and does not align with UN goal of collectively reducing emissions to prevent irreversible climate change. There is no benefit to the rail as the competition for the rail will be renewable electricity powered semitrailers.	If its not carbon neutral, do not proceed with construction.	<p>The Australian Government has committed to reducing greenhouse gas emissions by 43% below 2005 levels by 2030, with the goal of achieving net zero emissions by 2050. This commitment was lodged with the United Nations Framework Convention on Climate Change secretariat on 16 June 2022.</p> <p>It is forecast that Inland Rail will increase the capacity of existing freight infrastructure through the use of double stacked trains that transport more freight. Additionally, rail is four times more fuel efficient than moving freight by road. Consequently, Inland Rail is expected to result in a partial modal-shift for the transportation of freight between Melbourne and Brisbane, with 200,000 fewer trucks predicted to travel this route per year by 2050 once the Project is operational. On this basis, Inland Rail is expected to facilitate a reduction in carbon emissions by the freight transportation industry by 750,000 tonnes per year from 2050.</p> <p>Transport emissions in Australia make up 19 per cent of our total national emissions. The road freight sector contributes 38 per cent of our total transport emissions. Therefore, Inland Rail is a Project that will support our national efforts to achieve the 2030 and 2050 emissions commitments that have been made by the Australian Government to the UN.</p> <p>Electric vehicle models are currently available that are suitable for urban freight distribution purposes. However, the vehicle fleet and charging infrastructure required to support the inter-state movement of freight via road is not available. Until this is the case, electric-powered freight movement via road will not be considered as a feasible alternative to Inland Rail.</p> <p>Justification for the Project is provided in Chapter 2: Project Rationale. Discussion of the emissions objectives for the Project is provided in Chapter 7: Sustainability, Section 7.5.3.</p>	Chapter 2: Project Rationale Chapter 7: Sustainability Section 7.5.43
29	29.0001	Private	Surface Water	Directly impacted landowner	The overland water flow into the main dam on our property at Pittsworth will be stopped by the project.	Culverts in the correct position to catch the overland water flow.	<p>The revised Reference Design includes culverts under the proposed rail embankment to maintain existing flow paths. At property 1RP7482 runoff generated from catchments bisected by the proposed Inland Rail embankment allows for two culvert locations to maintain cross drainage flows to the farm dam, namely C164.16 (consisting of 6 x 0.9 m diameter reinforced concrete pipes) and C164.29 (consisting of 22 x 1.2 m diameter reinforced concrete pipes). C164.16 drains a catchment area of 6.5 ha and C164.29 a catchment area of 166.4 ha (see Appendix B1: Design Drawings). Due to the prevalent soil conditions scour and erosion protection measures at the culvert outlets are proposed to be provided. During Detailed Design the culvert placement, sizes and detailed configuration will be confirmed.</p> <p>ARTC will continue to consult with directly affected landowners through the Detailed Design stage and make refinements as required.</p> <p>A potential impact assessment for the above culvert IDs can be found in Table 14-114 of Chapter 14: Flooding and Geomorphology. These culvert IDs can be found in relation to property 1RP7482 in Appendix B1: Design Drawings.</p>	Chapter 14: Flooding and Geomorphology Table 14-114 Appendix B1: Design Drawings
29	29.0002	Private	Social Impact Assessment	Directly impacted landowner	Property access on the eastern side of the rail line is impacted as we need access with machinery and cattle.	Construct a culvert large enough to fit headers, trucks and the like through it.	<p>ARTC acknowledges landowner concerns regarding the potential impact of the Project on property operations. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners through detailed design and construction to mitigate impacts, accommodate the continuation of current property management activities and access, where possible. Individual property treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required and if possible.</p> <p>Appendix X: Social Impact Assessment, Section 8.6.1 notes individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p> <p>Appendix X: Social Impact Assessment, Section 8.6.1 notes that 'Impacts such as severance or loss of land area may affect the operations of these businesses and therefore farmers' or business owners' incomes, which will be considered as part of acquisition and compensation agreements'.</p>	Appendix X: Social Impact Assessment Section 8.6.1 Chapter 24: Draft Outline Environmental Management Plan
29	29.0003	Private	Flora and Fauna	Koala	The rail line is proposed through Koala habitat. They will not be able to move between feeding trees because of the rail embankment.	Nil	<p>Following the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS, Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Appendix P: Fauna Connectivity Strategy, identifies the location of proposed fauna crossing opportunities for species such as Koala. Opportunities to incorporate fauna infrastructure at other potential crossing points (e.g. large culverts) will be considered during the detail design process and in the Wildlife Connectivity Plan that will be prepared. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detail design process and incorporated where appropriate.</p> <p>The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Transport Infrastructure Delivery manual (DTMR 2024).</p> <p>The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, a range of different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p>	Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix P: Fauna Connectivity Strategy Section 5 and 7
29	29.0004	Private	Noise and Vibration	Operational rail noise	Noise will impact the township of Pittsworth.	Create a cutting on the eastern side of Pittsworth to form large embankments of both sides of the rail line to encapsulate the noise.	<p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment and impact to sleep. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment as per the Department of Transport and Main Roads' Interim Guideline - Operational Railway Noise and Vibration.</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale in the revised draft EIS, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>Regarding the proposed solution, as per the Interim Guideline - Operational Railway Noise and Vibration, reasonable and practicable mitigation measures should be implemented where noise criteria is exceeded. Creating a cutting to form large embankments to encapsulate noise is not reasonable or feasible due to factors such as impacts to hydrology, restriction of maintenance of the asset, and the volume of materials required to form the embankment.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design Stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.9.3 Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
30	30.0001	Private	Noise and Vibration	Operational rail noise	Level Crossing operational noise with lights and bells, and horns near the Cabin at Woodspring Farm on Millmerran Road will ruin Woodspring Farm peace and quiet.	The other side of the road has only scrub and no houses or businesses. Please seriously consider the need to cross the road at this point as doing so will destroy the livelihood of this family.	<p>As noted in Section 2.8 of the Chapter 2: Project Rationale, the alignment between Yelarbon to Gowrie was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's Interim Guideline Operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
30	30.0002	Private	Social Impact Assessment	Operational rail noise	The rail noise will impact the accommodation business due to the hourly train horns, bells and warning lights from the level crossing near Woodspring Farm.	The other side of the road has only scrub and no houses or businesses. Please seriously consider the need to cross the road at this point as doing so will destroy the livelihood of this family.	<p>ARTC has presented the results of the noise modelling and potential mitigation strategies in the revised draft EIS Chapter 16: Noise and Vibration (Section 16.8 and 16.10) and Appendix W: Noise and Vibration Assessment - Railway Operations (Sections 7, 8, 10,16, Appendix D, and Appendix E). The results include sensitive receivers predicted to exceed noise guidelines during the operation of Inland Rail. ARTC notes the structures on this property are approximately 750 metres from the proposed level crossing and have not been identified as exceeding said guidelines.</p> <p>ARTC will continue to engage with the community about noise and noise mitigation throughout the Detailed Design, Construction Works and Operations stages of the Project.</p> <p>ARTC acknowledges the request for Millmerran-Inglewood Road crossing to be grade separated; however, investigations clearly show that a grade separation is not required at Millmerran-Inglewood Road (Chapter 20: Traffic, Transport and Access, Table 20-30 and Appendix AA: Traffic Impact Assessment, Section 2.2.3).</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, including sighting distances, gradients and approach angles (Appendix AA: Traffic Impact Assessment, Section 3.6.2).</p> <p>The Proponent will continue to engage with QR and the Department of Transport and Main Roads about potential connections and interfaces between the two networks, along with identifying relevant operational considerations (Table 2.1 of Appendix AA: Traffic Impact Assessment).</p>	Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Chapter 20: Traffic, Transport and Access Table 20-30 Appendix W: Noise and Vibration Assessment - Railway Operations Section 7 Section 8 Section 10 Section 16 Appendix D Appendix E Appendix AA: Traffic Impact Assessment Section 2.2.3 Section 3.6.2 Table 2.1
30	30.0003	Private	Social Impact Assessment	Local business and industry procurement	Local business uses the accommodation let to market private beef business to guests. The impact of the level crossing with warning lights, bells and hourly train horns will impact their guests numbers and beef sales. There is no need to cross the road at this location as the other side of the road has scrub with no houses or businesses.	The other side of the road has only scrub and no houses or businesses. Please seriously consider the need to cross the road at this point as doing so will destroy the livelihood of this family.	<p>ARTC has presented the results of the noise modelling and potential mitigation strategies in the revised draft EIS Chapter 16: Noise and Vibration (Section 16.8 and 16.10) and Appendix W: Noise and Vibration Assessment - Railway Operations (Sections 7, 8, 10,17, Appendix D, and Appendix E). The results include sensitive receivers predicted to exceed noise guidelines during the operation of Inland Rail. ARTC notes the structures on this property are approximately 750 metres from the proposed level crossing and have not been identified as exceeding said guidelines.</p> <p>ARTC will continue to engage with the community about noise and noise mitigation throughout the Detailed Design, Construction Works and Operations stages of the Project.</p> <p>ARTC acknowledges the request for Millmerran-Inglewood Road crossing to be grade separated; however, investigations clearly show that a grade separation is not required at Millmerran-Inglewood Road (Chapter 20: Traffic, Transport and Access, Table 20-30 and Appendix AA: Traffic Impact Assessment, Section 2.2.3).</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, including sighting distances, gradients and approach angles (Appendix AA: Traffic Impact Assessment, Section 3.6.2).</p> <p>The Proponent will continue to engage with QR and the Department of Transport and Main Roads about potential connections and interfaces between the two networks, along with identifying relevant operational considerations (Table 2.1 of Appendix AA: Traffic Impact Assessment).</p>	Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Chapter 20: Traffic, Transport and Access Table 20-30 Appendix AA: Traffic Impact Assessment Section 2.2.3 Section 3.6.2 Table 2.1 Appendix W: Noise and Vibration Assessment - Railway Operations Section 7 Section 8 Section 10 Section 16 Appendix D Appendix E

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
31	31.0001	Private	Traffic and Transport	Road safety	Concern about access to emergency services due to the planned level crossing at Inglewood Millmerran Road. The proposed plans are flawed and the ARTC should be required to cross the Inglewood Millmerran Road only once, in a grade separated crossing.	The best solution would be to cross the Inglewood Millmerran Road only once, but an alternative would be to build an overpass if this crossing is deemed absolutely necessary.	<p>The Border to Gowrie alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewer farms affected mid-block ▶ Fewer farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringallily State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 3.7.6 Section 5.8 Section 5.9 Appendix BT
32	32.0001	Private	Traffic and Transport	Local business and industry procurement	Concern about the repeated crossing of Inglewood Millmerran Road and a level crossing on Inglewood Millmerran Road that will be dangerous and inconvenient. Concern that this will affect business, particularly submitter's daughter's camping and BnB business. People will not want to travel along this road and get stuck at the crossing.	The train line should stay in the forestry back from the houses on Millmerran road where it won't disrupt land used for farming or tourism, and cross the Millmerran Road only once (not 3 times). If the current crossing is deemed absolutely necessary it should be a grade separated crossing with adequate fencing to prevent pedestrian access.	<p>The Border to Gowrie alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewer farms affected mid-block ▶ Fewer farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. 32	32.0002	Private	Traffic and Transport	Modelling	The EIS says the wait time is just over 100 seconds but modelling is on a best case scenario and for 3600 m trains that are not the express super freighters this time could be considerably longer. It would make us choose a different route on our travels	The train line should stay in the forestry back from the houses on Millmerran road where it won't disrupt land used for farming or tourism, and cross the Millmerran Road only once (not 3 times). If the current crossing is deemed absolutely necessary it should be a grade separated crossing with adequate fencing to prevent pedestrian access.	<p>Revised draft EIS Chapter 5: Project Description (see Section 5.4.1) describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m train length is not part of the Project for which approval is being sought.</p> <p>Typically, existing rail operating services with design speeds slower than the 115 km/hr are also significantly shorter (generally <900 m) than the 1800 m long Inland Rail reference train. Shorter trains, even at lower speeds, are expected to take less time to traverse the level crossing.</p> <p>ARTC believe the modelling to be conservative, relative to all train types, up to 1,800 m long, that may use the network.</p>	Chapter 5: Project Description Section 5.4.1
32	32.0003	Private	Traffic and Transport	Level crossing	Concern about safety about school bus route and bus stopping in close proximity to the level crossing. Submitter would be extremely concerned for the safety of children, particularly if for some reason they were left alone at the bus stop with no adult supervision.	The train line should stay in the forestry back from the houses on Millmerran road where it won't disrupt land used for farming or tourism, and cross the Millmerran Road only once (not 3 times). If the current crossing is deemed absolutely necessary it should be a grade separated crossing with adequate fencing to prevent pedestrian access.	<p>Section 5.10.4 of the revised draft EIS Appendix AA: Traffic Impact Assessment details the impacts of the proposed rail alignment on school bus routes. The calculated disruption to the bus route due to the Millmerran-Inglewood Road level crossing is 1.69 minutes.</p> <p>The school bus route does not have designated bus stops, apart from the termini, prior to the Construction Works stage of the Project, and therefore suitable mitigation measures for the service, including the location of bus stops, will be identified in consultation with bus operators, local councils, impacted schools, Department of Education and the local community and be documented in the Traffic Management Plan to ensure school bus safety and understand any impacts to journey times, if any. These stakeholders will be consulted as part of the Project and made aware of the proposed changes to the school bus routes. The construction contractor will also be made aware of the presence of school bus routes and bus stops and their operational hours as part of the Project induction process.</p> <p>ARTC commits to maintaining existing bus stops during the Project construction. Where these require alteration, this will be agreed with the relevant service provider.</p> <p>The school bus routes, identified in Table 5.114, and the bus stops and pedestrian access to these stops must be maintained during construction of the development. Accordingly, if any temporary bus stop and pedestrian access arrangements or alternative bus routes are required when construction routes are finalised, the contractor must reach agreement on suitable arrangements with the DTMR TransLink Division (bus_stops@translink.com.au or on 3851 8700) and/or bus operator (whichever is relevant) prior to any construction or works commencing.</p> <p>During detailed design and construction the contractor will prepare a Road Use Management Plan and Traffic Management Plan, in accordance with DTMR and TRC guidelines and standards. These plans include regular assessment of road safety and road conditions to ensure safe access for all road users, including pedestrians. Appendix AA: Traffic Impact Assessment Section 5.2 provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.</p>	Appendix AA: Traffic Impact Assessment Section 5.2 Section 5.10.4 Table 5.114 Appendix BT
32	32.0004	Private	Noise and Vibration	Operational rail noise	Concern about taking the rail right through the town of Yelarbon. The impact of noise on all the houses in Yelarbon will be significant, especially at night,	In Yelarbon (and the rest of the rail line), any property owner who identifies as being annoyed by the rail line or unable to sleep within 6 months of operation should be offered property sound mitigation options.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 10 Section 11 Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
32	32.0006	Private	Social Impact Assessment	Land acquisition/com pensation	Yelarbon is a low socioeconomic area and ARTC needs to be mindful of the fact the residents are unlikely to be able to sell their property and move somewhere else.	ARTC needs to be mindful of the fact the residents are unlikely to be able to sell their property and move somewhere else and do their best to mitigate any negative effects they cause.	There is an existing rail line through Yelarbon. As described in Chapter 16: Noise and Vibration, Section 16.10, options for noise management are expected to include consideration of rail noise barriers (or similar) at Yelarbon. The review of noise barrier options for the Project are discussed in Section 16.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Section 16 of Appendix W discusses that for the other sensitive receptors where assessment criteria are predicted to be triggered, the reasonable and practicable noise mitigation options are expected to include architectural acoustic treatments to buildings to control rail noise within the internal environment of the building, and/or upgrades to existing property boundary fencing to improve screening of rail noise levels. This is expected to mitigate the potential for people to feel noise is impacting on their lifestyle to the extent that they wish to move.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 16 Section 16.4
33	33.0001	Private	General project opinion - positive		Submission notes that the train will be good for Inglewood, however raises various concerns.	Nil	ARTC note the positive feedback regarding Inglewood and are committed to continued engagement with the community as the Project progresses through the Detailed Design and Construction Works stages.	N/A
33	33.0002	Private	Traffic and Transport	Level crossing	I am concerned about the level crossings in close proximity to town, particularly at Inglewood Millmerran Road. Putting a level crossing on this road is dangerous. The site chosen is particularly dangerous because of the curves in the road, the trees growing right up to the side of the road, and the 100 km/hr speed limit which will mean the train and crossing will not be seen early and heavy vehicles might not have sufficient stopping time.	Please insist the train stays in the forestry on the western side of the Millmerran Road until it can cross at a site with good visibility away from the school bus route, with preferably only one crossing.	Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations. The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope. From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040, Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared. The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. This will take into account the highspeed road environment and provide sufficient signage and warning mechanisms for approaching vehicles. ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution. ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services and school services) through the Detailed Design and Construction Works stage to ensure that safety concerns and issues are addressed.	Appendix AA: Traffic Impact Assessment Section 3.7.6 Section 5.8 Section 5.9 Appendix BT
33	33.0003	Private	Social Impact Assessment	Workforce accommodation village	Concern about the 300 people living in the non-resident workforce accommodation on Inglewood Millmerran Road, and another 300 at Yelarbon where there is no doctor or hospital. This will impact on the medical services in Inglewood that cannot possibly be met by the current staff. Although our physicians and support staff in Inglewood are amazing, they simply cannot be expected to deal with nearly double the population, especially when many are in high risk construction roles. This has not been sufficiently dealt with by the draft EIS and it will put Inglewood residents at risk. The chosen mitigation option is to inform the QLD Health services of proposed population changes but we already have trouble attracting and retaining doctors.	Please insist that ARTC provide their own doctor and nurse based at one of the non-resident townships for the duration of the project.	The requirement for up to 900 workers to be based near Inglewood and Yelarbon is the peak requirement. Appendix X: Social Impact Assessment, Section 8.3.7 notes that the Project will provide access to paramedic services to reduce the demands on local health services. The Project has also committed to ensuring personnel are made aware of the need to attend to routine health issues whilst they are off roster, avoiding use of local GPs. As part of its planned quarterly consultation with Queensland Health during the Project's Construction Works stage, ARTC will monitor impact on local health services. If undue strain on local health services is identified to be attributable to the Project, ARTC will work with Queensland Health and the Darling Downs and West Moreton Primary Health Network (DD&WM PHN) to implement appropriate measures which may include: <ul style="list-style-type: none"> Funding additional health services and programs at non-resident accommodation facilities, which may include contract arrangements with local or remote health service providers Adjustment of policies regarding workforce behaviour (i.e. ensuring staff attend to routine health issues off roster as directed). Additionally, ARTC has implemented measures to minimise the spread of COVID-19 among its workforce and mitigate any associated impacts on local health services. Appendix X: Social Impact Assessment, Section 8.3.7 and Section 8.5.8 have been revised in this regard.	Appendix X: Social Impact Assessment Section 8.3.7 Section 8.5.8
34	34.0001	Private	Noise and Vibration	Operational rail noise	Concern that noise impacts, particularly to sleep and that the ARTC has discounted the importance of this by suggesting that not all people will react the same way to night-time noise. Submission notes that noise levels will be greater than those recommended in the WHO guidelines for sleep. Submission also notes the health impacts of such noise levels.	Unless suitable mitigation measures can bring the noise at my house down to below 49 decibels, I would prefer ARTC to acquire my property and I will move. ARTC must address how they will accomplish this prior to EIS acceptance.	The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations). The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014. Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBa Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA L _{eq,night} noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland. Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 16. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense. ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 11 Section 17
34	34.0003	Private	Stakeholder engagement	Mitigation measures	Concern that there will not be enough time to respond and adequately address resident concerns, noting that work is due to start on South Kurumbul road in June (reference made to Chapter 18 page 94), whilst submissions are due in April. In the event that ARTC proves it can mitigate noise at my house to a liveable level, it does not provide enough time to apply property treatments before construction noise begins.	With respect to the start work date, the detailed design phase should be mandated a minimum of 3 months from EIS acceptance to allow for the proponent to meet its commitments under the EIS including allowing time for local businesses to prepare.	The construction timeframes provided in the draft EIS in early 2021 were accurate at the time of submitting the draft EIS to the Coordinator-General; however, the draft EIS notes they are subject to change because of the Project approval timeframe (as well as detailed design and procurement timeframes). Following a review of the draft EIS and stakeholder submissions in late 2021, the Office of the Coordinator-General requested additional information to be provided by ARTC. This has been undertaken and presented in a revised draft EIS, which incorporates additional noise assessments to better inform community stakeholders who are impacted by construction and operational noise. The revised draft EIS has been prepared and will undergo a public notification period, with sufficient time to allow impacted stakeholders to engage with ARTC about how noise may affect their property or business. Construction timelines will be dependent on Project approval pathways. A revised construction timeframe will be determined through Detailed Design stage and communicated through ongoing engagement with communities. ARTC will work with affected individuals and businesses to prepare for impacts during construction and operation of the Project.	Appendix E: Consultation Report Section 7.2
34	34.0004	Private	Stakeholder engagement	Mitigation measures	In Chapter 5 sections 5.8.5.3 and 5.9 ARTC claim they will work with local businesses in the detailed design phase to provide briefings and communicate pre-qualification requirements and allow businesses to diversify and prepare to be relevant to the project. If work is to be done in June, there is not enough time for ARTC to meet these commitments,	With respect to the start work date, the detailed design phase should be mandated a minimum of three months from EIS acceptance to allow for the proponent to meet its commitments under the EIS including allowing time for local businesses to prepare.	As noted in Section 8 of Appendix X: Social Impact Assessment ARTC will prepare a Social Impact Management Plan (SIMP), which will include an action plan on local business and industry content. In addition, ARTC will comply with the Coordinator-General's conditions of approval regarding workforce participation and timing of installation of mitigation.	Appendix X: Social Impact Assessment Section 8
34	34.0005	Private	Traffic and Transport	Mitigation measures	Concern about damage to South Kurumbul road.	A commitment should be sought prior to approval that damage done to the road will be repaired immediately, especially in light of the need to bring over spec vehicles through Kurumbul.	Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts with Section 5.6.4 highlighting mitigation measures for pavement damages to local government roads. It is noted that residents have raised concern regarding maintenance of South Kurumbul Road during construction works. The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. In the case of South Kurumbul Road, EIS assumptions suggest this threshold will be reached in the early years of construction. As a result, ARTC has had ongoing discussions with the Road Manager, Goondwindi Regional Council (GRC) on pavement impact and road maintenance arrangements. These discussions will continue in detailed design with the contractor, ARTC and GRC. Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.	Appendix AA: Traffic Impact Assessment Section 5.6 Section 5.6.4
34	34.0006	Private	Traffic and Transport	Construction traffic	On page 74 of Chapter 18 of the draft EIS, in the Signalling and Communications section, the proponent suggests the project operation will be controlled by ATMS, a software package they have not developed yet. Submission raises safety concern about using an undeveloped, untested software.	The proponent needs to either use a different software package at inception or delay the construction of the rail until such time as they can demonstrate they can operate it safely. With respect to the software, ARTC needs to provide assurances and convince the Coordinator General that they have a safe, workable solution prior to the first train travelling on the greenfield sections of the track.	Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.1 includes discussion of the use of the ATMS signalling system. The Project will be operated using Advanced Train Management System (ATMS), a communications-based safe working signalling system currently being developed by ARTC. The system will provide significantly upgraded capabilities to the rail safety by providing positive train control. Prior to being rolled out the ATMS safe working system will be required to demonstrate its safety and functionality to receive the accreditation by the Rail Safety Regulator. This will involve demonstrating its suitability on existing ARTC corridors prior to implementation to Inland Rail. Should the ATMS development schedule be delayed, an existing ARTC safe working system will be temporarily implemented.	Appendix AA: Traffic Impact Assessment Section 3.1
34	34.0007	Private	Social Impact Assessment	Land acquisition/com pensation	Property value Section 15.8.1.3 says that any decrease in property values due to the rail will be diluted by other factors affecting value such as commodity prices and demand. Submission does not believe this is adequate rationale, and that the ARTC are attempting to exonerate themselves from real impact on property.	The ARTC refusing to buy property in advance except in case of hardship ensures the property owners are placed in a weak negotiating position. After acceptance of the EIS, and prior to construction, all impacted property owners should have the option to sell their properties at agreed market value, rather than waiting for compensation. ARTC needs to make a commitment to purchase entire properties of affected landowners at pre-project market value when they cannot effectively mitigate the adverse effects of noise.	Chapter 17: Social, Section 17.5 states that property values may be affected (not that impacts will be diluted) by a range of factors both related to and unrelated to the Project. Property acquisitions will be conducted by Department of Transport and Main Roads as the acquiring authority in accordance with the <i>Acquisition of Land Act 1967</i> (Qld) (AL Act). Assessment of compensation is undertaken in accordance with Section 20 of the AL Act. Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance.	Chapter 17: Social Section 17.6

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
34	34.0008	Private	Traffic and Transport	Road safety	Concern about waiting times and impacts to safety and emergency services due to proposed level crossings. Submission notes the following: - The Office of the National Rail Safety Regulator states in its level crossings policy that no new active crossings should be built, and that new projects in brownfield rail corridors should upgrade active crossings to grade separated crossings for public safety. - The proposed route has no less than 4 level crossings within 10 km of my house. This is inappropriate and could present a long wait for emergency services, especially in the event that a train slowing for the crossing loop causes a wait and then the train travelling the other direction compounds the wait or causes a wait at one of the adjacent crossings.	For level crossings ARTC needs to commit to grade separation wherever technically possible over public roads. This is a nation building exercise and the capital expense should not factor into the safety calculations.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stage to ensure that safety concerns and issues are addressed.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
34	34.0009	Private	Traffic and Transport	Level crossing	Concern about waiting times at level crossings. Submission would like to know wait times, noting that there would be 3600 m long trains slowing for the crossing loop and meeting a 3600 m passing train at the same or a nearby crossing. The modelling is all done on 1800 m trains travelling at top speed which does not give a valid answer.	Nil	<p>The proposal in Chapter 5: Project Description, Section 5.4.1 is for the operation of double-stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains are not part of the Project for which approval is being sought.</p> <p>Appendix AA: Traffic Impact Assessment, Section 5.9.3 discusses analysis assumptions at lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (see Section 2.4). This section also details how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, and train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9.1 'Analysis assumption' states that vehicles' wait time at passive crossings were calculated using the <i>Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings</i>. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> ▶ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line ▶ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate ▶ The time it takes the train to cross the level crossing ▶ Design vehicle consisting of a B-double for input parameters. <p>Train speed and train clearance times, calculations and assumptions for the level crossing are as follows:</p> <ul style="list-style-type: none"> ▶ Train clearance times were calculated based on an assumed maximum train speed of 115 km/h ▶ Calculation of the freight train acceleration rate ▶ Distance of the level crossing from passing loops ▶ Distance required to accelerate to maximum turnout speed (50 km/h) ▶ Distance travelled while at constant maximum turnout speed ▶ Distance required to accelerate to maximum speed after whole train has passed turnout ▶ Total distance required to reach maximum speed for train starting from turnout ▶ Total vehicles' wait time with train length of 1,800 m was estimated to be 104 seconds (including boom closure times). ▶ The wait times determined for each individual level crossing were calculated based on: ▶ Level crossing specific operating speeds which is impacted by topography and curvature of the alignment ▶ Time taken for the train to cross the level crossing ▶ Distance from train crossing loops ▶ Train length ▶ Summarised traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons) ▶ A sensitivity test based on a maximum train speed of 60 km/h (as opposed to up to 115km/h) to highlight the variability in closure times. <p>A typical active level crossing sequence for boom gate down time is, after 11 seconds (±11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (±22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or road trains), the delay before the booms commence lowering can be increased by a further 5 seconds-16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F highway signals become extinguished.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.1</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4</p> <p>Section 5.9.3</p> <p>Section 5.9.1</p>
34	34.0010	Private	Social Impact Assessment	Directly impacted landowner	Concern about impacts to rent due to loss of amenity and noise impact.	ARTC should be required to build a noise mitigation wall, at least as high as the highest locomotive exhaust stacks. The conceptual wall only reaches as far as the silos on the east and the town limit on the west. When the rest stop is reinstated, it should have a gated children's playground, perhaps with information and facilities that encourage learning about and playing with acoustics and a train theme to try to turn a negative into a positive and encourage travellers to stop. As the noise mitigation wall will presumably block the view of the silo art, the wall should have a complementary painting.	<p>The submitter's property is located on Georges Lane Kurumbul in close proximity to the rail alignment and states that their house is within 100 metres of an active level crossing. The submitter also identifies as the owner of an investment property in Yelarbon.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.4 notes with respect to noise near crossings, analysis of the predicted noise levels determined that where sensitive receptors are located within approximately 200 metres of each level crossing or train horn location (100 metres either side of level crossings), noise from the crossing alarm bells and train horns would potentially contribute to noise levels above ARTC's noise management levels, and noise mitigation measures may need to be investigated for receptors near some of the crossings.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.5 has been updated to note: The operational railway noise technical report (Appendix W: Noise and Vibration Assessment - Railway Operations) provided as part of the revised draft EIS proposed a concept noise barrier in Yelarbon to mitigate railway noise impacts on homes and businesses. Depending on its location, height, materials and length, a noise wall could affect views to the Yelarbon silo art (which is a recent enhancement to Yelarbon's character, and a tourism attraction) from the viewing platform on the other side of the rail line. Noise mitigation impacts will need to be balanced against potential impacts on views to the silos. Detailed design for a noise wall in Yelarbon will involve consultation with Yelarbon stakeholders. The objective will be to preserve visibility of the silos. If this would compromise noise mitigation, alternative mitigations for discussion with the Yelarbon community may include architectural treatment to sensitive receptors that would experience noise impacts, or moving the viewing platform.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.5</p> <p>Section 7.1.6</p>
34	34.0011	Private	Landscape and Visual Amenity		In discussing impacts to rent, submission raises concern about loss of amenity due to project.	ARTC should be required to build a noise mitigation wall, at least as high as the highest locomotive exhaust stacks. The conceptual wall only reaches as far as the silos on the east and the town limit on the west. When the rest stop is reinstated, it should have a gated children's playground, perhaps with information and facilities that encourage learning about and playing with acoustics and a train theme to try to turn a negative into a positive and encourage travellers to stop. As the noise mitigation wall will presumably block the view of the silo art, the wall should have a complementary painting.	<p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 3: Yelarbon rest area has been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>An additional site visit was undertaken in October 2021 to assess the potential impact of views from the GrainCorp silo artwork viewing area. As a result, an additional viewpoint assessment (Viewpoint 4) has been included within Appendix K: Landscape and Visual Assessment, Section 8.2.4 and Section 9.1.4. This viewpoint assessment includes a visualisation showing the potential impact of noise walls and other Project infrastructure in this location. In addition, an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p> <p>ARTC is investigating the design for the noise walls to determine whether satisfactory noise mitigation can be achieved without obscuring views to the silos. If views to the Yelarbon silos were affected by noise walls, ARTC would facilitate provision of mitigation measures e.g. a complementary mural on the noise wall and/or roadside landscaping, in consultation with the Yelarbon community and Goondwindi Shire Council.</p>	<p>Appendix K: Landscape and Visual Assessment</p> <p>Section 8.2.4</p> <p>Section 9.1.4</p>
34	34.0012	Private	Economics	Mitigation measures	Submission notes that the project is a nation building exercise and the capital expense should not factor into the safety calculations. ARTC is wholly government owned and this is an opportunity to stimulate the QLD economy post covid.	Nil	<p>Response noted. The reference design for the Project has an engineering design life of 100 years and it is based on industry best practice. The construction and operation of the Inland Rail Project is a key consideration for ARTC and the Inland Rail Program. Hazards and risks for the Border to Gowrie Project have been addressed in Chapter 21: Hazard and Risk in the revised draft EIS. ARTC's Safety Policy (Chapter 21: Hazard and Risk, Section 21.2.1) applies across all aspects of the Inland Rail Program and a copy of the policy is located in EIS Appendix C: Corporate policies and is available on line via the following link: artc.com.au/work/contractors/safety-policy.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Appendix C: Corporate policies</p> <p>Safety Policy</p>
35	35.0002	Private	Noise and Vibration	Modelling	Concern about inconsistencies in noise modelling. In the draft EIS, the business case says 14 trains a day are forecast in 2026 and 20-25 trains daily in 2040 (Chapter 1 Table 1.2), the Chapter on noise modelling says in Table 14.5 up to 19 trains per 24 hours in 2026 and 24 trains in 2040. Appendix O Table 2.4 says peak trains in 2040 will be 168 per week. Different figures for typical and peak are acceptable when clearly marked, but even where this is the case the forecast changes from Section to section.	Withdraw the EIS until it is internally consistent. There should only be one forecast for expected rail traffic used. The Co-ordinator general should insist the proponent resubmit a draft EIS that is internally consistent.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). As discussed in Section 6.2 of Appendix W: Noise and Vibration Assessment – Railway Operations, the Interim Guideline requires noise and vibration to be assessed based on the 'typical worst-case (e.g. typical maximum operating conditions)'. For Inland Rail this is the 'peak' daily train services, which account for the maximum forecast operations including the seasonal agricultural services. The adopted peak train numbers are the best available information at the time of assessment and considered representative of typical worse case operating conditions. In addition, the operational noise assessment only considers whole trains, so the train movements are rounded to the nearest integer. The business case was based on typical or average train movements.</p> <p>Table 16-4 of Chapter 16: Noise and Vibration and Table 6-1 of Appendix W: Noise and Vibration Assessment – Railway Operations are consistent with Appendix R: Air Quality Technical Report Table 2.4 presenting a worst-case operating scenario to ensure impacts are conservatively predicted.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Table 16-4</p> <p>Appendix R: Air Quality Technical Report</p> <p>Table 2.4</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Table 6-1</p>
35	35.0003	Private	Stakeholder engagement		ARTC have not engaged meaningfully with the community. ARTC using stakeholder consultation activities to inform and browbeat both historically and on the current project include lack of consultation in Euroa. Further, the ACCC found that ARTC did not supply transparency to stakeholders in the 2018 Interstate Access Undertaking	Provide actual mitigations solutions in the social impact monitoring plan beyond informing stakeholders, providing clear communication and alerting emergency and social services of activities; the onus should not be on council and community groups	<p>Appendix E: Consultation Report details the breadth of community engagement which supported the draft EIS and revised draft EIS development. Section 5.12 of Appendix E: Consultation Report details the engagement undertaken to inform the Social Impact Assessment (SIA) and Social Impact Management Plan (SIMP). This included engagement through one-on-one landowner meetings, Community Consultative Committees, interactive mapping (Social Pinpoint), fact sheets, website, social media, newsletters, community information sessions and the 1800 free call phone number.</p> <p>ARTC will continue to engage with stakeholders, including key emergency and social services in the region, through the finalisation of the revised draft EIS and development of detailed design. Appendix X: Social Impact Assessment, Section 8 outlines the Project's Social Impact Management Plan (SIMP), which describes how the Project will engage with communities and stakeholders including emergency services, to mitigate social impacts, enhance Project benefits for the SIA study area, and monitor and report on the delivery and effectiveness of management measures.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Appendix E: Consultation Report</p> <p>Section 5.12</p>
35	35.0004	Private	Stakeholder engagement		ARTC have not engaged meaningfully with the community. Submission notes that ARTC are patronising and paying lip service to: <ul style="list-style-type: none"> ▶ the Goondwindi Regional Council and Minister for Agriculture David Littleproud when they suggested an alternate route ▶ the communities of Coonamble, Warrumbungle, Gilgandra and Walgett 	Provide actual mitigation solutions in the social impact monitoring plan beyond informing stakeholders, providing clear communication and alerting emergency and social services of activities; the onus should not be on council and community groups	<p>Appendix E: Consultation Report, Section 5.12 details the community engagement undertaken to inform the Social Impact Assessment (SIA) and Social Impact Management Plan (SIMP). This included engagement through one-on-one landowner meetings, Community Consultative Committees, interactive mapping (Social Pinpoint), fact sheets, website, social media, newsletters, community information sessions and the 1800 freecall phone number.</p> <p>As noted in Appendix X: Social Impact Assessment (Section 8.5.8), ARTC will continue to engage with stakeholders, including key emergency and social services in the region, through the finalisation of the revised draft EIS and development of detailed design.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.12</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8.5.8</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
35	35.0005	Private	Stakeholder engagement	Flood immunity	ARTC have not engaged meaningfully with the community. Outright rejecting the local knowledge of residents on the Condamine floodplain about historical flood heights.	Provide actual mitigation solutions in the social impact monitoring plan beyond informing stakeholders, providing clear communication and alerting emergency and social services of activities; the onus should not be on council and community groups	<p>Appendix E: Consultation Report, Section 5.3 details the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>Community engagement has influenced the development of the reference design. The Condamine floodplain crossing design has been updated to incorporate community feedback and has been reviewed following recent major flood events. Community feedback, along with input from the Independent International Panel of Experts for Flood Studies has resulted in the following key changes:</p> <ul style="list-style-type: none"> ▶ extending the proposed bridge over the North Branch by approximately 250 m north ▶ moving the proposed Yandilla rail bridge further south and combining with the proposed Grasree Creek bridge ▶ increasing the number of proposed culverts near Yandilla grain silos to ensure the drainage channel to the south of the silos has sufficient culverts to convey flood water. <p>As noted in Appendix T1: Hydrology and Flooding (Section 14.6, Section 5.5.2-18.6.2, Section 22, Table 24.1), ARTC will continue to engage with impacted landowners in regard to the results of local catchment modelling through finalisation of the EIS and development of the detailed design. The purpose of this consultation will be to ensure that impacts to property-scale water balance features, such as irrigation channels and dams, are appropriately considered in the EIS and revised reference design. Outcomes of this consultation and revised local catchment modelling will be incorporated into the final EIS.</p> <p>Consultation with impacted stakeholders will continue through detailed design of the Project to ensure that alterations to the design and its impacts are communicated back to landowners. Impacts are to be determined at all drainage structures and waterways affected by construction works. The change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event (Appendix T1: Hydrology and Flooding, Section 5.5.2-18.6.2, Section 22, Table 24.1), in line with recommendations from the Independent International Panel of Experts for Flood Studies.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.3</p> <p>Appendix T1: Hydrology and Flooding</p> <p>Section 5.6-18.6</p> <p>Section 18.6.2</p> <p>Section 22</p> <p>Table 24.1</p>
35	35.0006	Private	Stakeholder engagement		ARTC have not engaged meaningfully with the community. ARTC refuse to release costings on specific projects as commercial in confidence but using the excuse that community suggested options are too expensive to countenance	Provide actual mitigations solutions in the social impact monitoring plan beyond informing stakeholders, providing clear communication and alerting emergency and social services of activities; the onus should not be on council and community groups	<p>In line with industry practice, ARTC will maintain commercial-in-confidence arrangements during the Detailed Design and Construction Works stages. ARTC has a robust local and indigenous employment and business participation commitment, as outlined in Appendix X: Social Impact Assessment, Section 8.3.3 and Section 8.6.3.</p> <p>The Project will underpin its planning with the minimum participation targets set by related Commonwealth and Queensland policy. The Project will drive outcomes toward aspirational or incentivised targets with Contractors to exceed these minimum benchmarks. The Project's contractual negotiations will remain commercial-in-confidence.</p> <p>ARTC will continue to engage with local businesses and employers during the Detailed Design, Construction Works and Operations stages, and notes that a detailed Social Impact Plan (SIMP) will be developed, including action plans to address:</p> <ul style="list-style-type: none"> ▶ community and stakeholder engagement ▶ workforce management ▶ housing and accommodation ▶ health and community wellbeing ▶ local business and industry content. <p>The SIMP will be subject to independent review and ongoing performance monitoring.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 8.3.3</p> <p>Section 8.6.3</p>
35	35.0007	Private	Stakeholder engagement		ARTC have not engaged meaningfully with the community. ARTC are running community engagement meetings in the Inner Darling Downs without allowing question time	Provide actual mitigations solutions in the social impact monitoring plan beyond informing stakeholders, providing clear communication and alerting emergency and social services of activities; the onus should not be on council and community groups	<p>ARTC has engaged widely with the community, involving many town halls, CCC meetings, comprehensive engagement programs.</p> <p>Community Consultative Committee meetings are run by an independent chair. Committee members have the opportunity to nominate agenda items for discussion at the meetings. In accordance with the committee charter, ARTC provides updates on the various components of the Project, which can be technical in nature. ARTC prepares detailed minutes of the meetings and slides, which are available on the Inland Rail website following endorsement by the members, and, where requested, provides the slide packs to members for their further consideration. Committee members also have the opportunity to ask questions and seek clarification on any points during the meeting or via phone or email after the meeting.</p> <p>Findings from the Project's Social Impact Assessment (SIA) and focus areas for the Project's Social Impact Management Plan (SIMP) are presented in the revised draft EIS Chapter 17: Social and Appendix X: Social Impact Assessment. The SIMP outlines objectives, outcomes and measures for mitigation of social impacts, and measures intended to enhance Project benefits and opportunities. Section 24.1 of Chapter 24: Draft Outline Environmental Management Plan presents and describes the Project Environmental and Social Management Framework.</p>	<p>Chapter 17: Social</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Section 24.1</p> <p>Appendix E: Consultation Report</p> <p>Appendix X: Social Impact Assessment</p>
35	35.0008	Private	Noise and Vibration	Baseline/backgroud sampling	Concern about noise mapping and selection of monitoring sites, resulting in understated impacts. Submission notes that in Chapter 14 page 12, the measuring sites for background noise are mapped. From 11 monitoring sites, there are no noise monitoring sites on the Millmerran Road, despite it making up over a quarter of the distance. Most sites seem to have been chosen on busy national highways, presumably to understate the impact of noise at quiet rural properties. The methodology used claims to account for train horns at active level crossings but also states that the top 5% of sound events are discarded during LAmax and LAeq calculations. This is to prevent statistical outliers from overstating noise impacts, in the event of very loud infrequent noises, such as blasting at a construction development. This would be appropriate in the majority of developments however when the loudest noises are regular, planned train horns to omit their impact from noise calculations on a statistical basis is misleading. The LAmax should be the level above which 95% of train passbys will not fall. This will not be the case at active level crossings.	Provide noise and crossing wait modelling on typical trains and not best case scenarios. Verify sound model adjacent to active crossings	<p>Background noise monitoring was undertaken at 29 representative locations along the Project alignment. Background noise monitoring is the LA90 - the noise level that is exceeded 90% of the time. The noise surveys quantified and characterised the local sources of noise to define the baseline environment prior to the construction and operation of the Project (Chapter 16: Noise and Vibration, Section 16.5.2 and Section 5.4 of Appendix V: Noise and Vibration - Construction Noise and Road Traffic). The survey locations provide a representative measure of existing noise for the various sensitive receptors located along the Project alignment. The background noise monitoring informs the construction noise assessment criteria and the most stringent applicable construction noise criteria were adopted across the Project as a result of the low existing background noise levels measured at all monitoring locations. Additional noise measurements would not have lowered the adopted noise criteria in the Millmerran Road area.</p> <p>ARTC notes that separate criteria are provided for construction noise and operational noise. For operational noise: 5% of events are excluded when assessing LAmax only, no rail passbys are excluded when assessing LAeq. Noise and vibration impacts from blasting are assessed separately. If blasting is deemed necessary for construction, appropriately trained and licenced shot firers will be engaged to undertake the blasting activities in accordance with Queensland's regulatory requirements and the limits (for air blast over-pressure and ground vibration) provided in Department of Transport and Main Roads (DTMR) 'Code of Practice (CoP) Volume 2' (Chapter 16: Noise and Vibration, Section 16.6).</p> <p>The operational noise and vibration modelling has been revised in accordance with the DTMRs' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.</p> <p>At level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5.2</p> <p>Section 16.6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 6.3</p>
35	35.0009	Private	Noise and Vibration	Modelling	Concern about noise modelling undertaken. Submission notes: Table B5 in Appendix T states that the monitored 95th percentile LAmax noise levels are less sensitive to outliers than the arithmetically averaged SEM noise levels. Consequently, the noise model, which adopted a consistent LAmax noise emission, validates better to the 95th percentile LAmax than the SEM. None of the monitoring sites included active level crossings so the model is verified for passby only but not for a situation with a predictedTable horn noise well above the passby noise, and not for a site where the noise of cars and heavy vehicles must stop and restart.	Provide noise and crossing wait modelling on typical trains and not best case scenarios. Verify sound model adjacent to active crossings	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.</p> <p>In level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources.</p> <p>Operational noise mitigation measures are recommended in Chapter 16 Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 6.3</p> <p>Section 17</p>
35	35.0010	Private	Noise and Vibration	Mitigation measures	Concern that ARTC has not considered many of the noises associated with rail operation when calculating which properties require noise mitigation. In particular, noises associated with rail operation around curves and adjacent to crossing loops and active crossings. The submission makes reference to Part 16 of the Queensland Government Noise Measurement Manual (8) and AS1055:2018.	Provide noise and crossing wait modelling on typical trains and not best case scenarios. Verify sound model adjacent to active crossings	<p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.</p> <p>The Project's designs do not include tight-radius curves (radius < 500 m), therefore the noise modelling did not apply noise emission correction factors for curving noise emissions (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 12.4).</p> <p>At level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.8). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources. The passive level crossings only included the train horns as noise sources. Train movements within the crossing loops are discussed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.9.</p> <p>Operational noise mitigation measures are recommended in Chapter 16 Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 16. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 12.4</p> <p>Section 17</p>
35	35.0011	Private	Traffic and Transport		ARTC says in Chapter 18 that Inland Rail coordinated by ATMS, a software package that has not been built yet.	ARTC should need to provide details of what will be done in the meantime, when the software will be ready and how it is being funded.	<p>Appendix AA: Traffic Impact Assessment, Section 3.1 includes discussion of the use of the ATMS signalling system.</p> <p>The Project will be operated using Advanced Train Management System (ATMS), a communications-based safe working signalling system currently being developed by ARTC. The system will provide significantly upgraded capabilities to the rail safety by providing positive train control.</p> <p>Prior to being rolled out, the ATMS safe working system will be required to demonstrate its safety and functionality to receive the accreditation by the Rail Safety Regulator. This will involve demonstrating its suitability on existing ARTC corridors prior to implementation to Inland Rail. Should the ATMS development schedule be delayed, an existing ARTC safe working system will be temporarily implemented.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.1</p>
35	35.0012	Private	Flooding - Condamine River	Proponent commitments	In Chapter D, Section 3.5.23.2 the draft EIS claims that approval is not required under the RPI Act however as the current alignment proposes to drastically alter overground water movement along 16 km of the Condamine floodplain, it could be argued that this project causes widespread and irreversible impact to strategic cropping land by essentially creating a long dam wall and approval under the Regional Planning Interests Act should be required.	Get an RPI approval or don't build across the Condamine floodplain	<p>As the Project is not a resource activity or a regulated activity under the RPI Act, the Act does not apply (Chapter 3: Legislation and Project Approvals, Section 3.4.26). However, the potential impact on areas of regional interest has been undertaken and included within Chapter 8: Land Use and Tenure, Section 8.5.1.</p>	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.4.26</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p>
35	35.0013	Private	Traffic and Transport	Level crossing	Concern that new crossings at Purcell Rd and Inglewood Millmerran Road have not been considered in accordance with the ARTC corporate policy. This is clearly not the case when grade separated crossings are possible and desired by the communities for reasons of safety and convenience (see Appendix C Table 4.11).	The Co-ordinator general should require ARTC to build grade separated crossings on all state routes and minor arterial roads at a minimum.	<p>ARTC recognises the complex decision-making process surrounding public road– rail interfaces. Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used to ensure a consistent safety-based risk approach to determine crossing treatments.</p> <p>At Purcell Road, ARTC is proposing to update the Project design as a result of design optimisation and incorporating stakeholder feedback in relation to the preferred location of the road– rail interface. The proposed updated design now includes:</p> <ul style="list-style-type: none"> ▶ Rail over road grade separation at Athol School Road, rather than a closure as previously proposed in the draft EIS ▶ Purcell Road closure at the rail interface, rather than a passive level crossing as previously proposed in the draft EIS ▶ Proposed new road connecting Purcell Road and Athol School Road with an intersection. <p>ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community including:</p> <ul style="list-style-type: none"> ▶ Removal of level crossing, increasing safety benefits for the community ▶ Diversion of through traffic to the recently upgraded Athol School Road and Gore Highway intersection, which is preferred by TRC and DTMR road managers over the Purcell Road and Gore Highway intersection ▶ More direct route to and from Toowoomba via Athol School Road. <p>Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran–Inglewood Road active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran– Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran– Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 3.7.6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
35	35.0014	Private	Traffic and Transport	Modelling	ARTC justifies decision for new crossing at Purcell Rd and Inglewood Millmerran Road by virtue of ALCAM scores claiming these sites are safe. However the ALCAM website identifies it as an assessment tool used to identify key potential risks at level crossings and to assist in the prioritisation of crossings for upgrades. The risk model is used to support a decision making process for both road and pedestrian level crossings and to help determine the most cost effective treatments. It is not intended to warrant safety during the construction phase of infrastructure building and the website says as much.	The Co-ordinator general should require ARTC to build grade separated crossings on all state routes and minor arterial roads at a minimum.	<p>At Purcell Road, ARTC is proposing to update the Project design as a result of design optimisation and incorporating stakeholder feedback in relation to the preferred location of the road rail interface. The proposed updated design now includes a road diversion and grade separation at Athol School Road.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by State and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides the Coordinator-General, DTMR and the community with further transparency on the design process undertaken and outlines that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road-rail interface locations throughout Project.</p> <p>The Inland Rail scope for Millmerran-Inglewood Road is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors such as sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p> <p>The two northern crossings of Millmerran–Inglewood Road (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran–Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran–Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation based on the detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future-proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate one train every two hours on average when Inland Rail is first operational and increasing to around one train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran–Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than two vehicles before the crossing is cleared.</p> <p>The Inland Rail scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 5.8 Section 5.9 Appendix BT
35	35.0015	Private	Economics		Concern that more money will need to be handed out to upgrade dangerous crossings. When the business case relies upon the certainty of transit time by avoiding traffic incidents on the coastal rail route (Draft EIS Section 2.5.1.3) it doesn't make economic sense to design a system with so many dangerous crossings. Traffic at the Purcell Road and Inglewood Millmerran Road crossings are only used by local traffic and so the reduction in long haul truck movements brought about by Inland Rail will do nothing to mitigate the risks at these crossings.	Use money from the post Covid Recovery stimulus package earmarked for Inland Rail to just make the Inland Rail right the first time around, instead of shifting the expense of appropriate grade separated crossings to future generations just to get this project completed cheaply at any social cost.	<p>ARTC recognises the complex decision-making process surrounding public road–rail interfaces and as such, will apply a consistent methodology to develop road–rail interface treatments across this Inland Rail Program, as described in the Public Level Crossing Treatment Methodology – Major Projects.</p> <p>The most southern crossing of Millmerran–Inglewood Road, at Inglewood, did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR-audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope, as the cost to grade separate is grossly disproportionate to the benefits. The Inland Rail scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>In the Athol area, ARTC is proposing to update the Project design as a result of design optimisation and incorporating stakeholder feedback in relation to the preferred location of the road–rail interface. Extensive engagement with the local community and road managers has continued throughout the EIS process as ARTC continue to optimise the design of the vertical rail alignment and the road–rail interfaces along the Project alignment. The proposed updated design now includes:</p> <ul style="list-style-type: none"> ▶ Rail over road grade separation at Athol School Road, rather than as a closure as previously proposed in the draft EIS ▶ Purcell Road closure at the rail interface, rather than a passive level crossing as previously proposed in the draft EIS ▶ A proposed new road connecting Purcell Road and Athol School Road with an intersection. <p>ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community including:</p> <ul style="list-style-type: none"> ▶ Removal of a level crossing and increasing safety benefits for the community. ▶ Diversion of through traffic to the recently upgraded Athol School Road and Gore Highway intersection, which is preferred by TRC and DTMR road managers over the Purcell Road and Gore Highway intersection ▶ A more direct route to and from Toowoomba via Athol School Road. <p>As described in Section 18.6 of Chapter 18: Economics, both the ONRSR Policy and the <i>Queensland Level Crossing Safety Strategy 2012-2021</i> (QLCSS) focus on avoiding, where possible, the installation of new level crossings. The ONRSR Policy acknowledges that for lower-risk level crossings, operators may be able to demonstrate that alternative controls minimise the risk to safety, so far as is reasonably practicable (SFAIRP), as defined in the ONRSR Guideline (ONRSR, 2016b). The reference design has been developed to limit the number of new level crossings; however, there are instances where the road-rail interface treatment assessment has concluded that the risk to safety SFAIRP can be achieved though the provision of level crossings in lower risk locations.</p> <p>Noting all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Border to Gowrie alignment, ARTC will continue to work collaboratively with road managers as detailed design progresses regarding the proposed road rail interface solutions. For more information, please see the Inland Rail Level Crossing Factsheet at: inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Chapter 18: Economics Section 18.6 Section 18.11 Chapter 20: Traffic, Transport and Access Section 20.6
35	35.0016	Private	Traffic and Transport	Level crossing	Concern about the introduction of dangerous crossings. Traffic at the Purcell Road and Inglewood Millmerran Road crossings are only used by local traffic and so the reduction in long haul truck movements brought about by Inland Rail will do nothing to mitigate the risks at these crossings.	Abide by the multiple sets of guidelines that strongly discourage level crossings	<p>At Purcell Road, ARTC is proposing to update the Project design as a result of design optimisation and incorporating stakeholder feedback in relation to the preferred location of the road rail interface. The proposed updated design now includes a road diversion and grade separation at Athol School Road.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by State and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides the Coordinator-General, DTMR and the community with further transparency on the design process undertaken and outlines that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road-rail interface locations throughout Project.</p> <p>The Inland Rail scope for Millmerran-Inglewood Road is to construct an active level crossing with boom barriers and flashing lights. 35	35.0017	Private	Social Impact Assessment	Operational traffic	Studies have found that when technical transport models, or "predict -and- provide" models such as ARTC is using in this reference design as used, that social impacts are overlooked and there is an overemphasis on economic and engineering considerations. The submission includes links to various studies to support this claim.	Nil	<p>The reference provided by the submitter refers to urban rail projects and states that quantitative design approaches often ignore wider social contexts. Appendix X: Social Impact Assessment includes a comprehensive social baseline as the social context for assessment of impacts and benefits.</p> <p>The Project's business case, alignment and design have been influenced by business case considerations and a route selection process extending over many years.</p> <p>Appendix X: Social Impact Assessment has examined the existing social context (Section 5) and evaluated the significance of social impacts (Section 7) in accordance with the revised draft EIS Terms of Reference and the Social Impact Assessment guideline.</p>	Appendix X: Social Impact Assessment Section 5 Section 7
36	36.0001	Private	Traffic and Transport	Level crossing	As an SES member, the submitter is concerned about the number of level crossings planned for B2G. Submitter is concerned about the impact of levels crossings on the time it takes to respond to incidents (for example when the SES services are required to direct traffic in emergencies). Submitter notes that timely traffic control is crucial in preventing small incidents from escalating. Questioned why Queensland is not following the same approach as Victoria by replacing level crossings with grade separations.	ARTC should be required to put grade separated crossings on all public roads, and upgrade all existing crossings to grade separation wherever technically possible, in light of the public safety risk from more frequent, bigger, faster trains.	<p>ARTC recognises the complex decision-making process surrounding public road–rail interfaces. Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road–rail interface locations and the approach used to ensure a consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides the Coordinator-General, DTMR and the community with further transparency on the design process undertaken and highlights that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road–rail interface locations throughout the Project. Many road–rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed by the Public Level Crossing Treatment methodology.</p> <p>In January 2023, the Office of the Road Safety Regulator (ONRSR) undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focusing on the public level crossings in the Border to Gowrie section. The key findings included that Inland Rail demonstrated a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process had fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road–rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solutions. For more information, please also refer to Inland Rail Level Crossing Factsheet at: inlandrail.artc.com.au/level-crossings-fact-sheet</p> <p>As part of the ongoing process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operation and are supportive of the Project's proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Consultation with the community and relevant government agencies and emergency services will continue through the detailed design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
36	36.0002	Private	Social Impact Assessment		Concerned raised around the impact of construction on the long term residents of Inglewood. Concerned that the high income of ARTC contractors/non resident workers will:	The principal contractor should be required to collaborate with Goondiwindi and Toowoomba Chambers of Commerce to formulate a fair enterprise bargaining agreement that employees can be employed under. This should be required to have behavioural standards for the non resident workforce both on and off the job.	<p>Appendix X: Social Impact Assessment, Section 8.4.4, includes the commitment to develop an Accommodation Management Plan (AMP) with the key outcome being avoidance of impacts on the local housing market. More detail regarding the AMP scope has been added to this section.</p> <p>The Project includes provision of three non-resident workforce accommodation facilities to minimise the potential for impacts on rental housing access (Appendix X: Social Impact Assessment, Section 6.1.6). Workforce accommodation facilities will be self-contained, i. e. meals and other services will be provided within the facilities, so demand-led inflation resulting from expenditure on services and products in town is not expected to be significant. There is no evidence to suggest that e.g. food prices or fuel prices will increase as the result of having an accommodation facility in the area.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.4, notes the possibility that the Project could compete with other businesses for personnel. Some of the types of trades required (e.g. welders, concreters) may also be in demand by local residents, however many of the trades required (e.g. machine operators, drillers, crane operators) are specific to major infrastructure projects.</p> <p>ARTC has established the Inland Rail Skills Academy to increase the skills and capacity of the local workforce to participate in construction employment (Appendix X: Social Impact Assessment, Section 8.3.2). Additionally, ARTC has partnered with Goondiwindi Regional Council to support a "Local Employment Roadmap" which aims to attract skilled workers to the region. Appendix X: Social Impact Assessment has been updated in this regard.</p> <p>ARTC is unable to collaborate on employment agreements with other parties. However, Appendix X: Social Impact Assessment, Section 8.3.7 notes that the Project has committed to monitoring Inland Rail projects' workforce ramp-up and the proportions of local and non-local personnel, and consulting with local Councils and Chambers of Commerce regarding any pressures they identify on local labour availability.</p> <p>If the Project is contributing to cumulative pressures on labour availability, ARTC will engage with the Contractor to refine the Project's recruitment and training strategies.</p>	Appendix X: Social Impact Assessment Section 8.3.2 Section 8.3.4 Section 8.3.7 Section 8.4.4
36	36.0003	Private	General project opinion - positive		Generally supportive of the project but has some reservations.	Nil	ARTC note the general support of the Project.	N/A
37	37.0001	Private	Traffic and Transport	Level crossing	Concerned for her grandchildren's safety who live along the alignment and go to school. Concerns raised around fencing near active crossings and school bus stops.	All fencing where the rail passes within a few hundred metres of schools or school bus stops should be at a minimum 1.8 m chain link fence. Do not place level crossings near school bus stops.	Revised draft EIS Chapter 5: Project Description, Section 5.4.12 discusses fencing. The rail corridor will be fenced with the exception of the Condamine floodplain due to increased risk of trapped debris causing blockage. In this area, guide posts will be used to demarcate the rail corridor. Where superior fencing is required (e.g. where tracks are in close proximity to key roads and/or communities, or where trespass is anticipated) a 1.8 m chain link boundary fence may be provided.	Chapter 5: Project Description Section 5.4.12

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
37	37.0002	Private	Traffic and Transport	Level crossing	The alignment crossing the Millmerran Road three times is dangerous, expensive and unnecessary.	It would be safer and more cost efficient for the alignment to stay in the forestry on the western side of the Millmerran Road, away from farm land and houses.	<p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewer farms affected mid-block ▶ Fewer farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringally State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at-grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p>	Appendix AA: Traffic Impact Assessment Section 3.7 Appendix BT
37	37.0003	Private	Social Impact Assessment		Concerned about the effects of up to 900 mostly young men moving into the area. Believes the work force will increase substance abuse and crime, putting a strain on medical and police services.	Perform a mandated number of drug tests for all employees, with those operating heavy machinery to have more frequent testing. ARTC should need to provide funding to community health services to support extra hiring in mental health and drug outreach programs in Inglewood, Millmerran and Goondiwindi.	<p>As local people will also be employed, there would not be 900 people moving into the area. The three non-resident workforce accommodation facilities are located over a distance of approximately 100 kilometres, and work crews will be distributed over a distance of approximately 200 kilometres, so no one area will experience an inundation of 900 workers. The average workforce has been revised in Appendix X: Social Impact Assessment, Section 4.1.7, and will be approximately 383 people.</p> <p>There is no evidence to suggest that non-local construction workers will contribute to increased substance abuse and crime in local towns. Project personnel will include a wide range of occupations, professions and trades. Of note, the average age of construction workers in Australia is 38 years (Australian Government 2021, Labour Market Information Portal, labourmarketinsights.gov.au, accessed 20 September 2021), so the perception that personnel will be primarily young men is incorrect.</p> <p>The Contractor will be required to implement a workforce Code of Conduct which adheres to ARTC's Code of Conduct and associated policies as a minimum standard. These policies require a commitment to a drug/alcohol free workplace and implementation of a drug/alcohol testing program that covers all workers. Revised draft EIS Appendix X: Social Impact Assessment, Section 7.2.5 has been updated in this regard.</p> <p>ARTC has sponsored 'Living in Place, to provide an independent monitor of community wellbeing measures and exploration of residents most pressing local area concerns, such as housing affordability, cost of living, crime/antisocial behaviour and drug/alcohol abuse (Appendix X: Social Impact Assessment, Section 4.3).</p> <p>ARTC has invested in a mental health partnership to increase the community's access to local, independent mental health services. ARTC has also initiated a partnership with Mates in Construction, established to address mental health concerns among Australian construction workers. Appendix X: Social Impact Assessment, Section 8.5.3 has been updated in this regard.</p>	Appendix X: Social Impact Assessment Section 4.1.7 Section 4.3 Section 7.2.5 Section 8.5.3
37	37.0004	Private	Social Impact Assessment	Local business and industry procurement	Concerned that the project will poach staff from local businesses, impacting their prosperity. Concerned the project is likely to pay above award wages to project work force and this will create acrimony between locals (who do not work on the project) and the non-resident workforce.	The principal contractor should be required to make the standard conditions of employment in consultation with the local councils and industry groups to prevent the shut down of local businesses.	<p>Appendix X: Social Impact Assessment, Section 8.3 states 'one of ARTC's primary aims is to maximise employment opportunities for residents within the SIA study area by:</p> <ul style="list-style-type: none"> ▶ Facilitating skills development opportunities to build regional capacity in construction and rail operation ▶ Building partnerships with training providers to strengthen workforce skills in the Social Impact Assessment (SIA) study area and reduce the potential for cumulative impacts to draw labour and skills from other businesses ▶ Requiring the Contractor to employ locally, and to implement workforce training and diversity strategies'. <p>Section 8.3.4 of Appendix X: Social Impact Assessment also notes 'there is also potential for cumulative demands for construction personnel for Inland Rail and other projects to cause labour shortages for businesses in the SIA study area'. Section 7.5 states 'some of the types of trades required (e.g. welders, concreters) may be in demand by local business and residents, however other trades required (e.g. those required for major civil construction, flashbutt welding and sleeper laying) are specific to major infrastructure projects. '</p> <p>ARTC has established the Inland Rail Skills Academy (Appendix X: Social Impact Assessment, Section 8.3.2) to increase the skills and capacity of the local workforce to participate in construction employment.</p> <p>ARTC partnered with Goondiwindi Regional Council to support a 'Local Employment Roadmap' which aims to attract skilled workers to the region. Appendix X: Social Impact Assessment, Section 8.3.4 has been updated in this regard.</p> <p>If the Project is contributing to cumulative pressures on labour availability, ARTC will engage with the Contractor to refine the Project's recruitment and training strategies (Appendix X: Social Impact Assessment, Section 8.3.7).</p> <p>Appendix X: Social Impact Assessment, Table 8.10 'summarises workforce management and development objectives, outcomes and actions that will maximise the employment of people from the SIA study area and Indigenous people in the Project's construction workforce, increase the skills profile of the SIA study area's labour force, and minimise impacts on other businesses. '</p>	Appendix X: Social Impact Assessment Section 7.5 Section 8.3 Section 8.3.2 Section 8.3.4 Section 8.3.7 Table 8.10
37	37.0005	Private	Hazard and Risk	Construction water supply	Concerned about the use of biodegradable polymers instead of water for dust suppression. To avoid use of hazardous materials where possible, water should be used exclusively for dust suppression. Believes spreading plastics near children who reside near the alignment is unnecessary.	Water should be used exclusively for dust suppression.	<p>Biodegradable dust suppression agents as an additive to water for dust suppression are an effective mitigation measure, aiding in minimising dust emissions and also typically providing significant reductions in the quantity of water required for dust suppression. Biodegradable dust suppression agent additives are used regularly in construction projects, and it is not expected that the use of polymer additives presents significant risk of impacts to sensitive receptors or the community. Any potential human health impacts resulting from the use of polymer additives will be reviewed for the particular polymer product selected for use, prior to application during construction. It is noted that there are numerous polymer products available for use.</p> <p>The suitability of using biodegradable dust suppression additives to water will be assessed by the 'Contractor' on a location-by-location basis. Where use of biodegradable additives is considered suitable, the handling, mixing and application of these agents will be conducted in accordance with the products' Technical Data Sheet and Safety Data Sheet.</p> <p>Mitigation measures and controls that will be adopted to manage dust generation are presented in Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
38	38.0001	Private	Traffic and Transport	Level crossing	Concerns raised about traffic delays caused whilst trains pass at level crossings. Submitter is pregnant and is specifically concerned about how these delays may impact access to Toowoomba hospital to deliver the baby.	Nil	<p>Regarding level crossings, ARTC recognises the complex decision-making process surrounding public road rail interfaces. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>Section 3.6 and Section 3.7 of EIS Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring a consistent safety-based risk approach to determine crossing treatments. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>Whilst recognising the difficulty of anyone making a long journey to deliver a baby, it is noted that there is only one level crossing proposed between Inglewood and Toowoomba traveling via Millmerran-Inglewood Road and the Gore Highway. The Millmerran-Inglewood Road level crossing has a total wait time per closure of 101 seconds. Further, it is noted that removing the existing level crossing on the Gore Highway at Brookstead and replacing it with a road bridge over rail grade separation will shorten the potential wait time on this journey.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
39	39.0001	Private	Traffic and Transport	Level crossing	The level crossing at Millmerran-Inglewood road will be a road hazard for the rural community. Submitter highlights this is a busy main road and school route. Concerned that the 37 level crossings proposed between Inglewood and Millmerran will exacerbate the number of near misses and fatalities which are already known to occur at level crossings. As a firefighter, submitter is concerned about how the road traffic delay (of approx. 10 mins) at level crossings will impact response time to incidents which are time critical.	Nil	<p>Regarding level crossings, ARTC recognises the complex decision-making process surrounding public road rail interfaces. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and an understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>Section 3.6 and Section 3.7 of EIS Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used to ensure a consistent safety-based risk approach to determining crossing treatments. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>It is noted that there is only one level crossing proposed between Inglewood and Toowoomba traveling via Millmerran-Inglewood Road and the Gore Highway. The Millmerran-Inglewood Road level crossing has a total wait time per closure of 101 seconds. Further, it is noted that removal of the existing level crossing on the Gore Highway at Brookstead in replace of a road bridge over rail grade separation will shorten the potential wait time on this journey.</p> <p>Section 5.9.3 of Appendix AA: Traffic Impact Assessment discusses analysis assumptions a lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (volumes are detailed in Section 2.4). This section also details on how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> ▶ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line ▶ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate ▶ The time it takes the train to cross the level crossing ▶ Design vehicle consisting of a B-double for input parameters. 	Appendix AA: Traffic Impact Assessment Section 3.4 Section 3.7 Section 5.8 Section 5.9 Section 5.9.1 Section 5.9.3 Appendix BT
40	40.0001	Private	Traffic and Transport	Level crossing	Concerned about the level crossing proposed for Millmerran-Inglewood road in QLD which intersects with a 100 km/hr Section of the highway. Submitter raised that level crossings are dangerous and cause fatalities. The risk of incidents at level crossings will be exacerbated due to the speed of Inland Rail trains. Submitter expressed that the community's safety should be paramount in the planning of this project and the proposal needs to be reconsidered.	Nil	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. Section 3.6 and Section 3.7 of EIS Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring a consistent safety-based risk approach to determine crossing treatments.</p> <p>From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONSRS audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
41	41.0001	Private	Noise and Vibration	Operational rail noise	Concerned that residences within 1 km of the rail line may experience noise at night exceeding 49dB (Chapter 14 page 35). Submission references WHO Night Noise Guideline for Europe (2009) which suggests there is strong evidence for increased rates of hypertension and myocardial infarction when maximum night noise is above 50dB and that other long term effects are likely but not yet proven.	Every residence within 1 km of the rail should be offered sound mitigation as a condition of the EIS. Mitigation should include where possible (but not limited to) rail dampers, track lubrication, noise barriers, earth mounds, insulation, double glazed windows and air conditioners or any combination of these that will bring the night noise below a LAmax of 49. Mitigations should be at proponents expense and implemented prior to Inland Rail being operational.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment – Railway Operations Section 11 Section 17
41	41.0002	Private	Traffic and Transport	Level crossing	The Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities. For this reason, the submitter believes the EIS should be conditional upon no new level crossings being built over state or council roads.	No new level crossings being built over state or council roads should be condition of project approvals.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none">▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019)▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides the Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
42	42.0001	Private	Traffic and Transport	Level crossing	Placing a level crossing on Millmerran Inglewood Road, a 100 km/hr highway, is irresponsible and dangerous. Trains are expected to run nearly hourly at 80-115 km/hr and this represents an unacceptable risk to public safety.	Implement overpass at this location.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. Section 3.6 and Section 3.7 of revised draft EIS Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring a consistent safety-based risk approach to determine crossing treatments.</p> <p>From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
43	43.0001	Private	Traffic and Transport	Level crossing	Placing a level crossing on Millmerran Inglewood Road, a 100 km/hr highway, is irresponsible and dangerous. Trains are expected to run nearly hourly at 80-115 km/hr and this represents an unacceptable risk to public safety.	Build a road over rail grade separation crossing or keep the alignment on the Western side of Millmerran Road and only cross once instead of three times.	<p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none">▶ Fewest farms affected mid-block▶ Fewest farm operations/dwellings within 200 metres of alignment▶ No direct impacts to feedlots▶ Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringallly State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none">▶ Restriction of access▶ Loss of flora and fauna▶ Changes to bushfire management▶ Weeds and pests▶ Changes to drainage and minimising sediment and erosion▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 3.7 Section 5.8 Section 5.9 Appendix BT
44	44.0001	Private	Noise and Vibration	Operational rail noise	The Brookstead Community Hall has not been identified as being a non residential sensitive receptor in Appendix T, pg. 61, Table 28. The hall is less than 150 m from the inland rail track.	Nil	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>Section 16.5 of Chapter 16: Noise and Vibration, and Appendix A and Appendix E of Appendix W: Noise and Vibration Assessment - Railway Operations presents a summary of sensitive land uses and receptors. As per Appendix A: Adopted Sensitive Receivers, Map 44A within Appendix W: Noise and Vibration Assessment - Railway Operations, the Brookstead Community Hall has been identified with a Receptor ID 262035. Appendix E: Predicted Airborne Railway Noise Levels - Year 2040 Design Year within Appendix W: Noise and Vibration Assessment - Railway Operations, Receptor ID 262035 does not exceed the noise criteria adopted from the Department of Transport and Main Roads' Interim Guideline - Operational Railway Noise and Vibration. Subsequently as per the Interim Guideline, the Brookstead Community Hall does not exceed the airborne noise criteria for mitigation and therefore is not a non-residential sensitive receptor.</p>	Chapter 16: Noise and Vibration Section 16.5 Appendix W: Noise and Vibration Assessment - Railway Operations Appendix A Appendix E

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
44	44.0002	Private	Noise and Vibration	Operational road traffic noise	The Brookstead Community Hall is less than 150 m from the inland rail track and will be affected by road noise caused by a road over rail overpass on the Gore Highway. Concerns raised that loaded heavy vehicle's accelerating and decelerating over this rail structure will create more noise at the hall.	Nil	<p>The Brookstead Community Hall is included as a sensitive receptor to the construction noise and vibration and operational road traffic noise assessments. Brookstead Community Hall (receptor 262035) is included as part of the sensitive receptor set in Appendix A of Appendix V: Noise and Vibration - Construction Noise and Road Traffic. The receptor has been assessed as a community receptor against the CoP V1 and CoP V2 criteria. Noise and vibration impacts to this building are in Appendix C, D, and I of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic The operational road traffic noise assessment predicted compliance with the CoP V1 criteria at the Brookstead Community Hall.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Appendix A</p> <p>Appendix C</p> <p>Appendix D</p> <p>Appendix I</p>
45	45.0001	Private	Flooding		The crossing of the Condamine flood plain puts lives and properties at risk. Millmerran Rail Group has had flood modelling done the findings of this support community consensus that this will not be safe.	Nil	<p>The flood modelling conducted for the Project, including the Condamine River modelling, has been reviewed by the Independent International Expert Flood Panel appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practices. This includes consideration of community safety and the potential impact of Inland Rail on flood behaviours.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>
45	45.0002	Private	Traffic and Transport	Level crossing	Department of Transport and Main Roads has a policy of building no new level crossings (8), as does the Office of the National Rail Safety Regulator (6), yet there are 37 level crossings in the draft design. According to the ARTC level crossing fact sheet on its website there are 1000 near misses at level crossings every year. The ONRSR says there were 37 collisions at level crossings in 2019-2020 (5). Six of these were collisions involving freight trains and 5 of those took place at active level crossings. The ARTC website claims these are all the result of driver error and as such no level of active controls can effectively mitigate the risk. I note the Inglewood Millmerran Road is the only state controlled road to be crossed more than once, and that one crossing is an active level crossing where cars and heavy vehicles travelling 100 km/hr around a curve may need to stop suddenly.	Build a grade separated crossing at the South Millmerran Road level crossing site. Build the extra earthworks required to stay on the western side of Millmerran Road where there are less properties impacted and less farming land.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides the Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>Further, in June 2020 ONRSR finalised an audit of the Inland Rail Road-Rail Crossing Strategy. The audit recognised a consistent, systematic and comprehensive process for the assessment of level crossings applied to determine adequate treatments, noting that the approach ensures level crossing safety risks are eliminated or minimised, so far as is reasonably practicable in accordance with Rail Safety National Law.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
45	45.0003	Private	Traffic and Transport	Operational traffic	The level crossing will increase Darling Downs double emergency life threatening illness response time by up to 7.7 minutes, doubling it from 8 minutes currently. This is due to the 2-3 minute wait time at level crossings, or 9 crossings within 5 km near Yelarbon. The solution in the EIS of appropriate access and egress arrangements as a mitigation measure is misleading, dangerous and disingenuous. The submitter is worried about slow going trains and its impacts on the wait time at the level crossing. The data provided in the draft EIS is modelled on 1800 m train travelling at 115 km/hr. If the trains become 3600 m trains in future the effect will be more pronounced.	Build a grade separated crossing at the South Millmerran Road level crossing site. Build the extra earthworks required to stay on the western side of Millmerran Road where there are less properties impacted and less farming land.	<p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> Fewest farms affected mid-block Fewest farm operations/dwellings within 200 metres of alignment No direct impacts to feedlots Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringally State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> Restriction of access Loss of flora and fauna Changes to bushfire management Weeds and pests Changes to drainage and minimising sediment and erosion Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road-rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low traffic volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 of Appendix AA: Traffic Impact Assessment reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
45	45.0005	Private	Social Impact Assessment	Local business and industry procurement	Need to publish percentage of local and indigenous business engagement as a percentage so benchmarks can be monitored.	Publish a social mitigation strategy with benchmarks such as using Acciona example of 10% of employment coming from within 125 km of the project and 2% indigenous involvement	<p>As noted in Appendix X: Social Impact Assessment, Section 7.5.3, ARTC's Australian Industry Participation Plan and Sustainable Procurement Policy have a key focus on providing local and Indigenous businesses and social enterprises with full, fair and reasonable opportunity to participate in the supply of goods and services to Inland Rail.</p> <p>The Project will underpin its planning with the minimum participation targets set by related Commonwealth and Queensland policy, and will drive outcomes toward aspirational or incentivised targets with Contractors to exceed these minimum benchmarks. The Project's contractual negotiations will remain commercial in confidence.</p> <p>Inland Rail's tender assessment criteria includes local Indigenous participation as a key element of all construction tender assessments. The minimum Indigenous procurement target referred to in the Commonwealth Indigenous Procurement Policy's organisation-based requirements is for 3 per cent indigenous procurement minimum, i. e. at least 3 per cent of the value of the contractor's Australian supply chain must be subcontracted to Indigenous enterprises, on average over the initial term of the contract (Australian Government, 2015). The Project will ascribe to the policy's minimum benchmark of 3 per cent Indigenous procurement by 2027/28.</p> <p>There is no relevant target for local procurement from within an area such as the Social Impact Assessment (SIA) study area. ARTC's planning will be guided by an aspirational target of 15 per cent of the value of Project procurement to be spent with businesses that are located within the SIA study area.</p> <p>As outlined in Appendix X: Social Impact Assessment, Section 8.7 and Table 8.14, the Contractor will be required to monitor of the number of people from the SIA Study Area that are employed in construction and the number and value of contracts with businesses located in the Goondiwindi and Toowoomba LGAs in line with targets, and report on outcomes.</p> <p>ARTC has also commenced delivery of business capability strategies; Appendix X: Social Impact Assessment, Section 6.2.6 has been updated in this regard.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 6.2.6</p> <p>Section 7.5.3</p> <p>Section 8.7</p> <p>Table 8.14</p>
45	45.0006	Private	Social Impact Assessment	Workforce accommodation village	More information behind the Social Impact Management Plan should be provide to the public around monitoring, frequency, the cut-off triggers. Concerned for Rural Townships landlords and lease agreements. The submitter is worried that ARCT might and lease agreements and end several tenancies without notice	Investigate the policy of forcing employees to live in the non-resident accommodation if local rents are affected to ensure fairness for tenants and landlords. Insist all contractors have done criminal record checks on all employees from outside the local area and exclude those with histories of violent crime. Insist on a zero tolerance policy to infractions of the code of conduct for all contractors and their employees. Work with councils to lessen the impact on availability of tradespeople in smaller townships.	<p>Appendix X: Social Impact Assessment, Section 7.3.5 notes the potential for unmanaged housing impacts to impact on local residents' housing access. Appendix X: Social Impact Assessment notes that if rental vacancy rates remain low (as is expected), ARTC would take steps to mitigate negative impacts by requiring workers to take up occupancy in the non-resident workforce accommodation provided, rather than in the rental market or short term accommodation premises.</p> <p>Appendix X: Social Impact Assessment, Section 8.7.3 (Table 8-14) also notes that the Project will monitor the percentage of its total workforce requiring accommodation, occupancy rates of the non-resident workforce accommodation, the number of people being accommodated in the impact assessment area each month and rental vacancy rates in potentially impacted communities, and that monitoring would be conducted quarterly during first two years of construction (or to workforce peak).</p> <p>Additional information has been provided in Appendix X: Social Impact Assessment, Section 8.4.4 with respect to accommodation management and mitigation of housing impacts.</p> <p>The Contractor will be required to implement a workforce Code of Conduct which adheres to ARTC's Code of Conduct and associated policies as a minimum standard. These policies require a commitment to a drug/alcohol free workplace and implementation of a drug/alcohol testing program that covers all workers.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.3.5</p> <p>Section 8.4.4</p> <p>Section 8.7.3</p> <p>Table 8-14</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
45	45.0007	Private	Social Impact Assessment	Workforce and employment	Non-resident workforce accommodations should be required to operate shuttle buses to the local pubs to help prevent drink driving, and prevent the boredom that may lead to socially unacceptable behaviour.	Insist all contractors have done criminal record checks on all employees from outside the local area and exclude those with histories of violent crime. Insist on a zero tolerance policy to infractions of the code of conduct for all contractors and their employees. Provide a courtesy shuttle bus to bring employees from the non-resident workforce accommodation camps to town to prevent the incidence of drink driving and boredom/isolation/mental health issues. Work with councils to lessen the impact on availability of tradespeople in smaller townships.	<p>The Contractor will provide appropriate social facilities within the non-resident workforce accommodation. Depending on the location of non-resident workforce accommodation facilities in relation to nearby towns, provision of a shuttle bus may be appropriate to enable workers to access local shops, hotels and services.</p> <p>ARTC requires its contractors to undertake due diligence in the recruitment of all personnel. Personnel are required to hold the appropriate certification to work on construction sites.</p> <p>Appendix X: Social Impact Assessment, Section 7.4.7 notes that ARTC will employ strategies to reduce concerns about, and potential impacts on, community safety including:</p> <ul style="list-style-type: none"> Enforcing a Code of Conduct containing requirements for positive behaviours and respect for local residents and businesses applying to all contractor and Project personnel Ensuring that the Contractor has appropriate workforce conduct policies and procedures, complemented by complaints mechanisms which ensure fast and effective resolution to any issues experienced <p>ARTC will require the Contractor to:</p> <ul style="list-style-type: none"> Report on implementation of, and compliance with, the Code of Conduct Through consultation with Queensland Police Service and regular monitoring of community complaints, ensure that any personnel behaviour that offends local values is addressed through communication and contractual arrangements. <p>As described in Appendix X: Social Impact Assessment, Section 8.4.4, Councils will be involved in the Accommodation Management Plan development process and in approval processes for accommodation facilities. ARTC has also committed to engagement with Goondiwindi Regional Council and Toowoomba Regional Council.</p>	Appendix X: Social Impact Assessment Section 7.4.7 Section 8.4.4
45	45.0008	Private	Social Impact Assessment	Workforce and employment	Out-of-town workforce should be managed by a code of conduct. The literature shows that increases in crime and the marginalisation of women in towns experiencing rapid growth is a very real phenomenon and so it should not be trivialised. The ARTC employment conditions should specify a criminal record check, which excludes individuals with a history of violent crime.	Investigate the policy of forcing employees to live in the non-resident accommodation if local rents are affected to ensure fairness for tenants and landlords. Insist all contractors have done criminal record checks on all employees from outside the local area and exclude those with histories of violent crime. Insist on a zero tolerance policy to infractions of the code of conduct for all contractors and their employees. Provide a courtesy shuttlebus to bring employees from the non-resident workforce accommodation camps to town to prevent the incidence of drink driving and boredom/isolation/mental health issues. Work with councils to lessen the impact on availability of tradespeople in smaller townships.	<p>Appendix X: Social Impact Assessment, Section 7.4.7 notes that ARTC will employ strategies to reduce concerns about and potential impacts on community safety including:</p> <ul style="list-style-type: none"> Enforcing a Code of Conduct containing requirements for positive behaviours and respect for local residents and businesses applying to all contractor and Project personnel Ensuring that the Contractor has appropriate workforce conduct policies and procedures, complemented by complaints mechanisms which ensure fast and effective resolution to any issues experienced. <p>ARTC will require the Contractor to:</p> <ul style="list-style-type: none"> Report on implementation of, and compliance with, the Code of Conduct Through consultation with Queensland Police Service and regular monitoring of community complaints, ensure that any personnel behaviour that offends local values is addressed through communication and contractual arrangements (outlined in Section 8.3.7 of Appendix X: Social Impact Assessment). <p>There is no evidence to suggest that non-local construction workers will contribute to increased crime in local towns. ARTC requires its contractors to undertake due diligence in the recruitment of all personnel. Personnel are required to hold the appropriate certification to work on construction sites.</p> <p>Management measures which are provided as part of the Project's Accommodation Management Plan (AMP) framework (Appendix X: Social Impact Assessment, Section 8.4.4) include</p> <ul style="list-style-type: none"> Provision of an adequate number of non-resident workforce accommodation beds to meet peak workforce demand Discouraging single status personnel from renting houses in local communities Avoiding use of rental housing in Social Impact Assessment study area postcodes where the rental vacancy rate is less than 2.5 per cent (which signifies a tight rental market) Use of local short-term accommodation, where appropriate, in view of peak demands <p>Any use of local housing and accommodation will be monitored in relation to rental vacancy rates and as described in Appendix X: Social Impact Assessment, Section 8.4.4, corrective action will be taken if local access or tourism access to accommodation is being effected.</p> <p>As described above, ARTC will require the contractor to enforce a Code of Conduct and appropriate policies and procedures containing requirements for positive behaviours and respect for local residents and businesses applying to all contractor and Project personnel.</p> <p>The Contractor will provide social facilities within the non-resident workforce accommodation. Depending on the location of non-resident workforce accommodation facilities in relation to nearby towns, provision of a shuttle bus may be appropriate to enable workers to access local shops, hotels and services.</p> <p>As described in Appendix X: Social Impact Assessment, Section 8.4.4, Councils will be involved in the AMP development process and in approval processes for accommodation facilities. The Project will also continue to engage with stakeholders including Councils, Toowoomba and Surat Basin Enterprise, Toowoomba Chamber of Commerce and Goondiwindi Chamber of Commerce to monitor labour draw, and implement corrective actions such as changes to recruitment advertising or specific training strategies addressing skilled shortages if stakeholder feedback indicates that this is necessary to reduce competition with local businesses and organisations. (Appendix X: Social Impact Assessment, Section 7.2.2).</p>	Appendix X: Social Impact Assessment Section 7.2.2 Section 7.4.7 Section 8.4.4
45	45.0009	Private	Social Impact Assessment	Workforce and employment	SIMP says the impact on medical services will be mitigated by providing paramedics and advance notice to QLD Health. While the inclusion of paramedics is laudatory, it does not go far enough. This will not prevent the strain on doctors and the emergency clinics at the Inglewood and Millmerran Medical Centres and hospitals. There is already a long wait for appointments and this will only grow.	ARTC should employ a doctor for the provision of non-emergency medical care.	<p>The requirement for up to 900 workers to be based near Inglewood and Yelarbon is the peak requirement. Appendix X: Social Impact Assessment, Section 8.3.7 notes that the Project will provide access to paramedic services to reduce the demands on local health services.</p> <p>The Project has also committed to ensuring personnel are made aware of the need to attend to routine health issues whilst they are off roster, avoiding use of local GPs.</p> <p>As part of its planned quarterly consultation with Queensland Health during the Project's Construction Works stage, ARTC will monitor impact on local health services. If undue strain on local health services is identified to be attributable to the Project, ARTC will work with Queensland Health and the Darling Downs and West Moreton Primary Health Network (DD&WM PHN) to implement appropriate measures which may include:</p> <ul style="list-style-type: none"> Funding additional health services and programs at non-resident accommodation facilities, which may include contract arrangements with local or remote health service providers Adjustment of policies regarding workforce behaviour (i.e. ensuring staff attend to routine health issues off roster as directed). <p>Additionally, ARTC has implemented measures to minimise the spread of COVID-19 among its workforce and mitigate any associated impacts on local health services.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.7 and Section 8.5.8 have been revised in this regard.</p>	Appendix X: Social Impact Assessment Section 8.3.7 Section 8.5.8
45	45.0010	Private	Social Impact Assessment	Local business and industry procurement	Local people will not be able to find local tradespeople during construction. There is no mitigation option for the related impact of local businesses losing their tradespeople to lucrative short term contracts.	Employment contracts should be formulated in collaboration with local councils to ensure locals are not left worse off.	<p>Appendix X: Social Impact Assessment, Section 8.3.4, notes the possibility that the Project could compete with other businesses for personnel, as it will encourage local participation in the work force.</p> <p>ARTC has committed to the implementation of training programs (Appendix X: Social Impact Assessment, Section 8.3.7) which will increase the capacity of non-experienced workers to be employed by the Project, and mitigate skilled labour draw. Local businesses will also have the opportunity to supply to the Project, as described in Appendix X: Social Impact Assessment, Section 7.5. Appendix X: Social Impact Assessment, Section 8.3.7 and Section 8.6.5 has been updated to reflect recent initiatives and commitments with regard to local workforce and industry participation.</p> <p>Of note, ARTC has partnered with Goondiwindi Regional Council to support a "Local Employment Roadmap" which aims to attract skilled workers to the region. Appendix X: Social Impact Assessment, Section 8.3.4 has been updated in this regard.</p> <p>ARTC is unable to collaborate on employment agreements with other parties. However, Appendix X: Social Impact Assessment, Section 8.3.4 notes that the Project has committed to monitoring Inland Rail Projects' workforce ramp-up and the proportions of local and non-local personnel, and consulting with local Councils and Chambers of Commerce regarding any pressures they identify on local labour availability.</p> <p>If the Project is contributing to cumulative pressures on labour availability, ARTC will engage with the Contractor to refine the Project's recruitment and training strategies.</p>	Appendix X: Social Impact Assessment Section 7.5 Section 8.3.4 Section 8.3.7 Section 8.6.5
45	45.0011	Private	Social Impact Assessment	Local business and industry procurement	While construction stage of the project may improve tourism business due to the non-resident workforce, those who are in close proximity to the rail will see a drastic fall in custom once ARTC becomes operational.	Mitigation or compensation measures should be put in place for businesses who will suffer. Work with industry groups and individual businesses to provide mitigation or compensation commensurate to losses during the operation phase of the project.	<p>ARTC will work with stakeholders, including impacted local businesses and tourism operators, to minimise or offset impacts. Appendix X: Social Impact Assessment, Section 8.6.5 notes the potential for operational noise to impact the amenity of businesses in Yelarbon, Brookstead and Pittsworth. ARTC will work with business operators to reduce the potential for impacts on their amenity. For the operational period, impacts would be managed through the imposed conditions of the Project's EIS approval and ARTC's operational management standards.</p> <p>Appendix X: Social Impact Assessment, Section 8.6.2, also notes that ARTC will consult with tourism-related businesses when the Project's detailed design is confirmed regarding potential impacts, and work with tourism stakeholders to minimise or offset these impacts.</p> <p>Additionally, Appendix X: Social Impact Assessment, Section 8.6.5 states ARTC and/or the Contractor will also:</p> <ul style="list-style-type: none"> Consult with local Chambers of Commerce, tourism associations and tourism service providers to explain management measures regarding amenity, road connections, and supply chain development and seek feedback Work with local Chambers of Commerce, Toowoomba and Surat Basin Enterprise, Southern Queensland Country Tourism, tourist information centres and the Goondiwindi and Toowoomba Regional Councils to develop a strategy to ensure that any potential impacts on tourism visitation are mitigated through support for tourism marketing campaigns targeting potentially impacted communities and/or other projects agreed with stakeholders. <p>There is no legislative requirement to pay compensation for a loss in value unless land is acquired from a property. Additionally, the Project will develop a Community Wellbeing Plan (Appendix X: Social Impact Assessment, Section 8.5.6) which will include placemaking initiatives to offset impacts on local character, and/or support recreation or tourism initiatives.</p>	Appendix X: Social Impact Assessment Section 8.5.6 Section 8.6.2 Section 8.6.5
46	46.0001	Private	Traffic and Transport	Level crossing	Placing a level crossing on Millmerran Inglewood Road, a 100 km/hr highway is irresponsible and dangerous. Trains are expected to run nearly hourly at 80-115 km/hr and this represents an unacceptable risk to public safety.	Suggests adding an overpass at this section.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. This will take into account the highspeed road environment and provide sufficient signage and warning mechanisms for approaching vehicles. ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 3.7 Section 5.8 Section 5.9 Appendix BT

47	47.0001	Private	Traffic and Transport	Level crossing	Placing a level crossing on Millmerran Inglewood Road, a 100 km/hr highway is irresponsible and dangerous. Trains are expected to run nearly hourly at 80-115 km/hr and this represents an unacceptable risk to public safety.	Suggests adding an overpass at this Section in the interest of safety.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. 48	48.0001	Private	Flooding	Infrastructure crossings/interaction	Concerned about the proposed alignment on the Eastern side of Millmerran Inglewood Road as it requires crossing floodwaters from Canning Creek. "As I write this, there is about 6 metres of water flowing down Canning Creek. Aerial photos show the flood waters are pressing up against the proposed alignment of the Inland Rail on the Eastern side of Millmerran Inglewood Road. ARTC has made a claim in Section 5.1.3 of the draft EIS they are trying to minimise watercourse crossings but then come within very close proximity at the Southern end of Millmerran Inglewood Road. You would not be able to run a train on the proposed alignment today. The western side of Millmerran Inglewood Road is high and dry. "	Consider re-routing alignment to western side of Millmerran Inglewood Road which is high and dry. It impacts less freehold properties, has a similar length and transit time and does not cross into the flood zone for Canning Creek. It requires more earthworks but the savings from the alternative are spurious.	<p>A hydraulic impact assessment has been prepared for the proposed alignment at Canning Creek. The alignment is designed to cater for the required 1% AEP flood immunity.</p> <p>As described in Section 2.8-2.10 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5% (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5% (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5% technical viability: 17% safety: 16.5% constructability: 12.5% operations: 16.5%. <p>The Border to Gowrie alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> Fewest farms affected mid-block Fewest farm operations/dwellings within 200 metres of alignment No direct impacts to feedlots Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Appendix E: Consultation Report
48	48.0002	Private	Traffic and Transport	Level crossing	B2G will have 37 level crossings and increase the number of level crossings in QLD by 2.3-3. 0% and the risk of level-crossing incidents in QLD by a commensurate amount. The rail provides no benefit to Inglewood, only traffic delays and dangerous crossings. he cost of level crossing incidents is calculated to be approximately \$10 million annually to Queensland (3), and the border to Gowrie Section would increase this by \$300000pa	Reject the inappropriate proposition of an active level crossing on the Millmerran Inglewood Road, and budget for more sensible and well designed grade separated crossings.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. 48	48.0003	Private	Traffic and Transport	Level crossing	Concerned about the impacts of the level crossings on response time for emergency services. Between chainage 38 and 84 there are 17 level crossings, effectively cutting off properties on the east and north of Inglewood from prompt arrival at Inglewood hospital in an emergency, or prompt transfer to Toowoomba hospital from Inglewood Hospital.	Budget for more sensible and well designed grade separated crossings.	<p>ARTC notes that between Ch 38 km – Ch 84 km there are 7 level crossings, these are noted below:</p> <ol style="list-style-type: none"> Whetstone Access Road Cremascos Road Lovells Crossing Road Thornton Road Millmerran-Inglewood Road Grays Road Wongavale - Yugilbar Road <p>Of the level crossings above, there is only one level crossing proposed between Inglewood and Toowoomba traveling via Millmerran-Inglewood Road and the Gore Highway. The Millmerran-Inglewood Road level crossing has a total wait time per closure of 101 seconds. Further, it is noted that removal of the existing level crossing on the Gore Highway at Brookstead in replace of a road bridge over rail grade separation will shorten the potential wait time on this journey.</p> <p>Section 5.9.3 of Appendix AA: Traffic Impact Assessment discusses analysis assumptions a lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (volumes are detailed in Section 2.4). This Section also details on how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate The time it takes the train to cross the level crossing Design vehicle consisting of a B-double for input parameters. 	Appendix AA: Traffic Impact Assessment Section 2.4 Section 5.9.1 Section 5.9.3 Appendix BT
48	48.0004	Private	Social Impact Assessment	Local business and industry procurement	Concerned about the impacts on services, in particular Queensland Health services. During construction there will be up to 600 extra people from the non-resident workforce accommodations in Yelarbon and Inglewood accessing medical services in Inglewood. This will cause further delays for doctor's appointments for residents in those areas.	ARTC should be required to provide their own doctor.	<p>The requirement for up to 900 workers to be based near Inglewood and Yelarbon is the peak requirement. Appendix X: Social Impact Assessment, Section 8.3.7 notes that the Project will provide access to paramedic services to reduce the demands on local health services.</p> <p>The Project has also committed to ensuring personnel are made aware of the need to attend to routine health issues whilst they are off roster, avoiding use of local GPs.</p> <p>As part of its planned quarterly consultation with Queensland Health during the Project's Construction Works stage, ARTC will monitor impact on local health services. If undue strain on local health services is identified to be attributable to the Project, ARTC will work with Queensland Health and the Darling Downs and West Moreton Primary Health Network (DD&WM PHN) to implement appropriate measures which may include:</p> <ul style="list-style-type: none"> Funding additional health services and programs at non-resident accommodation facilities, which may include contract arrangements with local or remote health service providers Adjustment of policies regarding workforce behaviour (i.e. ensuring staff attend to routine health issues off roster as directed). <p>Additionally, ARTC has implemented measures to minimise the spread of COVID-19 among its workforce and mitigate any associated impacts on local health services.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.7 and Section 8.5.8 have been revised in this regard.</p>	Appendix X: Social Impact Assessment Section 8.3.7 Section 8.5.8

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
48	48.0005	Private	Project alignment		From page 16 of the attached Inglewood to Millmerran Engineering and Environmental Studies report by Luke Smith and Mark Barnett (1), it can be seen that the Western side of the Millmerran Road referred to as route 3133 impacts less freehold properties, has a similar length and transit time, but requires 64% more earthworks. The study does not mention that this route has a lower price for land resumption, a lower price for road/rail interfaces and does not cross into the flood zone for Canning Creek that is currently under water. It would appear this route has been chosen entirely to avoid the expense of earthworks, but these savings are spurious. Especially if one rejects the inappropriate proposition of an active level crossing on the Millmerran Inglewood Road, and budgets for a more sensible grade separated crossing.	Provide 3 grade separated crossings on Millmerran Inglewood Road to ensure public safety.	<p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> ▶ Fewer farms affected mid-block ▶ Fewer farm operations/dwellings within 200 metres of alignment ▶ No direct impacts to feedlots ▶ Fewer residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringallity State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> ▶ Restriction of access ▶ Loss of flora and fauna ▶ Changes to bushfire management ▶ Weeds and pests ▶ Changes to drainage and minimising sediment and erosion ▶ Changes to interests on the State forests e.g. apiaries permits, grazing leases and timber values with the forest. <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing with boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 3.7 Section 5.8 Section 5.9 Appendix BT
49	49.0001	Private	Traffic and Transport	Level crossing	Concerned about the danger of level crossings and also traffic delays. ARTC has misrepresented the data which indicated the wait times by assuming they're going faster than what they will be during crossing. Particularly concerned about the delays when accessing emergency medical care.	ARTC should be required to complete the wait times and queuing data for EVERY crossing based on the slowest moving train and not the fastest.	<p>Revised draft EIS Chapter 5: Project Description, Section 5.4.1 describes the operation of the double-stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC notes that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system.</p> <p>Appendix AA: Traffic Impact Assessment, Section 5.9.3 discusses analysis assumptions of a lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (see Section 2.4). This Section also details how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the <i>Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings</i>. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> ▶ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line ▶ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate ▶ The time it takes the train to cross the level crossing ▶ Design vehicle consisting of a B-double for input parameters <p>Train speed and train clearance times (s) calculations and assumptions (as obtained from road-rail interface) for the level crossing are as follows:</p> <ul style="list-style-type: none"> ▶ Train clearance times were calculated based on an assumed maximum train speed of 115 km/h ▶ Calculation of the freight train acceleration rate ▶ Distance of the level crossing from passing loops ▶ Distance required to accelerate to maximum turnout speed (50 km/h) ▶ Distance travelled while at constant maximum turnout speed ▶ Distance required to accelerate to maximum speed after whole train has passed turnout ▶ Total distance required to reach maximum speed for train starting from turnout ▶ Total vehicles' wait time with train length of 1,800 m was estimated to be 104 seconds (including boom closure times). ▶ The wait times determined for each individual level crossing were calculated based on: ▶ Level crossing specific operating speeds which is impacted by topography and curvature of the alignment ▶ Time taken for the train to cross the level crossing ▶ Distance from train crossing loops ▶ Train length ▶ Summarised traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons) ▶ A sensitivity test (to represent a conservative upper level crossing time delay) has been undertaken based on a maximum train speed of 60 km/h (as opposed to up to 115 km/h) to highlight the variability in closure times. <p>Typical active level crossing sequence for boom gate down time is, after 11 seconds (t=11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (t=22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or Road trains), the delay before the booms commence lowering can be increased by a further 5 seconds to 16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F highway signals become extinguished.</p>	Chapter 5: Project Description Section 5.4.1 Appendix AA: Traffic Impact Assessment Section 2.4 Section 5.9.1 Section 5.9.3
49	49.0002	Private	Traffic and Transport	Construction traffic	Concerned about the effect of oversize vehicles transporting 29 m super-T precast concrete girders on the road.	Would like reassurances that the Yelarbon Kurumbul Road will be maintained during and after the construction activity ends.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts with Section 5.6.4 highlighting mitigation measures for pavement damages to local government roads. It is noted that residents have raised concern regarding maintenance of Yelarbon Kurumbul Road during construction works.</p> <p>The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted. ARTC has had ongoing discussions with the Road Manager, Goondiwindi Regional Council (GRC) on pavement impact and road maintenance arrangements.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAASRA roughness counts. The degradation of the pavements based on NAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	Appendix AA: Traffic Impact Assessment Section 5.6 Section 5.6.4
49	49.0003	Private	Noise and Vibration	Directly impacted landowner	The average daytime and night time noise and maximum noise levels are projected to be above trigger levels at her property. Concerned about the health impacts of the noise during construction and operations. Believes that noise mitigation treatments will not be able to bring the noise back to a liveable level.	Approval of the draft EIS should be conditional on the proponent commitments Appendix being amended to ensure property treatments (sound barriers) are offered to all affected property owners, not just investigated. Should consultation with a sound engineer determine that noise mitigation treatments will not bring the noise back to a liveable level at her property, she would like ARTC to offer to buy her house at (pre-project) market value.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at sensitive receptors along the Border to Gowrie alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The assessment of noise levels with conceptual noise barriers has identified that, depending on the final extent and the height of the noise barriers, the noise criteria may not be fully achieved at all receptors (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4). At-property treatments could then be applied to sensitive receptors that do not achieve the noise criteria, this would be determined by ARTC on a case-by-case basis. All noise mitigation will be in place prior to commencement of Inland Rail operations. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17 Section 17.4
50	50.0001	Private	Traffic and Transport	Level crossing	Placing a level crossing on Millmerran Inglewood Road, a 100 km/hr highway is irresponsible and dangerous. Trains are expected to run nearly hourly at 80-115 km/hr and this represents an unacceptable risk to public safety.	Suggests adding an overpass at this section.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT provides an overview of the assessment methodology for developing road–rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. This will take into account the highspeed road environment and provide sufficient signage and warning mechanisms for approaching vehicles. ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	Appendix AA: Traffic Impact Assessment Section 3.7 Section 5.8 Section 5.9 Appendix BT

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
51	51.0001	Private	Project alignment		The alignment should be rerouted to an area less prone to accidents and loss of lives.	The inland rail would be better to follow the route drawn in the attached map. It goes through state forest and would cut out 5 main road crossings and taken away from good farm land.	<p>The preferred location for the proposed rail corridor (as presented in Chapter 2: Project Rationale, Section 2.8 and Section 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs The outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15 in Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the <i>Corridor Options Report</i> (AECOM, 2017b), based on the Australian Government's announcement that the base case via Wellcamp Charlton alignment was to be progressed through a phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale which describes the route selection process.</p> <p>ARTC worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The process for this comparative assessment of four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to the Project. <p>Road-rail interfaces are described in Chapter 5: Project Description, Section 5.4.8. While ARTC has sought to limit the number of new level crossings in the revised reference design, the Project includes lower-risk level crossings where the road-rail interface treatment assessment has concluded that the risk to safety has been minimised 'so far as is reasonably practicable'. Proposed public road-rail interfaces and proposed treatments included in the revised reference design are provided in Chapter 5: Project Description, Table 5-15.</p> <p>As described in the Public Level Crossing Treatment Methodology (see Appendix BT: Inland Rail Road Interface Methodology of Appendix AA: Traffic Impact Assessment), ARTC apply a consistent methodology to develop road-rail interface treatments across this Inland Rail program which complies with Rail Safety National Law and the Office of the National Rail Safety Regulator (ONRSR) Guidelines. Noting all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Project.</p> <p>The Border to Gowrie alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> Fewest farms affected mid-block Fewest farm operations/dwellings within 200 metres of alignment No direct impacts to feedlots Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Figure 2.14 Figure 2.15 Chapter 5: Project Description Section 5.4.8 Table 5-15 Appendix E: Consultation Report Appendix AA: Traffic Impact Assessment Appendix BT
52	52.0001	State Agency	Nil Response		Nil response from DSDSATIP.	Nil	ARTC acknowledges that DSDSATIP raised no comments on the draft EIS.	N/A
53	53.0001	Private	Noise and Vibration	Operational rail noise	ARTC admits residences within 1 km of the rail may experience noise at night above 49dB (Chapter 14 page 35 draft EIS) The evidence for increased rates of hypertension and myocardial infarction is strong when maximum night noise is above 50dB (Night Noise Guideline for Europe, WHO, 2009) with other long term effects likely but not yet proven.	It should be a condition of the EIS that every residence within 1 km of the rail is offered sound mitigation including where possible (but not limited to) rail dampers, track lubrication, noise barriers, earth mounds, insulation, double glazed windows and air conditioners or any combination of these that will bring the night noise below a LAmax of 49. This should be at the proponents expense, and built by the proponent or its contractors prior to the Border to Gowrie Section of Inland Rail becoming operational.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (see Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration – Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration – Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration – Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration – Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17
53	53.0002	Private	Traffic and Transport	Level crossing	The Office of the National Rail Safety Regulator and Queensland Transport and Main Roads both have policies of no new level crossings due to the severity of potential high speed train/heavy vehicle crashes. There are over 600 near misses yearly, and were 40 collisions between trains and road vehicles in 2017-2019, many resulting in fatalities.	The EIS should be conditional upon no new level crossings being built over state or council roads.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
54	54.0001	Private	Noise and Vibration	Operational rail noise	Passing lane less than 1 km from residences. In conjunction with this passing loop is an active level crossing, to allow access to our divided property. As this is an active level crossing, trains will be required to sound their horn. (These facts are stated in the Inland Rail EIS and consultation with ARTC staff) The combination of the passing loop, with trains stopping and starting as well as sounding their horns at the level crossing on an almost hourly basis will have completely unacceptable implications on lifestyle.	Suggests if ARTC were to undertake negotiations to purchase a portion of their property, the need for access would be negated and thus no level crossing necessary. No suggestions made for noise created from the passing loop.	<p>Operational noise and vibration modelling for the revised draft EIS has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). As part of the assessment, noise levels from the crossing loops and level crossings have been assessed in Chapter 16: Noise and Vibration and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.</p> <p>At level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources. Train movements within the crossing loops are discussed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during the Detailed Design stage. Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable. ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible.</p> <p>Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 6.3 Section 17
54	54.0002	Private	Social Impact Assessment	Property Devaluation	Concerned for substantial devaluation of their property. Noise impacts will make several of the residences on the property less attractive to tourists, as owners had plans to turn property into a B&B during their retirement years.	No solutions provided.	<p>The submitter notes that they have two residences on the property which are intended for use as Bed & Breakfast accommodation in the future. The nearest of the property's three dwellings is approximately 1.1 kilometres to the south of the rail alignment. At this distance, exceedance of noise criteria is not predicted in noise modelling undertaken for the Project.</p> <p>ARTC will continue to engage with the community about noise and noise mitigation throughout the Detailed Design, Construction Works and Operations stages of the Project.</p> <p>ARTC notes that in the Detailed Design stage it will remove the level crossing and propose an alternative road access to the property via Cremascos Road.</p>	N/A
54	54.0003	Private	Social Impact Assessment	Land acquisition/com pensation	Concerned the division of their property will make future development on the unimproved divided area extremely difficult.	If a suitable agreement is reached on the sale of the divided area, considering future development plans, there would no longer be a need for future plans in the divided area.	<p>Property acquisitions will be undertaken by Department of Transport and Main Roads (DTMR) as the Acquiring Authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967 (Qld) (AL Act).</p> <p>Appendix X: Social Impact Assessment, Section 7.1.2 notes that landowners will be entitled to claim compensation for the loss of a legal interest in land or estate in land, in accordance with the AL Act. If eligible for compensation, the compensation payable includes highest and best use market value of the land taken at the date of resumption.</p> <p>Compensation for disturbance caused by the resumption may also apply and may include, for example, reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs, and the reasonable financial costs incurred that are a direct consequence of the resumption of the land.</p> <p>Where only part of a land parcel is acquired, compensation for damage caused by the severance of land the resumed land and the impact upon the remaining land may also apply. The process for claiming compensation is set out in the AL Act. If the parties do not agree on compensation, a dispute about compensation can be referred to the Land Court.</p>	Appendix X: Social Impact Assessment Section 7.1.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
54	54.0004	Private	Social Impact Assessment	Directly impacted landowner	The owner had the intention to retire on their property however they are concerned the proximity of the rail will significantly decrease the standard of living and peace.	Suggests eliminating the active level crossing will help however, they see no solution to the constant noise.	<p>The submitter is located on McDougall's Crossing Road Inglewood and identifies a passing lane and an active level crossing less than 1 kilometre from three residences.</p> <p>The level crossing of McDougall's has been removed from the Project design. The revised draft EIS has been updated to reflect this change.</p> <p>At 1 kilometre from the rail line, revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations, Section 7 and Section 8 of Appendix W: Noise and Vibration Assessment - Railway Operations, indicates that noise exceedances are unlikely to be experienced.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 7</p> <p>Section 8</p>
54	54.0005	Private	Noise and Vibration		Concerned the passing loop and active level crossing that are less than 1 km from their residences will have completely unacceptable implications on their lifestyle with horns being sounded and trains crossing on an hourly basis.	No solution provided	<p>Operational noise and vibration modelling for the revised draft EIS has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). As part of the assessment, noise levels from the crossing loops and level crossings have been assessed in Chapter 16: Noise and Vibration and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.</p> <p>At level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources. Train movements within the crossing loops are discussed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3. It should be noted that the stopping and idling of trains at passing loops while generating noise of differing character to the passing trains is a less significant noise source than trains passing at higher speed.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.3</p> <p>Section 17</p>
54	54.0006	Private	Surface Water	Directly impacted landowner	The rail line will isolate half of their residence from access to water. Currently, the water access for the whole property is the Macintyre Brook.	Suggests sale of the property will eliminate this issue.	<p>It is acknowledged that the submitter's property will be substantially impacted by the Project. ARTC is in the process of consulting with landowners to determine an appropriate make-good strategy on a case-by-case basis. Through this process, the measures developed for each impacted property will be unique and commensurate with the level of impact realised.</p> <p>As outlined in Appendix S: Surface Water Quality Technical Report, Section 7.2 (Table 7.1), the detailed design will be developed to ensure that, where possible, private water storages and infrastructure are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources and associated infrastructure cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private water infrastructure (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).</p>	<p>Appendix S: Surface Water Quality Technical Report</p> <p>Section 7.2</p> <p>Table 7.1</p>
54	54.0007	Private	Hazard and Risk	Directly impacted landowner	The property has been organically certified for 30 years. Owner is concerned the rail will cause certification issues regarding potential chemical contamination from weed treatments along the line.	Suggests ARTC engaged with stakeholders and communicate closely with the owners to make sure no property contamination.	<p>The suitability of chemical use, such as herbicides, will be assessed by the 'Contractor' on a location-by-location basis which will include consultation with adjoining landowners.</p> <p>Where use of herbicides is considered suitable and acceptable to adjoining landowners, the handling, mixing and application of these chemical will be conducted in accordance with the products' Technical Data Sheet and Safety Data Sheet (Chapter 24: Draft Outline Environmental Management Plan).</p> <p>If landowners advise ARTC engaged with stakeholders or the 'Contractor' of a preference for herbicides not to be used in proximity to their property, then alternative methods of weed control will be adopted. This control measure is reflected in Section 21.6 of Chapter 21: Hazard and Risk.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
55	55.0001	Private	Noise and Vibration	Directly impacted landowner	Concerned the passing loop will disturb the residence due to the close proximity of the rail.	Suggests moving the loop to the north east to Ch 131.31-133.53 or to Ch 137.0 km. This would be further from homes and busy roads.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). As part of the assessment, train movements within the crossing loops are discussed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.</p> <p>Consideration of alternative passing loop locations was not part of the noise and vibration studies, however, as noted in Chapter 2: Project Rationale, Section 2.8 and 2.9, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report, Sections 3 and 4), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works Stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 3</p> <p>Section 4</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 6.3</p> <p>Section 17</p>
55	55.0002	Private	Traffic and Transport	Operational traffic	Concerned there will be long delays at the crossing	Suggests moving the loop.	<p>The selection of crossing loop locations has followed an iterative process between the operational modelling team and the Project's design team, with the specific locations accounting for local constraints and considerations (see Section 8.4 of Chapter 8: Land Use and Tenure), while ensuring that capacity and transit time requirements can still be achieved. Operational modelling determined the number of crossing loops required in each Inland Rail project to ensure that sufficient crossing opportunities are provided to deliver the required capacity and transit times across the network. This frequency ensures that Inland Rail will meet the service offering of <24hrs transit time by facilitating the passing of trains on single line track. Discussion regarding Project crossing loops is discussed in Chapter 5: Project Description, Section 5.4.3.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.3</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.4</p>
55	55.0003	Private	Land Use and Tenure	Directly impacted landowner	States it is not necessary to use his land.	Suggests using Lovels road which has not been used for 50 years.	<p>The submitters concern is noted.</p> <p>Mitigation measures that have been factored into the reference design, or otherwise implemented during the Reference Design stage for the Project are described in Chapter 8: Land Use and Tenure, Section 8.6.1 and include:</p> <ul style="list-style-type: none"> ▶ The Project is co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. ▶ Where possible the Project footprint is located adjacent to property boundaries to reduce potential fragmentation and sterilisation of agricultural land ▶ The Project footprint has been established to provide the minimum-sized area required to safely and efficiently construct, maintain and operate the Project. ▶ Where stock routes have been intersected by the Project footprint, design solutions have been proposed that allow for the continuity of stock movement. <p>During detailed design, the Project footprint will be further refined to that which is required to safely construction, operate and maintain the Project, which will include minimising property acquisition requirements, property severance and disruption to land use and transport networks (Chapter 8: Land Use and Tenure, Section 8.5.4, Table 8-46). ARTC will continue to consult with the affected landholder through the Detailed Design stage.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.4</p> <p>Section 8.6.1</p> <p>Table 8.46</p>
56	56.0001	Private	Noise and Vibration	Directly impacted landowner	An inventory pad and the Inland Railway are proposed about 80 m from the landholder's dwelling. Noise from construction and during operation will be a nuisance. A community consultation meeting confirmed that noise levels will be higher than the allowable decibels.	Early property acquisition.	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the Construction Works and Operations stages of the Project. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the Detailed Design stage of the Project. Mitigation has been included in the revised draft EIS. Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
56	56.0002	Private	Air Quality	Directly impacted landowner	Landholder's dwelling will be impacted by pollution (dust and fumes) from the nearby proposed inventory pad and construction machinery, and from operating trains.	Early property acquisition.	<p>As a landholder in close proximity to the alignment, the Project acknowledges their concern. The landholder's dwelling has been considered in the air quality assessment for the Project. In the dispersion model developed for the assessment of the Operations stage in Appendix F of Appendix R: Air Quality Technical Report, the landholder's dwelling has been represented by sensitive receptor R1832. The landholder's dwelling is located less than 50 metres from the edge of the permanent footprint for the Project.</p> <p>The Construction Works and Operations stages of the Project will result in emissions to air. However, the assessment of the Construction Works and Operations stages has determined that the impact of air emissions to sensitive receptors, including the landholder's dwelling, will not be significant with the inclusion of recommended mitigation measures.</p> <p>Construction dust emissions have been assessed for the potential to impact human health (i.e., airborne dust, which can be inhaled) and cause nuisance or amenity impacts (i.e., deposited dust). As discussed in Section 12.3.2 of Chapter 12: Air Quality, gaseous emissions (fumes) from construction vehicles are unlikely to present a risk of significant impact.</p> <p>The Construction Works stage assessment has considered the type of emission sources present during construction, the magnitude of the expected dust emissions, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. With the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts for impacts to health and nuisance/amenity will be low or negligible.</p> <p>The assessment of the Operations stage determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in the Air Quality Chapter) within the study area for the Project.</p> <p>Further information on the results of the Construction Works and Operations stage assessment on impacts to air quality are presented in Section 12.5 of Chapter 12: Air Quality. Section 12.6 of the Chapter presents the mitigation measures recommended for the Project. These mitigation measures are to be included in the Construction Environmental Management Plan (CEMP) for the Project, as described in Chapter 24: Draft Outline Environmental Management Plan, and, when implemented, impacts to sensitive receptors are not expected to be significant.</p> <p>The property is not being considered for acquisition as it is not directly impacted by the Project. Both ARTC and the Contractor will continue to engage with landowners during future Project stages to ensure information is shared, and potential impacts from Project activities are effectively minimised and managed.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.7</p> <p>Section 12.8</p> <p>Section 12.3.2</p> <p>Section 12.5</p> <p>Section 12.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix R: Air Quality Technical Report</p> <p>Appendix F</p>
56	56.0003	Private	Social Impact Assessment	Property Devaluation	The project will devalue the landholder's property, which was intended to be their retirement home.	Early property acquisition.	<p>The revised draft EIS is unable to provide advice on individual property values. Property owners' concerns about the potential for impacts on the value of their properties is acknowledged in Appendix X: Social Impact Assessment, Section 7.1.9. As noted, property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres.</p> <p>The revised draft EIS is unable to comment on the specifics of individual land acquisition agreements as these will be determined by the acquiring authority in consultation with landowners.</p> <p>With the exception of early acquisitions by ARTC based on demonstrated hardship, the majority of land required for the Project will be acquired by Department of Transport and Main Roads (DTMR), as the acquiring authority, under the Acquisition of Land Act 1967 (Qld) (Appendix X: Social Impact Assessment, Section 7.1.2). However this won't commence until the Project is approved.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.2</p> <p>Section 7.1.9</p>
56	56.0004	Private	Social Impact Assessment	Directly impacted landowner	Project is a cause of stress for the landholder and their family, which is negatively affecting their health.	Early property acquisition.	<p>Appendix X: Social Impact Assessment, Section 8.5.3, acknowledges that the Project has resulted in stress and anxiety for some landowners and residents. In addition to the ongoing community engagement process which aims to provide information and enable consideration of landowners' concerns, ARTC has invested in a mental health partnership to enable people affected by the proposed Project to access mental health support services.</p> <p>The revised draft EIS is unable to provide advice on individual property values. Property acquisitions will be undertaken by Department of Transport and Main Roads (DTMR) as the acquiring authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967 (Qld). This includes compensation for reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs and other reasonable financial costs incurred that are a direct consequence of the resumption of the land (Appendix X: Social Impact Assessment, Section 7.1.2).</p> <p>ARTC will also provide supporting information for people who need to relocate, including referral to Department of Communities, Housing and Digital Economy housing support programs where necessary.</p> <p>Land acquisition is currently only available to property owners whose land is directly affected by the Project, or where satisfactory noise mitigation could not be achieved. There is no legislative requirement to acquire or pay compensation for a loss in value unless land is acquired from a property for the Project.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.2</p> <p>Section 8.5.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
56	56.0005	Private	Social Impact Assessment	Directly impacted landowner	Project construction and operation will make the landholder's performance horses stressed, which will negatively impact their health and ability to perform.	Early property acquisition.	<p>Ongoing consultation with affected landowners, and the wider communities, will be undertaken in accordance with ARTC's consultation plan, as discussed in Chapter 6: Stakeholder Engagement. Negotiation of land acquisition will be undertaken in accordance with the Acquisition of Land Act 1967 (Qld), which includes the process for the resumption of land by a constructing authority (e.g. Department of Transport and Main Roads) and compensation.</p> <p>A summary of land within the permanent footprint that will potentially be subject to full or partial acquisition is provided in Table 8-36 of Chapter 8: Land Use and Tenure, and a detailed record of all impacted properties is in Appendix F: Impacted Properties. The extent of land acquisition will be confirmed following completion of the Detailed Design stage.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Chapter 8: Land Use and Tenure</p> <p>Table 8-36</p> <p>Appendix F: Impacted Properties</p>
56	56.0006	Private	Stakeholder engagement	Land acquisition/compensation	ARTC staff at a community consultation meeting were surprised the landholder had not already been considered for early acquisition due to the close proximity of the project to their property/dwelling.	Early property acquisition.	<p>The Department of Transport and Main Roads (DTMR) is managing the property acquisition process for the Project (see Section 5.3.5, Chapter 5: Project Description and Chapter 8: Land Use and Tenure). ARTC notes that subsequent to the submission of the draft EIS, the submitter applied for early acquisition and was informed that because the property was not directly impacted by the reference design, it did not meet the requirements to be considered for early acquisition.</p> <p>Impacted properties are summarised in Appendix F: Impacted Properties. Properties not directly impacted by the Project will be engaged on a case-by-case basis to determine appropriate mitigation measures are in place to minimise the impact of noise and vibration in line with Australian standards.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.3.5</p> <p>Chapter 8: Land Use and Tenure</p> <p>Appendix F: Impacted Properties</p>
57	57.0001	Private	Land Use and Tenure	Directly impacted landowner	Project is proposed to occupy 60 acres of the landholder's property with about 30 acres between the rail and boundary fence. This land will be inaccessible to farm.	Move the alignment.	<p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-51, where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. 	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.2</p> <p>Table 8-51</p>
57	57.0002	Private	Flora and Fauna	Koala	Koala habitat aligns the area of the landholder's property where the railway is proposed to be located. The project will have a significant impact on the koalas that use that habitat.	Move the alignment.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
57	57.0003	Private	Groundwater	Private groundwater bore/s	Landholder has experienced water scarcity with the ongoing drought. ARTC proposes to excavate about 30 metres in the area where the landholder accesses their water - cutting their water supply. Landholder wants to know what will happen to the aquifers they access and where will ARTC source the water required for the project.	Move the alignment.	<p>The predictive groundwater modelling undertaken as part of the revised draft EIS indicates that the horizontal extent of drawdown is predicted to extend a maximum of 10 m to 43 m horizontally from the rail centreline (from the deepest cuts). This drawdown will be localised around the vicinity of the deep cuts that intersect groundwater only. No regional groundwater drawdown or wider impact on the aquifer is anticipated, nor is drawdown expected to occur outside the disturbance footprint (see Chapter 15: Groundwater, Section 15.6.2).</p> <p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements. The current hierarchy of water supply source preferences prioritises non-potable sources to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, it would be secured through private agreement through trading or purchasing of existing allocated entitlements, and the licenced capacity of existing bores will not be exceeded as described in Tables 15-17 and 15-20.</p> <p>The preferred alignment for the proposed rail corridor was identified based on an analysis of multiple corridor options, with the final preferred alignment presenting the strongest benefits for industry and the community in general, while minimising impacts to the natural and rural landscape. The location of the alignment was selected in part as it is located within the existing Southern Freight Rail Corridor, gazetted as a future rail corridor in 2010. While some registered groundwater bores will be impacted as a result of the Project alignment, ARTC will engage with these impacted water users/landowners to determine appropriate make-good mitigation measures on a case-by-case basis (see Chapter 15: Groundwater, Section 15.7.4).</p>	<p>Appendix B5: Construction Water Requirements</p> <p>Chapter 15: Groundwater</p> <p>Section 15.6.2</p> <p>Section 15.7.4</p> <p>Table 15-17</p> <p>Table 15-20</p>
58	58.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 6.2 of Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
58	58.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial phase of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
58	58.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> ▶ Non compliance with TOR set by CG 16.11.2018. ▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
58	58.0004	Private - Brookstead	Flooding - Condamine River		<p>The ongoing assessment of the Independent Panel of Experts for flood studies, is expected to be completed by the end of 2021 and thus are not including in the Draft EIS.</p> <p>The Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth Government findings and recommendations are released after the deadline for the submission on the draft EIS. These findings affect stakeholders, including affected landowners on the Condamine River floodplain.</p>	<p>The draft EIS should be withdrawn and it should be ensured that all necessary items under the TOR are incorporated into the draft EIS for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The draft EIS should incorporate the Independent Panel of Experts for Flood Studies advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The findings from the Senate Inquiry in Management of Inland Rail project by ARTC and the Commonwealth should be considered for comment by affected stakeholders and affected landowners on the Condamine River floodplain.</p>	<p>The final report by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice, has now been released. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Matters raised by the Expert Flood Panel in their Final Report, dated 6 September 2022 have been addressed in Sections 5 to 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. The Expert Flood Panel's 'Issues Management Register' has been included in Sub-Appendix A of Appendix T1: Hydrology and Flooding Technical Report - Volume 1, with a statement against each comment demonstrating where ARTC has addressed these issues within the revised documentation</p> <p>The impact assessment documented in both Chapter 14: Flooding and Geomorphology (Section 14.8) and Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 through to 21) has been updated on a catchment by catchment basis to account for comments made by the Expert Flood Panel as well as incorporating revised Flood Impact Objectives (FIO) developed in consultation with the Expert Flood Panel. Mitigation measures have been provided against each FIO exceedance.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Sections 5 - 21</p> <p>Sub-Appendix A</p>
58	58.0005	Private - Brookstead	Stakeholder engagement		<p>ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p>	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> ▶ The first meeting in Millmerran: <ul style="list-style-type: none"> ▶ ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ▶ ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. ▶ A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. ▶ Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. ▶ Condamine floodplain: <ul style="list-style-type: none"> ▶ Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. ▶ In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ▶ ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. ▶ Social Impact survey: <ul style="list-style-type: none"> ▶ A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). ▶ ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). ▶ Future consultation: <ul style="list-style-type: none"> ▶ As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. ▶ Brookstead and Pampas road and rail consultation: <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ▶ ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ▶ ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
58	58.0006	Private - Brookstead	Social Impact Assessment	Modelling	<p>The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.</p>	<p>The Survey should be repeated.</p>	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Appendix X: Social Impact Assessment, Section 4.3, notes that the survey did not return a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>The Social Impact Assessment (Appendix X: Social Impact Assessment) has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6</p> <p>Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
58	58.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none"> Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation. Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140. 	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>The revised draft EIS Terms of Reference require that the selected alignment is assessed.</p> <p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, while construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Appendix X: Social Impact Assessment, Section 8 provides a comprehensive Social Impact Management Plan addressing all identified impacts, including community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in revised draft EIS Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p> <p>Additionally, ARTC has sponsored "Living in Place", an independent survey run by social research specialists, to provide a statistically valid and ongoing monitor of community values and experiences, as well as an exploration of residents most pressing local area concerns as they relate to the liveability of their local area (Appendix X: Social Impact Assessment, Section 6.2.2). This monitoring tool will be initiated in the Project Approvals and Corridor Acquisition stage of the Project and will enable all local stakeholders to build an understanding of top local area concerns, how they change over time, and how they compare beyond, across and within their Local Government Area.</p> <p>Appendix X: Social Impact Assessment, Section 6.2 has been updated in this regard.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Section 8</p> <p>Section 8.5.6</p>
59	59.0001	Private - Brookstead	Social Impact Assessment		<ul style="list-style-type: none"> Concern raised due to the potential social impacts of the close proximity of the rail corridor to the quiet country town of Pittsworth, which has lots of retirees who chose to move there in retirement and that all residents in and around Pittsworth love their lifestyle where they are. The submitter highlights that several people who have bought property on the edge of Pittsworth had their Solicitor undertake a search for infrastructure when purchasing their land and houses, and these searches did not show any infrastructure concerns however, these people are being told that they have to move from their homes. The submitter states that they bought a property just on the outskirts of Pittsworth on Lochaber Road to shed their caravan and valuables away from flood waters on their property at Pampas. The submitter highlights that the Brookstead State School is just metres from the railway line and questions how the children will be able to travel to and from school with the increased road risk due to the rail proximity and crossing. 	<ul style="list-style-type: none"> The submitter states that there is an alternative route that would not affect so many people and this route will not expose so many people to so much anxiety and mental health issues. The submitter states that the community consultation process needs to be undertaken again and requests that an independent facilitator oversees the consultation, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication. The submitter states that the consultation in the Pittsworth region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The submitter highlights that as the detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS, it does not provide an opportunity to adequately respond to the EIS as they do not have sufficient information and that in itself is a failing of stakeholder engagement, the planning and communication process. The submitter states on this basis that the draft EIS should be rejected on the incomplete nature of information needed to effectively comment on environmental and social impact. 	<p>The Project traverses the northern outskirts of Pittsworth. As noted in Section 2.9.3 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders, and properties.</p> <p>The revised draft EIS assesses changes to the Project's reference design which have resulted from stakeholder engagement since the draft EIS was submitted, and/or in relation to the preferred contractor's design solutions. The revised draft EIS Chapter 24: Draft Outline Environmental Management Plan provides mitigation measures which will be adaptive to any changes to impacts as a result of the detailed design process.</p> <p>Assessment of the Project's potential operational noise impacts is detailed in revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations (SLR, 2020) and indicates the potential for noise to exceed the assessment criteria at the Brookstead State School, where noise mitigation measures may be required.</p> <ul style="list-style-type: none"> ARTC has engaged with Department of Education and the agreed approach is to work with the Department of Education during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. ARTC has also advised Department of Education about the need for permanent road realignments at Brookstead, and committed to consultation with the Brookstead community in the development of more detailed traffic management measures during the Detailed Design stage. <p>As further discussed in Appendix X: Social Impact Assessment, Section 8.5.1, ARTC will consult with the Department of Education and Brookstead State school during the development of the Detailed Design stage and confirmation of construction works methodology to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to local traffic during construction, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways Conduct an audit of the affected schools' sites layouts, to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, which may include façade treatments, fence treatments or air conditioning Confirm all relevant school bus services and contact details for their operators to enable consultation with the operators Identify any specific considerations (e.g. off-campus sports or activities) which should be considered in the Project's Road Use Management Plan and Traffic Management Plan. <p>The Terms of Reference require the EIS to assess the nominated route, which was selected after extensive analysis and consultation, as described in Appendix E: Consultation Report.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8.5.1</p>
59	59.0002	Private - Brookstead	Flora and Fauna	Koala	<ul style="list-style-type: none"> The submitter highlights the issue of impacts on wildlife, specifically Koala habitats in the proposed railway line location from Pampas to Southbrook and states that it is the breeding ground of an extensive koala community. The submitter notes that in Chapter 10, Figure 10-2d, there are no ecological survey sites taken between Pittsworth and Southbrook and they further note that in Chapter 10, Figure 10-8d there are no koala communities indicated at Yarranlea nor between Pittsworth and Southbrook. The submitter disputes the EIS, stating that it has not addressed the Terms of Reference for flora and fauna in Section 11.95 (listed above), as there is not an accurate indication of the numbers, diversity and extent of the koala habitat in the local region. 	<ul style="list-style-type: none"> The submitter states that the studies from Millmerran to Southbrook need to revisit surveys of and impacts on local wildlife specifically, the EIS Chapter on Flora and Fauna needs to be redone to include accurate information on the koala numbers and habitat from Millmerran to Southbrook The submitter states that without accurate numbers, impacts and mitigation cannot be determined in an acceptable and sustainable way. 	<p>Following the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koala, during the Construction Works stage. Fauna crossing structures and fencing will be installed to maintain habitat connectivity and restrict access to the rail corridor. As outlined in Chapter 11: Flora and Fauna, these mitigation measures have been selected based on the best available information including government guidelines and similar projects.</p> <p>Since the submission of the draft EIS, ARTC has developed a Draft Koala Management Plan. Appendix M: Draft Koala Management Plan, proposes management and mitigations that specifically addresses impacts to Koalas during both construction and railway operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.7</p> <p>Appendix E: Consultation Report</p> <p>Chapter 11: Flora and Fauna</p> <p>Appendix M: Draft Koala Management Plan</p>
59	59.0003	Private - Brookstead	Noise and Vibration	Modelling	The submitter disputes the numbers given in Figure 2-15, Chapter 2, stating that the numbers on affected residents only include those with property within the rail corridor and therefore do not include the 3296, residents of Pittsworth (2016 census numbers) living within 5 km of the rail line that will be affected by the noise and disruption of rail construction and operation. The submitter states that the numbers in Chapter 2 are misleading to make the Base case route look better.	<p>A night-time curfew, to be placed on trains passing through the towns of Pampas, Brookstead and Pittsworth. The submitter states that the detail of train signalling being only provided in the detailed design stage subsequent to the EIS, does not provide an opportunity to adequately respond to the EIS as there is insufficient information on potential noise issues. The submitter states that the information provided in the EIS, Chapter 23 regarding noise barriers does not provide the necessary level of detail around noise levels and mitigation options and in itself is a failing of the ToR. On this basis, the submitter states that the draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on noise and vibration and social impact.</p>	<p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS project alignment. The study area is substantially larger than normally applied on transport infrastructure projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale in the revised draft EIS, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, has been updated to include an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and Regional Councils.</p> <p>Regarding proposed solution, it is not feasible to place a night-time curfew on trains travelling through the towns of Pampas, Brookstead and Pittsworth, as one of the remits of Inland Rail is to move freight between Melbourne and Brisbane within 24 hours. However, ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
59	59.0004	Private - Brookstead	Noise and Vibration	Mitigation measures	The submitter highlights that the noise and vibration from the Inland Rail line will be heard all over town, causing immense stress and disruption to lives. The submitter highlights that the railway line will be just metres from the Brookstead State School and questions how the children will be able to work with noise and vibration happening daily.	<p>A night-time curfew, to be placed on trains passing through the towns of Pampas, Brookstead and Pittsworth. The submitter states that the detail of train signalling being only provided in the detailed design stage subsequent to the EIS, does not provide an opportunity to adequately respond to the EIS as there is insufficient information on potential noise issues. The submitter states that the information provided in the EIS, Chapter 23 regarding noise barriers does not provide the necessary level of detail around noise levels and mitigation options and in itself is a failing of the ToR. On this basis, the submitter states that the draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on noise and vibration and social impact.</p>	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, has been updated to include an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and Regional Councils.</p> <p>The Brookstead and Yelarbon State Schools are located within 200 m of the Project footprint and the Southbrook Central State School is located 900 m from the alignment. These schools may be impacted by construction and/or operational noise and construction activities. Consultation with these schools and the Department of Education (DoE) commenced in 2017. Engagement with DoE and the school principals in 2018, 2021 and 2022 has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. Details of these meetings are outlined in Appendix E: Consultation Report, Section 4.2, Queensland Government engagement. The agreed approach is to work with the schools and DoE during detailed design to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments</p> <p>Regarding proposed solution, it is not feasible to place a night-time curfew on trains travelling through the towns of Pampas, Brookstead and Pittsworth, as one of the remits of Inland Rail is to move freight between Melbourne and Brisbane within 24 hours. However, ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 10</p> <p>Section 17</p>
60	60.0001	Private - Brookstead	Flooding - Condamine River	Modelling	The submitter states concern that lives will be lost if the Inland Rail is built across the Condamine floodplain near Pampas. The submitter highlights that the current rail design includes an embankment 1.095 m higher than current bank heights and this is a big difference on a flat, wide floodplain and that there is also insufficient bridging and culverts to allow free-flowing water under this new embankment height. The submitter states their concern that the culverts and bridges will also cause debris to build up and the flow of water wont be able to pass and then recede. The submitter recounts the floods at Pampas in 2010/2011; that their property on Fysh Road, Pampas was completely covered with flood water, that lives were lost at Grantham and stresses that floods will happen again.	The submitter states the detail of the flood model by the panel of experts and the likely impacts and increased flood risk and impact due to increased embankment heights with obstructed free flow across the flood plain are not yet available, so the EIS hydrology should be rejected until we have accurate information on hydrology. The submitter states that there is a much better alternative route where the railway line can be built and the other route would not affect as many peoples lives, their property and the flood impacts would be much less.	<p>The EIS is focussed on the chosen alignment selected by the Australian Government.</p> <p>The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale, Section 2.8. Section 2.8 and 2.9 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail.gov.au/people-and-community/Border-to-Gowrie-route-assessment.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
60	60.0002	Private - Brookstead	Flooding	Modelling	The submitter disputes the numbers given in Figure 2.-15, Chapter 2 of the EIS as well as the cost comparisons between the route have been made on accurate numbers. The submitter states that the like-for-like costings did not include the additional bridging and construction costs to cross the flood plain, as ARTC have only become aware of construction difficulties on black soil foundations, and the real width and volume of water flowing across the floodplain between Millmerran and Brookstead in recent years. The submitter states that the numbers in Chapter 2 of the EIS are misleading to make the Base case route look better, and states that they were formed in 2016, before the flood modelling had been undertaken and before the flood plain crossing had been designed. The submitter states that the costs for the rail design have blown out substantially since then, as the enormity and reality of crossing the floodplain has become apparent.	The costings of the route comparisons in Figure 2.15 in Chapter 2 of the EIS must be undertaken on realistic figures around the current flood plain design to allow for a fair route comparison.	Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b) an independent process executed by consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The method of like-for-like design comparison options undertaken as part of the Corridor Options Report (outlined in Section 2.9.3 of Chapter 2: Project Rationale) are appropriate for design development because they allow designers to evaluate different design options based on a consistent set of criteria. When considering design alternatives, it is crucial to have a fair and objective basis for comparison at a set point in time to ensure that the best design choice is made with the information available at that time. By using like-for-like design comparisons, designers can assess the strengths and weaknesses of each option in relation to specific parameters such as functionality, cost, environmental impact, and feasibility. This approach ensures that all design options are evaluated on an equal footing, providing a fair and unbiased assessment. A chosen design undergoes refinement and adaptation to incorporate inputs such as updated flood modelling, site surveys, geotechnical studies, environmental assessments, and other relevant information.	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15
60	60.0003	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> The submitter expresses that they have experienced issues with ARTC through the community consultation process and that ARTC have failed to build trust and credibility in stakeholder engagement. The submitter states that ARTC have dismissed local knowledge and records of flood heights, treating affected landowners with contempt. The submitter expressed that when ARTC came to visit their property (which had been badly damaged from flood waters) and showed ARTC records and markers of previous flood heights, ARTC responded stating that the flood could not have been that deep and that the flood line was painted on the shed. The submitter disputes that ARTC have undertaken the consultation process described in Appendix C, Figure 2-1, where they claimed they would 'inform, consult, involve, collaborate and empower' affected landowners. 	<ul style="list-style-type: none"> The community consultation process needs to be undertaken again. The submitter requests that an independent facilitator oversees the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Appendix C, Figure 2.1). The consultation in the Brookstead and pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses, particularly with reference to the flood model and likely impacts on future flood events. The submitter states that the detail of road and rail design will only be provided in the 'Detailed Design Phase' subsequent to the EIS, and this does not provide an opportunity to adequately respond to the EIS as we do not have sufficient information. This in itself is a failing of stakeholder engagement and the planning and communication process. On this basis, the draft EIS should be rejected based on the incomplete nature of information we need to effectively comment on environmental and social impact (Chapter 23, Table 23.5) 	<p>Details of the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design is outlined in Appendix E: Consultation Report, Section 5.3. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>ARTC's flood model has been reviewed by the International Independent Panel of Experts on Flood Studies to increase confidence in the reference design and mitigation measures proposed.</p> <p>As noted in Appendix T1: Hydrology and Flooding, ARTC will continue to consult with impacted landowners in regard to the results of local catchment modelling through finalisation of the EIS and development of the detailed design. The purpose of this consultation will be to ensure that impacts to property-scale water balance features, such as irrigation channels and dams, are appropriately considered in the EIS and Project design. Impacts are to be determined at all drainage structures and waterways affected by construction works. The change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event. Feedback from this consultation will be used to update flood modelling for the Project, if appropriate to do so. Outcomes of this consultation and revised local catchment modelling will be incorporated into the final EIS and alterations to the design and additional flood mitigation measures are communicated back to impacted landowners.</p> <p>In reference to this submission, since the draft EIS, the Pampas road design has been revised following consultation with key stakeholders and local road users. Details of these changes at Pampas can be found in Chapter 20: Traffic, Transport and Access and the engagement conducted in Appendix E: Consultation Report, Section 5.5.</p> <p>The road and rail design solution for Brookstead is still under development. As the reference design is an iterative process, engagement about road and rail design is ongoing with stakeholders.</p>	<p>Appendix E: Consultation Report Section 5.3 Section 5.5</p>
61	61.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Chapter 17: Social Section 17.6 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 11 Section 17</p>
61	61.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation. (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial phase of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.6 Section 16.8 Section 16.10 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 4.3 Section 6 Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 5 Section 6 Section 10 Section 12.3 Section 17 Appendix G</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
61	61.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
61	61.0004	Private - Brookstead	Flooding - Condamine River		The ongoing assessment of the Independent Panel of Experts for flood studies, is expected to be completed by the end of 2021 and thus are not including in the Draft EIS. The Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth Government findings and recommendations are released after the deadline for the submission on the draft EIS. These findings affect stakeholders, including affected landowners on the Condamine River floodplain.	<p>The draft EIS should be withdrawn and it should be ensured that all necessary items under the TOR are incorporated into the draft EIS for the CG and stakeholders, including affected landowners on the Condamine River floodplain. A The draft EIS should incorporate the Independent Panel of Experts for Flood Studies advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The findings from the Senate Inquiry in Management of Inland Rail project by ARTC and the Commonwealth should be considered for comment by affected stakeholders and affected landowners on the Condamine River floodplain.</p>	<p>Matters raised by the Expert Flood Panel in the International Panel of Experts for Flood Studies of Inland Rail in Queensland - Final Report, dated 6 September 2022 have been addressed in Sections 5 to 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. The Expert Flood Panel's 'Issues Management Register' has been included in Sub-Appendix A of Appendix T1: Hydrology and Flooding Technical Report - Volume 1, with a statement against each comment demonstrating where ARTC has addressed these issues within the revised documentation</p> <p>The impact assessment documented in both Chapter 14: Flooding and Geomorphology (Section 14.8) and Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 through to 21) has been updated on a catchment by catchment basis to account for comments made by the Expert Flood Panel as well as incorporating revised Flood Impact Objectives (FIO) developed in consultation with the Expert Flood Panel. Mitigation measures have been provided against each FIO exceedance.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 5 - 21</p> <p>Appendix A</p>
61	61.0005	Private - Brookstead	Stakeholder engagement		ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out addtional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible. In the detailed design and construction works methodology, individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. Brookstead and Pampas road and rail consultation: <ul style="list-style-type: none"> As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below: <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
61	61.0006	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.	The Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Appendix X: Social Impact Assessment, Section 4.3, notes that the survey did not return a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>The Social Impact Assessment (Appendix X: Social Impact Assessment) has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
61	61.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none"> Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation. Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140. 	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>The revised draft EIS Terms of Reference require that the selected alignment is assessed.</p> <p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, while construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Appendix X: Social Impact Assessment, Section 8 provides a comprehensive Social Impact Management Plan addressing all identified impacts, including community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in revised draft EIS Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p> <p>Additionally, ARTC has sponsored 'Living in Place', an independent survey run by social research specialists, to provide a statistically valid and ongoing monitor of community values and experiences, as well as an exploration of residents most pressing local area concerns as they relate to the liveability of their local area. This monitoring tool will be initiated in the Project Approvals and Corridor Acquisition stage of the Project and will enable all local stakeholders to build an understanding of top local area concerns, how they change over time, and how they compare beyond, across and within their Local Government Area.</p> <p>Appendix X: Social Impact Assessment, Section 6.2.2 has been updated in this regard.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 6.2.2</p> <p>Section 8</p> <p>Section 8.5.6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
62	62.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
62	62.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation. (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial phase of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
62	62.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 6.2 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected school's site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
63	63.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for the assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for the modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation is forecast to be 1 to 2 train movements per hour, with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise-enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline is detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is confident that all sensitive have been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>To illustrate how the proposed noise walls could look like, concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings and, where appropriate, will consider the inclusion of community artwork. Viewpoint 20 (Near Brookstead State School) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2.20, has been updated to include an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and Regional Councils.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2.20</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
63	63.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
64	64.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation. (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 10.4) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial phase of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
64	64.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
65	65.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
65	65.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
65	65.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
67	67.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none">▶ Non compliance with TOR set by CG 16.11.2018.▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none">▶ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks.▶ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways.▶ Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning.▶ Confirm all relevant school bus services to enable consultation with the operators.▶ Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan.▶ Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none">▶ Commence implementation of management measures relating to schools as agreed during the Detailed Design stage.▶ Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks.▶ Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
67	67.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none">▶ Non compliance with TOR set by CG 16.11.2018.▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation. (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial phase of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
67	67.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none">▶ Non compliance with TOR set by CG 16.11.2018.▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.9</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
68	68.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
68	68.0004	Private - Brookstead	Flooding - Condamine River		The ongoing assessment of the Independent Panel of Experts for flood studies, is expected to be completed by the end of 2021 and thus are not including in the Draft EIS. The Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth Government findings and recommendations are released after the deadline for the submission on the draft EIS. These findings affect stakeholders, including affected landowners on the Condamine River floodplain.	<p>The draft EIS should be withdrawn and it should be ensured that all necessary items under the TOR are incorporated into the draft EIS for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The draft EIS should incorporate the Independent Panel of Experts for Flood Studies advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The findings from the Senate Inquiry in Management of Inland Rail project by ARTC and the Commonwealth should be considered for comment by affected stakeholders and affected landowners on the Condamine River floodplain.</p>	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
68	68.0005	Private - Brookstead	Stakeholder engagement		<p>ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p>	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. Brookstead and Pampas road and rail consultation: <ul style="list-style-type: none"> As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below: <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
68	68.0006	Private - Brookstead	Social Impact Assessment	Modelling	<p>The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.</p>	<p>The Survey should be repeated.</p>	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Appendix X: Social Impact Assessment, Section 4.3, notes that the survey did not return a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>The Social Impact Assessment (Appendix X: Social Impact Assessment) has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
68	68.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none"> Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation. Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140. 	<p>Nil</p>	<p>The revised draft EIS assesses changes to the Project's reference design which have resulted from stakeholder engagement since the draft EIS was submitted, and/or in relation to the preferred contractor's design solutions. The revised draft EIS Chapter 24: Draft Outline Environmental Management Plan provides mitigation measures which will be adaptive to any changes to impacts as a result of the Detailed Design stage.</p> <p>Assessment of the Project's potential operational noise impacts is detailed in revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations and indicates the potential for noise to exceed the assessment criteria at the Brookstead State School, where noise mitigation measures may be required.</p> <p>ARTC has engaged with Department of Education and the agreed approach is to work with the Department of Education during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. ARTC has also advised Department of Education about the need for permanent road realignments at Brookstead, and committed to consultation with the Brookstead community in the development of more detailed traffic management measures during the Detailed Design stage.</p> <p>As further discussed in Appendix X: Social Impact Assessment, Section 8.5.8, ARTC will consult with the Department of Education and Brookstead State school during the development of the Detailed Design stage and confirmation of Construction Works methodology to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road realignments and associated laydown areas and access tracks Describe the construction schedule and the nature of road/rail interface treatments, temporary disruptions to local traffic during construction, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways Conduct an audit of the affected schools' sites layouts, to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, which may include façade treatments, fence treatments or air conditioning Confirm all relevant school bus services and contact details for their operators to enable consultation with the operators Identify any specific considerations (e.g. off-campus sports or activities) which should be considered in the Project's Road Use Management Plan and Traffic Management Subplan. <p>The EIS Terms of Reference require the EIS to assess the nominated route, which was selected after extensive analysis and consultation, as described in Appendix E: Consultation Report.</p> <p>ARTC is committed to working directly with landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise impacts during the Construction Works stage and through to operations.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8.5.8</p>
69	69.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	<p>Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.</p>	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
69	69.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> ▶ Non compliance with TOR set by CG 16.11.2018. ▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment. .</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
69	69.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> ▶ Non compliance with TOR set by CG 16.11.2018. ▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
69	69.0004	Private - Brookstead	Flooding - Condamine River		The ongoing assessment of the Independent Panel of Experts for flood studies, is expected to be completed by the end of 2021 and thus are not including in the Draft EIS. The Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth Government findings and recommendations are released after the deadline for the submission on the draft EIS. These findings affect stakeholders, including affected landowners on the Condamine River floodplain.	<p>The draft EIS should be withdrawn and it should be ensured that all necessary items under the TOR are incorporated into the draft EIS for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The draft EIS should incorporate the Independent Panel of Experts for Flood Studies advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The findings from the Senate Inquiry in Management of Inland Rail project by ARTC and the Commonwealth should be considered for comment by affected stakeholders and affected landowners on the Condamine River floodplain.</p>	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
69	69.0005	Private - Brookstead	Stakeholder engagement		<p>ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.</p> <p>ARTC has failed to build credibilty with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p>	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> ▶ The first meeting in Millmerran: <ul style="list-style-type: none"> ▶ ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ▶ ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. ▶ A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. ▶ Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. ▶ Condamine floodplain: <ul style="list-style-type: none"> ▶ Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. ▶ In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ▶ ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. ▶ Social Impact survey: <ul style="list-style-type: none"> ▶ A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ▶ ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). ▶ Future consultation: <ul style="list-style-type: none"> ▶ As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. ▶ Brookstead and Pampas road and rail consultation: <ul style="list-style-type: none"> As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below: <ul style="list-style-type: none"> ▶ ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ▶ ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
69	69.0006	Private - Brookstead	Social Impact Assessment	Modelling	<p>The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.</p>	<p>The Survey should be repeated.</p>	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6</p> <p>Section 6.2.2</p>
69	69.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<p>Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation.</p> <p>Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140.</p>	<p>Nil</p>	<p>The revised draft EIS Chapter 24: Draft Outline Environmental Management Plan provides mitigation measures which address impacts such as noise, dust and other environmental impacts. Relevant EIS chapters and technical reports also provide detailed assessments of the environmental, economic, cultural and social impacts that may result from the Project. Appendix X: Social Impact Assessment provides a detailed assessment of social impacts, along with a comprehensive Social Impact Management Plan. Appendix X: Social Impact Assessment has been updated to provide additional detail on management and mitigation measures in response to submissions and stakeholder engagement.</p> <p>Assessment of the Project's potential operational noise impacts is detailed in Appendix W: Noise and Vibration Technical Assessment - Railway Operations (SLR, 2020). Predicted noise levels and location of the nearby sensitive receptors triggered an investigation of rail noise barriers in Brookstead. This assessment indicates the potential for noise to exceed the assessment criteria at the Brookstead State School, where noise mitigation measures may be required. ARTC has engaged with Department of Education and the agreed approach is to work with the Department of Education during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in- corridor or at- property noise treatments. ARTC has also advised Department of Education about the need for permanent road realignments at Brookstead, and committed to consultation with the Brookstead community in the development of more detailed traffic management measures during the Detailed Design stage.</p> <p>As further discussed in Appendix X: Social Impact Assessment, Section 8.5.8, ARTC will consult with the Department of Education and Brookstead State school during the development of the Detailed Design and confirmation of construction methodology to:</p> <ul style="list-style-type: none"> ▶ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks ▶ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to local traffic during construction, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways ▶ Conduct an audit of the affected schools' sites layouts, to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, which may include façade treatments, fence treatments or air conditioning ▶ Confirm all relevant school bus services and contact details for their operators to enable consultation with the operators ▶ Identify any specific considerations (e.g. off-campus sports or activities) which should be considered in the Project's Road Use Management Plan and Traffic Management Plan. <p>The revised draft EIS Terms of Reference require the revised draft EIS to assess the nominated route, which was selected after extensive analysis and consultation, as described in Appendix E: Consultation Report.</p> <p>ARTC is committed to working directly with landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise impacts during the Construction Works stage and through to operations.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8.5.8</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
71	70.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
70	70.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment. .</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 11</p> <p>Section 17</p> <p>Appendix G</p>
70	70.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
70	70.0004	Private - Brookstead	Flooding - Condamine River		The ongoing assessment of the Independent Panel of Experts for flood studies, is expected to be completed by the end of 2021 and thus are not including in the Draft EIS. The Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth Government findings and recommendations are released after the deadline for the submission on the draft EIS. These findings affect stakeholders, including affected landowners on the Condamine River floodplain.	<p>The draft EIS should be withdrawn and it should be ensured that all necessary items under the TOR are incorporated into the draft EIS for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The draft EIS should incorporate the Independent Panel of Experts for Flood Studies advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The findings from the Senate Inquiry in Management of Inland Rail project by ARTC and the Commonwealth should be considered for comment by affected stakeholders and affected landowners on the Condamine River floodplain.</p>	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
70	70.0005	Private - Brookstead	Stakeholder engagement		ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibilty with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.	Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none">▶ The first meeting in Millmerran:<ul style="list-style-type: none">▶ ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development.▶ ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts.▶ A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6.▶ Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows.▶ Condamine floodplain:<ul style="list-style-type: none">▶ Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS.▶ In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022.▶ ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3.▶ Social Impact survey:<ul style="list-style-type: none">▶ A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope.▶ ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).▶ Future consultation:<ul style="list-style-type: none">▶ As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.▶ Brookstead and Pampas road and rail consultation:<ul style="list-style-type: none">▶ As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:<ul style="list-style-type: none">▶ ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead.▶ ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing.	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
70	70.0006	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.	The Survey should be repeated.	<p>The revised draft EIS Chapter 24: Draft Outline Environmental Management Plan provides mitigation measures which address impacts such as noise, dust and other environmental impacts. Relevant EIS chapters and technical reports also provide detailed assessments of the environmental, economic, cultural and social impacts that may result from the Project. Appendix X: Social Impact Assessment provides a detailed assessment of social impacts, along with a comprehensive Social Impact Management Plan. Appendix X: Social Impact Assessment has been updated to provide additional detail on management and mitigation measures in response to submissions and stakeholder engagement.</p> <p>Assessment of the Project's potential operational noise impacts is detailed in Appendix W: Noise and Vibration Technical Assessment - Railway Operations (SLR, 2020). Predicted noise levels and location of the nearby sensitive receptors triggered an investigation of rail noise barriers in Brookstead. This assessment indicates the potential for noise to exceed the assessment criteria at the Brookstead State School, where noise mitigation measures may be required. ARTC has engaged with Department of Education and the agreed approach is to work with the Department of Education during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in- corridor or at- property noise treatments. ARTC has also advised Department of Education about the need for permanent road realignments at Brookstead, and committed to consultation with the Brookstead community in the development of more detailed traffic management measures during the Detailed Design stage.</p> <p>As further discussed in Appendix X: Social Impact Assessment, Section 8.5.8, ARTC will consult with the Department of Education and Brookstead State school during the development of the Detailed Design and confirmation of construction methodology to:</p> <ul style="list-style-type: none">▶ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks▶ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to local traffic during construction, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways▶ Conduct an audit of the affected schools' sites layouts, to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, which may include façade treatments, fence treatments or air conditioning▶ Confirm all relevant school bus services and contact details for their operators to enable consultation with the operators▶ Identify any specific considerations (e.g. off-campus sports or activities) which should be considered in the Project's Road Use Management Plan and Traffic Management Plan. <p>The revised draft EIS Terms of Reference require the revised draft EIS to assess the nominated route, which was selected after extensive analysis and consultation, as described in Appendix E: Consultation Report.</p> <p>ARTC is committed to working directly with landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise impacts during the Construction Works stage and through to operations.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8.5.8</p>
70	70.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none">▶ Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation.▶ Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140.	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during the Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6) acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.8.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
71	71.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> ▶ Non compliance with TOR set by CG 16.11.2018. ▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> ▶ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. ▶ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. ▶ Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. ▶ Confirm all relevant school bus services to enable consultation with the operators. ▶ Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. ▶ Agree the communication process between ARTC and school communities during the Construction Works stage. <p>The construction Contractor will:</p> <ul style="list-style-type: none"> ▶ Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. ▶ Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. ▶ Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
71	71.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> ▶ Non compliance with TOR set by CG 16.11.2018. ▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment. .</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
71	71.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> ▶ Non compliance with TOR set by CG 16.11.2018. ▶ The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ▶ The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10, and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 7. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10, and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead and Yelarbon State Schools. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> ▶ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. ▶ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. ▶ Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. ▶ Confirm all relevant school bus services to enable consultation with the operators. ▶ Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> ▶ Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. ▶ Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. ▶ Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

72	72.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected school's site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. 72	72.0005	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> As noted in-Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. Brookstead and Pampas road and rail consultation: <ul style="list-style-type: none"> As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below: <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
72	72.0006	Private - Brookstead	Stakeholder engagement	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.	The Survey should be repeated.	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6) acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
72	72.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none"> Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation. Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140. 	The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6) acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. 73	73.0001	Private - Brookstead	Project alignment		The submitter states that the corridor selected fails to be the safest location for a modern high speed freight train (115 km per hour carrying thousands of tones of freight). The submitter states that whilst rural communities do have trains and railways at present which were welcomed at the time when built (to service the needs of the community); these railway lines were built during the steam train era which only carried a fraction of the tonnage at a fraction of the speed. The submitter states that the goal of inland rail is to put freight on rail, being a great and much needed project, to reduce road transport for the safety of the travelling motorist, however building a high speed railway across a built up area when there is no need to contradicts what inland rail is about being safety. The submitter states that there is a failure of a duty of care.	The submitter states that the Cecil Plains route is the safest possible location and will be accepted by the people the best.	<p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>Chapter 21: Hazard and Risk of the EIS identifies and describes hazards and risks relevant to the Project and assesses the potential for impacts to people, property, and the environment. Policies, standards and guidelines of relevance to this assessment are introduced and summarised in Table 21-1. The following legislation is relevant to the assessment of hazards and risks for the Project:</p> <ul style="list-style-type: none"> Rail Safety National Law Work Health and Safety Act 2011 (Qld) (WHS Act) Explosive Act 1999 (Qld) Public Health Act 2005 (Qld) <p>Further discussion regarding the above legislation, their relevance to the Project and how the Project complies, is provided in Chapter 3: Legislation and Project Approvals Process.</p> <p>ARTC are committed to continued consultation with the community and key stakeholders through detailed design and construction to identify impacts and, where possible, mitigation measures.</p> <p>With respect to the Cecil Plains option, subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes.</p> <p>The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Chapter 21: Hazard and Risk</p> <p>Table 21-1</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Chapter 3: Legislation and Project Approvals Process</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
73	73.0002	Private - Brookstead	Project alignment		The submitter states that the corridor selection for B2G is a highly built up area and the tenure of the land within the permanent footprint of the corridor is predominantly freehold. The submitter states that each freehold land parcel is a private enterprise that produces a product or provides a service that the people of the communities rely upon for a livelihood. The submitter states that Inland rail is going to traverse hundreds of freehold parcels of land placing in danger the lives of the people that frequent these locations. The submitter states that there is a failure of a duty of care	The submitter states that the Cecil Plains route is the safest possible location and will be accepted by the people the best.	<p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>ARTC acknowledges the impact to landowner's properties and operations as a result of the Project, which will continue to be addressed as the design and construction planning progresses. In accordance with mitigation measures in Chapter 8: Land Use and Tenure, Section 8.6.2, the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as is reasonably practicable. Consultation with landowners would be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whelstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (https://www.inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.2</p> <p>Appendix E: Consultation Report</p>
74	74.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
74	74.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3). Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment. .</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
74	74.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway Operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
74	74.0004	Private - Brookstead	Flooding - Condamine River		The ongoing assessment of the Independent Panel of Experts for flood studies, is expected to be completed by the end of 2021 and thus are not including in the Draft EIS. The Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth Government findings and recommendations are released after the deadline for the submission on the draft EIS. These findings affect stakeholders, including affected landowners on the Condamine River floodplain.	The draft EIS should be withdrawn and it should be ensured that all necessary items under the TOR are incorporated into the draft EIS for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The draft EIS should incorporate the Independent Panel of Experts for Flood Studies advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment for the CG and stakeholders, including affected landowners on the Condamine River floodplain. The findings from the Senate Inquiry in Management of Inland Rail project by ARTC and the Commonwealth should be considered for comment by affected stakeholders and affected landowners on the Condamine River floodplain.	The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1
74	74.0005	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power rotation between ARTC representatives to landowners. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022 followed by a second in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. Brookstead and Pampas road and rail consultation: <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
74	74.0006	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the project.	The Survey should be repeated.	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6) acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
74	74.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none"> Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation. Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc.) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140. 	The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6) acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. 75	75.0001	Private	Economics		The project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none"> not accept the draft EIS as the final EIS request additional information from ARTC to be included in a revised draft EIS to be released for public comment. The requested additional information in the revised draft EIS to be released for public comment should include: <ol style="list-style-type: none"> detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcamp a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only' require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government. 	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> Direct impacts on properties e.g. severance and loss of productive land Impacts on property accesses and connectivity, including the location of level crossings on private roads Impacts on the movement of stock, water, produce and equipment. <p>In response to the additional information requested:</p> <ul style="list-style-type: none"> Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020 (Chapter 2: Project Rationale, Section 2.9.3). Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (https://www.inlandrail.gov.au/understanding-inland-rail/publications-and-reports). <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 1.4. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of media commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?q=independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&rlz=C1C6CEB_enAU1015AU1015&q=independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aqs=chrome..69i57.9731j0j4&sourceid=chrome&ie=UTF-8</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 18: Economics</p> <p>Section 18.9</p> <p>Section 18.12</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 5.5</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
76	76.0001	Private	Groundwater	Private groundwater bore/s	Landholder's bores access the Main Range Volcanics (MRV) aquifer, which is expected to be impacted by constructing the project. This could potentially lead to draw down at the landholder's bores. ARTC has committed to make good on bores they decommission but not on bores they inadvertently draw down, should this occur.	ARTC to commit to make good on bores that are drawn down as a result of the project.	<p>Predictive groundwater modelling was undertaken to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts. The indicative cuts were selected as best representing the local geological conditions and worst-case potential impacts (i.e. cuts most likely to intersect groundwater). The revised draft modelling results indicates that the extent of drawdown is to extend up to 10 m to 43 m from the centre of the Project alignment (from the deepest cuts) during the Construction Works stage. The modelling was updated and further refined as part of Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.</p> <p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project. This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging (see Chapter 15: Groundwater, Section 15.5.4). Real properties (lot/plan) to be intersected by the Project footprint were targeted and landowners were provided an opportunity to be identified via this survey (Chapter 15: Groundwater, Table 15.7). Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users, potential make-good process and measures, and detailed in Chapter 15: Groundwater, Table 15.20. ARTC is engaged with licenced users/landowners to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/substitution make-good solutions are not required.</p>	<p>Chapter 15: Groundwater Section 15.5.4 Section 15.6.2 Section 15.7.4 Table 15-20 Appendix U: Groundwater Technical Report Section 6.3</p>
76	76.0002	Private	Surface Water	Construction water supply	ARTC has not confirmed how it will be sourcing the water for construction. There is no reasonable justification for ARTC to claim they will be able to source construction water from private agreements.	ARTC to provide a construction water plan for public comment.	<p>Information is provided in Chapter 5: Project Description, Section 5.6.24 regarding construction water, specifically the estimated volumes required, water quality parameters, potential sources, access and reliability.</p> <p>Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan, to be finalised prior to the commencement of construction. A detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	<p>Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements</p>
76	76.0003	Private	Landscape and Visual Amenity		Draft EIS says Pittsworth will not be 'directly impacted' despite large infrastructure proposed to be built nearby the town that would change and obscure views. An embankment is proposed that can be clearly seen from Viewpoint 17. There is no attempt to avoid, mitigate or manage this in the EIS.	ARTC to propose measures to avoid, mitigate or manage the impact of the embankment on the landscape and visual amenity at Pittsworth.	<p>The Landscape and Visual Impact Assessment (LVIA) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of the potential alternative options that may have been considered in the vicinity of Pittsworth.</p> <p>The LVIA assessment notes that the potential magnitude of effect of the Project on Viewpoint 17 (now 22) during operation is High.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to Detailed Design and liaison with relevant land owners and managers.</p> <p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.9.3 Appendix K: Landscape and Visual Impact Assessment Section 11.2 Table 95</p>
76	76.0004	Private	Social Impact Assessment		Project has already divided the town of Pittsworth with people living close to the alignment anxious of the noise, property value and amenity impacts and people further south hopeful of the imminent prosperity from the construction phase. Not training activities or community outreach activities to upskill Pittsworth locals have occurred that would allow locals to take the necessary roles for construction of Inland Rail.	Deliver training activities and community outreach activities to upskill Pittsworth locals and ensure the town benefits from the project.	<p>The submission describes a diversity of views on the Project. The potential for effects on community cohesion is noted in Appendix X: Social Impact Assessment, Section 7.1.8. Community engagement and community investments to help strengthen the community's ability to adapt to stresses are outlined in Section 8.2 and 8.5.6 respectively.</p> <p>Section 8.5.6 of Appendix X: Social Impact Assessment outlines the Community Wellbeing Plan to be provided by the Project, which will include projects which support community cohesion and resilience, e.g. community events, arts and cultural programs, or skills training for volunteers and community organisations. ARTC has also commissioned an independent survey of community wellbeing and quality of life metrics called "Living in Place", to understand community values across the Social Impact Assessment (SIA) study Area, including experiences and priorities to enhance local liveability.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 states 'ARTC is committed to ensuring that SIA study area residents will benefit from employment in the Project's construction, including residents who have the relevant skills and experience to take up employment opportunities, and those who will gain skills as part of Inland Rail Skills Academy initiatives or through on-the-job training'.</p> <p>As at 30 June 2021, Inland Rail Skills Academy (Appendix X: Social Impact Assessment, Section 8.3.2) has implemented preliminary training and business capacity building strategies in Toowoomba which is within a 35 minute drive of Pittsworth. Inland Rail Skills Academy will continue to deliver training programs including programs in communities across the SIA study area, including Pittsworth and at locations accessible to Pittsworth locals. As noted in Appendix X: Social Impact Assessment, Section 8.3.2, following Project approval, the Contractor will implement a program for apprenticeships, traineeships and facilitation of industry accreditation to support employment into Inland Rail projects and other major regional industries.</p> <p>Appendix X: Social Impact Assessment, Section 8.1 has been updated to reflect the most recent training and development initiatives.</p>	<p>Appendix X: Social Impact Assessment Section 7.1.8 Section 8.1 Section 8.2 Section 8.3.2 Section 8.5.6</p>
76	76.0005	Private	Flora and Fauna	Koala	Reconsider railway fencing and koala crossings. Consider consulting with the wildlife carer near Millmerran about a new location to release koalas.	ARTC's proposal to fence the railway with standard rural fencing will allow koalas to pass under the fence and make a mockery of koala crossings. There is a wildlife carer near Millmerran who releases koalas in close proximity to the proposed alignment.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Appendix P: Fauna Connectivity Strategy Identifies the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the Detailed Design stage. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the Detailed Design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy)</p> <p>Appendix P: Fauna Connectivity Strategy, Section 6, proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g., revegetation). These scenarios will be used to inform design workshops and community consultation at the Detailed Design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTM's Fauna Sensitive Transport Infrastructure Delivery manual (DTMR 2024). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the Detailed Design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with key stakeholders including conservation groups during the Detailed Design stage. Initiatives outlined in this submission can be further investigated during the Detailed Design stage prior to construction commencing.</p>	<p>Appendix E: Consultation Report Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix P: Fauna Connectivity Strategy</p>
76	76.0006	Private	Flora and Fauna		Consider an alternative alignment to avoid impacting Condamine Earless dragon habitat	The Condamine Earless dragon is endemic to the Condamine Floodplain and predominantly occupies small parcels of native vegetation on roadside reserves which would be significantly impacted by the sections of the alignment that run along the Gore highway.	<p>The Project footprint has been subject to historical disturbance/clearing and one third of its length is located within brownfield (areas already subject to development). The remaining greenfield portions of the Project footprint extend largely through areas subject to historical and current agricultural land uses. The conservative nature of the assessment ensured that the maximum potential impact to species was determined to guide the impact assessment and future Project direction in relation to mitigation strategies.</p> <p>Clearing of vegetation will be restricted to the minimum required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross drainage and rail maintenance access roads. Habitat for threatened species (including the Condamine earless dragon) has been avoided wherever possible. (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report). To ensure that Project permeability is maintained, 22 bridge structures are proposed that will maintain habitat connectivity across the Project.</p> <p>Where impacts to threatened species habitat cannot be avoided, mitigation and management measures will be implemented. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, during both the Construction Works and Operations stages. Impact mitigation will include pre-clearance surveys prior to disturbance. Management and mitigation measures to protect vulnerable and endangered species are proposed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>In instances where a significant residual impact as identified by the relevant EPBC Act and NC Act significant assessment criteria, biodiversity offsets will be secured (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report). ARTC will provide biodiversity offsets in accordance with the relevant state or commonwealth legislation and guidelines. ARTC's approach to delivering environmental offset requirements is outlined in Appendix Q: Environmental Offset Delivery Strategy.</p>	<p>Chapter 24: Draft Outline environmental Management Plan Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix Q: Environmental Offset Delivery Strategy</p>
76	76.0007	Private	Flora and Fauna	Survey effort/field investigation data	The vast majority or field studies took place during drought conditions, meaning the results are not representative of the actual biodiversity present in the region.	Nil.	<p>Additional field work has been undertaken across the entire project footprint to inform the revised draft EIS and present ground truthed information. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods and results of these survey efforts are available in Chapter 11: Flora and Fauna.</p> <p>The full survey reports are available in Appendix I of Appendix L: Terrestrial and Aquatic Ecology Technical Report, and Appendix O: Matters of National Environmental Significance.</p>	<p>Chapter 11: Flora and Fauna Section 11.3 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Section 4</p>
76	76.0008	Private	Noise and Vibration	Operational rail noise	Impact of noise at Pittsworth has been understated because the rail will be elevated and modelling only considered noise impacts of trains 1800 m long. Trains up to 3200 m long are expected to eventually use the rail, leading to a significant increase in average noise levels and most likely making several other houses eligible for mitigation. ARTC's plans for sound barriers are tentative.	ARTC should commit to sound mitigation barriers for Pittsworth where possible and providing the public and residents with the opportunity to comment on the specifications of any proposed sound mitigation measures' to install property treatments concurrently with the rail, such that all treatments are finished prior to the first train running. ARTC be required to treat all properties where there will be noise exceedances based on the World Health Organisation's environmental noise guidelines.	<p>The current design only allows for 1,800 m long trains to utilise Inland Rail, therefore the assessment only considers trains of 1,800 m length. This is further detailed in Chapter 5: Project Description, Section 5.2.25.4.1 and as it relates to the operational railway noise assessment in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 1.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. A concept noise barrier has been included in Pittsworth (Section 17.4). There will be engineering, further acoustic assessment works (including noise modelling), and community engagement undertaken during the Detailed Design and Construction Works stages of the Project. All mitigation measures will be in place prior to the commencement of Inland Rail operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The Interim Guideline does not require ARTC to provide noise mitigation to comply with the WHO guideline. The WHO guideline is specifically written for Europe and the WHO guideline does not form part of contemporary rail noise policy in Australia. The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014. Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>To provide an illustration of how noise walls could look like, concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2.22, has been updated to include an artists impression showing the potential for mitigation measures in this location, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and Regional Councils.</p>	<p>Chapter 5: Project Description Section 5.24.1 Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4 Chapter 16: Noise and Vibration Section 16.10 Appendix K: Landscape and Visual Impact Assessment Section 8.2.22 Section 11.2 Table 95 Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17 Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
76	76.0009	Private	Land Use and Tenure	Severance of agricultural land	The alignment requires up to 580 ha of strategic cropping land to be resumed. Strategic cropping land is scarce, occupying only 2% of Queensland.	ARTC to reassess the alignment with special attention paid to the future food security of Queensland.	<p>Chapter 8: Land Use and Tenure, Section 8.5.1 and Table 8-29 provide an assessment of impacts on strategic cropping areas. The permanent footprint of the Project will affect approximately 3,329.23 ha of mapped strategic cropping areas within the Darling Downs regional planning area, which is representative of 0.027 per cent of strategic cropping areas within the region. The permanent footprint will also impact 52.94 ha of strategic cropping areas within the South East Queensland regional planning area, which represents less than 0.01 per cent of these areas within the region. RPI Act Statutory Guideline 03/14 – Carrying out resource activities in the strategic cropping area prescribes a 2 per cent threshold of permanent impact to strategic cropping area on an individual property to determine whether a resource activity will result in a material impact. The Project will impact significantly less than 2% of mapped strategic cropping areas within either of the relevant regional planning areas, and accordingly does not have a material impact on strategic cropping areas.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6 identifies that with respect to priority agricultural areas and strategic cropping areas, given the unique nature of these areas, it is virtually impossible to offset the impact on these areas, or provide land-based compensation for the land take. In accordance with the Acquisition of Land Act 1967 (Qld), compensation will be negotiated between the constructing authority, ARTC, and the affected landowner if areas are compulsorily acquired. ARTC have land acquisition powers through negotiation, but not the ability to compulsorily acquire land. The consideration of partial or full acquisition of these areas will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine appropriate compensation arrangements.</p> <p>It is noted in Chapter 8: Land Use and Tenure, Table 8-46: Project's Consistency with the relevant State Planning Policy State Interests that the Project will use the existing South Western Line and Millmerran Branch Line rail corridors, where possible, to minimise adverse impacts to agricultural land uses including the loss of agricultural land (including strategic cropping land).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering. construction and operating costs. multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6</p> <p>Table 8-29</p> <p>Table 8-46</p> <p>Appendix E: Consultation Report</p>
76	76.0010	Private	Social Impact Assessment	Property Devaluation	The draft EIS acknowledges that the community is very concerned about the value of properties along the alignment but ARTC considers property values will be affected by other market forces such as agricultural commodity prices so they cannot be held to account. The submitter argues that agricultural commodity prices will not affect property values in townships along the alignment. The submitter also cites studies into property prices near rail identify that property values can increase if there are 'access benefits' and decrease where the rail creates nuisance (noise impacts, etc.).	ARTC to compensate landowners for property impacts.	<p>Appendix X: Social Impact Assessment, Section 7.1.9 notes that property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres. All relevant research the revised draft EIS team could identify is presented within Appendix X: Social Impact Assessment.</p> <p>The Project has committed to a wide range of environmental mitigation and management measures to minimise noise impacts, impacts on scenic amenity and changes to connectivity which could otherwise affect property values.</p> <p>Compensation provisions under the Acquisition of Land Act 1967 (Qld) apply only to compensation for acquisition of land.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.9</p>
76	76.0011	Private	Stakeholder engagement	Private groundwater bore/s	ARTC has not consulted with submitter on potential impacts to their groundwater bores despite the issue being raised at a public meeting. Information presented in the draft EIS about the location of bores that were studied was in Easting and Northing rather than the standard latitude and longitude.	ARTC to consult with submitter on potential Project impacts (and mitigation measures, if required) on groundwater bores.	<p>Since the draft EIS, ARTC conducted an additional groundwater bore survey, between December 2021 to April 2022, to better inform a groundwater management strategy (see Section 15.5.4 of Chapter 15: Groundwater). All directly impacted landowners were contacted by email and mail and invited to complete a groundwater survey. A total of 74 surveys were completed, identifying additional registered and unregistered groundwater bores that may be potentially impacted by the Project. Groundwater bore management will be addressed on a case-by-case basis.</p> <p>The results of this engagement has informed the development of a make-good strategy to address the Project's potential impact to any privately-owned water assets. Chapter 15: Groundwater details how the Project will address groundwater, including the provision of construction water required for construction. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.5.4</p> <p>Appendix B5: Construction Water Requirements</p> <p>Appendix E: Consultation Report</p> <p>Section 5.4</p>
76	76.0012	Private	Stakeholder engagement		Various issues are raised at community meetings such as property values, noise impacts, level crossing wait times, and barriers for local business involvement in construction but ARTC takes no action to address them.	ARTC to address issues raised at community meetings.	<p>The Stakeholder Engagement Chapter notes that the consultation approach for the Project is guided by the International Association of Public Participation (IAP2)-engagement principles - also referred to as core values, which define the expectations and aspirations of the community engagement process. Chapter 6 shows how ARTC's engagement process is modelled on the IAP2 public participation spectrum, which defines the public's role in any community engagement program and sets out the promise being made to the public at each participation level. It details ARTC's engagement activities in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints.</p> <p>In response to the specific points listed in the submission:</p> <ul style="list-style-type: none"> Property value - ARTC is unable to provide advice on individual property values. The saleability or value of a property is determined by a seller and a buyer based on a range of factors besides proximity to roads, rail or other infrastructure. There is no legislative requirement to pay compensation for a loss in value unless land is acquired from a property. Noise - ARTC shared the results of the noise modelling and potential mitigation strategies with sensitive receivers. As noted in Appendix T1: Hydrology and Flooding, ARTC will continue to engage with the community about noise and noise mitigation throughout the Detailed Design, Construction Works and Operations stages of the Project. The Project has also presented at both the Inner Darling Downs (IDD) and Southern Darling Downs (SDD) Community Consultative Committee's (CCCs) regarding noise, responding to all questions from the floor. Level crossing wait times - ARTC acknowledges that there will be wait times at level crossings; however, as the number and configuration of trains is subject to market demand and operators, it is not possible to provide specific advice at this point in time. Business involvement. ARTC will ensure the development and implementation of an Australia Industry Participation Plan focusing on opportunities for involvement by local business in construction and operation of the Project. ARTC will continue to engage with Toowoomba and Surat Basin Enterprise (TSBE), Chambers of Commerce and local business groups/associations (refer to Table 6-6 Chapter 6: Stakeholder engagement). 	<p>Chapter 6: Stakeholder Engagement</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 5</p>
76	76.0013	Private	Hazard and Risk		Additional safeguards are required if dangerous goods are to be transported on the railway considering the risk of train collisions, particularly for freight trains operating on a railway with 37 level crossings.	Restrictions should apply to cargo that is too dangerous to carry on a vehicle travelling at high speed with no ability to stop suddenly.	<p>The National Transport Commission's Australian Code for the Transport of Dangerous Goods by Road & Rail provides the national standard and requirements for transporting dangerous goods by both road and rail. The Code specifies classification categories for all dangerous goods and hazardous materials and provides details on the minimum construction and testing requirements for packaging, containers or tanks that materials must be transported in. All Rail Operators who wish to access and use the Inland Rail network will need to demonstrate compliance with the Code.</p> <p>Further to this, the transport of dangerous goods by rail is regulated in Queensland through Chapter 14 (Transporting dangerous goods by rail) of the <i>Transport Infrastructure Act 1994</i> and the Transport Infrastructure (Dangerous Goods by Rail) Regulation 2018. Control measures proposed for the transportation of dangerous goods along the Border to Gowrie Section of Inland Rail are specified in Section 21.6.2, Table 21-16 of Chapter 21: Hazard and Risk.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.6.2</p> <p>Table 21-16</p>
76	76.0014	Private	Hazard and Risk		Fencing standards proposed for the project are insufficient to prevent ingress of children, wildlife and some livestock.	ARTC engaged with stakeholders should use chain link fences adjacent to school bus stops and townships' to commit that no landowners will be worse off and landowners will be compensated for the effects on their business of losing fences due to storm water movement. Fencing standards for the rest of the corridor should be upgraded in consultation with local councils and agricultural industry groups. This should not detract from the rights of the individual landowner to negotiate superior fencing where required.	<p>Fencing will be provided for the majority of the rail corridor to limit access to the Project's rail alignment. Fencing will act to protect adjoining lands from trespass and to prevent livestock from gaining access to the railway. Fencing is to extend between the corridor and private lots or property adjoining the railway. Property or land use-specific fencing considerations will be discussed with relevant landowners as part of the detailed design process.</p> <p>As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will typically be provided according to ARTC fencing procedure, Boundary Fencing ETM-17-02 (available on the ARTC Extranet: extranet.artc.com.au).</p> <p>Where ARTC engaged with stakeholders propose to construct within the Queensland Rail corridor for all returned works (South Western Line and Millmerran Branch Line), ARTC engaged with stakeholders will comply with Queensland Rail standards; this includes new and replacement fencing. All existing fencing is proposed to be removed and replaced.</p> <p>Where superior fencing is required (for example where tracks are in close proximity to roads and/or communities, or where trespass is anticipated to occur) a 1.8 m chain link boundary fence may be provided.</p> <p>Fencing of the rail corridor has not been included in the revised reference design across floodplain areas because landowners have advised that fencing can</p> <ol style="list-style-type: none"> increase the risk of debris being caught and causing blockages; and be washed away in flood events causing downstream impacts. Instead, guideposts or other alternative means of rail corridor boundary protection will be installed in order to demarcate the rail corridor and prevent access to the rail corridor. The track elevation through these areas will also act as a deterrent to trespass or livestock access to the railway, where this may otherwise occur. <p>Maintaining effective fauna movement across the rail corridor has been an important design consideration for the Project. A preliminary fauna movement provision and fencing strategy has been prepared for the Project and is included in Appendix P: Fauna Connectivity Strategy. The fencing strategy for the Project is discussed in Section 5.4.12 of Chapter 5: Project Description.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.12</p> <p>Appendix P: Fauna Connectivity Strategy</p>
76	76.0015	Private	Traffic and Transport	Level crossing	Building level crossings is against the policy of the Office of the National Rail Safety Regulator and Qld Dept of Transport and Main Roads. Level crossings impact on the response time for emergency services and are an inconvenience for the public waiting for slow moving trains. The draft EIS does not account for the forecast increase in train lengths up to 3600 m or different speeds of different freight services at different chainages.	Select an alignment with fewer public road interfaces or build grade separated crossings.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p>
77	77.0001	Private - Turalin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turalin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecasted construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran, as per Section 5.6.4 of Chapter 5: Project Description.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>An engagement session with the community was held in October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further details on how ARTC will be managing workforce accommodation is contained in the Social Impact Management Plan (detailed in Appendix X: Social Impact Assessment). Non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to commencing accommodation establishment works.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix X: Social Impact Assessment</p>

Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Projects safe commutable distances requirements, with proximity to the townships of Yelarbon, Ingleswood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in the footprint at Yelarbon and Ingleswood have been identified as suitable for the establishment of non-resident workforce accommodation. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 and ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
77	77.0003	Private - Turallin Workers	Air Quality		<p>Location lacks services. Should generators be required to supply power this would create greenhouse emissions.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Ingleswood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Ingleswood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised by the Contractor during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
77	77.0004	Private - Turallin Workers	Noise and Vibration		<p>Proposed location lacks services. Should generators be required to supply power, this would create noise.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Ingleswood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised by the Contractor during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p>
77	77.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	<p>a. Impact on properties, variation of property values.</p> <p>b. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Ingleswood, and the Millmerran area.</p> <p>The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Ingleswood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with Toowoomba Regional Council and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with Toowoomba Regional Council and Goondiwindi Regional Council indicated that the non-resident workforce accommodation facilities are likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community (Appendix E: Consultation Report, Section 5.11).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>

77	77.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the Contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation facilities at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20.5.1</p> <p>Section 20.6</p>
77	77.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
77	77.0009	Private - Turallin Workers	Flora and Fauna		<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>Chance of Flora & Fauna displacement</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4, of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined during detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
78	78.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Ingleswood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Ingleswood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 and ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
78	78.0003	Private - Turallin Workers	Air Quality		<p>Location lacks services. Should generators be required to supply power this would create greenhouse emissions.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have noted community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Ingleswood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Ingleswood and Yelarbon) have been identified as suitable for establishing non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised by the Contractor during the Detailed Design stage of the Project. As mentioned in Sections 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
78	78.0004	Private - Turallin Workers	Noise and Vibration		<p>Proposed location lacks services. Should generators be required to supply power, this would create noise.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Ingleswood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised by the Contractor during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.37/38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p>
78	78.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	<p>a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Ingleswood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Ingleswood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with Toowoomba Regional Council and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with Toowoomba Regional Council and Goondiwindi Regional Council indicated that the non-resident workforce accommodation facilities are likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community (Appendix E: Consultation Report, Section 5.11).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>

78	78.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the ontractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas. These are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20</p> <p>Section 20.6</p>
78	78.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
78	78.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Chapter 5: Project Description, Section 5.6.4, of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined during detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to camp infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

79	79.0002	Private - Turallin Workers	Traffic and Transport		<p>a. Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre.</p> <p>b. Increase in traffic on narrow roads that are already heavily traversed.</p> <p>c. Impact on Travel time as it is further from the alignment of the rail project.</p> <p>d. Turallin and Ellerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length.</p> <p>e. Could impact on Millmerran town parking availability.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Ingleswood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Ingleswood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023, ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
79	79.0003	Private - Turallin Workers	Air Quality		<p>Location lacks services. Should generators be required to supply power this would create greenhouse emissions.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Ingleswood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Ingleswood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facility would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
79	79.0004	Private - Turallin Workers	Noise and Vibration		<p>Proposed location lacks services. Should generators be required to supply power, this would create noise.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the Border to Gowrie revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Ingleswood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p>
79	79.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	<p>a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Ingleswood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Ingleswood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with Toowoomba Regional Council and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with Toowoomba Regional Council and Goondiwindi Regional Council indicated that the non-resident workforce accommodation facilities are likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community (Appendix E: Consultation Report, Section 5.11).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>

Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated by the Contractor. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with Toowoomba Regional Council and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with Toowoomba Regional Council and Goondiwindi Regional Council indicated that the non-resident workforce accommodation facilities are likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community (Appendix E: Consultation Report, Section 5.11).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>
79	79.0007	Private - Turallin Workers	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Ellerslie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the ontractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas. These are documented in Section 20 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20</p> <p>Section 20.6</p>
79	79.0008	Private - Turallin Workers	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
79	79.0009	Private - Turallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
80	80.0001	Private	Noise and Vibration		Noise from construction and operation of the project will cause sleep deprivation and anxiety for the submitter who is a resident of a directly-affected township.	<p>Double glaze all windows at affected households install soundproofing fence/barrier move existing house and outbuildings re-establish tank and fit filter system to address dust and other airborne pollutants establish electric gates for easy access at front/back entrances</p>	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the Construction Works and Operations stages of the Project. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment.</p> <p>The noise and vibration emissions from the construction and operation of the Project have been assessed against criteria and limits designed to minimise the potential for impacts to sensitive receptors. Sleep disturbance impacts are discussed in Section 6.1 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. A range of feasible noise and vibration mitigations are provided in Chapter 16: Noise and Vibration, Section 16.10, and the associated technical reports Appendix V: Noise and Vibration Assessment: Construction and Road Traffic, Section 7, and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.</p> <p>The mitigations are based on the anticipated worst-case noise and vibration impacts at the most affected sensitive receptors, including the residences located within a relatively close distance of the Project. The development and implementation of such measures will be subject to further detailed studies and verification of noise and vibration levels during construction works and within six months of the commencement of railway operations on the Project.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
80	80.0002	Private	Noise and Vibration		Ground borne noise and vibration from blasting, machinery and/or piling will impact on the submitter's house and cause stress and anxiety in the residents.	Restump the house relocate the house back on the block restump and establish new laundry and take with water filtration system implement a permanent soundproof fence/barrier.	<p>Section 13 of Appendix W: Noise and Vibration Assessment - Railway Operations has assessed the potential vibration impacts of the railway operations to sensitive receptors. The assessment identified the minimum offset distance from the outer rail of the Project where the ground-borne vibration criteria would be expected to be achieved. Based on the highest estimated off-set distance for the night-time railway operations for the Design Year 2040 scenario, an estimated off-set distance of 12 m from the outer rail would be required to achieve ground-borne vibration criteria. A review of the Project alignment identified that all sensitive receptors, excluding those expected to be acquired by the Project, would be outside of the 12 m off-set distance from the outer rail of the Inland Rail track. On this basis, the railway operations on the Project rail tracks would achieve the ground-borne vibration assessment criteria at all sensitive receptors. Further assessment of impacts is recommended during the Detailed Design stage to verify the screening assessment outcomes.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>All reasonable and practicable measures will be taken to minimise noise and vibration impacts on the community during the Construction Works stage. Construction noise and vibration impacts will be temporary and noise impacts at each receptor will reduce due to increases in distance as the works progress along the alignment. Construction noise and/or vibration monitoring will be undertaken if required to assess compliance of construction activities against adopted criteria.</p> <p>Section 16.10 of Chapter 16: Noise and Vibration discusses the mitigation measures for blasting. Vibration impacts from blasting will be assessed once the locations and depths of blasting and the charges to be used are confirmed. This assessment will confirm the receptors/locations at which blasting impacts are expected to exceed the Project blasting vibration performance criteria as specified in the Outline EMP, if at all. If blasting is deemed necessary for construction, appropriately trained and licenced shot firers will be engaged to undertake the blasting activities in accordance with Qld's regulatory requirements. In addition, ARTC will provide regular updates to the local community to ensure that residents are kept informed when basting activities will be carried out. In relation to blasting activities, the following measures to mitigate blasting impacts are suggested where practicable:</p> <ul style="list-style-type: none"> ▶ Reducing the charge size by use of delays and reduced charge masses ▶ Ensuring adequate blast confinement to minimise the amount of overpressure ▶ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. ▶ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ▶ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. ▶ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. ▶ Airblast will be monitored to verify that the specified limits are not exceeded. Ground vibration will also be measured where required. Blasting monitoring shall be undertaken in accordance with CoP Vol 2 and AS 2187.2. The equipment used for monitoring must be calibrated annually by a NATA accredited testing facility or approved manufacturer's facility <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
80	80.0003	Private	Noise and Vibration		Noise from increased road traffic and realigning the highway closer to the submitter's home will create a nuisance, disrupting sleep and cause anxiety for the residents.	Move the house back on the block double glaze and sound proof the front fence provide suitable accommodation for residents while the house is being moved implement permanent soundproof fence/barrier.	<p>ARTC acknowledges the concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during both construction and railway operations. The revised draft EIS assesses the impacts construction and operational road traffic may have on local communities.</p> <p>Operational road traffic noise impacts have been predicted based on a preliminary road traffic noise assessment and conservative assumptions, as detailed Section 8, Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. Operational road traffic noise mitigation measures will be determined on a receptor-by-receptor basis following a detailed operational road traffic noise assessment during detailed design. The noise mitigation hierarchy detailed in the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 1: Road Traffic Noise has been recommended for the management and mitigation of operational road traffic noise impacts.</p> <p>As detailed in Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 6.1, construction road traffic noise has been assessed under the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 – Construction Noise and Vibration. Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 6.1 , address the construction road traffic assessment and predicted impacts.</p> <p>Additional noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 and Section 8 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 1, reasonable and practical noise mitigation and management measures have been presented in Section of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>ARTC understands noise could be a source of annoyance and potentially result in sleep disturbance and are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6.1</p> <p>Section 7</p> <p>Section 8</p>
80	80.0004	Private	Noise and Vibration		Vibration from construction works will cause physical damage to the submitter's house by undermining load-bearing walls and piers.	Move and restump the house before commencing construction move outbuildings back on block double glaze windows construct carport for back entrance.	<p>ARTC acknowledges concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during the Construction Works stage of the Project. The revised draft EIS construction vibration assessment has considered the worst-case construction scenarios and has predicted that construction of the Project has the potential to result in exceedances of nominated construction vibration criteria at vibration sensitive receptors.</p> <p>Construction vibration impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation. Construction vibration impacts predicted to each sensitive receptor are based on the shortest distance separating construction works to each receptor. The revised draft EIS has made preliminary but conservative predictions of potential construction vibration impacts, recommended measures to mitigate construction vibration impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise and vibration assessment (Section 16.10 of Chapter 16: Noise and Vibration, Section 6.2 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic).</p> <p>The EIS has identified the need for mitigation and management of construction vibration impacts, to be informed by a detailed construction vibration assessment based on a detailed construction methodology during detailed design. The detailed construction vibration assessment will assess potential construction vibration impacts to sensitive receptors in greater detail.</p> <p>Prior to construction commencing, the construction Contractor, will undertake dilapidation surveys on selected properties along the Project alignment, to assess structural integrity of buildings and related infrastructure. ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>Mitigation measures for construction noise and vibration impacts are detailed in Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 7</p>
80	80.0005	Private	Social Impact Assessment		Increased heavy vehicle traffic will increase road and traffic safety risks, especially directly outside the submitter's house. Submitter has support people attend her home and is concerned the project will negatively affect access to her home and parking.	Supply safe access to home via installing automatic electric gates at front and back entrances provide a clean thoroughfare through permit to permit safe front entrance and exit from rear of property transplant fruit trees reinstall side carport and support carport at rear entrance provide safe parking at front of home for support workers at both entrance and exit, if possible.	<p>ARTC notes that the reference design does not necessitate the need to alter any access arrangements for this property. The reference design includes a proposal to extend the highway; however, the Section outside this property would be posted at 60 kilometres per hour. ARTC notes there is back lane access to this property.</p> <p>Submission refers to current road noise and Project potential to exacerbate noise, and concerns about road safety.</p> <p>Where noise exceedances are identified, the Project will be required to provide noise mitigation measures. In Yelarbon this may include a noise wall, and/or architectural treatments at sensitive receptors to reduce noise levels to acceptable levels.</p> <p>The Project's Traffic Management Plan will need to consider speed limits and the safe operation of heavy vehicles associated with Project construction (refer to Chapter 24: Draft Outline Environmental Management Plan).</p> <p>Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
80	80.0006	Private	Social Impact Assessment	Property Devaluation	The submitter's property will be impacted by excessive dust and debris, and nuisance noise from the project, thus devaluing the property.	Pay support people to maintain and clean air conditioning and solar panels on a regular basis limit speeds to 40 km via speed cameras install cameras at both ends of town limit or eliminate night-time shunting and train horn blowing install filter system on catchment and delivery side of water tank due to contamination by diesel trains and trucks, dust and debris during construction and afterwards assist in helping to make our home better rather than undermining its value.	<p>The revised draft EIS is unable to provide advice on individual property values. Appendix X: Social Impact Assessment, Section 7.1.9 notes that property values may be affected by a range of factors related or unrelated to the project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres.</p> <p>ARTC will implement the mitigation measures recommended in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS to maintain the amenity of noise-affected sensitive receptors. ARTC will also provide specific engagement mechanisms with residents of properties exposed to noise impacts, to ensure the potential for impacts on amenity is clearly explained, and where relevant, to obtain their inputs to the development of property-specific mitigation measures.</p> <p>The assessment of air quality provided as Appendix R: Air Quality Technical Report concluded that unmitigated air emissions from the construction of the Project pose a 'medium' risk of human health impacts and a 'medium' risk of dust deposition Appendix R: Air Quality Technical Report, Table 9.1). Recommended mitigation measures provided in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS include, in addition to detailed measures regarding the management of activities which may generate dust or emissions, developing an Air Quality Management Plan, as a component of the Construction Environmental Management Plan (CEMP). The Air Quality Management Plan will specify controls and procedures for the avoidance or minimisation of impacts relating to dust and emissions during construction, including monitoring requirements and complaint response procedures.</p> <p>There is no legislative requirement to pay compensation for a loss in value unless land is acquired from a property.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, notes that an independent Community Relations Monitor will be appointed. The Community Relations Monitor's tasks will include, along with other relevant tasks, attending meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures, and providing support to stakeholders and communities that are facing change due to Inland Rail.</p> <p>The results of the air quality assessment of Project operations (Appendix R: Air Quality Technical Report, Section 6 and Section 7, Table 7.2 of the revised draft EIS) indicate that cumulative background plus Project air quality pollutants will be below guideline levels at all sensitive receptors. Additionally, assessment of the potential deposition of emissions in water tanks predicted that concentrations of potential contaminants would be significantly lower than Australian Drinking Water Guidelines (Appendix R: Air Quality Technical Report, Section 7.2).</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix R: Air Quality Technical Report</p> <p>Section 6</p> <p>Section 7</p> <p>Section 7.2</p> <p>Table 7.2</p> <p>Table 9.1</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.9</p>
80	80.0007	Private	Social Impact Assessment	Flood immunity	Project impacts on water drainage may lead to increased flood insurance premiums for the property.	Ongoing insurance compensation for increased premiums on insurance policies, should flood insurance increase as a result of the rail/road construction.	<p>As noted in the Appendix E: Consultation Report, Section 5.3, in June 2020, the Australian and Queensland governments established an Independent International Panel of Experts for Flood Studies (the Expert Flood Panel) in Queensland to provide advice on the flood models and structural designs developed by ARTC for Inland Rail in Queensland.</p> <p>The Expert Flood Panel released its draft report on 25 March 2021, and final report in October 2022. Following the release of the final report and as part of additional assessment and studies conducted for this revised draft EIS, ARTC has assessed all local catchments against the new Flood Impact Objectives (FIOs). The FIOs determine the acceptable parameters within which the Project can change or increase the existing flood conditions, including afflux, time of inundation, velocity, hazard and flow directions.</p> <p>Note that the FIO's have been carefully developed to account for the various receptors present in the floodplains, including dwellings, other buildings, infrastructure, and a range of land-use types. They recognise and reflect the sensitivity of these floodplain receptors with a view to appropriately minimising any changes in flood behaviour. At dwellings for example, which may be quite sensitive to changes in flood behaviour, the FIO target is to limit any flood level changes (afflux) to just 10 millimetres (1 centimetre).</p> <p>Additionally, in October 2022 ARTC undertook consultation with all landowners that were shown to have appreciable exceedances to the FIOs, in order to discuss these potential impacts and allow ARTC to develop mitigations specific to each area or property. Property specific impacts were identified during the consultation sessions with the potentially impacted landowners (e.g. access, property specific observations and constraints) and the results recorded for incorporation when mitigations are applied in detailed design along with FIO application. Further details on the FIOs and mitigation measures are provided in Chapter 14: Hydrology and Geomorphology, Section 14.9. Further consultation with landowners will also be undertaken throughout the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.9</p> <p>Appendix E: Consultation Report</p> <p>Section 5.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
80	80.0008	Private	Air Quality		Project will generate dust, dirt and airborne pollutants that will contaminate water quality in tanks, negatively affect resident's health, require solar panels to be cleaned and maintained fortnightly/monthly.	Prior to commencing works, install a rainwater collection system with first flush devices and install a filtration system on water tank with feed to home kitchen.	<p>Whilst the construction and operation of the Project will result in emissions to air, the assessment of the Construction Works and Operations stages has determined that the impact to sensitive receptors, including the landholder's dwelling, as a result of air emissions will not be significant with the inclusion of recommended mitigation measures.</p> <p>The operational air quality assessment investigated the impact of emissions from the Project during construction and operation, and determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in the Chapter 12: Air Quality) for all pollutants.</p> <p>Construction dust emissions have been assessed for the potential to impact human health (i.e., airborne dust which can be inhaled) and cause nuisance or amenity impacts (i.e., deposited dust). The assessment of construction has considered the location and timing of dust emissions, the magnitude of the expected dust emissions, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. These measures are expected to result in low or negligible impact significance of construction dust impacts to health and nuisance/amenity. On this basis, regular (fortnightly/monthly) cleaning and maintenance of solar panels are not expected to be required.</p> <p>In addition to assessing impacts on air quality at households, the assessment also investigated potential impacts to tank water quality during the operation of the Project (Section 12.3.3 of Chapter 12: Air Quality). This assessment was completed by predicting the deposition of pollutants of the rooves of residential dwellings within the study area. The concentration of pollutants in a residential water tank was then estimated assuming that all deposited matter was washed from the roof into a water tank.</p> <p>This assessment showed that the operation of the Project would not significantly impact tank water quality and that highest predicted pollutant concentrations in water tanks were over one thousand times lower than the guideline values prescribed by the <i>Australian Drinking Water Guidelines</i> (National Health and Medical Research Council and National Resource Management Ministerial Council 2022). As presented in Section 12.5 in Chapter 12: Air Quality, the assessment considered potential air contaminants as arsenic, cadmium, lead, nickel and chromium VI. Based on the results of the assessment and with the implementation of recommended mitigation measures, significant impacts to air quality or tank water quality at sensitive receptors are not expected.</p> <p>Further information on the assessment of construction dust impacts for the Project is available in Section 12.5.1 of Chapter 12: Air Quality. Section 12.6.3 of the Chapter presents the mitigation measures which have been recommended for the Construction Works and Operations stages of the Project. The recommended management and mitigation measures will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Based on the results of the assessment of potential impacts to tank water quality during the operation of the Project (Section 12.5.2 of Chapter 12: Air Quality), no treatment or mitigation measures such as first flush systems or filtration systems are required for rainwater tanks.</p> <p>ARTC are committed to continuing to engage with directly and indirectly impacted landowners to ensure any impacts are managed throughout construction and operation.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.3.3</p> <p>Section 12.5</p> <p>Section 12.5.1</p> <p>Section 12.5.2</p> <p>Section 12.6.3</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
80	80.0009	Private	Land Use and Tenure	Property Devaluation	Changes to property access and movement of highway to directly out front of the submitter's home will directly impact value of the property.	Assist in making dwelling as attractive as possible by installing a variety of property improvements (see submission for further details). Install speed cameras for traffic coming into town, ensure sufficient space for parking outside homes, ensure safe accessibility for all from both front and rear entrances.	<p>Chapter 8: Land Use and Tenure. Section 8.6.2 states that where land-use impacts are confirmed, individual property management measures will be developed in consultation with the landowner to reduce impacts to an acceptable and agreeable level. Management measures will include:</p> <ul style="list-style-type: none"> Individual property mitigation measures developed in consultation with landowners/occupants with respect to the development of detailed design and/or the management of construction on, or immediately adjacent to, private properties. The property mitigation measures will detailed required adjustments to fencing, access, farm infrastructure, and relocation of any impacted structures, as required. Consultation with landowners will be undertaken to ensure that owners and occupiers are informed about the timing and scope of activities in their area, particularly in relation to potential impacts to access, services, or farm operational arrangements. This consultation will be ongoing throughout construction. Feedback from landowner consultation, including agreed property mitigation measures, will be incorporated into property agreements (or similar), as appropriate. <p>The requirement for Project components outside of the Project footprint will be confirmed through the Detailed Design stage, as the construction approach is refined.</p> <p>As stated in Section 8.6.3 (Table 8-51) of Chapter 8: Land Use and Tenure, the detailed design for the Project will be developed to ensure that legal access for private properties is maintained.</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Construction Works stage process to develop and implement property-specific measures to avoid or minimise impacts that could affect property access (Section 8.6.3 of Chapter 8: Land Use and Tenure).</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.2</p> <p>Section 8.6.3</p> <p>Table 8-51</p>
81	81.0001	Private	Noise and Vibration	Aquatic fauna	Noise from construction and operation of the project will cause sleep deprivation and anxiety for the submitter whose home is approx.60 metres from the railway.	Double glaze all windows at affected households install soundproofing fence/barrier	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the Construction Works and Operations stages of the Project. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment.</p> <p>The noise and vibration emissions from the construction and operation of the Project have been assessed against criteria and limits designed to minimise the potential for impacts to sensitive receptors. Sleep disturbance impacts are discussed in Section 6.1.5 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. A range of feasible noise and vibration mitigations are provided in Chapter 16: Noise and Vibration, Section 16.10, and the associated technical reports Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 7, and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.</p> <p>The mitigations are based on the anticipated worst-case noise and vibration impacts at the most affected sensitive receptors, including the residences located within a relatively close distance of the Project. The development and implementation of such measures will be subject to further detailed studies and verification of noise and vibration levels during construction works and within six months of the commencement of railway operations on the Project.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Railway Operations</p> <p>Appendix W: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1.5</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
81	81.0002	Private	Noise and Vibration		The submitter's house will not withstand impacts from ground borne noise and vibration generated from constructing the highway and railway.	Restump the house relocate the house back on the block restump and establish new laundry and tank with water filtration system implement a permanent soundproof fence/barrier.	<p>ARTC acknowledges the concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during the Construction Works stage.</p> <p>The construction vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction vibration levels based on a preliminary construction methodology (refer to Section 16.6 of Chapter 16: Noise and Vibration). Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction vibration impacts during the Detailed Design stage of the Project will be undertaken. Mitigation has been included in the revised draft EIS (Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p> <p>Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys prior to assess the structural integrity of buildings along the alignment in accordance with the assessment considerations outlined in Section 16.10 within Chapter 16: Noise and Vibration.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise community disruption in the Construction Works stage and through to operations.</p> <p>Mitigation measures for construction noise and vibration impacts are detailed in of Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 7</p>
81	81.0003	Private	Noise and Vibration		Noise from increased road traffic and realigning the highway closer to the submitter's home will create a nuisance, disrupting sleep and cause anxiety for the residents.	Move the house back on the block double glaze and sound proof the front fence provide suitable accommodation for residents during house moving period. Supply a new home or compensation to purchase a replacement home.	<p>ARTC acknowledges the concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during both construction and railway operations. The revised draft EIS assesses the impacts construction and operational road traffic may have on local communities.</p> <p>Operational road traffic noise impacts have been predicted based on a preliminary road traffic noise assessment and conservative assumptions, as detailed Section 8, Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. Operational road traffic noise mitigation measures will be determined on a receptor-by-receptor basis following a detailed operational road traffic noise assessment during detailed design. The noise mitigation hierarchy detailed in the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 1: Road Traffic Noise has been recommended for the management and mitigation of operational road traffic noise impacts.</p> <p>As detailed in Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 6.1, construction road traffic noise has been assessed under the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 – Construction Noise and Vibration. Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 6.1 , address the construction road traffic assessment and predicted impacts.</p> <p>Additional noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 and Section 8 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 1, reasonable and practical noise mitigation and management measures have been presented in of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>ARTC understands noise could be a source of annoyance and potentially result in sleep disturbance and are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6.1</p> <p>Section 7</p> <p>Section 8</p>
81	81.0004	Private	Noise and Vibration		Vibration from construction works will cause physical damage to the submitter's house by undermining load-bearing walls and piers.	Move and restump the house before commencing construction move outbuildings back on block double glaze windows construct carport for back entrance.	<p>The construction vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction noise and vibration impacts will be implemented based on community consultation and a detailed assessment of construction vibration impacts during the Detailed Design stage of the Project will be undertaken. Mitigation has been included in the revised draft EIS (Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). It is premature to present specific property treatments when the railway noise and vibration levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys prior to assess the structural integrity of buildings along the alignment in accordance with the assessment considerations outlined in Section 16.10 within Chapter 16: Noise and Vibration.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise community disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 7</p>
81	81.0005	Private	Social Impact Assessment		Increased heavy vehicle traffic will increase road and traffic safety risks, especially directly outside the submitter's home.	Supply safe access to home via installing automatic electric gates at front entrance provide clean thoroughfare through property to permit safe entrance and exit from rear of property transplant fruit trees reinstall clothesline supply carport at rear entrance provide safe parking at the front of the house for support workers.	<p>Private access to individual properties will be temporarily disrupted during construction where the Project will result in the severance of driveways and informal private access roads to properties, or access is restricted where land is required temporarily for construction activities. Legal access to properties will be retained through the provision of alternative access roads, grade separation or a level crossing where appropriate. ARTC is consulting with affected land holders to determine appropriate measures to mitigate potential individual property access impacts (Appendix X: Social Impact Assessment, Section 7.1).</p> <p>If partial acquisition of the submitter's property was required they would be entitled to claim compensation for the loss of a legal interest in land or estate in land, in accordance with the Acquisition of Land Act 1967 (Qld). Compensation is assessed on an individual basis (Appendix X: Social Impact Assessment, Section 7.1.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1</p> <p>Section 7.1.2</p>
81	81.0006	Private	Social Impact Assessment	Property Devaluation	The submitter's property will be impacted by excessive dust and debris, and nuisance noise from the project, thus devaluing the property.	<ul style="list-style-type: none"> pay support people to maintain and clean air conditioning and solar panels on a regular basis limit speeds to 40 km/h via speed cameras- install cameras both ends of town limit or eliminate night-time shunting and train horn blowing- install filter system on catchment and delivery side of water tank assist in making home better rather than undermining its value. 	<p>The revised draft EIS is unable to provide advice on individual property values. Appendix X: Social Impact Assessment, Section 7.1.9 notes that property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres.</p> <p>ARTC will implement the mitigation measures recommended in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS to maintain the amenity of noise-affected sensitive receptors. 81	81.0007	Private	Flooding	Flood immunity	Project impacts on water drainage may lead to increased flood insurance premiums for the property.	Ongoing insurance compensation for increased premiums on insurance policies, should flood insurance increase as a result of the rail/road construction.	<p>As noted in the Appendix E: Consultation Report Section 5.3, in June 2020, the Australian and Queensland governments established an Independent International Panel of Experts for Flood Studies (the Flood Panel) in Queensland to provide advice on the flood models developed by ARTC for Inland Rail in Queensland.</p> <p>The Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Flooding & Hydrology Technical Report - Volume 1 (e.g. Section 5.5.3 for Gowrie Creek, Section 6.5.3 for Westbrook/Dry Creeks and so on). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Additionally, in October 2022, ARTC undertook consultation with all landowners that were shown to have appreciable exceedances to the FIOs, in order to discuss these potential impacts and allow ARTC to develop mitigations specific to each area or property. A total of 96 private landowners were identified for this consultation program, as outlined in Appendix E: Consultation Report, Section 5.3. Property specific impacts were discussed during the consultation sessions with the potentially impacted landowners (e.g. access, property specific observations and constraints) and any observations and outcomes recorded. These will inform further mitigation in the Detailed Design stage. Further details on the FIOs and mitigation measures are provided in Chapter 14: Hydrology and Geomorphology, Section 14.9. Further consultation with landowners will also be undertaken throughout the Detailed Design stage of the Project.</p>	Chapter 14: Flooding and Geomorphology Section 14.8 Section 14.11 Appendix E: Consultation Report Section 5.3
81	81.0008	Private	Air Quality		Project will generate dust, dirt and airborne pollutants that will contaminate water quality in tanks, negatively affect resident's health, require solar panels to be cleaned and maintained fortnightly/monthly, and evaporative cooler battens/filters will need to be cleaned or replaced.	Prior to commencing works, install a rainwater collection system with first flush devices and install a filtration system on water tank with feed to home kitchen.	<p>Whilst the construction and operation of the Project will result in emissions to air, the assessment of the Construction Works and Operations stages has determined that the impact to sensitive receptors, including the landholder's dwelling, as a result of air emissions will not be significant with the inclusion of recommended mitigation measures.</p> <p>The air quality assessment investigated the impact of emissions from the Project during construction and operation. The operational air quality assessment determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in Chapter 12: Air Quality) for all pollutants.</p> <p>Construction dust emissions have been assessed for the potential to impact human health (i.e., airborne dust which can be inhaled) and cause nuisance or amenity impacts (i.e., deposited dust). The assessment of construction has considered the type of emission sources present during construction, the magnitude of the expected dust emissions, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. These measures are expected to result in low or negligible impact significance of construction dust impacts to health and nuisance/amenity. On this basis, regular (fortnightly/monthly) cleaning and maintenance of solar panels are not expected to be required.</p> <p>In addition to assessing impacts on air quality at households, the assessment also investigated potential impacts to tank water quality during the operation of the Project (refer to Section 12.3.3 of Chapter 12: Air Quality). This assessment was completed by predicting the deposition of pollutants on the rooves of residential dwellings within the study area. The concentration of pollutants in a residential water tank was then estimated assuming that all deposited matter was washed from the roof into a water tank. This assessment showed that tank water quality would not be significantly impacted by the operation of the Project and that highest predicted pollutant concentrations in water tanks were over one thousand times lower than the guideline values prescribed by the <i>Australian Drinking Water Guidelines</i> (National Health and Medical Research Council and National Resource Management Ministerial Council 2022). As presented in Section 12.3.3 of Chapter 12: Air Quality, the assessment considered potential air contaminants as arsenic, cadmium, lead, nickel and chromium VI. Based on the results of the assessment and with the implementation of recommended mitigation measures, significant impacts to air quality or tank water quality at sensitive receptors are not expected.</p> <p>Further information on the assessment of construction dust impacts for the Project is available in Section 12.5.1 of Chapter 12: Air Quality. Section 12.6.3 of the Chapter 12: Air Quality presents the mitigation measures which have been recommended for the Construction Works and Operations stages of the Project. The recommended management and mitigation measures will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Based on the results of the assessment of potential impacts to tank water quality during the operation of the Project (refer to Section 12.6.3 of Chapter 12: Air Quality), no treatment or mitigation measures such as first flush systems or filtration systems are required for rainwater tanks.</p>	Chapter 12: Air Quality Section 12.7 Section 12.8 Section 12.3.3 Section 12.5.2 Section 12.6.3 Chapter 24: Draft Outline Environmental Management Plan
81	81.0009	Private	Land Use and Tenure	Property Devaluation	Changes to property access and movement of highway to directly out front of the submitter's home will directly impact value of the property	Assist in making dwelling as attractive as possible by installing a variety of property improvements (see submission for further details). Install speed cameras for traffic coming into town, ensure sufficient space for parking outside homes, ensure safe accessibility for all from both front and rear entrances.	<p>Chapter 8: Land Use and Tenure, Section 8.6.2 states that where land-use impacts are confirmed, individual property management measures will be developed in consultation with the landowner to reduce impacts to an acceptable and agreeable level. Management measures will include:</p> <ul style="list-style-type: none">Individual property mitigation measures developed in consultation with landowners/occupants with respect to the development of detailed design and/or the management of construction on, or immediately adjacent to, private properties. The property mitigation measures will detailed required adjustments to fencing, access, farm infrastructure, and relocation of any impacted structures, as required.Consultation with landowners will be undertaken to ensure that owners and occupiers are informed about the timing and scope of activities in their area, particularly in relation to potential impacts to access, services, or farm operational arrangements. This consultation will be ongoing throughout construction.Feedback from landowner consultation, including agreed property mitigation measures, will be incorporated into property agreements (or similar), as appropriate. <p>The requirement for Project components outside of the Project footprint will be confirmed through the Detailed Design stage, as the construction approach is refined.</p> <p>As stated in Section 8.6.3 (Table 8-51) of Chapter 8: Land Use and Tenure, the detailed design for the Project will be developed to ensure that legal access for private properties is maintained.</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Construction Works stage process to develop and implement property-specific measures to avoid or minimise impacts that could affect property access (Section 8.6.3 of Chapter 8: Land Use and Tenure).</p>	Chapter 8: Land Use and Tenure Section 8.6.2 Section 8.6.3 Table 8-51
82	82.0001	State Agency	Editorial		Services has nil response to the draft EIS	nil.	Noted that Infrastructure and Economic Resilience falls within the Department of State Development, Infrastructure, Local Government and Planning and has nil response to the draft EIS.	N/A
83	83.0001	State Agency	Editorial		Department of Health's Capital and Asset Services Branch reviewed, confirmed there are no QH assets impacted and has no further comment.	nil.	Noted that Department of Health has reviewed the Project materials including the alignment and had no further comment on the proposal at that time.	N/A
84	84.0001	Private	Economics		The project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The OCG should:</p> <ol style="list-style-type: none">not accept the draft EIS as the final EISrequest additional information from ARTC to be included in a revised draft EIS to be released for public commentthe requested additional information in the revised draft EIS to be released for public comment should include:<ol style="list-style-type: none">a detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcampa detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only'require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government.	<p>In response to public consultation, ARTC has made a number of updates to the draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none">Direct impacts on properties e.g. severance and loss of productive landImpacts on property accesses and connectivity, including the location of level crossings on private roadsImpacts on the movement of stock, water, produce and equipment. <p>Impacts to agricultural land will be reduced from the implementation of the mitigation methods developed within Section 3 Part B: Draft Soil Management Plan in Appendix AB: Earthworks Strategy and Draft Soil Management Plan.</p> <p>A Soil Management Plan has been created as a component of the CEMP as a mitigation method which has been developed to reduce impacts to agricultural land. The Soil Management Plan outlined in Chapter 24: Draft Outline Environmental Management Plan includes the following procedures and protocols relevant to potential impacts on land resources:</p> <ul style="list-style-type: none">Soil/land conservation objectives for the Project to minimise impacts on soil conservation plans and viable productive landManagement of problem soilsMinimising exposure of dispersive subsoils through methods such as staging construction disturbance, topsoil replacement or rehabilitation immediately following constructionSpecification of type and location of erosion and sediment controlsStockpiling and management/segregation of topsoil where it contains native plants seedbank or weed material <p>The revised draft EIS has been updated to provide detailed flood modelling and impact assessment. Refer to Section 14.6.3 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology. In response to the additional information requested:</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?q=independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&rlz=1C1GCEB_enAU1015AU1015&q=independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aqs=chrome..69i57j931j0j4&sourceid=chrome&ie=UTF-8</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Section 18: Economics Section 18.9 Section 18.12 Chapter 24: Draft Outline Environmental Management Plan Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix Y: Economic Impact Assessment Section 5.5
85	85.0001	Private	Land Use and Tenure	Severance of agricultural land	Submitter's agricultural property will no longer be viable with either irrigated cropping, dryland cropping or livestock because of the project. Project will dissect submitter's agricultural property prohibiting movement of livestock or machinery between sections of the property. Irrigation bore will most likely be decommissioned. No guarantee that the stock bore will remain due to location or disruption to electricity supply to the bore. Rear Section of property will be land locked with no road access, and proposed closure of Athol School Road will compromise access to front Section of property.	Total acquisition of the property.	<p>It is noted that the property is located at 5 Athol School Road.</p> <p>At this location, the Project is proposing to update the design as a result of design optimisation and incorporating stakeholder feedback in relation to the preferred location of the road rail interface. The proposed updated design now includes:</p> <ul style="list-style-type: none">Rail over road grade separation at Athol School Road, rather than a closure as previously proposed in the draft EISPurcell Road closure at the rail interface, rather than a passive level crossing as previously proposed in the draft EISProposed new road connecting Purcell Road and Athol School Road with an intersectionSlight western shift in alignment to avoid direct impacts to Lot 6RP215310. <p>ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community:</p> <ul style="list-style-type: none">Removal of level crossing, increasing safety benefits for the communityDiversion of through traffic to the recently upgraded Athol School Road and Gore highway intersection, which is preferred by Toowoomba Regional Council and Department of Transport and Main Roads road managers over the Purcell Road and Gore Highway intersection.More direct route to/from Toowoomba via Athol School Road. <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.3 of the revised draft EIS for further detail.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises (Table 8-51). This has included the identification of:</p> <ul style="list-style-type: none">Landowners' needs regarding access to the properties and the closure of private roadsProperty infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring AuthorityThe potential for changes in access to natural resources, such as groundwater and overland flow. <p>Further detail on consultation and mitigations are presented in Appendix E: Consultation Report. Negotiation of land acquisition will be undertaken in accordance with the Acquisition of Land Act 1967 (Qld), which includes the process for the resumption of land by a construction authority and compensation.</p>	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.3 Table 8-51 Appendix E: Consultation Report

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
85	85.0002	Private	Surface Water	Overland flow/diversion	Rail line will cross a natural waterway that in times of rainfall events has a high volume of water flowing through.	Extensive earthworks would be required on both sides of the rail line to create waterways to allow water to flow down to the natural waterway, which would then have to also be allowed to go under the rail line.	The Inland Rail revised reference design has been informed by a flooding and drainage assessment to ensure that existing flow paths are maintained and subject to minimal change (in line with the Project FIO's as endorsed by the Independent International Expert Flood Panel). This is discussed in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The proposed drainage structures are detailed in Appendix B1: Design drawings.	Appendix B1: Design Drawings Appendix T1 - Hydrology and Flooding Technical Report - Volume 1
85	85.0003	Private	Land Resources	Erosion	Disturbance to soil on prime agricultural land with proposed cuttings and fill areas creating loss of valuable top soil and creating possibility of future erosion.	Unable to foresee a solution.	A detailed soil investigation (Section 3.2.2, Section 4.5 and Section 5.0 of Appendix J: Soil Assessment Report) has been undertaken along the Project footprint to understand the soil properties further and refine existing soil mapping. Findings from the detailed soil investigation have informed soil-specific management measures (Section 9.5.4 in Chapter 9: Land Resources and Section 3 in Appendix AB: Earthworks Strategy and Draft Soil Management Plan) and will assist in planning, detailed design of structures, embankments, erosion control measures (both temporary and permanent), soil treatment and management, and site rehabilitation planning. Soil handling protocols prioritising the protection of topsoil have been detailed in a Soil Management Plan in Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Part B (Section 3). A Project concept erosion and sediment control plan (concept ESCP) will need to be developed to guide the development of area, site or section-specific ESCPs and include detailed erosion hazard assessments and ESC structure designs. Each of these will need to be regularly updated and maintained during construction. Refer to Chapter 24: Draft Outline Environmental Management Plan for specific details on these Plans.	Chapter 9: Land Resources Section 9.5.4 Chapter 24: Draft Outline Environmental Management Plan Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix J: Soil Assessment Report Section 3.2.2 Section 4.5 Section 5.0
85	85.0004	Private	Land Resources	Erosion	Soil from other areas being used on property during construction allowing foreign weeds and soil degradation.	Unable to foresee solution.	ARTC acknowledges the concern from landowners about the potential spread of weeds during the Construction Works stage of the Project. As outlined in Chapter 24: Draft Outline Environmental Management Plan, "A Biosecurity Management Plan has been developed as a component of the CEMP. This Plan will include: <ul style="list-style-type: none"> Requirements for pre-clearing and operational surveys to determine the risk of weeds or pest animals being present within the Project footprint Maps of the existing extent, confirmed through surveys, and severity of weed infestation (e.g., restricted matters including mother-of-millions (<i>Bryophyllum delagoense</i>), opuntoid cacti, African boxthorn (<i>Lycium ferocissimum</i>), lippia (<i>Phyla canescens</i>) and lantana (<i>Lantana camara</i>) and weed-management requirements Pest animal management controls, including protocols for severing, realigning and reinstating the wild dog check fence and the Darling Downs Moreton Rabbit Board DDMRB rabbit fence Review of fire ant zones to confirm if the preparation of a fire ant management plan is required Site hygiene and waste-management procedures to deter pest animals Locations of vehicle washdown (light vehicle and oversize vehicles), wheel washes and rumble grids Weed surveillance and treatment during construction and rehabilitation activities such as: <ul style="list-style-type: none"> -Vehicle and plant washdown requirements for fleet moving from low-risk areas to high-risk areas -Weed certification requirements for vehicles, plant and materials arriving at the construction site. Requirements in relation to pesticide and herbicide use, including any limitations on use. Erosion and sediment control risks associated with broad-scale weed removal or treatment Corrective actions should the outcomes not achieve the adopted objectives. " 	Chapter 9: Land Resources Section 9.5.6 Chapter 24: Draft Outline Environmental Management Plan
85	85.0005	Private	Land Use and Tenure		Bores are likely to be decommissioned to allow the project to progress. The property will no longer be able to run livestock or grow irrigated crops.	Unable to foresee a solution.	As stated in Chapter 8: Land Use and Tenure, Section 8.6.3, where possible, the Project has been aligned such that it avoids or minimises impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Where a groundwater bore is expected to be decommissioned or have access/usage disrupted as a result of the Project, 'make-good' measures will be agreed in consultation with the impacted landowners. See Appendix U: Groundwater Technical Report for further detail regarding the 'make-good' process (Chapter 15: Groundwater, Section 15.7.4). ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of: <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. 	Chapter 8: Land Use and Tenure Section 8.6.3 Chapter 15: Groundwater Section 15.7.4 Appendix U: Groundwater Technical Report Section 7.1 Section 7.2 Section 8.2 Table 8.2
85	85.0006	Private	Social Impact Assessment	Directly impacted landowner	Loss of current and future income. Property is currently operated as a successful and profitable business being utilised for both cropping (irrigated and dryland) and livestock production. Main source of submitter's livelihood.	Negotiation on acquisition of property bearing in mind that a property of this calibre and all it offers will not be easy to replace in this vicinity.	Property acquisitions will be undertaken by Department of Transport and Main Roads (DTMR) as the acquiring authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967 (Qld) (AL Act). Appendix X: Social Impact Assessment, Section 7.1.2 notes that landowners will be entitled to claim compensation for the loss of a legal interest in land or estate in land, in accordance with the AL Act. If eligible for compensation, the compensation payable includes highest and best use market value of the land taken at the date of resumption. Compensation for disturbance caused by the resumption may also apply and include, for example, reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs, and the reasonable financial costs incurred that are a direct consequence of the resumption of the land. Where only part of a land parcel is acquired, compensation for damage caused by the severance of land, the resumed land and the impact upon the remaining land may also apply. The process for claiming compensation is set out in the AL Act. If the parties do not agree on compensation, a dispute about compensation can be referred to the Land Court (Appendix X: Social Impact Assessment, Section 7.1.2).	Appendix X: Social Impact Assessment Section 7.1.2
85	85.0007	Private	Social Impact Assessment	Directly impacted landowner	This property is also the submitter's security for retirement (approx. 10-12 years). The value of the property will increase considerably in this time ensuring a comfortable retirement.	Negotiation on acquisition of property bearing in mind that a property of this calibre and all it offers will not be easy to replace in this vicinity.	Property acquisitions will be undertaken by Department of Transport and Main Roads (DTMR) as the acquiring authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967 (Qld) (AL Act). Appendix X: Social Impact Assessment, Section 7.1.2 notes that landowners will be entitled to claim compensation for the loss of a legal interest in land or estate in land, in accordance with the AL Act. If eligible for compensation, the compensation payable includes highest and best use market value of the land taken at the date of resumption. Compensation for disturbance caused by the resumption may also apply and include, for example, reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs, and the reasonable financial costs incurred that are a direct consequence of the resumption of the land. Where only part of a land parcel is acquired, compensation for damage caused by the severance of land, the resumed land and the impact upon the remaining land may also apply. The process for claiming compensation is set out in the AL Act. If the parties do not agree on compensation, a dispute about compensation can be referred to the Land Court (Appendix X: Social Impact Assessment, Section 7.1.2).	Appendix X: Social Impact Assessment Section 7.1.2
85	85.0008	Private	Social Impact Assessment	Directly impacted landowner	Huge sentimental value as property has been held by myself and earlier family members for over 100 years. Ashes of deceased relative (a Vietnam Veteran) are also scattered on the property as per his request.	Unable to foresee a solution. The sentimental value of this property cannot be determined by a monetary value.	ARTC acknowledges the effects of acquisition on landowners' attachment to the land. Discussions with the submitter regarding land acquisition are ongoing. ARTC investigations indicate that the area of land where the ashes were scattered would not be affected by the Project footprint, however the potential for acquisition to impede the landowners' access to this area is acknowledged. The Project will work with individual landowners to find the best solution to relocate memorial sites that are directly impacted by construction of Inland Rail. The Project's land acquisition and consultation processes are outlined in Chapter 8: Land Use and Tenure and Appendix E: Consultation Report.	Chapter 8: Land Use and Tenure Appendix E: Consultation Report
85	85.0009	Private	Social Impact Assessment		Loss of income and my own employment due to the ramifications my property suffers due to the project making the property unviable.	Total acquisition of property by Inland Rail. However, to find another property of this calibre in the area will be extremely difficult.	Property acquisitions will be undertaken by Department of Transport and Main Roads (DTMR) as the acquiring authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967 (Qld) (AL Act). Appendix X: Social Impact Assessment, Section 7.1.2 notes that landowners will be entitled to claim compensation for the loss of a legal interest in land or estate in land, in accordance with the AL Act. If eligible for compensation, the compensation payable includes highest and best use market value of the land taken at the date of resumption. Compensation for disturbance caused by the resumption may also apply and include, for example, reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs, and the reasonable financial costs incurred that are a direct consequence of the resumption of the land. Where only part of a land parcel is acquired, compensation for damage caused by the severance of land, the resumed land and the impact upon the remaining land may also apply. The process for claiming compensation is set out in the AL Act. If the parties do not agree on compensation, a dispute about compensation can be referred to the Land Court (Appendix X: Social Impact Assessment, Section 7.1.2).	Appendix X: Social Impact Assessment Section 7.1.2
85	85.0010	Private	Stakeholder engagement	Directly impacted landowner	Submitter spoke with various Inland Rail representatives who were unable to answer his specific questions. Inland Rail claims the project will benefit Primary Industries but does not offer opportunities for produce to be loaded at points along the route.	Nil.	The development of sidings is driven by the market. Private enterprise determines where it is viable to locate and operate a siding or terminal. Additionally, the Federal and State government are jointly undertaking a business case into intermodal terminals in south-east Queensland. Details can be found on the Australian Government website at investment.infrastructure.gov.au/Projects/111245-20qld-mrl . Potential opportunities for the community and business operators who are interested in potentially transporting agricultural freight and other goods have been and will continue to be identified. Information about the service offering including length and frequency of trains was publicly available and promoted.	N/A
86	86.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3, notes that the survey did not return a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope. The Social Impact Assessment (Appendix X: Social Impact Assessment) has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2

86	86.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, while construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Appendix X: Social Impact Assessment, Section 8, provides a comprehensive Social Impact Management Plan addressing all identified impacts, including community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in revised draft EIS Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
86	86.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.</p>	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Section 5.1.3 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p>
86	86.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>
86	86.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.</p>	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations' (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (QLD) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report, Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
86	86.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Heildon, Heildon to Calverly, and Calverly to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Appendix AC: Proponent Commitments also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
87	87.0001	Private	Traffic and Transport	Level crossing	Proposed level crossing at Inglewood does not align with Queensland's level crossing safety strategy which encourages alternatives to level crossings in new infrastructure projects. Level crossings are one of the main reasons why accidents occur in railway traffic and 40% of accidents involving people occur on level crossings.	Re-evaluate the current plan and not put in a level crossing near Inglewood. There are alternatives that do not increase the accident risk.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT
87	87.0002	Private	Traffic and Transport	Level crossing	The proposed level crossing at Inglewood would cause delays for emergency services, worsening access to health care for locals.	Re-evaluate the current plan and not put in a level crossing near Inglewood. There are alternatives that do not worsen the access to health care for locals.	<p>An assessment of potential delays to road traffic at level crossing was undertaken as detailed in EIS Appendix AA: Traffic Impact Assessment, Section 5.8 and 5.9. The modelling undertaken within this assessment provides an accurate representation of the impacts to vehicles, using traffic vehicle numbers and the calculated wait times for specific level crossings.</p> <p>All active level crossings have been analysed in the peak periods, accounting for the individually calculated wait times, in order to determine queue lengths and resultant impacts to traffic. Table 5.69 in Appendix AA provides the individual wait times for the level crossing locations along the alignment. The wait times determined for each individual level crossing were calculated based on;</p> <ul style="list-style-type: none"> ▶ Level crossing specific operating speeds (up to maximum design speed of 115 km/hr). The operating speed is impacted by topography and curvature of the alignment ▶ Time taken for the train to cross the level crossing ▶ Distance from train crossing loops and hence time taken for the train to accelerate from standstill. ▶ Train length ▶ Boom gate and signal operating times <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet</p>	Appendix AA: Traffic Impact Assessment Section 5.8 Section 5.9 Table 5.69
88	88.0001	Private - Turallin Workers	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 of Appendix E: Consultation Report).</p> <p>Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 and ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
88	88.0002	Private - Turallin Workers	Traffic and Transport		<ol style="list-style-type: none"> Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre. Increase in traffic on narrow roads that are already heavily traversed. Impact on Travel time as it is further from the alignment of the rail project. Turallin and Ellerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length. Could impact on Millmerran town parking availability. 	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 and ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
88	88.0003	Private - Turallin Workers	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4

88	88.0004	Private - Turallin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power at the non-resident workforce accommodation at Turallin, this would create noise and greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Border to Gowrie alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the Project revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6</p>
88	88.0005	Private - Turallin Workers	Social Impact Assessment	Property Devaluation	<ol style="list-style-type: none"> Impact on properties, variation of property. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the Contractor during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
88	88.0009	Private - Turrallin Workers	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4 Chapter 11: Flora and Fauna Chapter 24: Draft Outline Environmental Management Plan</p>
89	89.001	Community Group	Land Resources	Erosion	It is noted that EIS Section 8.5.5 states that soil conservation plans (SCPs) are approved under the Soil Conservation Act, 1986(Qld) (the Act). The EIS notes that multiple approved soil conservation property and project plans (SCPs) exist within the impact assessment area. However, not all SCPs are approved under the Act.	<p>There are other soil conservation farm plans in existence (e.g. plans that the Queensland Department of Natural Resources (QDNR), and previous Departmental versions, developed with farmers, but not approved) that would be affected by the Project. These have not been identified but should be included with the list of SCPs.</p>	<p>Detailed design will involve a review of all available Soil Conservation Plans (SCPs) (see Chapter 9: Land Resources, Section 9.4.4 and Section 9.5.5) and engagement with affected stakeholders. SCPs are being reviewed and incorporated in drainage design for the revised draft EIS reference design.</p> <p>Where available, SCPs have been reviewed as part of the reference design and cross drainage aligned to ensure consistency within hydraulic modelling. Refer to Chapter 14: Flooding and Geomorphology, Section 14.6.3 and Section 14.9.1.</p> <p>ARTC will review and consider these within the detailed design of cross-drainage infrastructure. Ongoing consultation with impacted landowners and the Department of Resources will occur to further align cross-drainage design with existing conditions. Refer to Section 6.7 in Chapter 6: Stakeholder Engagement.</p>	<p>Chapter 6: Stakeholder Engagement Section 6.7 Chapter 9: Land Resources Section 9.4.4 Section 9.5.5 Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.9.1</p>
89	89.002	Community Group	Land Resources	Erosion	There are instances where cross-rail drainage works will be required, but not identified in the Design Drawings Appendices of the EIS (see Section 8 of this submission). These will need to be identified, and it is likely that on-farm soil conservation works will be necessary to accommodate those structures and a SCP developed for that property or part thereof.	<p>nil.</p>	<p>Cross-rail drainage works are included in the revised draft EIS drawings, with revised cross-rail drainage works included in Appendix B1: Design Drawings. Where available, Soil Conservation Plans (SCPs) have been reviewed as part of the reference design and cross-drainage aligned to ensure consistency within hydraulic modelling.</p> <p>ARTC will review and consider these within the detailed design of cross-drainage infrastructure. Ongoing consultation with impacted landowners and the Department of Resources will occur to further align cross drainage design with existing conditions. Refer to Section 6.7 in Chapter 6: Stakeholder Engagement.</p>	<p>Chapter 6: Stakeholder Engagement Section 6.7 Appendix B1: Design Drawings</p>
89	89.003	Community Group	Land Use and Tenure	Erosion	Many of the existing SCPs may require amendment due to alteration of drainage patterns (both existing natural and artificial patterns) due to proposed works such as cut and fills, cross-corridor culverts, borrow pits and storage areas as a result of the railway alignment and construction. Under the Act, any amendments of approved plans involve a process of consultation with all affected landholder(s) (ensuring accounting for any co-ordination issues) and the advertisement and subsequent approval by the QDNR, now the Department of Resources (DoR). It is also noted that any proposed amendment can be subject to an appeal by an affected landholder. Other non-approved SCPs may be altered once agreed upon using a consultation process with all affected landowners. As well, any altered drainage patterns may well have a knock-on effect to downstream landowners with a possibility of them having to accept extra runoff, thus necessitating implementation of additional measures to control that runoff.	<p>These areas should be identified and any necessary soil conservation works and plans developed and implemented.</p>	<p>Detailed design will involve a review of all available SCPs (including all in Section 9.4.4 of Chapter 9: Land Resources), and engagement with affected stakeholders. SCPs are being reviewed for incorporation in drainage design for the revised draft EIS. Soil Conservation Plans and associated properties traversed by the Project alignment are listed in Table 9-15 and illustrated in Figure 9.21a-p of Chapter 9: Land Resources.</p> <p>ARTC has liaised with the Department of Resources on requirements around existing SCPs. ARTC will continue to consult with impacted landowners in regard to the flood modelling results and flood impact objective exceedances through development of the detailed design.</p>	<p>Chapter 9: Land Resources Section 9.4.4 Table 9-15 Figure 9.21a-p</p>
89	89.004	Community Group	Land Resources	Erosion	It is proposed in the EIS that agreements with regard to SCPs will be reached, and amendments approved and implemented during the pre-construction phase of the project. Where any required new works involve alterations to waterway locations and dimensions, it is essential that the waterway bed and banks have adequate vegetal cover before runoff is diverted into them. In fact, achievement of suitable levels of cover may take at least 2-3 years depending on weather conditions (DSITI, 2015).	<p>Given this, and the proposed project timelines, this process of SCP amendment and implementation should be instigated immediately upon approval of the Project or the necessary planning and implementation of works will not be carried out in time to accept any altered runoff patterns.</p>	<p>Where available, Soil Conservation Plans (SCPs) have been reviewed as part of the reference design and cross-drainage aligned to ensure consistency within hydraulic modelling.</p> <p>ARTC will review and consider these within the detailed design of cross drainage infrastructure. Ongoing consultation with impacted landowners will occur to further align cross-drainage design with existing conditions.</p> <p>Significant bridge openings and cross-drainage culverts have been allowed for in the reference design to retain the existing flow of flood water. In addition, a geomorphology assessment has been undertaken as reported in revised draft EIS Chapter 14: Flooding and Geomorphology (Section 14.9.1) to identify appropriate mitigation that may be required as a result of disturbances to waterways.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.9.1</p>
89	89.005	Community Group	Land Resources	Erosion	It is also stated in the EIS that the QDNR (now DoR) will be part of the consultation process required to amend SCPs. The DoR does not currently have staff with the requisite expertise, experience and training to undertake such a task yet alone do any design, implementation and monitoring. As such, there is a high risk of regulatory failure.	<p>nil.</p>	<p>ARTC will continue to consult with the Department of Resources and impacted property owners throughout the Detailed Design stage to ensure that all Soil Conservation Plans (SCPs) are updated to reflect any revisions to cross drainage due to the introduction of Inland Rail (refer to Section 14.8 and 14.9.1 of Chapter 14: Flooding and Geomorphology). Stakeholder consultation is outlined in Appendix E: Consultation Report.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8 Section 14.9.1 Appendix E: Consultation Report</p>
89	89.006	Community Group	Land Resources	Erosion	This group stresses that any new soil conservation measures required as a result of the Project must be identified and implemented and in a state fit to receive runoff well before the rail line is constructed and that relevant Queensland Government Departments be given sufficient resources to oversee this task.	<p>nil.</p>	<p>Detailed design will involve a review of all available Soil Conservation Plans (SCPs) (including all those listed in Chapter 9: Land Resources, Section 9.4.4), and engagement with affected stakeholders. SCPs are being reviewed and incorporated into the drainage design for the revised draft EIS reference design.</p> <p>Where available, SCPs have been reviewed as part of the reference design and cross drainage aligned to ensure consistency within hydraulic modelling. SCPs have been updated throughout Chapter 14: Flooding and Geomorphology.</p> <p>ARTC has liaised with the Department of Resources on requirements around existing SCPs with mitigation measures to be developed by a suitably qualified Certified Practicing Soil Scientist.</p> <p>ARTC will review and consider these within the detailed design of cross-drainage infrastructure. Ongoing consultation with impacted landowners and the Department of Resources will occur to further align cross drainage design with existing conditions. Refer to Section 6.7 in Chapter 6: Stakeholder Engagement.</p>	<p>Chapter 6: Stakeholder Engagement Section 6.7 Chapter 9: Land Resources Section 9.4.4 Chapter 14: Flooding and Geomorphology</p>
89	89.007	Community Group	Land Use and Tenure	Severance of agricultural land	The proposed route will alienate a further 1,861 ha of Class A and B land (outside existing corridors) (Chapter 8, Land Resources, Section 8.6.2, Loss of Soil Resources) and will traverse 286 freehold lots of productive agricultural land (Table 57, AECOM, 2017). Along with loss of land, this incursion onto those lots will disrupt farming operations (enormously in some cases) adding to production costs and/or losses. The Queensland Government has a policy of protecting productive agricultural land for food supply for future generations. Their Regional Planning Interests Act 2014 supposedly had the purpose and intent of supporting this policy. However, in reality, it appears that this policy is given scant regard when development projects such as housing sub-divisions, mining projects, electricity generation and distribution, and transport corridors are considered as is the case here. The EIS describes the land surrounding the Project as predominantly used for livestock grazing, combined with other agricultural uses including irrigated cropping. What it fails to indicate is that the corridor traverses one of the most productive dry-land agricultural areas in Australia, regardless of its current use.	<p>It is recommended that the value of the productive agricultural land be given an appropriate weighting when assessing alternate route options, with a view to minimising the alienation of agricultural Land Classes A and B.</p>	<p>As described in Section 8.5.1, Chapter 8: Land Use and Tenure of the revised draft EIS, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none"> 0.02 per cent of Class A land, 0.02 per cent of Class B land, and 0.01 per cent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none"> 0.17 per cent of Class A land, 0.22 per cent of Class B land, and, 0.19 per cent of IAA land <p>The Regional Planning Interests Act 2014 (Qld) is discussed in Chapter 3: Legislation and Project Approvals Process, Section 3.4.26. The Project is not a resource activity or a regulated activity under the Regional Planning Interests Act 2014 and therefore the Regional Planning Interests Act 2014 does not apply to the Project. To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9 by the Project, which provides a total of areas of regional interest in relation to the Project footprint. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.3).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Section 8.6.3 of Chapter 8: Land Use and Tenure).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>Appendix Y: Economic Impact Assessment states, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. Chapter 2: Project Rationale states, foreseeable opportunities for proceeding with Inland Rail Project to increased agricultural production include (further detail, refer Chapter 2: Project Rationale, Section 2.5.1):</p> <ul style="list-style-type: none"> Improved access in agricultural areas to key local, regional and international markets, which will improve market drought resilience and the ability to move greater volumes of grain via rail. The Project will be dual-gauged to help agricultural producers in northern NSW and SEQ to be able to take advantage of this significant time saving. It is more cost effective for grain growers in northern NSW to send grain by rail to the Port of Brisbane than to Newcastle. Reduced transport costs may improve competitiveness of key markets and economic activity, particularly in the agricultural sector 	<p>Chapter 2: Project Rationale Section 2.5.1 Chapter 3: Legislation and Project Approvals Process Section 3.4.26 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.3 Table 8-9 Appendix Y: Economic Impact Assessment</p>

89	89.008	Community Group	Land Use and Tenure	Severance of agricultural land	Although the overall area alienated from agricultural use is relatively small, it is important to protect such land for agricultural uses now and into the future as further loss and erosion of such highly productive land will impact on the State's agricultural production. This incremental loss is yet another nail in the coffin of lost land and production. There may well be opportunity during the design stage of the Project to address this issue somewhat by adjusting the actual rail alignment within the rail corridor such that the loss of this productive land is minimised.	nil.	<p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. ARTC has considered this throughout the design development and will continue to consider as design progresses.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p>	Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.2 Table 8-46
89	89.009	Community Group	Land Use and Tenure	Severance of agricultural land	It is noted that Environmental Offset Delivery and Offset Area Management Plans will be developed and implemented by ARTC prior to construction (subject to approval) under the Commonwealth's Environmental Protection and Biodiversity Act, Environmental Offset Policy (2012) and the Queensland Government's Queensland Environmental Offsets Policy (under the State Development and Public Works Organisation Act (1971) (EIS Chapter 10, Flora and Fauna and Appendix N Environmental Offset Delivery Strategy). This group asks: why is there not a similar requirement on ARTC with regard to loss of productive agricultural land?	nil.	<p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none"> 0.02 percent of Class A land, 0.02 percent of Class B land, and 0.01 percent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately:</p> <ul style="list-style-type: none"> 0.17 percent of Class A land, 0.22 percent of Class B land, and, 0.19 percent of IAA land. <p>Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>The Regional Planning Interests Act 2014 (Qld) is discussed in Chapter 3: Legislation and Project Approvals Process, Section 3.4.26. The Act aims to strike an appropriate balance between protecting priority land uses and delivering a diverse and prosperous economic future for our regions. The Project is not a resource activity or a regulated activity under the Regional Planning Interests Act 2014 and therefore the Regional Planning Interests Act 2014 does not apply to the Project. To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9 by the Project, which provides a total of areas of regional interest in relation to the Project footprint. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations, as discussed above.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.4.26 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Table 8-9
89	89.010	Community Group	Land Use and Tenure	Severance of agricultural land	This group recommends that the route be re-assessed so that high quality productive agricultural land is protected and the rail line placed on lesser quality agricultural land; or that offsets similar to those for impacted environmental issues be a requirement for approval of the Project.	nil.	<p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. As described in Chapter 2: Project Rationale, of the Revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail program of works.</p> <p>The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none"> 0.02 percent of Class A land, 0.02 percent of Class B land, and 0.01 percent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately:</p> <ul style="list-style-type: none"> 0.17 percent of Class A land, 0.22 percent of Class B land, and, 0.19 percent of IAA land <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible (Chapter 8: Land Use and Tenure, Section 8.5.4 Table 8-46).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. 89	89.011	Community Group	Land Resources	Erosion	We note that it is proposed to cross the Condamine River floodplain and other floodplains with a mix of bridges and embankments with culverts. If flood flows are not managed appropriately on floodplains, soil erosion can result in damage to infrastructure, permanent loss of production and productive area, and farm management difficulties. Gully erosion on cracking clay floodplains caused by concentration of overland flows has been widely observed and documented on the eastern Darling Downs for more than 60 years see photographs 1-12 below and References DPI 1981a, 1981b. Considerable effort has been made by landowners, Queensland Government Departments (Primary Industries, Natural Resources, Main Roads, etc.) and local Governments over many years to develop farming and engineering practices appropriate to floodplains, see, for example, Marshall, 1988, QDNR, 1999, and Knowles-Jackson and McLatchey, 2002. The key underlying principle is to keep flood flows as shallow and slow as possible to minimise soil erosion risk i. e. spread as much as possible. Applying this principle to flood plain management involves practices such as lowering roads, strip cropping, maintenance of anchored crop stubble and minimum tillage.	Any infrastructure on floodplains should be designed to accommodate this principle.	<p>A detailed soil investigation (Appendix I: EMR Search Certificates and Soil Laboratory Certificates) has been undertaken along the Project's rail alignment disturbance footprint to further understand the soil properties and refine existing soil mapping. Findings from the detailed soil investigation have informed soil-specific management measures and assisted in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross-drainage structures (i.e., bridges and culverts). Current flow paths will not be disrupted and existing velocities will be maintained where practicable. As per ARTC's Mitigation Framework, ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>The flood modelling and drainage assessment methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix I: EMR Search Certificates and Soil Laboratory Certificates Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
89	89.012	Community Group	Surface Water	Overland flow/diversion	It is noted (EIS, Chapter 5, Section 5.2.10, Fencing) that no fences will be erected across floodplains. This is in line with local recommended floodplain management practices that, where no fences are required, remove them if they exist. However, where livestock form part of the farming enterprises adjacent to the corridor in these areas, now and in the future, any fencing should be appropriate to floodplains and not cause any obstruction or diversion of flows. Advice with regard to suitable fencing on floodplains is given in QDNR, 1999.	nil.	<p>To limit access to the Project's rail alignment, fencing will be provided for the majority of the rail corridor. Fencing will act to protect adjoining lands from trespass and to prevent livestock from gaining access to the railway. Fencing is to extend between the corridor and private lots or property adjoining the railway. Property or land use specific fencing considerations will be discussed with relevant landowners as part of the detailed design process.</p> <p>As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will typically be provided according to ARTC fencing procedure, Boundary Fencing ETM-17-02 (available on the ARTC Extranet: extranet.artc.com.au). Where ARTC propose to construct within the Queensland Rail corridor for all returned works (South Western Line and Millmerran Branch Line), ARTC shall comply with Queensland Rail standards; this includes new and replacement fencing. All existing fencing is proposed to be removed and replaced. Where ARTC are proposing to construction new railway corridor that coincides with road manager or landowner fencing, this will be replaced typically with ARTC fencing procedure, Boundary Fencing ETM-17-02. Where superior fencing is required (for example where tracks are in close proximity to roads and/or communities, or where trespass is anticipated to occur) a 1.8 m chain link boundary fence may be provided, refer Section 5.4.12 and Table 5.19 in Chapter 5: Project Description.</p>	Chapter 5: Project Description Section 5.4.12 Table 5.19
89	89.013	Community Group	Surface Water	Overland flow/diversion	It is shown in the Draft Report on Review of Border to Gowrie Section for flood studies (IPE, 2021) that the (5% and 95%) confidence limits around estimate peak discharges for the Annual Exceedance Probabilities (AEPs) examined are quite wide often greater than a ten-fold difference. That report also notes that the peak discharges estimated for the Condamine River at Brookstead may well be underestimated.	If this is the case, then there is no question that viaducts should be used to cross all floodplains - to allow flows to pass relatively unimpeded and remain spread - and that these viaducts should be designed with a generous safety factor (or freeboard) in mind.	<p>The flood modelling conducted for the Project (including the hydrologic estimates) has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
89	89.014	Community Group	Surface Water	Aquatic fauna	It is stated in the EIS Summary of Findings Section on Flora and Fauna, pg. 54, that bridges are preferred over culverts to maintain connectivity for matters of national environmental significance such as Murray Cod. This group agrees with this sentiment and believes this statement should be expanded to include impacted landowners and the conservation of land resources.	nil.	<p>Appendix P: Fauna Connectivity Strategy details that the current fauna crossing location criteria encompasses remnant vegetation, high-value wildlife habitat, drainage features, areas containing historical records for fauna species, and areas recognised as a biodiversity corridor. The current design does not account for any other factors as the crossing criteria accounts for permeability across the landscape for fauna only. Appendix P: Fauna Connectivity Strategy further states that it is expected that there will be limited impacts on Murray Cod habitat with open span bridges being built over large waterways and flood plains. It is expected that connectivity is to be maintained for this reason.</p> <p>Chapter 11: Flora and Fauna, outlines ecological value specific mitigation and management measures for the Murray cod, including:</p> <ul style="list-style-type: none"> Construction activities will be scheduled to avoid/minimise instream works and associated riparian habitat in identified habitat Construction works will take place outside of the wet season when flows in floodplain systems are more likely Pre-construction surveys of watercourse crossings that are identified as potential habitat if suitable waterholes are present (i.e. Condamine River floodplain channels and the Macintyre River) will be undertaken to identify whether the species occurs; surveys will follow the <i>Survey Guidelines for Australia's Threatened Fish</i> (DSEWPaC, 2011b) Where a temporary impoundment or diversion is required for construction purposes and the species is found to be present, an appropriately qualified person will be consulted to make an assessment on the method of recovery, transport and release of fish and will follow relevant State (i.e. Department of Agriculture and Fisheries) fish salvage guidelines during construction activities Where possible, instream habitat will be reinstated to its pre-construction state (e.g. replacement of large woody debris and ensuring no or limited change to instream flows to allow fish passage) Implementation of the Biosecurity Management Plan, Soil Management Plan and the Surface Water Management Plan. 	<p>Chapter 11: Flora and Fauna Section 11.5</p> <p>Appendix P: Fauna Connectivity Strategy Section 5 and 7</p>
89	89.015	Community Group	Surface Water	Overland flow/diversion	If infrastructure must be above the 1% AEP flood levels, it is recommended that viaducts spanning entire floodplains (with a safety factor allowance) be accepted as an appropriate means of satisfying the requirement of maintaining spread flows as they have minimal impact on flow paths and allow flows to pass under them with minimal diversion, concentration or ponding.	nil.	<p>The flood modelling conducted for the Project (including the hydrologic estimates) has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft IS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
89	89.016	Community Group	Surface Water	Erosion	This group recommends that, in order to minimise soil degradation risk and probable subsequent legal liability, viaducts should be used to cross the full extent of all floodplains.	nil.	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised reference resign aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of the revised draft EIS Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Scour protection requirements for culverts during the revised reference resign were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the allowable soil velocities shown in Table 3.1 of AGRD. In addition to initial scour protection requirements identified during the revised reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design. Scour protection measures will be reviewed and confirmed during detailed design, when detailed soil mapping information is available, and in consultation with specialist Geomorphologists and Soil Scientists. ARTC are happy for this commitment to be conditioned as part of the EIS approval (Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.3).</p> <p>With respect to ongoing maintenance of culverts ARTC, as the operator of Inland Rail will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf), Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages. ETG-10-01 (Flooding) considers that blockage or partial blockage of waterway 20% loss of area due to debris, rubbish or siltation is a defect. The required response time is within 28 days to repair/restore.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Chapter 14: Flooding and Geomorphology Figure 14.20a-e</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 22.3</p>
89	89.017	Community Group	Surface Water	Erosion	It is noted that, for the design of the Condamine River floodplain crossing at Brookstead, it is now planned to replace approximately 20% of previously proposed reinforced concrete pipes (RCPs) 452 now with 76 reinforced concrete box culverts (RCBCs) between a system of bridges or viaducts. This group foresees ongoing problems if the proposed design of a mix of embankments with culverts and bridges for rail corridor crossing of black soil floodplains is implemented. As well, where culverts are located on Vertosol and Sodic soils, ongoing monitoring and maintenance costs can be expected to be quite high.	nil.	<p>Scour protection requirements for culverts during reference design were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the allowable soil velocities shown in Table 3.1 of AGRD. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design.</p> <p>Scour and erosion protection measures (including the need for flow spreaders and/or dissipaters) will be reviewed and confirmed during detailed design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available (Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.3).</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 22.3</p>
89	89.018	Community Group	Surface Water	Modelling	The inaccuracy of the elevation data used in the hydraulic modelling used to assess flow dynamics together with changes in micro topography across the floodplains over time see below, Section 3.6 LIDAR Surveys and infrastructure requirements on floodplains - gives concern with respect to the proposed location and number of culverts.	nil.	<p>As detailed within Appendix T1: Hydrology and Flooding Technical Report - Volume 1, various sources of LIDAR have been utilised to inform hydraulic modelling including 1 m ARTC LIDAR, SRTM data and third-party data where available. It is acknowledged that the vertical accuracy of LIDAR used is variable depending on the data source. Detailed survey of the alignment corridor is proposed to be obtained during the Detailed Design stage of the Project to accurately represent the terrain, and associated drainage lines, to allow appropriate placement of cross drainage structures. It is considered that the adopted LIDAR utilised as part of the revised draft EIS hydraulic modelling is of sufficient accuracy for a Reference Design.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4</p>
89	89.019	Community Group	Surface Water	Erosion	There are some inconsistencies in proposals between the EIS and various reports presented previously with regard to the outlet velocities proposed for these culverts. For example, it is proposed in the EIS that the outlet velocities of culvert discharges onto stiff clays be kept below 2.0 m/s. The Yéarlon to Gowrie Corridor Options Report, (AECOM, 2017), recommended that flow velocities on floodplains be no more than 1 m/s their modelling shows, for the events they reported, the estimated peak velocities in the Condamine River floodplain to be mostly less than 1 m/s and that drainage will be designed to ensure that velocity of flows be maintained at existing levels. The proposed velocity of 1 m/s is satisfactory for the cracking black clay soil present on the Condamine floodplain and elsewhere provided there is well anchored vegetative cover. However, when flows do occur under flooding and inundation conditions, the clays present on the Condamine floodplain are not stiff but are saturated and flows at much lower velocities can cause erosion, not only of land downstream but possibly also to the rail embankment.	DSITI (2015) recommends flow velocities of no more than 0.6 m/s on bare cultivated clay soils a situation that will often arise in the cultivated areas downstream of the floodplain crossings.	<p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the allowable soil velocities shown in Table 3.1 of AGRD.</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the Reference Design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design. Scour protection measures will be reviewed and confirmed during detailed design, when detailed soil mapping information is available, and in consultation with specialist Geomorphologists and Soil Scientists. ARTC are happy for this commitment to be conditioned as part of the EIS approval (Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.3).</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 22.3</p>
89	89.020	Community Group	Surface Water	Erosion	It is reported in the Draft Report on Review of Border to Gowrie Section for Flood Studies (IPE, 2021) that the Quantitative Design Limits for flow velocities on agricultural land adjacent to the Narrabri to North Star Section of the line not exceed 0.5 m/s unless they already do (and then only a 20% increase) or are site-specifically justified.	The soils there are similar to those on the floodplains and other cultivated lands in Queensland and, as such, those design limits should apply equally in Queensland.	<p>A review of the Flood Impact Objectives (FIOs) has been undertaken in consultation with the Expert Flood Panel to consider the NSW Quantitative Design Limits with revised FIOs detailed in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section (Section 5 to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p>	<p>Chapter 14: Flooding and Hydrology Section 14.11</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17</p>
89	89.021	Community Group	Surface Water	Mitigation measures	Thus, where culverts are to be used, there is a need for well-maintained energy dissipaters and flow spreading structures at their outlets to bring flow velocities down to acceptable levels (0.6 m/s maximum).	To achieve this velocity, and to ensure flows are spread before runoff is discharged onto cultivated land, these energy dissipation structures may well have to be extended outside the corridor.	<p>A review of the Flood Impact Objectives (FIOs) has been undertaken in consultation with the Expert Flood Panel to consider the NSW Quantitative Design Limits with revised FIOs detailed in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. 89	89.024	Community Group	Surface Water	Overland flow/diversion	During the detailed design phase, there could well be a need to change the location of culverts to that presented in the EIS. Overland flow paths were identified for the majority of the Condamine River floodplain during the Upper Condamine River Floodplain Project (UCRP) (Knowles-Jackson and McLatchey, 2002). Examples of these how these flow paths been altered by on and off farm infrastructure are shown on Attachments 1-5. These examples give evidence that careful consideration should be given to placement of infrastructure on floodplains so that flows are not diverted. Copies of those maps with the identified flow paths are available from the Toowoomba DoR office.	nil.	As detailed within Appendix T1: Hydrology and Flooding Technical Report - Volume 1, various sources of LiDAR have been utilised to inform hydraulic modelling including 1 m ARTC LiDAR, SRTM data and third-party data where available. It is acknowledged that the vertical accuracy of LiDAR used is variable depending on the data source. Detailed survey of the alignment corridor is proposed to be obtained during the Detailed Design stage of the Project to accurately represent the terrain, and associated drainage lines, to allow appropriate placement of cross drainage structures. It is considered that the adopted LiDAR utilised as part of the revised draft EIS hydraulic modelling is of sufficient accuracy for a reference design and EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1
89	89.025	Community Group	Surface Water	Mitigation measures	Other considerations with regard to culverts that we consider to be essential to reduce the potential for structural failure, siltation and soil erosion are: <ul style="list-style-type: none"> where box culverts are to be used, they should be placed side by side for the entire length of an embankment culverts should be placed in the lowest point of the natural depression regardless of what the chainage map says in order to minimise the chance of flow diversions, culverts should be aligned with the natural flow directions not just be at 90 degrees to the embankment in upland areas where a SCP exists, culverts should be placed in accordance with agreements made with affected upstream and downstream landowners. 	nil.	As detailed within Appendix T1: Hydrology and Flooding Technical Report - Volume 1, various sources of LiDAR have been utilised to inform hydraulic modelling including 1 m ARTC LiDAR, SRTM data and third-party data where available. Detailed survey of the alignment corridor is proposed to be obtained during the Detailed Design stage of the Project to accurately represent the terrain, and associated drainage lines, to allow appropriate placement of cross drainage structures. Culvert placement and skew will be determined based on existing flow paths and governed by appropriate design standards. Where existing SCPs exist, ARTC will review and consider these within the detailed design of cross drainage infrastructure. Ongoing consultation with impacted landowners will occur to further align cross drainage design with existing conditions (Section 22.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 22.3
89	89.026	Community Group	Surface Water	Mitigation measures	It is noted in the Draft Report on Review of Border to Gowrie Section for Flood Studies (IPE, 2021) that hard structures such as culverts should not be used on Vertosol soils (as are present on most floodplains the line crosses) as they will lead to high monitoring and maintenance costs. They (the IPE) recommend use of viaducts instead. We concur with their recommendation.	nil.	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts).</p> <p>Scour protection requirements for culverts during the revised reference design were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). 89	89.028	Community Group	Surface Water	Mitigation measures	The proposed approximately 12.5 km of embankments across the Condamine River floodplain (from chainages 131.39 to 150.01 less 6.034 km of bridges) together with those across other floodplains will act similarly to dam banks during periods of flow, particularly where flood inundation or ponding may exist over a period of hours or days. Without proper construction, ring tanks built on Vertosols and similar soils have failed due to seepage, formation cracking, animal burrows, piping along abutments and pipes, compaction flaws and erosion (Barrett, 2007) (Photographs, 11, 12). This led to design modifications for such structures including a need for walls to be constructed as shown in Diagram 1. It is noted that the Project design drawings show embankment batters of 1.5H:1V. In view of the above reference, we consider that batters of 1.5H:1V are too steep for formations on black soil plains and erosion and slumping of the embankments are likely. A prime example of this is the 18 m high embankment at Chamberlain Road crossing (approximate Chainage 204.5)) if this is constructed using the soils there and this batter, the embankment is likely to fail.	Without specific data on the soils upon which the embankments are to be built being available, it is impossible to determine what foundations are necessary, including the depth of any cut-off trench required, batter slopes, thickness of the embankment, what is required along pipes to prevent seepage, possibility of liquefaction and so on. This issue has been noted in the EIS (Section 8.6.3) and TOR (Section 10.7) and that further investigations are proposed to be carried out on the soils across the Condamine River floodplain with possible design changes prior to construction. We recommend detailed soil/geological investigations be carried out prior to reassessment of any design features of the proposed rail line; and if any embankments are required on floodplains then flatter batters are implemented.	<p>A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Section 3.2.2, Section 4.5 and Section 5.0 of Appendix J: Soil Assessment Report). The surveys were conducted by suitably qualified and experienced persons and the report was endorsed by Certified Practising Soil Scientist. Soil management units from the investigation are provided in Section 3.3 and Figure 3.16. This level of investigation is sufficient to allow determination of soil suitability and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. Findings from the detailed soil investigation have informed soil-specific management measures and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning.</p> <p>Chapter 9: Land Resources Section 9.6.3, Table 9-29 also details the following: "An Erosion and Sediment Control Plan (ESCP) will be implemented as a component of the CEMP and will guide development of site or Section specific ESCPs and include detailed erosion hazard assessments and erosion and sediment control structure designs. The erosion and sediment control measures will be developed by a certified practitioner in erosion and sediment control, in accordance with the intent of <i>Best Practice Erosion and Sediment Control</i> (IECA, 2008) and the <i>Soil Conservation Guidelines for Queensland</i> (DSITI, 2015) and will be implemented during construction of the Project".</p> <p>Section 3 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan also presents mitigation measures for soil units present within the Project footprint.</p> <p>ARTC have consulted QDNRME as a contributor to the study area for the North-South Rail Corridor study as indicated in Table E-6 of Appendix E: Consultation Report of the revised draft EIS. Consultation will continue to take place with the relevant stakeholders for the Condamine floodplains and contaminated.</p> <p>Construction and operations flood impacts on land in the Condamine River floodplain have been described in Section 14.8.1 of the revised draft EIS Chapter 14: Flooding and Geomorphology and Section 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	Chapter 9: Land Resources Section 9.6.3 Table 9-29 Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix J: Soil Assessment Report Section 3.2.2 Section 4.5 Section 5.0 Appendix E: Consultation Report Table E-6 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 7.5.3
89	89.029	Community Group	Land Resources	Monitoring	One of the project performance criteria (Chapter 22, Outline Environmental Management Plan, Section 22.11.2.2) is Project works do not cause erosion or contamination beyond the temporary or permanent works. The EIS does not clarify whether and who will carry out any required monitoring, maintenance and modifications, or how far outside of the rail corridor this will this occur. It should be noted that soil degradation (erosion, sedimentation, etc.) on floodplains may occur many kilometres downstream of actual works due to diversion/concentration of flood flows. That soil degradation may well cause loss of productivity to that land which may take years to recover to its original productivity if at all.	It is recommended that monitoring of the impacts of runoff be carried out for all parts of the affected floodplains; and that ARTC take responsibility for all soil degradation issues and carry out repairs to restore the productivity of any impacted upstream and downstream lands.	<p>Chapter 9: Land Resources, Section 9.6.3, Table 9-29 details the following in relation to contaminated land: "A Contaminated Land Management Plan will be developed by a suitably qualified person, as recognised under the <i>Environmental Protection Act 1994</i> (Qld), and will be further developed and incorporated into the Construction Environmental Management Plan (CEMP)". The plan will establish an unexpected finds protocol/procedure if potentially contaminated materials, including unexploded ordnance (UXO), are encountered during construction activities.</p> <p>Chapter 9: Land Resources, Section 9.6.3, Table 9-29 also details the following: "An Erosion and Sediment Control Plan (ESCP) will be implemented as a component of the CEMP and will guide development of site or Section specific ESCPs and include detailed erosion hazard assessments and erosion and sediment control structure designs. The erosion and sediment control measures will be developed by a certified practitioner in erosion and sediment control, in accordance with the intent of <i>Best Practice Erosion and Sediment Control</i> (IECA, 2008) and the <i>Soil Conservation Guidelines for Queensland</i> (DSITI, 2015) and will be implemented during construction of the Project".</p> <p>A detailed soil investigation at a scale of 1:10,000 has been completed (Refer to Section 4.5 and Section 5.0 of Appendix J: Soil Assessment Report). Further soil management measures are provided in Section 3 of Appendix AB: Draft Earthworks Strategy and Soil Management Plan for specific soils identified within the Project footprint.</p> <p>The effectiveness of permanent erosion controls (e.g., scour protection or vegetated swales) will be monitored as part of the maintenance inspection schedule for the Project, as prescribed in the Operational Environmental Management Plan. Controls that are found to be failing or not performing as intended will either be modified or replaced, as required.</p>	Chapter 9: Land Resources Section 9.6.3 Table 9-29 Appendix J: Soil Assessment Report Section 4.5 Section 5.0 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3
89	89.030	Community Group	Land Resources	Monitoring	Over time, there will be a likely need to review the monitoring program along with remediation works implemented to assess their effectiveness. This should be carried out in consultation with all affected stakeholders.	It is recommended that monitoring and maintenance programs be regularly reviewed and altered accordingly in consultation with all affected stakeholders.	<p>It is noted in of Chapter 24: Draft Outline Environmental Management Plan, the predicted Project impacts on land resources will be minimised through the detailed design process and implementation of the Rehabilitation and Landscape Management Plan. Once the Project becomes operational, the impact management approach will transition to a maintenance program informed by periodic and event-based inspections and monitoring. The focus of the maintenance program will be on infrastructure integrity and safety. This focus will include the rehabilitation and landscape works delivered as part of the Project.</p> <p>Where periodic inspections and monitoring detect the Project contributing directly to the diminution of land resources in the Project footprint, ARTC will undertake specific remedial actions as necessary to mitigate the risk of further losses.</p>	Chapter 24: Draft Outline Environmental Management Plan

89	89.031	Community Group	Land Resources	Erosion	During December 2020 discussions with ARTC staff, it was mentioned that ARTC were in the process of calling construction tenders. Given the lack of relevant data/information such as what soils are present and what construction techniques are appropriate for the range of soils, uncertainty around flood modelling results and the need for further survey information, it would appear premature to progress any tendering processes. There is a high potential for failure if inappropriate construction techniques are used due to inadequate information on soil properties, and associated land degradation risks.	nil.	ARTC has completed an assessment in Appendix J: Soil Assessment Report, of the Project's potential impacts on soils in accordance with the guidelines listed below: <ul style="list-style-type: none"> Department of Environment and Science, Guidelines for Soil Survey along Linear Features Department of Resources, Queensland Soil and Land Resource Survey Information Guideline, Version 2. 00 CSIRO, Guidelines for surveying soil and land resources and Australian soil and land survey field handbook Appendix J: Soil Assessment Report was completed to a scale of 1:10,000 and has identified soil management units to inform appropriate soil management plans (as described in Appendix J: Soil Assessment Report, Section 1.3). Given the soil sampling intensity and the refinement of rail alignment in the revised reference design, it is considered that impacts at a property scale can be assessed and appropriate mitigation measures proposed in Part B: Draft Soil Management Plan (Section 3) of Appendix AB: Earthworks Strategy and Draft Soil Management Plan. This was undertaken by suitably qualified soil scientists. A third-party Certified Professional Soil Scientist undertook the review (including soil management plan). The soil survey work, data collection and laboratory analysis updates have been reflected in Chapter 9: Land Resources. <p>In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Expert Flood Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Expert Flood Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both draft and final reports from the Expert Flood Panel are publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?q=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&rlz=1C1GCEB_enAU1015AU1015&oq=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aqs=chrome..69i57.9731j0j4&sourceid=chrome&ie=UTF-8</p> For specific details on the modelling undertaken, refer to Chapter 14: Flooding and Geomorphology, Section 14.5.	Chapter 9: Land Resources Chapter 14: Flooding and Geomorphology Section 14.5 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix J: Soil Assessment Report Section 1.3
89	89.032	Community Group	Surface Water	Modelling	It is noted that a mix of publicly available LiDAR (Light Detection and Ranging) and SRTM (Shuttle Radar Topographic Mission) elevation data sets were used for the hydraulic modelling of the Condamine floodplain (AECOM, 2017, GTA, 2020) it is not clear where each data set was used. Whilst it is acknowledged that these are the best elevation data sets currently available, question marks remain as to the vertical accuracy of that data. LiDAR data is often quoted as having a vertical accuracy in the 10-20 cm range whilst accuracy of SRTM data is in the metres. That accuracy is also affected by the presence/absence of vegetation if light does not reach the actual soil surface. As well, the surface of the expansive clay soils of the Condamine River floodplains rises and falls as the soils wet up/dry out. This change in elevation is often spatially variable across the floodplain due to differential water entry and subsequent use resulting from uneven precipitation and overland flows, and presence/absence of growing (transpiring) crops. This and variations in surface hydraulic roughness due to presence/absence of crops can influence flood flows, with the result that actual flood flow paths may not be as modelled. Thus, given the inherent inaccuracy in the elevation data and possible changes in flow paths over time, there is a question mark on the model(s) outputs and the choice of location and number of culverts as presented may well be incorrect. To be fair, it is noted that updated LiDAR data will be acquired for the whole model domain to facilitate model updates during the detailed design phase to overcome the discrepancies between the LiDAR data sets used for the hydraulic modelling (Appendix Q1, p.82).	Again, it would appear premature for ARTC to call for construction tenders before the substrate identification, upgraded modelling and any necessary changes to design are completed.	As detailed within Appendix T1: Hydrology and Flooding Technical Report - Volume 1, various sources of LiDAR have been utilised to inform hydraulic modelling including 1 m ARTC LiDAR, SRTM data and third-party data where available. It is acknowledged that the vertical accuracy of LiDAR used is variable depending on the data source. Detailed survey of the alignment corridor is proposed to be obtained during the Detailed Design stage of the Project to accurately represent the terrain, and associated drainage lines, to allow appropriate placement of cross drainage structures. It is considered that the adopted LiDAR utilised as part of the revised draft EIS hydraulic modelling is of sufficient accuracy for a reference design. <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as detailed in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4
89	89.033	Community Group	Hazard and Risk	Erosion	The list of hazards in Section 19 (Introduction) is incomplete. Another natural hazard that can affect risks from the project during all phases is soil type, particularly saline and sodic soils. As well, the statement Permanent alteration to land form and topography remains a medium risk due to the potential for loss of soil resources through erosion and disturbance of existing contaminated land during the construction phase of the project is correct as far as it goes. Agricultural land has a high ongoing risk from erosion during floods particularly when the soil surface is bare. Erosion prone areas include those immediately downstream of rail cross-drainage works, those upstream of the rail corridor due to lateral drainage along the line and soil conservation works both upstream and downstream in and adjacent to the rail corridor.	As such the statement above should include this ongoing risk not only during the construction phase.	Detailed soil survey and mapping has been conducted to inform the revised draft EIS. The risks associated with the various soil types that have been mapped within the Project footprint are discussed in detail in Section 4.5 of Appendix J: Soil Assessment Report and summarised in Section 9.4.2 of Chapter 9: Land Resources. <p>It is not the intention of Chapter 21: Hazard and Risk to duplicate the assessment of risk where this has been presented in detail elsewhere in the revised draft EIS.</p> Acknowledging that soil type is a risk to the Project, a reference to this risk has been provided in Section 21.1 (Scope of chapter) and Table 21-15 (Natural hazards) of Chapter 21: Hazard and Risk, with cross-reference to locations of detailed risk assessment in Appendix J: Soil Assessment Report and Chapter 9: Land Resources.	Chapter 9: Land Resources Section 9.4.2 Chapter 21: Hazard and Risk Section 21.1 Table 21-15 Appendix J: Soil Assessment Report Section 4.5
89	89.034	Community Group	Land Resources	Local business and industry procurement	During December 2020 discussions with ARTC staff, it was mentioned that ARTC were in the process of calling construction tenders. Given the lack of relevant data/information such as what soils are present and what construction techniques are appropriate for the range of soils, uncertainty around flood modelling results and the need for further survey information, it would appear premature to progress any tendering processes. 89	89.037	Community Group	Hazard and Risk	Erosion	Table 19.2 is incomplete and should also include Soil Conservation Guidelines for Queensland (DSIT1, 2015).	These Guidelines provide information on soil degradation and practical tools for its prevention by water erosion. They also provide tools and techniques to remediate degraded areas. Other publications that could be included are Marshall, 1988, Knowles-Jackson and McLatchey, 2002 and QDNR, 1999.	Soil conservation plans are described in detail in Chapter 9: Land Resources. Refer to Table 9-1 and Section 9.4.4 and 9.5.5 for information on soil conservation plans.	Chapter 9: Land Resources Table 9-1 Section 4.4.4 Section 9.5.5
89	89.038	Community Group	Hazard and Risk		Table 19.6.2 (Environmental receptors) should also include productive soils for cropping, grazing and flora and fauna habitat.	nil.	Section 21.4 of Chapter 21: Hazard and Risk has been amended to include productive soils for cropping, grazing as land use and infrastructure receptors (Section 21.4.3) and flora and fauna habitat listed as an environmental receptor (Section 21.4.2).	Chapter 21: Hazard and Risk Section 21.4 Section 21.4.2 Section 21.4.3
89	89.039	Community Group	Hazard and Risk	Overland flow/diversion	Table 19.7.1.2 (Flooding, storms and cyclones) should include the words: On the northern floodplains of the Murray-Darling Basin, flooding also occurs from overland flow from adjacent higher land (uplands) and from torrential and storm rainfall over the floodplains themselves as well as, conventional flooding from surcharging of creeks and rivers.	nil.	Wording is amended to Section 21.5.1.2 of Chapter 21: Hazard and Risk: flooding, storms and cyclones.	Chapter 21: Hazard and Risk Section 21.5.1.2
89	89.040	Community Group	Hazard and Risk	Erosion	In Section 19.7, the potential impacts should include: <ul style="list-style-type: none"> ▶ damage to crops and farm infrastructure such as irrigation works, on-farm access tracks and roads, fences etc. ▶ changes to soil conservation structures (contour banks and waterways) and farm management practices. 	nil.	The potential impacts that have been raised are discussed and addressed in Chapter 21: Hazard and Risk as follows: <ul style="list-style-type: none"> ▶ Damage to crops and farm infrastructure: Section 21.5 of Chapter 21: Hazard and Risk ▶ On farm access tracks and roads: Section 21.5 of Chapter 21: Hazard and Risk ▶ Changes to soil conservation structure and farm management practices: Section 21.5 of Chapter 21: Hazard and Risk 	Chapter 21: Hazard and Risk Section 21.5
89	89.041	Community Group	Hazard and Risk	Erosion	In Section 19.8.1 (Mitigation through the initial design phase), Table 19.11 (Initial mitigation measures of relevance to hazard and risk) there is no reference to measures required to address changes to, and impacts on, existing soil conservation measures or upon farm irrigation infrastructure adjacent to the rail corridor except for the Yelarbon flood levee.	The risk of damage to adjacent soil conservation structures such as contour banks and waterways and farm irrigation infrastructure along with increased soil erosion downstream of rail cross-drainages associated with flooding should be assessed and shown in Table 19.13 (Impact assessment for potential impacts associated with hazard and risk). There is a further risk that farmers will have to change their soil surface management practices (and associated machinery) to counteract any increased overland flows and should be compensated for this as part of any make-good arrangements.	A summary of mitigation measures that are relevant to soil conservation measures and farm irrigation infrastructure is presented in Table 21.16 of Chapter 21: Hazard and Risk. Detailed soil conservation measures are presented in Appendix AB: Earthworks Strategy and Draft Soil Management Plan.	Chapter 21: Hazard and Risk Table 21.16 Appendix AB: Earthworks Strategy and Draft Soil Management Plan
89	89.042	Community Group	Outline EMP		Our comments here relate to Chapter 22 (Outline Environmental Management Plan, OEMP) specifically with regard to Section 22.3 (Roles and responsibilities), Table 22.4 (Proposed mitigation measures Land resources) and Table 22.13 (Proposed mitigation measures Hydrology and flooding). It is noted in Table 22.1 that, if a soil conservation plan requires modification, it is put forward that this would be progressed in consultation with QDNR (now DoR). As outlined above, given the demise of the Soil Conservation Branch of the QDNR (or earlier Departmental versions), there are very few personnel within that, or other, departments with the adequate expertise to carry out such a role. A similar situation arises during the Construction stage with regard to auditing of the Construction Environmental Management Plan (CEMP). It is noted the Coordinator-General is responsible for administering the State Development and Public Works Organisation Act 1971 (Queensland) and must approve the Outline CEMP (Table 22.1, Section 22.6.3). As that department does not have the necessary resources and qualified personnel to provide advice on all aspects of the CEMP, presumably other Departments will be called on to provide assistance. It is doubtful whether those Departments have adequate resources and expertise to carry out those tasks either. Therefore, it is not clear as to who will oversee the adequacy of a proposed Operation Environmental management Plan (OEMP) in relation to land degradation issues.	nil.	The Construction Environmental Management Plan and Operation Environmental Management Plan must be reviewed and endorsed by the Environmental Monitor prior to commencement of relevant stage of the Project. Once endorsed by the Environmental Monitor, both the Construction EMP and the Operation EMP will be provided to the Coordinator-General. Should the Coordinator-General determine that the Project can proceed, and then impose conditions for the Project, then the Coordinator-General may also state the responsible entities for particular conditions. The resourcing of various government departments is not a matter for ARTC. However, ARTC will confirm the currency Soil Conservation Plans that may be impacted by the Project. ARTC will consult with Department of Resources (DoR) in addition to the holders of each soil conservation plan and affected stakeholder. Any amendments to a Soil Conservation Plan, if required, would be progressed in consultation with a Certified Professional Soil Scientist, approved by DoR and the holder of the Soil Conservation Plan (Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
89	89.043	Community Group	Outline EMP		It is noted that during the Pre-Construction stage, impacts from flooding must be determined at all drainage structures and waterways affected by construction works (Table 22.13). For instance, the change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event. Whilst it is noted that flood levels and velocities outside the corridor are to be examined, there is no mention of soil erosion and/or sedimentation which will be some of the obvious impacts.	It is recommended these potential impacts be assessed using the proposed upgraded flood models.	Any design modifications during detailed design will be subject to re-runs of the updated existing flood models, to demonstrate continued compliance with the design objectives of the Project, including for extent and time of inundation, afflux, hazard and flow velocities. The Project has adopted the flood impact objectives (FIO) established by the International Independent Panel of Flood Experts (Expert Flood Panel) for its design and construction. The Draft Outline EMP (Chapter 24: Draft Outline Environmental Management Plan) has adopted this work in addressing the Erosive Threshold Velocities for natural ground surfaces on a site-by-site basis. Performance criteria for a range of surfaces is provided and will apply to Pre-Construction Activities and Early Works, as well as Construction works. The detailed design will address and strive to achieve the FIO within the impact assessment area. Erosion and Sediment controls will be installed for Project infrastructure, and will be monitored and refined for each stage of the Project (Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
89	89.044	Community Group	Outline EMP		Table 22.13 also indicates that during the Operation stage, impacts from flooding (scour, blockages, overtopping, culvert damage etc.) will be inspected and any corrective actions carried out. It is not clear, for either the Construction or Operation stages, whether adequate inspections and corrective actions will also be carried out on all affected properties outside the corridor particularly those properties some distance upstream and downstream of the rail corridor.	This group stresses that monitoring, reporting and rectification of any natural resource degradation due to the Project both within and outside of the corridor is essential and that relevant Queensland Government Departments be given resources to oversee these tasks.	Chapter 24: Draft Outline Environmental Management Plan, provides flood impact objectives developed for the Project by the Expert Flood Panel. The detailed design of the Project will address the FIO which deal with changes in peak water levels, duration of inundation, flood flow distribution, flow velocities, flood hazards and event risk management. Both the flood models and the detailed design will be refined in an iterative approach to design development. The outcome of the detailed design process should address and resolve most if not all flood-related impacts directly related to implementation of the Project. Consistent with the finalised Outline Environmental Management Plan, the Operation Environmental Management Plan will require ongoing monitoring and maintenance of Project infrastructure, including drainage structures, to address potential flood damage, such as scours, blockages, overtopping and culvert damage. Furthermore, such inspections will be conducted in accordance with ARTC's Structures Inspection Engineering Code of Practice (ETE-09-01). Infrastructure damage will be repaired as soon as practicable and safe, following a flood event. The attribution of flood damage will require a detailed analysis of each flood event, based on recorded data. The Project cannot reasonably be required to address unrelated flood damage.	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
89	89.045	Community Group	Project alignment	Baseline/backgr ound sampling	<p>It is noted in the EIS, Appendix A (Terms of Reference), Section 6.7, that feasible alternate route options are required to be presented and addressed including the criteria used in that assessment and why certain options or courses are preferred or rejected. As this comparison is difficult to find in the EIS, we have attempted to do this using other documents namely GTA, 2020 and AECOM, 2017. The AECOM 2017 Corridor Option Report (review of 4 optional routes) was early in the route selection process and should be reviewed. Further investigations into the Forestry Route via Cecil Plains and other route options have been carried out by this group during 2020, and identified flaws in some of the arguments presented. There are some inconsistencies presented in GTA, 2020. For example, the modelled 1% AEP flood level shown in Map 1 (from GTA, 2020) and Maps D1, D2 and D3 (from GTA, 2020) see attached shows the width of flow to be approximately the same at Cecil Plains as at Brookstead (about 12 km), yet Table 1 (again from GTA, 2020) gives the Condamine floodplain at Cecil Plains as 33 km wide. Then, GTA, 2020, (Table 1.1) notes that significant areas within the floodplain remain dry during a 1% AEP flood event inferring the rail line in those areas would not require cross-rail drainages. These reports show that the flood modelling for all cases was carried out using a mix of publicly available LiDAR and SRTM shuttle elevation data see Section 3.6 above. Yet it is intended to acquire updated LiDAR data for the Brookstead route whole model domain to facilitate model updates during the detailed design phase. It is considered that if this is not also done for the Cecil Plains routes, then a like-for-like comparison has not been undertaken. Another inconsistency is in regard to the terrain traversed by alternate routes. In GTA, 2020, Table 2.3, pg. 7 it is claimed that the Cecil Plains routes have more challenging terrain than the currently accepted route. This seems to be in conflict with the long sections shown in Diagram 2 (from GTA, 2020, pg. 35) which shows that the Brookstead route has steeper and higher sections than the alternate routes examined and this is reinforced by Photographs 13 and 14. Further, corridor widths use in the analyses carried out have not been consistent when comparing options. We also believe that not all the costs associated with the construction and operation of the line have been included in the comparisons. For example, there is no mention of the cost of necessary alterations to Soil Conservation Plans anywhere nor the ongoing cost of maintenance and make good arrangements. It is recognised that when selecting a route there should be no unintended impacts on the use and productivity of nearby lands without due compensation. It is assumed that the cost of acquiring land and minimising the length of the route were important selection criteria for the Project team. However, it appears that the cost of specialist works to cross floodplains has not been included, nor the cost of possible class action if inadequately designed works lead to major limitations placed on the use of the floodplains for dryland and irrigated agriculture. During the public consultation phase of the Project in 2018, representatives from ARTC and their consultant indicated that only the Millmerran - Brookstead route was under consideration at the direction of the Commonwealth Government. This indicates there could well be some political interference in the process of selecting the most appropriate route. It would appear that a fair comparison of alternate routes has been not been satisfactorily carried out.</p>	<p>It is recommended that the value of the productive cropping land be given an appropriate weighting when assessing alternate route options, with a view to minimising the alienation of agricultural Land Classes A and B. We recommend that a detailed re-assessment of route options be undertaken with a view to clarifying all relevant issues relating to a number of potential routes within the Ingleswood/Millmerran/Cecil Plains/Wellcamp region, including:</p> <ul style="list-style-type: none"> the relationship to the long term land use plan for the region; comparative erosive flooding risks; comparative impact on agricultural properties; number of residential/industrial properties likely impacted; and comparative costs of all possible infrastructure options. 	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it also became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development (Section 2.8.2).</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for the Project in 2017, the Australian Government announced the base case via Charlton-Wellcamp alignment was to be progressed through the Project phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020 (Chapter 2: Project Rationale, Section 2.9.3). Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to the Project.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.8.2</p> <p>Section 2.9</p> <p>Section 2.9.3</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
89	89.046	Community Group	Stakeholder engagement		<p>ARTC's public consultation process was guided by the International Association of Public Participation (IAP2) core principles (Section 2.5, Appendix C, Stakeholder Engagement Report) (Inform, Consult, Involve, Collaborate and Empower). It appears that the project so far has only worked with the first four of those principles as there is little evidence of the adoption of the fifth principle - empowerment of the public. Perhaps during the pre-construction phase the other one, empowerment, will come into play. This is particularly so as, in the IAP2 Spectrum, one of the promises to the public is that 'we will implement what you decide'.</p>	<p>We recommend that, as ARTC is only one of the stakeholders involved in this Project, a coordinated approach to planning and works implementation by meaningfully engaging all directly affected stakeholders be adopted.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>ARTC notes that since the draft EIS and stakeholder submission, two workshops have been held with the submitter in 2022 and 2023 to present updated Project reference design, including cross drainage design, culvert design and other geotechnical components. Stakeholder engagement with the submitter also comprised of a presentation of the findings of Soil Assessment Report and the results of the draft Independent International Panel of Experts for Flood Studies (the Flood Panel). This engagement will continue through Detailed Design and Pre-Construction Activities and Early Works stages. Chapter 24: Draft Outline Environmental Management Plan; notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 5.3</p>
89	89.047	Community Group	Surface Water	Scour protection	<p>We found some inaccuracies and omissions in some of the design drawings presented as part of the EIS Appendices. As an example, we found, in Design Drawings, Part 1, pg. 49 - a contoured catchment to a natural depression at approximately chainage 121.5 km, discharges across a 3.5+ m cutting without any drainage works shown. Another area of concern is where the proposed rail line crosses Back Creek (chainage 127 km). The proposed corridor alignment shows the rail line crossing Back Creek about 1 km downstream of the Back Creek realignment carried out at the Millmerran Power Partners Commodore Mine. Implementation of this re-alignment by the mine operators has recently been completed in accordance with Water Licence Number 104534 (a licence to interfere with flow by diversion) issued under provisions of the Water Act 2000. That approval specified the width of Back Creek to be 300 m wide between containment levees. The Back Creek floodplain bridge at 127 km should be at least 300 m wide in accordance with the above approval (and probably wider) at this point and not the 230 m shown in Design Drawing Part 1, pg. 51. We understand that there will be modifications and amendments to these design drawings during the detailed design phase of the Project, and a need to clarify specifications, sizes and positions of items such as cross drainage structures.</p>	<p>However it is imperative that all stakeholders have an opportunity to peruse and understand what is intended by those drawings and amendments be made as necessary, prior to construction.</p>	<p>The revised reference design does not require permanent diversion of any watercourses, as defined under the Water Act 2000 however two trapezoidal diversion drains are expected to be required for the permanent diversion of mapped waterways under the Fisheries Act 1994.</p> <p>As detailed in Section 18.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 13.5.2 of Chapter 13: Surface Water of the revised draft EIS, one trapezoidal diversion drain is provided from Ch 120.77 km to Ch 121.43 km to divert runoff originating from the west away from the Project where the proposed rail is in cut. The rail in cut intersects a mapped waterway at Ch 121.43 km, and this diversion drain connects this waterway to another one at Ch 120.77 km. The diverted flow returns to the original flow path 750 m downstream of the Proposed alignment.</p> <p>An additional trapezoidal diversion drain is provided at Ch 192 km to slightly alter the flow path of the unnamed tributary of One Mile Gully to accommodate the proposed rail embankment. The rail embankment intersects the mapped waterway at Ch 192 km, and this diverted flowpath runs for 200 m long at Ch 192.2 km before crossing the alignment obliquely. The diverted flow returns to the original flow path 200 m downstream of the Proposed alignment. Due to the level of detail of the reference design drawing package, these diversions have been identified by the design team but has not yet been shown on the design drawings.</p> <p>The inclusion of the Back Creek Diversion Project has not been considered as part of the hydraulic modelling. As part of the Detailed Design of Inland Rail, projects that are likely to affect the local hydrology and floodplain behaviour, and that is likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority, and where applicable, designs reviewed to account for any change in flooding behaviour.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 13: Surface Water</p> <p>Section 13.5.2</p> <p>Appendix T1: Flooding and Hydrology Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 18.2.3</p>
90	90.0001	Private	Social Impact Assessment	Property Devaluation	<p>The project did not come up when the submitters did their due diligence when buying their property, which is located within the 'focused area of investigation'. The project has affected their capacity to take out a loan and reduced the value of their property. The submitters state they are not entitled to compensation.</p>	<p>Nil.</p>	<p>The revised draft EIS is unable to provide advice on individual property values. The 'focussed area of investigation' is a corridor of approximately 2 kilometres width extending approximately 1 kilometre either side of the rail alignment with variations for topography etc. Being within the area of investigation doesn't mean that a property would necessarily be impacted by the Project.</p> <p>The revised draft EIS is unable to comment on property owners' specific financial circumstances or any relationship between personal financial circumstances and the Project.</p> <p>There is no legislative requirement to pay compensation for a loss in property value unless the Project intended to acquire land of that property.</p>	<p>N/A</p>
90	90.0002	Private	Social Impact Assessment	Operational rail noise	<p>The submitter's home is about 600 m from project and is concerned about the impact operational rail noise will have on their health and well being. Noise travels very easily in a country setting with no barriers.</p>	<p>Nil.</p>	<p>Assessment of rail noise is detailed in Appendix W: Noise and Vibration Assessment - Railway Operations which indicates that the predicted noise levels would exceed the noise assessment criteria requiring mitigation measures to be investigated for some sensitive receptors (Section 10). At a distance of 600 metres, assessment of operation noise impacts indicates that exceedance of noise criteria is unlikely, however detailed noise contour mapping and assessment has been undertaken to identify those sensitive receptors where noise exceedances may be experienced and that would require noise mitigation measures (Appendix D and Appendix F of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The assessment presented in Appendix W: Noise and Vibration Assessment - Railway Operations of the revised draft EIS concludes that based on the predicted noise levels and the remoteness of the sensitive receptors, feasible and reasonable measures to suitably reduce railway noise impacts are expected to be limited to property controls such as architectural property treatments and upgrades to property fencing. Mitigation measures are discussed in Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Sensitive receptors located on land within the Project footprint would be acquired to enable construction of Project. Beyond this distance, noise mitigation measures will be investigated and implemented in consultation with affected property owners.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 10</p> <p>Section 16</p> <p>Appendix D</p> <p>Appendix F</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
90	90.0003	Private	Air Quality	Water quality	Water used for the household could become contaminated from dust generated by the project. Dust will also impact on filters and films of dust will cover the inside of the submitter's home.	Nil.	<p>Whilst the construction and operation of the Project will result in emissions to air, the assessment of the Construction Works and Operations stages has determined that the impact to sensitive receptors, including the landholder's dwelling, as a result of air emissions will not be significant with the inclusion of recommended mitigation measures.</p> <p>Construction dust emissions have been assessed for the potential to impact human health (i.e., airborne dust which can be inhaled) and cause nuisance or amenity impacts (i.e., deposited dust). The assessment of construction has considered the type of emission sources present during construction, the magnitude of the expected dust emissions, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. It is expected that these adopted mitigation measures would also limit any potential dust deposition within households. Overall, with the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts for impacts to health and nuisance/amenity will be low or negligible.</p> <p>The operational air quality assessment determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in Chapter 12: Air Quality) for all pollutants. The assessment determined that the worst affected (highest cumulative prediction) receptor for deposited dust is receptor R539. The predicted maximum cumulative dust deposition level at R539 was 50.1 milligrams per square metre per day (mg/m²/day), which is well below the air quality goal (120 mg/m²/day), and represents 41 per cent of the goal.</p> <p>Based on the results of the assessment, dust emissions from the Project are not expected to result in significant impacts and will not impact on filters, or cover the inside of dwellings with films of dust.</p> <p>The air quality assessment also quantitatively investigated potential impacts to tank water quality during the operation of the Project. As noted in Chapter 12: Air Quality, Section 12.5.1, predicted pollutant concentrations were more than a thousand times lower than the drinking water guideline values prescribed by the <i>Australian Drinking Water Guidelines</i> (National Health and Medical Research Council and National Resource Management Ministerial Council 2022) for all pollutant species of concern.</p> <p>Based on the results of the assessment, impacts to tank water quality are not expected to be significant.</p> <p>Further information on the results of the Construction Works and Operations stage assessment on impacts to air quality and tank water quality are presented in Chapter 12: Air Quality. Section 12.5. Section 12.6.3 of the Chapter present the mitigation measures which have been recommended for the Construction Works stage of the Project. The recommended mitigation and management strategies will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 12: Air Quality Section 12.5 Section 12.6.3 Chapter 24: Draft Outline Environmental Management Plan
90	90.0004	Private	Traffic and Transport	Road safety	Submitter lives on a crest and is concerned about construction traffic going past their property creating dust and causing a hazard when entering and exiting their property.	Nil.	<p>The potential risk of dust emissions has been assessed in Appendix R: Air Quality Technical Report for the Project stages, Detailed Design, Pre-Construction Activities and Early Works and Construction Works. Proposed mitigations for dust generation from earthworks, blasting, clearing and grubbing, construction activities, concrete batching and exposed areas within the construction footprint include but are not limited to:</p> <ul style="list-style-type: none"> Development of an Air Quality and Dust Management Plan prior to construction commencing. The Plan will include the multiple measures, tailored to be specific to the construction methodology (detailed in Appendix R: Air Quality Technical Report, Section 8.3, Table 8-2) Implementation of controls to prevent/minimise dust generation during activities involving excavation or disturbance of soils or vegetation, or handling ballasts Determination of which dust controls to apply in a given instance will be guided by the objective to minimise the use of water during construction to that absolutely necessary (Appendix R: Air Quality Technical Report, Section 8.3, Table 8-2). <p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties (Appendix R: Air Quality Technical Report, Section 8.3 Table 8-2).</p> <p>The agreements may include:</p> <ul style="list-style-type: none"> Measures to minimise property impacts, including on agricultural operations Specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible Measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities Required adjustments to affected structures. <p>ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services and school services) through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	Appendix R: Air Quality Technical Report Section 8.3 Table 8.2
90	90.0005	Private	Surface Water		Submitter concerned about project impacts on the feed quality of their livestock and the health of livestock water flow for their dams.	Nil.	<p>The revised draft EIS assesses water quality impacts against the ANZG guidelines for 95% species protection of water quality and EPP (protection of aquatic ecosystems) which are typically more stringent in terms of guideline values for assessing water quality than drinking water quality guidelines. Noting this, Chapter 13: Surface Water, Section 13.6.2, Table 13-16 details the mitigation and management measures that will be undertaken in detailed design, informed by detailed water and hydrology assessments and in conjunction with the contractor's CEMP. These are expected to confer protection to aquatic system environmental values in addition to providing the protection required for human use (as an environmental value).</p>	Chapter 13: Surface Water Section 13.6.2 Table 13-16
90	90.0006	Private	Surface Water	Erosion	Submitter concerned that the project will change the flow of water and cause erosion or damage to their existing contour banks.	Nil.	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIO's, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures (Section 22.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>The flood modelling and drainage assessment methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 22.3
91	91.0001	Private	Project alignment		The proposed design has a curvature of just 800 m, which is too tight and much less than the Queensland standard of 2200 m.	At the very least a curvature not less than 1200 m should be adopted.	<p>The submitter has raised an important point regarding horizontal curvature requirements in railway track design. ARTC basis of design standards have been summarised in Section 5.4 of Chapter 5: Project Description, which discusses the parameters used for design to meet the Inland Rail Program service offering.</p> <p>The development of the Basis of Design has been informed by relevant ARTC and Australian standards which form the minimum requirements for which designs are produced. As specified in the Basis of Design, 1,200 m radius curves have been designed, which are technically compliant for 1800 m long trains achieving the desired speed of 115 km/h.</p> <p>ARTC firmly believes that the rail alignment design is both technically compliant and safe. We have taken all necessary measures to ensure that the design meets the required standards and guarantees the safety of train operations.</p>	Chapter 5: Project Description Section 5.4
91	91.0002	Private	Project alignment		There are reverse curves with a radius of 1200 m between 71 km and 77 km as shown on the Future Freight maps.	Avoid so called 'reverse curves' which are two or more curves in close proximity where the train moves in one direction, and then another.	<p>The submitter has raised an important point regarding "reverse curves" in railway track design. Reverse curves refer to sections where the direction of alignment curvature changes in an opposite direction (or S-shape), typically without or with a minimal straight Section in between. It is acknowledged that careful design and consideration are required for reverse curves to ensure safe and efficient train operations. The curvature and transition between reverse curves are required to prevent issues such as excessive lateral forces on the train or potential derailment. The design must adhere to engineering standards governing rail alignment and safety.</p> <p>As per Appendix B1: Design Drawings, the locations identified by the submitter, specifically "between Ch 71 and Ch 77," include two 80 m long transitions and a 292 m long tangent (straight track) between the curves. This configuration is technically compliant with the Inland Rail Basis of Design and allows 1800 m long trains to achieve the desired target speed of 115 km/h.</p> <p>The use of reverse curves in railway design enables designers and rail authorities to closely follow the natural contours of the land, minimising the need for extensive earthworks and reducing the overall environmental impact. Additionally, in this specific location, the implementation of reverse curves allowed for a less skewed angle when crossing the road-rail interface of Millmerran Inglewood Road, thereby improving safety.</p> <p>ARTC firmly believes that the rail alignment design is both technically compliant and safe. We have taken all necessary measures to ensure that the design meets the required standards and guarantees the safety of train operations.</p>	Appendix B1: Design Drawings
91	91.0003	Private	Project alignment	Level crossing	The Future Freight maps show a crossing of the Millmerran at Inglewood Road between 71 km and 77 km. The Exec Summary notes Table 6 Road interface treatments included in the reference design and Table 3 List of bridges.	Include a detailed list of all level crossings too.	<p>The Executive Summary provides an overview of each of the chapters included within the revised draft EIS. The Executive Summary provides a summary of road rail interface treatments in the revised reference design including level crossings and grade separated crossings.</p> <p>Road-rail interfaces are described in Chapter 5: Project Description, Section 5.4.8 and their locations displayed in Appendix AA: Traffic Impact Assessment, Figure 1.2. Proposed public road–rail interfaces and proposed treatments included in the revised reference design are provided in Chapter 5: Project Description, Table 5-14.</p>	Executive Summary Chapter 5: Project Description Section 5.4.8 Table 5-14 Appendix AA: Traffic Impact Assessment Figure 1.2
91	91.0004	Private	Project alignment		The current ARTC crossing loop ruling length is 1800 m. Class I railroads in Canada are no moving to 3600 m.	At least 2700 m for crossing loop lengths should be used on new construction for the project.	<p>The revised draft EIS investigations are limited to the impacts of trains of 1,800 metre (m) length. As stated in Chapter 5: Project Description, Table 5.4, for Inland Rail and the Project:</p> <ul style="list-style-type: none"> The reference train is of 1,800 m length The performance specification for crossing loops is 2,200 m length to accommodate 1,800 m trains. <p>The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains are not part of the proposal for which approval is being sought.</p> <p>Moving to 3,600 m trains would be reliant upon the maturity of Inland Rail network volumes warranting more efficient, longer and heavier train. Design alterations such as the length of crossing loops and software upgrades to signalling systems would be required, which are not part of this approval process. The transition to 3,600 m long trains is driven by market demand and may occur in the indeterminate future, which is why it is unsuitable for it to form part of the EIS assessment.</p>	Chapter 5: Project Description Table 5.4
91	91.0005	Private	Project alignment		Project does not meet the standards agreed for the interstate rail network in the longer term.	<p>The Project should meet the agreed standards, along with increased clearances to allow double stacking of containers:</p> <ul style="list-style-type: none"> axle loads up to 21 tonnes a maximum speed of 125 km/h and an average speed of 100 km/h at axle loads between 21 and 25 tonnes a maximum speed of 100 km/h and an average speed of 80 km/h. 	Road-rail interfaces are described in Chapter 5: Project Description, Section 5.4.8 and their locations displayed in Appendix AA: Traffic Impact Assessment, Figure 1.2. Proposed public road–rail interfaces and proposed treatments included in the revised reference design are provided in Chapter 5: Project Description, Table 5-14.	Chapter 5: Project Description Section 5.4.8 Table 5-14 Appendix AA: Traffic Impact Assessment Figure 1.2
91	91.0006	Private	Project alignment		60 kg per metre will be used on this Section of the railway. This is commended.	Nil.	ARTC note the support of the use of 60 kg rail.	N/A
91	91.0007	Private	Project alignment		The project proposes for all but 7 km of the 216 km length be dual gauge track. Submitter suggests two more cost effective alternatives.	Viable alternatives are available and are in need of urgent review.	<p>As described in Chapter 5: Project Description, Section 5.4.1, the Basis of Design has been developed across the Inland Rail program. The purpose of this design framework is to ensure consistency in design requirements and parameters across the Inland Rail Program.</p> <p>The Border to Gowrie Section of the Inland Rail Program comprises of dual gauge track to accommodate both standard gauge and narrow-gauge trains. This design enables seamless interoperability between the new Inland Rail infrastructure, the existing QR network, and their respective operators. The primary goal is to meet the operational needs of existing services in Queensland while also facilitating the transportation of freight between Melbourne, Brisbane, and various intermodal hubs.</p> <p>It is important to note that the operation of the QR network and any upgrades or modifications to it fall under the jurisdiction of the Department of Transport and Main Roads, acting as the rail authority. If there are proposed modifications that go beyond the scope of the current Inland Rail Program, such as upgrading from narrow gauge to standard gauge, the appropriate course of action would be to directly submit those proposals to the respective rail authority. The submitter may not fully understand the costs involved in the alternatives, such as upgrading the QR narrow gauge to standard gauge beyond the Project limits, and the potential negative impact on business opportunities in Queensland by limiting the dual gauging to the QR South Western Line between Kildonan and Whetstone.</p>	Chapter 5: Project Description Section 5.4.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
91	91.0008	Private	Project scope		The project should be capable of conveying passengers.	Nil.	Inland Rail will be open for any accredited operator to run a train along the rail line, once operational. The Business Case is based upon operators transporting freight (domestic goods) across a range of sectors to our cities, such as fresh food, packaged goods, hardware, white goods, and bulk goods. Inland Rail is freight infrastructure, however, the decision to run passenger services will be a matter for each State Government or for private operators. ARTC, the operators of Inland Rail, have a long history of working with Government and private operators to ensure passenger trains have access to the national rail network. This will continue to be the case for Inland Rail; however, due to the lack of available passenger stations along the alignment, it has not been factored into our assessments.	N/A
91	91.0009	Private	Air Quality		Reduction of emissions are considered as important, but appear to be lightly treated in the Exec Summary for the EIS. The project would result in a reduction in emissions (CO2 equivalent) of about 250,000 tonnes per annum.	Nil.	The Project, and the Inland Rail Program as a whole provides the opportunity to lower freight transportation emissions by providing for a mode shift from freight to rail. Transportation of freight via the Inland Rail Program is expected to use approximately one-third of the fuel when compared to transportation of the same volume of freight via existing road routes. Reduction in fuel usage and greater efficiencies in freight transportation will result in a significant overall reduction in greenhouse gas emissions. The Executive Summary and Chapter 25: Conclusions have been updated to recognise these sustainability Project benefits.	Executive Summary Chapter 25: Conclusions
91	91.0010	Private	Economics		External costs are important yet do not appear to be addressed in the Exec Summary of the EIS. Submission outlines two broad scenarios: 1. Inland Rail does not go ahead, and continued reliance on high levels of road freight. 2. Inland Rail proceeds to good engineering standards.	Project should be construction to North American Class 1 railroad standards.	ARTC acknowledges, due to the nature of the incremental assessment approach adopted for this revised draft EIS, that a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with the Queensland Government, costs have not been included in the Appendix Y: Economic Impact Assessment technical report. The North American Class 1 railroad standards are not applicable in Australia. ARTC will comply with all relevant Commonwealth and State legislative requirements in relation to the design, construction and operation of a transport freight infrastructure Project.	
92	92.0001	Private	Land Use and Tenure		Need to ensure access is provided across the rail corridor as the corridor severs off the best black soil farming country, creek frontage and water sources for the entire property. This farming land is also used to grow stock feed which is particularly critical in times of drought.	Need to secure access to the bottom half of their farm once the corridor is in place, and need to secure a definite and continuous water supply.	As stated in Chapter 8: Land Use and Tenure, Section 8.6.3, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Potential impacts on agricultural uses and activities are described in Chapter 8: Land Use and Tenure, Section 8.5.1. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. As detailed in Table 8-51 (Section 8.6.3) of Chapter 8: Land Use and Tenure, ARTC will continue to work with directly affected landowners whose property would be partially or fully acquired for the Project regarding land acquisition following the EIS process. ARTC's strategy to reduce the impacts of property acquisition on landowners, tenants and their families include: <ul style="list-style-type: none"> Consult directly affected landowners and tenants who would need to relocate as the result of the Project's land acquisitions, to identify their specific needs and concerns and refer them to services that can support them in the relocation process if required Confirm property-specific management measures Provision of a relocation support team who will provide information, liaison and if necessary, service referrals to residents who need to relocate Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Section 8.6 of the revised draft EIS for further detail.	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6 Section 8.6.3 Table 8-51
92	92.0002	Private	Surface Water	Directly impacted landowner	Want to ensure they will have access to the same amount and quality of water as they currently do. The corridor will sever their current water sources from the remainder of the property. Can their current water entitlement be transferred to a new bore if no access provided to current bore.	Need to secure access to the bottom half of their farm once the corridor is in place, and need to secure a definite and continuous water supply.	It is acknowledged that the submitter's property will be substantially impacted by the Project. ARTC is in the process of consulting with landowners to determine an appropriate make-good strategy on a case-by-case basis. Through this process, the measures developed for each impacted property will be unique and commensurate with the level of impact realised. <u>Groundwater bore</u> Where a groundwater bore is expected to be decommissioned or have access/usage impaired as result of the Project, 'make good' measures will be agreed in consultation with the affected landowners during detailed design. An overview of the proposed groundwater bore 'make-good' process is presented on Figure 15-31 (Section 15.7.4) of Chapter 15: Groundwater. If the landowner does not accept the 'make good' assessment (either whether there is an impairment in the first place, or the level of impairment), ARTC will: <ul style="list-style-type: none"> Advise the landowner that they are entitled to obtain an assessment from a suitably qualified person (SQP) Advise the landowner that ARTC will pay their reasonable costs Provide ARTC's bore assessment to the landowner for review by the landowner's SQP Advise landowners of their expectations as to the reasonable costs of obtaining a bore assessment. <u>Surface water storages</u> The detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner (Chapter 13: Surface Water, Section 13.6.2 Table 13-16). Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).	Chapter 13: Surface Water Section 13.6.2 Table 13-16 Chapter 15: Groundwater Section 15.7.4 Figure 15-31
92	92.0003	Private	Land Use and Tenure	Severance of agricultural land	The rail corridor will sever off the best farming country and creek frontage of the entire property. The compensation needs to take into account all factors not just current land value (lost income over time, inconvenience, livelihood, possible devaluation of whole property). Corridor is going to resume rich black soil creek flats. This is the best soil which cannot be replaced.	Need to secure access to the bottom half of their farm once the corridor is in place, and need to secure a definite and continuous water supply.	Potential impacts on agricultural uses and activities are described in Chapter 8: Land Use and Tenure, Section 8.5.1. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties (including compensation requirements) will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2 and 8.6.3). Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption as well as any damage caused by severance or injurious affection to the balance land and disturbance cost. ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises (Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-51). This has included the identification of: <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. This will inform development of the detailed design and Construction Environmental Management Plan. Refer to Chapter 8: Land Use and Tenure, Section 8.6 of the revised draft EIS for further detail.	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2 Section 8.6.3 Table 8-51
92	92.0004	Private	Noise and Vibration	Mitigation measures	How is the noise going to be managed/mitigated? Two houses on their property are approximately 265 m from the train line. This may make them unrentable.	Nil.	The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). Based on the owner's provided address in the submission, the owner's property is identified with a receptor ID 2008349. The operational railway modelling results have indicated the $L_{eq(24 hr)}$ and the SEM criteria are not triggered for this receptor. The modelling results are further discussed and detailed in Section 10, Appendix D, and Appendix E of Appendix W: Noise and Vibration Assessment Railway Operations. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 10 Section 17 Appendix D Appendix E
92	92.0005	Private	Social Impact Assessment	Land acquisition/com pensation	As a landowner the process is taking too long and we need certainty to provide security for future planning and to provide stable emotions surrounding land acquisition.	Nil.	ARTC acknowledges that the duration of the design and EIS process has resulted in stress and uncertainty for landowners whose property may be acquired. ARTC has met with affected landowners to explain the status of the land acquisition process and the likely timing for acquisition processes to commence (i.e. post EIS approval). With the exception of early acquisitions by ARTC based on demonstrated hardship, the majority of land required for the Project will be acquired for the Project by Department of Transport and Main Roads under the <i>Acquisition of Land Act 1967</i> (Qld). However this can't commence until the Project is approved. The acquisition and consultation processes for the Project are outlined in Chapter 8: Land Use and Tenure and Appendix E: Consultation Report. A full list of properties expected to be impacted by the Project are outlined in Appendix F: Impacted Properties.	Chapter 8: Land Use and Tenure Appendix E: Consultation Report Appendix F: Impacted Properties
93	93.0001	Private - Brookstead	Stakeholder engagement	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project.	The SIA Survey should be repeated.	This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Section 4.3 notes that the survey did produce not produce a statistically valid report for the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope. The Social Impact Assessment (Appendix X: Social Impact Assessment Technical Report) has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the SIA study area and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).	Appendix E: Consultation Report Section 4.6 Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
93	93.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing. Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry. The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement. ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
93	93.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines. Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Section 5.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations. ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.	Chapter 16: Noise and Vibration Section 16.5 Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
93	93.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4
93	93.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 14 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none">Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks.Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways.Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning.Confirm all relevant school bus services to enable consultation with the operators.Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none">Commence implementation of management measures relating to schools as agreed during the Detailed Design stage.Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks.Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Section 17.6 Table 17-41 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
93	93.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none">ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community.ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners.The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.	<ul style="list-style-type: none">Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication.Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses.The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process.Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none">The first meeting in Millmerran:<ul style="list-style-type: none">ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development.ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts.A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6.Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows.Condamine floodplain:<ul style="list-style-type: none">Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS.In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022.ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3.Social Impact survey:<ul style="list-style-type: none">A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope.ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).Future consultation:<ul style="list-style-type: none">As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. <p>Chapter 24: Draft Outline Environmental Management Plan notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures, and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p>	Chapter 6: Stakeholder Engagement Section 6.2.4 Section 6.2.5 Section 6.3 Section 6.4 Section 6.6 Table 6.11 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 2 Section 2.1 Section 4 Section 5.3 Section 5.5 Section 6 Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
93	93.0007	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none">Concern raised with respect to the community consultation program and the claim in the EIS SIA, that the SIA engagement is inclusive of all interested stakeholders, yet the Pampas Rural Neighbourhood Watch Committee has not been approached by ARTC or consulted with in any way.The Pampas Rural Neighbourhood Watch Committee note that they have not been listed as an Impacted Community Group within their community (Appendix C, Table 2.2).The submitter states that given past performance of ARTC's lack of professional communication and ineffective engagement strategies, together with an approach that is devoid of empathetic and sensitive consideration of community mental health and well-being, they do not have confidence in their ability to oversee or develop a detailed Community Wellbeing Plan.	<ul style="list-style-type: none">The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The Wellbeing Plan must be developed by an independent facilitator working independently of ARTC as their stakeholder engagement has been unsuccessful and has had a negative impact on community health and well-being.The draft EIS is incomplete as indicated in Table 23.5. The true social impact on the communities of Pampas, cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.	<p>ARTC notes that it has undertaken extensive engagement with residents in the Pampas area. The list of community groups in the revised draft EIS has been updated to include the Pampas Rural Neighbourhood Watch Committee.</p> <p>As the submitter has noted, during the Project's Detailed Design stage, ARTC will work to finalise the Project's Community Wellbeing Plan, including further stakeholder consultation, and detailing measures that addressing impacts on local amenity, character, cultural landscapes, cohesion or connectivity. This commitment is noted in Appendix AC: Proponent Commitments and detailed in Appendix X: Social Impact Assessment Section 8 outlines the Project's Social Impact Management Plan (SIMP).</p> <p>Design is an iterative process and landowners have been provided with information as it becomes available. As noted in the Proponent's Statement of Commitments, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>Chapter 24: Draft Outline Environmental Management Plan notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures, and provide support to stakeholders and communities that are facing change due to the Project, as well as other relevant tasks.</p>	Appendix E: Consultation Report Section 5.11 Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
93	93.0008	Private - Brookstead	Social Impact Assessment	Mitigation measures	<p>► Pampas Rural Neighbourhood Watch Committee raises concern with respect to the SIA stating that the rates of crime in all three SA2s were well below the rate for Queensland, however the Pampas Neighbourhood Watch group has already noted increased activity around assessment and planning phases including ARTC and contractors within the local community.</p> <p>► There have been instances of trespass where contractors have entered private property without land access agreement.</p> <p>► There have been requests from local residents to ARTC to have all contractors vehicles clearly labelled so that increased activity can be validated as IR related, and monitored by the local neighbourhood watch group. The submitter states that it is essential to maintain current safety standards and low crime rates within the community, and the submitter notes that contractors constantly disregard this request.</p> <p>► There is genuine concern within the Pampas Neighbourhood watch group that work camps and contractor engagement through construction phase will erode the safety standards and low crime rates which are currently experienced in the small, cohesive rural community.</p> <p>► Pampas Rural Neighbourhood Watch Committee notes that no specific risk avoidance or mitigation measures have been addressed in the EIS around community safety due to increased construction activity, thus contravening TOR 11.140.</p>	<p>► The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The Wellbeing Plan must be developed by an independent facilitator working independently of ARTC as their stakeholder engagement has been unsuccessful and has had a negative impact on community health and well-being.</p> <p>► The draft EIS is incomplete as indicated in Table 23.5. The true social impact on the communities of Pampas, cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>ARTC expects a high standard of professional conduct and ethics in our business, and safety is our number one priority. All ARTC employees, directors, contractors and consultants must comply with the ARTC Code of Conduct, with breaches resulting in disciplinary action including dismissal or termination of contract. There is no evidence to suggest that non-local construction workers will contribute to increased crime in local towns. Appendix X: Social Impact Assessment, Section 7.4.7 notes that ARTC will employ strategies to reduce concerns about, and potential impacts on, community safety including:</p> <ul style="list-style-type: none"> ► Enforcing a Code of Conduct containing requirements for positive behaviours and respect for local residents and businesses applying to all contractor and Project personnel ► Ensuring that the Principal Contractor has appropriate workforce conduct policies and procedures, complemented by complaints mechanisms which ensure fast and effective resolution to any issues experienced ► Appropriate authorisation procedures and means of identification for personnel accessing private property <p>Prior to undertaking field work, all contractors and subcontractors are required to participate in an induction conducted by ARTC or representative. This includes the land access process, and behavioural expectations in the field, including branding of vehicles and engaging with stakeholders. All incidents, including contractors inadvertently accessing an incorrect property, are reported to the ARTC stakeholder engagement team to follow up with the landowner. ARTC responds to complaints from community members in line with the ARTC Complaints Management Handling Procedures, and all stakeholder issues are recorded, categorised and analysed, and responded to within set timeframes, with the minimum standards outlined in Appendix E: Consultation Report, Table E-5.</p> <p>Additionally, with regard to non-resident workforce accommodation, ARTC will require the Principal Contractor to develop an Accommodation Management Plan, which will include a Section detailing how the non-resident workforce accommodation will be managed to avoid impacts on nearby landowners and communities, including management of workforce behaviour (Appendix X: Social Impact Assessment, Section 8.4.4).</p> <p>The timing for development of the Community Wellbeing Plan as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that:</p> <ul style="list-style-type: none"> ► The Project's detailed design may change the location or nature of impacts requiring mitigation ► Stakeholders need the opportunity to understand specific impacts before they can confirm priorities for implementation ► Councils and communities have a range of interests in responding to Inland Rail, with time needed to consider local priorities ► ARTC is unable to make further financial commitments until after the Project evaluation is completed. <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing plan during the revised draft EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 6.1.</p> <p>Additionally, ARTC has sponsored 'Living in Place', an independent survey run by social research specialists, to provide a statistically valid and ongoing monitor of community values and experiences, as well as an exploration of residents most pressing local area concerns as they relate to the liveability of their local area. This monitoring tool will be initiated in the Project Approvals and Corridor Acquisition stage of the Project and will enable all local stakeholders to build an understanding of top local area concerns, how they change over time, and how they compare beyond, across and within their Local Government Area.</p> <p>Appendix X: Social Impact Assessment, Section 8.5.6 has been updated in this regard.</p>	<p>Appendix E: Consultation Report</p> <p>Table E-5</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 6.1</p> <p>Section 7.4.7</p> <p>Section 8.4.4</p> <p>Section 8.5.6</p>
94	94.0001	Private - Brookstead	Social Impact Assessment	Modelling	<p>► The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.</p> <p>► The SIA survey does not represent views of the community members who may be impacted by the project.</p>	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
94	94.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<p>► The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase.</p> <p>► The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
94	94.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport Infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Section 5.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p>
84	94.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 1 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>
94	94.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> ► Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. ► Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. ► Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. ► Confirm all relevant school bus services to enable consultation with the operators. ► Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> ► Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. ► Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. ► Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
94	94.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
95	95.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
95	95.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
95	95.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Section 5.1.3 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p>
85	95.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
95	95.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report, Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
95	95.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>A range of targeted engagement tools were used to inform the SIA, including the Social Impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p> <p>Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable, and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3.</p> <p>There has been ongoing engagement with the communities, businesses and local road users along the alignment during the development of the revised draft EIS, and changes to the reference design have been made in response to stakeholder input and feedback. Details of traffic and transport consultation outcomes are in Appendix E: Consultation Report, Section 5.5.</p> <p>The reference design is an iterative process, and stakeholder engagement is ongoing. As noted in Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
96	96.0001	Community Group	Traffic and Transport	Level crossing	Level Crossing - safety with heavy vehicles	Active level crossing east of Sawmill Road-Suttons Road	<p>Appendix AA: Traffic Impact Assessment, Section 5.2.3 discusses the Construction Works stage road-rail interface assessment and required mitigation.</p> <p>With regard to the level crossing at East Sawmill Road/Suttons Road, the existing crossing is a passive level crossing, with gravel approaches on both sides.</p> <p>The proposed upgraded treatment of Sutton Road crossing will be a passive control crossing to the required standards of AS1742.7. Additionally, the Project is upgrading the road approaches to the required geometrical standards and sight distance requirements to ensure compliance with engineering standards. The crossing will also be temporarily closed during the Construction Works stage to upgrade the crossing. In addition, road safety audits will also be required to be undertaken based on the design and based on as-constructed conditions.</p> <p>The revised reference design provides sufficient stacking distance to accommodate for the largest design vehicle (36.5 m Road Train). As per AS1742.7 a distance comprising the design vehicle plus a safety factor of 5 m stopped at the intersection without fouling the tracks is required. Stacking of >200 m is available.</p> <p>In addition to this specific safety measures for the given location, there a number of project-wide safety requirements for all road rail interfaces which detailed in the remainder of the aforementioned Section of the Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.3</p>
97	97.0001	Private	Land Resources	Severance of agricultural land	Project will impact prime agricultural land. Concerns about stability of the line and that the line crossing flood plain in the widest area.	Prime agricultural land should not have a rail line built on it.	<p>As described in Chapter 2: Project Rationale of the revised draft EIS (Section 2.8-2.10), a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that there will be a loss of agricultural land that cannot be avoided. Chapter 8: Land Use and Tenure, Tables 8-31 and 8-32, have been updated for the revised draft EIS, detailing land to be sterilised due to the revised alignment. The Project will sterilise productive agricultural land within the Project footprint, which has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1.</p> <p>Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses:</p> <ul style="list-style-type: none"> 0.02 percent of Class A land, 0.02 percent of Class B land, and 0.01 percent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none"> 0.17 percent of Class A land, 0.22 percent of Class B land, and, 0.19 percent of IAA land <p>Where the loss of agricultural land could not be avoided, refinement of the horizontal alignment was considered (among other environmental, social, cultural, economic and technical constraints) to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible. ARTC will continue to engage with affected landowners to minimise impacts on existing agricultural practices.</p> <p>Regarding concerns about the flood impacts, Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Table 7-43 Condamine River - Summary of flood impacts on private land outside the rail disturbance footprint, presents a summary of private properties located outside the rail disturbance footprint with potential Flood Impact Objectives (FIO) exceedances due to the potential Project rail impacts. Section 7.5, Appendix T1: Hydrology and Flooding Technical Report - Volume 1 provides a summary of key impacts, exceedance justification and mitigation measures. The hydraulic impacts in the local catchments are considered 'localised' compared to regional flood impacts due to the shorter time of flood inundation, shallower depths and smaller flood extents.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Table 8-31</p> <p>Table 8-32</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 7.5</p> <p>Table 7-43</p>
97	97.0002	Private	Social Impact Assessment		Submitter is concerned one of his houses will be uninhabitable due to noise and vibration from the railway.	Pick another route where less people are affected.	<p>The EIS Terms of Reference (see Appendix A2: Terms of Reference Cross Reference Table) require the revised draft EIS to assess the nominated route, which was selected after extensive analysis and consultation, as described in Appendix E: Consultation Report.</p> <p>Where noise or vibration would affect the amenity of houses, mitigation measures would be triggered, and would be selected on consultation with the property owner.</p>	<p>Appendix A2: Terms of Reference Cross Reference Table</p> <p>Appendix E: Consultation Report</p>

98	98.0001	State Agency	Social Impact Assessment		<p>Accommodation Management Plan. The department supports most of the EIS proposals outlined in the Accommodation Management Plan (AMP) in 15.9.4 to manage impacts on affordable housing and short-term accommodation and the related monitoring framework Section outlined in Table 15.26.</p> <p>However, the department notes that the displacement of households from residential properties required by this project and related impact mitigation proposals for them are not documented in the AMP. Further it is noted that the EIS provides no breakdown of the tenure of the residential properties to be acquired because of this project.</p> <p>Consequently, the CEMP and CWP would appear to have been prepared in the absence of required data, with the former focusing primarily on liaising with, and managing impacts for, landowners (potentially owner occupiers and landlords) and the latter addressing support for landowners and tenants should they request assistance.</p> <p>This tenure information is required for the comprehensive assessment of project impacts and formulation of more complete impact mitigation proposals given historically tight rental markets in the affected Councils and the very limited current capacity of local region townships to absorb new rental demand.</p> <p>The tenure of residential properties required for acquisition needs to be identified in the EMP's detailed design phase of refining the permanent project impact footprint so it is available to inform the likely need for an upgraded AMP, CEMP, CWP and monitoring framework.</p> <p>Given current challenging market conditions, the department considers that the proponent in this phase needs to determine the number of tenants the property acquisitions will displace and the cost of a tenant support program (if tenants are identified) on the basis of the number of tenants and a commitment to proactively assist them to find alternative accommodation (inclusive of relocation and associated costs). Thus, if displaced tenants are identified, the proponent will be able to put in place an upgraded program for delivery by either a principal project contactor or a community organisation that will more comprehensively and proactively address household displacement.</p> <p>Accordingly, it is recommended that this matter be addressed via a condition in any project approval granted by the Coordinator General.</p> <p>In addition, it is recommended that ongoing compliance with the resultant plans and the related monitoring framework elements stemming from this requirement be subject a condition of any project approval granted by the Coordinator-General (CG).</p>	<p>A CG condition of approval requiring the proponent to determine in the detailed design phase the number of tenants project property acquisitions will displace and the cost of a tenant support program (if tenants for displacement are identified) on the basis of the number of tenants and a proponent commitment to provide staff and funds to proactively assist them to find alternative accommodation (inclusive of relocation and associated costs).</p> <p>This above condition should include a clause, that in the event of displaced tenants being identified in the projects detailed design phase, the proponent will provide an upgraded AMP, CEMP and CWP and monitoring framework incorporating a commitment to fund a tenant support program based on this condition for delivery by either a principal project contactor or a suitable community organisation.</p> <p>A CG condition requiring the proponent to conform with the resultant AMP, CEMP, CWP and the related monitoring framework elements upon the completion of work required by the above condition.</p>	<p>The Accommodation Management Plan addresses workforce accommodation. Relocation of residents and support for the residents is addressed as part of the Community and Stakeholder Engagement measures in Appendix X: Social Impact Assessment, Section 8.2.2. ARTC will provide assistance to residents who are displaced by property resumption activities, including tenants.</p> <p>On the basis of the proposed revised reference design and consultation with landowners to date, ARTC anticipates that the land acquisition requirement will include up to 30 residential dwellings, requiring affected households to relocate. Approximately three of the affected dwellings are rented to tenants who would also need to find alternative accommodation (Appendix X: Social Impact Assessment, Section 7.1.2). The currently very tight rental market is noted, however the requirement for three new rental dwellings is not a major requirement.</p> <p>As noted in the Department's submission, land acquisition requirements may change during the detailed design process. Consultation between the Constructing Authority and specific landowners regarding impacts on properties and the compensation payable will be undertaken during the Detailed Design stage. These two processes may affect the number of residents, including landowners and tenants, who would relocate.</p> <p>Prior to conclusion of the Detailed Design stage, and consequent to the outcomes of the Department of Transport and Main Roads' negotiation with landowners, the Project will confirm the number of tenants and the number of landowners who would need to relocate, in order to calibrate the level of assistance required, e.g. the number of tenants who would require the support of tenancy services to relocate, and the level of assistance services required from ARTC to support relocating tenants and other residents. If landowners or tenants who would need to relocate identify a need for support, ARTC will consult with Department of Communities, Housing and Digital Economy (DCHDE) regarding access to DCHDE programs and any need for any additional funding for a locally based community organisation to assist residents to access alternative accommodation and support services, with funding arrangements to be agreed between DCHDE and ARTC. The social impact assessment (SIA) has been updated in this regard (Appendix X: Social Impact Assessment, Section 7.1.2 and 8.4.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.2</p> <p>Section 8.2.2</p> <p>Section 8.4.2</p>
99	99.0001	Private	Stakeholder engagement	Workforce accommodation village	<p>Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran.</p> <p>The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan</p> <p>Section 8.4</p>
99	99.0002	Private	Traffic and Transport		<p>a. Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre.</p> <p>b. Increase in traffic on narrow roads that are already heavily traversed.</p> <p>c. Impact on Travel time as it is further from the alignment of the rail project.</p> <p>d. Turallin and Ellerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length.</p> <p>e. Could impact on Millmerran town parking availability.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. 99	99.0003	Private	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
99	99.0004	Private	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6</p>
99	99.0005	Private	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property values. b. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	nil.	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>
99	99.0006	Private	Social Impact Assessment		The camp site could have a possible negative Life Style impact on the small rural historic community.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
100	100.0001	Private	Landscape and Visual Amenity		The railway will be built on an embankment 9 to 15 metres high, which will ruin the rural aspect of the submitter's property and the township of Pittsworth. ARTC has a responsibility to avoid social impacts such as this, especially if there is no way of mitigating or managing it. There are other suitable routes that have been proposed.	<p>Reassess the alignment with serious consideration of the negative impacts at Pittsworth.</p>	<p>The Landscape and Visual Impact Assessment (LVIA) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of potential alternative options that may have been considered.</p> <p>The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artists impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p> <p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.8 and 2.9 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p>
100	100.0002	Private	Traffic and Transport	Road safety	Diverting traffic from Dallman Road down Quibet Road will bring more local traffic to the Quibet Road -Pittsworth/Oakey Road intersection creating more risk of accidents.	ARTC to justify diverting traffic from Dallman Road down Quibet Road	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.9.4 explicitly discusses the diversion from Dallman Road onto Oakey Pittsworth Road. This Section details the rerouting assumptions that have been made and the impacts of the diversion on active and public transport, sight distance, link capacity, intersection performance, turn warrant requirements and safety. In each case, justifications of the diversion and required mitigations are included.</p> <p>Based on the impact assessment and intersection analysis undertaken in the study, the Project will have negligible impacts on the traffic performance of Oakey Pittsworth Road and its intersections with Gore Highway and Quibet Road. Furthermore, the Project is not expected to have significant impacts on public transport operation and active transport on this road and its surrounding road network. From a traffic operation viewpoint, therefore, no upgrades to this road and its intersections with Gore Highway and Quibet Road are proposed as part of this assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.9.4</p>
100	100.0003	Private	Stakeholder engagement		Submitter attended several community meetings and was unable to ascertain answers to their simple requests including why Dallman Road cannot be reopened back onto Locherba Road.	nil.	<p>The revised reference design shows that the access from Dallman Road across the proposed Border to Gowrie rail line to the Gore Highway would be provided via Quibet Road and Oakey Pittsworth Road (see Section 5.9.4 in Appendix AA: Traffic, Transport and Access and Appendix B1: Design Drawings). There is no existing formed road between Dallman Road and Lochaber Road.</p> <p>The design and realignment of roads and road rail interfaces is determined by a number of factors including local government requirements for maintaining connectivity of existing roads, and future proofing the road network. Design of the realignment of Quibet Road was done in consultation with Toowoomba Regional Council to meet local road design requirements.</p>	<p>Appendix AA: Traffic, Transport and Access</p> <p>Section 5.9.4</p> <p>Appendix B1: Design Drawings</p>
100	100.0004	Private	Traffic and Transport	Level crossing	Many level crossings are proposed, which is against the policy of the Office on the National Rail Safety Regulator and Qld's Department of Transport and Main Roads because they are an unacceptable risk to public safety.	<p>Insist the grade separated crossings are built wherever technically possible.</p>	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none">▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019)▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
100	100.0005	Private	Traffic and Transport	Level crossing	ARTC is inappropriately using the ALCAM tool to inform choices of where to build new level crossings. According to its own website, the ALCAM tool is intended to prioritise the upgrading and removal of existing level crossings, not to justify the construction of more.	Insist grade level crossings are built wherever technically possible.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none">▶ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019)▶ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution. 100	100.0009	Private	Noise and Vibration	Operational rail noise	WHO's guidelines are based on the science relating noise nuisance with medical conditions.	Condition ARTC to follow WHO guideline regarding rail noise at night.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
100	100.0010	Private	Noise and Vibration	Mitigation measures	Submitter believes that noise cannot be effectively mitigated at their property because the rail will be elevated near their house. The draft EIS states that there is no provision in the Acquisition of Land Act for ARTC to pay compensation to non-impacted land owners, however they may legally purchase any land they choose.	It should be a condition of the EIS that ARTC be required to offer to purchase any land where they cannot mitigate the nuisance noise.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the Construction Works and Operations stages of the Project. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). DTMR's Interim Guideline requires that ARTC provides reasonable and practicable noise mitigation - there is no requirement for properties to be purchased for noise impacts.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments. The revised assessment is included in Sections 7, 8, 9 and 10 within Appendix: W Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 7</p> <p>Section 8</p> <p>Section 10</p> <p>Section 17</p>
100	100.0011	Private	Groundwater	Private groundwater bore/s	Submitter relies on bore water for everyday living. Draft EIS has not taken unregistered bores into account, and even states that without this added variable their models have a 'high degree of uncertainty'.	Require post compliance monitoring and a feasible plan to supply water to residents in Quibet Road in the event that deep cuts cause unexpected large draw down.	<p>ARTC have undertaken a groundwater bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project (water bores - under the Water Act). This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging, etc (Chapter 15: Groundwater, Section 15.5.4). Real properties (lot/plan) to be intersected by the Project footprint were targeted and landowners were provided an opportunity to be identified via this survey. Revised draft EIS Chapter 15: Groundwater, Section 15.5.4 and Section 15.7.4 have been updated accordingly with groundwater users, potential make-good policy and measures, and detailed in Table 15.20. ARTC is engaged with licenced users/landowners to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/substitution make-good solutions are not required (Section 15.7.4 and Table 15.20 of Chapter 15: Groundwater, Table 8.1 Appendix U: Groundwater Technical Report).</p> <p>Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (Chapter 15: Groundwater, Section 15.4.4). The baseline groundwater dataset, in addition to regular groundwater monitoring during the Construction Works and Operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project. The proposed groundwater management and monitoring program (GMPM) is outlined Chapter 15: Groundwater, Section 15.7.3 and provides a detailed approach to monitoring for impacts during construction.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.4.4</p> <p>Section 15.5.4</p> <p>Section 15.7.3</p> <p>Section 15.7.4</p> <p>Table 15-20</p> <p>Appendix U: Groundwater Technical Report</p> <p>Table 8.1</p> <p>Table 8.2</p>
100	100.0012	Private	Groundwater	Private groundwater bore/s	Where will ARTC source water for construction? ARTC states their preference is to privately purchase water from allocation holders. They have given no indication that they have made overtures to owners of large allocations, or the likelihood of holders being induced to sell. Residents at Pittsworth and Brookstead cannot afford any interruption to groundwater, and all allocations are currently fully subscribed.	Require the construction water management plan to form part of the EIS rather than deferring it to detailed design.	<p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. The current hierarchy of water supply source preferences prioritises non-potable sources to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, trading or purchasing of existing allocated entitlements will be pursued in the first instance through a water broker. Section 5.6.24 of Chapter 5: Project Description of the revised draft EIS details the findings of the current construction water procurement process. Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.24</p> <p>Appendix B5: Construction Water Requirements</p>
100	100.0013	Private	Social Impact Assessment	Property Devaluation	The project will ruin the visual amenity from the submitter's home, potentially cause the submitter's groundwater bore to fail or become contaminated if acid rock drainage is caused by the deep cuts proposed upstream from the submitter's property, and cause loud intermittent noise. For these reasons, the project will devalue the submitter's property.	Nil.	<p>The EIS is unable to provide advice on individual property values.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.6, acknowledges that the intensification of the rail corridor in the Project's brownfield sections and the location of Project infrastructure in greenfield sections may affect residents' enjoyment of local character and their sense of place.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.5 and 7.1.6, also notes that where operational noise would exceed noise criteria, noise mitigation measures such as architectural treatments would be implemented to reduce noise to below the criteria.</p> <p>ARTC has committed to undertaking an additional bore survey prior to construction of the Project to confirm the presence and location of registered water bores (under the <i>Water Act 2000</i> (Qld)) and to identify any unregistered bores that may be impacted from the Project. ARTC will then engage with licenced users and landowners with bores to determine an appropriate make-good mitigation strategy on a case-by-case basis. Where drawdown impacts are anticipated in bores that would not otherwise be decommissioned by the Project, ARTC will engage with each licenced user to determine and agree an appropriate mitigation approach, such as monitoring with bore-specific impact thresholds for intervention and 'make good' agreements (see Chapter 15: Groundwater, Section 15.7.4).</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.7.4</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.5</p> <p>Section 7.1.6</p>
100	100.0014	Private	Social Impact Assessment	Property Devaluation	Draft EIS claim that impacts on property values are unknown and that other factors affect property value such as agricultural commodity prices and the perceived value of infrastructure to potential buyers is disingenuous. The rail does not stop at Pittsworth, does not take passengers, and the land in the township does not supply commodities. There are no confounding factors. ARTC takes no responsibility for this, and has made no attempt to avoid it.	Nil.	<p>The EIS is unable to provide advice on individual property values. Appendix X: Social Impact Assessment, Section 7.1.9 notes that property values may be affected by a range of factors related or unrelated to the Project. Impacts to property values would be differential depending on potential buyers' perceptions about potential impacts as well as the actual impacts (such as rail noise). Values may also be affected by factors that are unrelated to the Project, such as supply and demand, agricultural commodity prices, or the effects of other projects. All relevant research the EIS team could identify is presented within Appendix X: Social Impact Assessment.</p> <p>The Project has committed to a wide range of environmental mitigation and management measures to minimise noise impacts, impacts on scenic amenity and changes to connectivity which could otherwise affect property values.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.9</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
100	100.0015	Private	Flora and Fauna	Koala	Koala habitat will be affected. ARTC could not provide submitter with answers on how koalas would be protected.	Require a wildlife management plan that incorporates fauna spotters for the whole alignment and documents the procedure for dealing with rescued fauna, including who will remove them and how they will be transported and released safely.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes, Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during both Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix M: Draft Koala Management Plan.</p> <p>Appendix N: Draft Fauna Management Plan outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.11</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 6.3</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
100	100.0016	Private	Flora and Fauna	Terrestrial fauna	Additional work is required in the EIS to address the potential extinction of this species.	The Condamine Earless Dragon will be impacted by the project. It occupies habitat in road reserves. Proposed fencing will not mitigate the effect of train strike compounding the impacts of habitat destruction on population size.	<p>Chapter 11: Flora and Fauna and Appendix O: Matters of National Environmental Significance Technical Report acknowledge that the Project will result in a significant residual impact on the Condamine earless dragon.</p> <p>A standalone fauna management plan has been provided in Appendix N: Draft Fauna Management Plan of the revised draft EIS. The fauna management plan (FMP) outlines the potential impacts of the Project on Matters of National Environmental Significance (MNES) and Matters of State Environmental Significance (MSES) fauna, including the Condamine earless dragon, and proposes a range of avoidance, minimisation and mitigation measures to reduce these impacts.</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie outlines the properties that make up the Project offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES, and also includes a summary of how the proposed offset portfolio will acquit the anticipated offset requirements for the Condamine earless dragon to achieve no net loss.</p> <p>Appendix P: Fauna Connectivity Strategy assesses the impact of the Project on connectivity for four target fauna groups by comparing the connectivity for these fauna groups both pre and post Project. The strategy also evaluates the effectiveness of different mitigation scenarios at restoring ecological connectivity and reducing wildlife mortality, including experimenting with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops at the Detailed Design stage of the Project.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix O: Matters of National and Environmental Significance Technical Report</p> <p>Section 5</p> <p>Appendix P: Fauna Connectivity Strategy</p> <p>Section 5 and 7</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p>
100	100.0017	Private	Project scope		There is no solution to move the freight from Acacia Ridge to the Port of Brisbane. The proposed B2G alignment has many significant impacts that could be avoided by a route the avoids Pittsworth, Toowoomba and Brisbane.	Investigate alternative route alignments with fewer impacts.	<p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across the Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p> <p>The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal - heritage, land use and economic impacts) Approvals and stakeholder engagement 12.5: per cent Technical viability: 17 per cent Safety 16.5: per cent Constructability: 12.5 per cent Operations: 16.5 per cent. <p>Australia's population is predicted to increase by 60 per cent over the next 40 years with high levels of growth in South-East Queensland, metropolitan Brisbane and Melbourne. Trains currently run to the port and will continue to do so once Inland Rail is operational; however, trains accessing the Port of Brisbane will not be required to be double stacked as they will be transporting bulk freight such as coal or grain for export. The Australian Government and Queensland Government are undertaking a joint study of options and requirements for port/rail connections that will consider current and future demand and the relationship with the Inland Rail project. Future freight demand is discussed in Chapter 2: Project Rationale, Section 2.2.</p> <p>Trains that will utilise Inland Rail to get to either the Acacia Ridge or Bromelton terminals will not (in the overwhelming majority of cases) carry any products that are destined for export and hence require transfer at the terminal from rail to road. Supply chain operators, including train operators, aim for the most efficient means of transport possible and that is achieved by having trains that consist of freight for specific markets (i.e. domestic or export markets), rather than trains with a mixture of both.</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to the Project and Appendix 4 (pp. 109-116) provide a detailed history of routes via Warwick that have been considered over time.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.2</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
100	100.0018	Private	Flooding - McIntyre Brook	Modelling	The flood risk on the Macintyre floodplain has not been adequately addressed. The Technical Report is not sufficiently comprehensive to meet the Panel's TOR. Additional details are required in relation to the calibration of the flood models, the use of flood frequency analyses completed with respect to other catchments, and the modelling of design events.	Address the Flood Panel's TOR.	The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
100	100.0019	Private	Land Use and Tenure		Draft EIS fails to meet TOR 11.71(a) regarding the compatibility of the project with existing and proposed land uses in regional plans and local government planning schemes. The Toowoomba Regional Council Planning Scheme and Planning Code specifically avoid development around Pittsworth, except where the development provides necessary services to Pittsworth. The project will provide no services to Pittsworth and is therefore incompatible. ARTC has not addressed this in the EIS.	Address TOR 11.71(a).	<p>The EIS addresses TOR11.71(a), the regional plan and zoning of land within the relevant planning schemes. When traversing through Pittsworth, the Project footprint follows alongside the Gore Highway minimising further fragmentation of land uses.</p> <p>The revised draft EIS has been updated with further detail from the regional plan and planning scheme zoning, refer Chapter 8: Land Use and Tenure, Section 8.5.4.</p> <p>The Project is being assessed under the Office of the Coordinator-General's Coordinated Project Framework and therefore not bound to the requirements of the Goondiwindi Regional Planning Scheme 2018 and the Toowoomba Regional Planning Scheme 2012. However, the strategic framework, zones, and overlays have been explored to provide a local understanding of the area and assessment of the Project's compatibility with the local government's plans and vision for the region (Chapter 8: Land Use and Tenure, Section 8.5.4).</p> <p>The strategic framework within the Toowoomba Regional Planning Scheme sets policy direction and forms the basis for appropriate development and is critical to the planning initiatives of the local area. The Inland Rail is discussed in the strategic framework, where it is noted the Project will enhance market access and facilitate development within the Toowoomba Regional Council area. With regard to future urban and rural development, the strategic framework outlines areas which will be expanded to facilitate population growth, particularly in the towns of Highfields, Drayton, Westbrook and Toowoomba City. It is not anticipated that the Inland Rail will encroach on these expansion areas, thus mitigating potential conflicts.</p> <p>The Toowoomba Regional Planning Scheme outlines twenty-one different types of zones, where the Border to Gowrie Section of the Inland Rail traverse though five zones, specifically 'Community Facilities', 'Medium Impact Industry', 'Open Space', 'Rural', and 'Township'. Of these zones, the Project most significantly impacts the rural zone, with 2,052.44 ha of rural land being impacted by the permanent disturbance footprint, and 709.91 ha being impacted by the temporary disturbance footprint (Chapter 8: Land Use and Tenure, 8.5.4).</p> <p>The key resource areas located within Toowoomba are contained within the Natural Resources Overlay and are separated into three categories: extractive resources overlay code, agricultural land overlay code, and the water resource catchments overlay code. The only intersection between the Border to Gowrie alignment and the aforementioned overlays is with the agricultural land overlay code (Chapter 8: Land Use and Tenure, Section 8.5.1). As previously noted, the Inland Rail is not obliged to fulfill the requirements outlined by the Toowoomba Planning Scheme, however the potential adverse effects have been identified and minimised.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.5.4</p>
101	101.0002	Private	Social Impact Assessment		Submitter offers to provide: - adjacent area to lease for sit down yard- water supply for project.	Nil.	ARTC encourages the submitter to attend local information sessions which will be held by the Contactor prior to construction, or visit or call an ARTC office for more information.	N/A
101	101.0003	Private	Air Quality		Dust from construction site and access routes.	Water regime to be in place.	<p>Construction dust emissions have been assessed for the potential to impact human health (i.e., airborne dust which can be inhaled) and cause nuisance or amenity impacts (i.e., deposited dust). The Construction Works stage assessment has considered the type of emission sources present during construction, the magnitude of the expected dust emissions, and the location of sensitive receptors (households) in Chapter 12: Air Quality.</p> <p>The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. Recommended mitigation measures include the use of water sprays as dust suppression, restricting vehicle speeds on unsealed roads and covering stockpiles when not in use. With the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts for impacts to health and nuisance/amenity will be low or negligible.</p> <p>The recommended mitigation and management strategies for the Construction Works stage of the Project will be included in the Construction Environmental Management Plan (CEMP), and can be found in Section 12.6.3 of Chapter 12: Air Quality.</p> <p>A watering regime is proposed to be implemented as part of the Project to mitigate and manage dust emissions during construction. The use of water application as a dust suppression tool is recommended as a mitigation measure for the Project in Section 12.6.3 of Chapter 12: Air Quality. As a mitigation measure for dust emissions from unsealed haul roads, water applied at a rate of 2 litres per metre squared per hour (L/m2/hr) is expected to reduce dust emissions by up to 50 per cent. Further information on proposed mitigation measures to control construction dust are outlined in Section 12.6.3 of the Chapter 12: Air Quality. These mitigation measures will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Community will be able to utilise the Project 1800 phonenumber to raise concerns about dust management throughout construction.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.6.3</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
101	101.0004	Private	Flooding		It has been demonstrated that floodwater will be higher than historically due to railway design. This is a particular issue at 'Culverthorpe' house.	Upgrade flood banks surrounding property.	<p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, as part of detailed design.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
101	101.0005	Private	Social Impact Assessment	Directly impacted landowner	Impact on farming operation during construction - limitation of crop spraying due to health impact on workers on construction site.	Agreed spraying periods where staff must leave site.	<p>ARTC will work with individual property owners to manage impacts on their operations. Farming operational activities, such as spraying, will be managed through a one-on-one approach with each landowner.</p> <p>Spraying periods is an option that ARTC will discuss with the relevant stakeholders during the Detailed Design stage of the Project. Interruptions to the Project's construction schedule may or may not be warranted. This will be assessed as part of the Project's Work Health and Safety assessments.</p>	N/A
101	101.0006	Private	Social Impact Assessment	Directly impacted landowner	Impact on farming operation during construction - maintaining ability to move water as required around property for irrigation of crops.	Make temporary infrastructure as agreed upon with landholder.	ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants and will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.	N/A
101	101.0007	Private	Social Impact Assessment	Directly impacted landowner	Impact on farming operation during construction - ability to move machinery across railway line area. To be noted machine shed is on opposite side of railway to large proportion of farming land.	Continuous access across railway area to be maintained during construction.	<p>Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p> <p>ARTC is currently in discussions with the submitter regarding their property. The revised draft EIS is unable to comment on the specifics of individual negotiations and agreements.</p>	N/A

101	101.0008	Private	Surface Water	Increase in flows	Existing pipes under railway will not be compliant under current proposal.	Replace pipes to be compliant whilst retaining existing function (flow rate).	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs), refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the revised Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1
101	101.0009	Private	Social Impact Assessment	Directly impacted landowner	Current pump site and existing irrigation infrastructure will be within proposed area.	Move pump site to an agreed upon location and rebuild irrigation infrastructure to meet current and future operations.	<p>This issue is noted. Adjustments may be made during the Detailed Design stage of the Project to consider at-property treatments by the appointed contractor.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none">▶ Landowners' needs regarding access to the properties and the closure of private roads▶ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the acquiring authority▶ The potential for changes to groundwater access. <p>The consultation for the Project is outlined in Appendix E: Consultation Report.</p>	Appedix E: Consultation Report
101	101.0010	Private	Traffic and Transport	Directly impacted landowner	Access after construction across railway area on Gilgai Lane. Access needs to be suitable for large machinery.	Overpass on Gilgai Lane, at least 9 m wide.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>Noting the above, the revised reference design has updated the road rail interface treatment for Gilgai Lane from a level crossing to a grade separation (rail-over-road). This will have a clearance of 5.4 m and a span width of 23 m sufficient for the road reserve. The Project will use Gilgai Lane to access a laydown area for concrete culverts, bridge structures, water, and other construction activities. The intersection is expected to accommodate Over Size Over Mass (OSOM) vehicles to transport precast concrete girders (OSOM mitigations are discussed in Section 5.8.4 of Appendix AA: Traffic Impact Assessment). It is expected that peak right turn construction movements will be approximately 8 vehicles per hour in March 2027, resulting in a total right turn demand of up to 9 vehicles per hour (including background traffic). This intersection will be used for HV construction traffic from 2026-2027 and worker vehicles for the full length of the Construction Works stage of the Project. While this is "temporary", this duration is considered long enough to warrant a permeant upgrade of the intersection to include a short channelised right turn treatment (CHR(s)). This treatment will be further investigated during the Detailed Design stage and confirmed when construction routes and volumes are finalised and take into consideration OSOM turning vehicle requirements.</p> <p>During construction, Gilgai Lane will be subject to a Road Use Management Plan and Traffic Management Plan, which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans include regular assessment of road safety and road conditions to ensure Gilgai Lane is safe for road users. Appendix AA: Traffic Impact Assessment Section 5.2.2 provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.</p>	Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 5.8.4 Appendix BT
101	101.0011	Private	Land Resources	Directly impacted landowner	Removal of trees due to construction.	Financial reimbursement.	<p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to minimise and mitigate impacts on properties. Where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the <i>Acquisition of Land Act 1967</i> (Qld). The Department of Transport and Main Roads is the acquiring authority for land for the Inland Rail Project in Queensland. The Department of Transport and Main Roads has the power to acquire or resume property for the purposes of transport, for an incidental purpose, for the purpose of a transport associated development or for a combination of these purposes (Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-49). The Department of Transport and Main Roads will manage the compulsory land acquisition process under the Queensland legislation set out in the <i>Acquisition of Land Act 1967</i> (Qld).</p> <p>Assessment of compensation is undertaken in accordance with Section 20 of the <i>Acquisition of Land Act 1967</i> (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Costs attributable to compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none">▶ Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation▶ Costs related to the purchase of replacement comparable land▶ Storage and removal costs▶ Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. <p>During construction, land will be acquired temporarily in accordance with the <i>Acquisition of Land Act 1967</i> (Qld). Purchasing or leasing arrangements for these properties will be investigated in consultation with relevant landowners.</p>	Chapter 8: Land use and Tenure Section 8.6.2 Table 8-49
102	102.0001	Private	Stakeholder engagement	Workforce accommodation village	Lack of consultation with the local and neighbouring residents in Turallin/Millmerran area	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none">▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes▶ Land tenure and ownership of each site▶ Available land area▶ Proximity to supporting infrastructure and services▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation▶ To avoid areas that are within the 1% AEP floodplains where possible▶ Constraints such as significant vegetation communities, threatened species or heritage sites▶ Road access▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
102	102.0002	Private	Traffic and Transport		<p>a. Workers could find it difficult to access the Millmerran's facilities as 9 km from city centre.</p> <p>b. Increase in traffic on narrow roads that are already heavily traversed.</p> <p>c. Impact on Travel time as it is further from the alignment of the rail project.</p> <p>d. Turallin and Eilerslie Roads would require substantial upgrades to accommodate existing and future traffic, this being approx.8 km in length.</p> <p>e. Could impact on Millmerran town parking availability.</p>	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. 102	102.0003	Private	Air Quality		Location lacks services. Should generators be required to supply power this would create greenhouse emissions.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>An engagement session with the community was held on 13 October 2021 with ARTC. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Feedback received by the Project to date will be passed on to the Contractor for consideration. Consultation with relevant stakeholders (local/state governments, emergency service providers etc.), directly affected landowners and the broader community will continue through the Detailed Design stage.</p> <p>Following this consultation, feedback through the draft EIS and a site feasibility study, Turallin is no longer being considered as a suitable location for a non-resident workforce accommodation facility.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, an initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation facilities in the vicinity of Yelarbon, Inglewood and Millmerran. Locations have been identified with consideration for:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties (Inglewood and Yelarbon) have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for the non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>It is expected that power demand for the non-resident workforce accommodation facilities would be serviced by the mains power grid (Energen), and that only stand-by generators would be required in case of emergency, to provide electricity in the case of a power outage. Greenhouse gas emissions from the operation of a stand-by, back-up generator would be minor in magnitude. Other forms of power generation, such as solar arrays which do not generate emissions, are not suitable for stand-by power generation.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>
102	102.0005	Private	Social Impact Assessment	Property Devaluation	a. Impact on properties, variation of property. Cost of fuel and maintenance of the generators, water supply and waste water treatment could become an ongoing issue.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity. e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas), and the Contractor is currently undertaking due diligence to identify a third site in the Millmerran area.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>
102	102.0006	Private	Social Impact Assessment		The camp site could have a possible negative Life Style impact on the small rural historic community.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with community, Appendix E: Consultation Report, Section 5.11.</p>	<p>Chapter 17: Social</p> <p>Section 17.5</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.11</p>
102	102.0007	Private	Flooding		Risks of flooding and erosion due to earthworks. Pine Creek could flood and both Turallin and Eilersie Roads are subject to flooding which could result in road closures.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The two 20 hectare non-resident workforce accommodation sites have been included in the temporary footprint to accommodate the Project construction workforce requirements, one at Inglewood and another at Yelarbon. A third non-resident workforce accommodation site will be required in the Millmerran area and the contractor is currently undertaking feasibility assessments to identify the optimal location for the site in the Millmerran region. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken by the contractor during detailed design.</p> <p>Flood risk assessments have been performed for a material distribution centre at Whetstone, non-resident workforce accommodation at Yelarbon and Inglewood, a Turallin facility and approximately 78 laydown areas and are documented in Section 20.5.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. Control measures to maintain flood immunity of temporary construction facilities have been discussed in Section 20.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 20.5.1</p> <p>Section 20.6</p>
102	102.0008	Private	Surface Water		Pollution from waste water could potentially flow through the creek. Water Supply and waste water treatment, could be an ongoing issue if the site remains.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design (Section 5.6.4, Chapter 5: Project Description). However, it is recognised that Toowoomba Regional Council and members of the community (particularly businesses owners) have expressed support for the accommodation facilities to be located close to the towns to maximise business opportunities.</p> <p>Supporting and additional infrastructure associated with each accommodation will include water and wastewater collection and treatment facilities, including temporary package sewage treatment and adequate availability of land for treated effluent disposal (estimated capacity of 300 equivalent population).</p> <p>Opportunities for beneficial reuse of construction facilities, such as non-resident workforce accommodations, will be investigated through consultation with local governments and relevant stakeholders.</p> <p>Where a beneficial reuse cannot be identified, the construction facilities will be progressively decommissioned so that reinstatement and revegetation activities can commence as soon as possible.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
102	102.0009	Private	Flora and Fauna		Chance of Flora & Fauna displacement	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft Border to Gowrie EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Two facility locations have been presented in the revised draft EIS, with a third facility to be determined at a location determined in detailed design. Separate approvals will be sought for this facility, if and when needed. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Ingelwood, and Millmerran. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>A potential impact to flora and fauna is displacement as a result of habitat loss, habitat fragmentation, invasion by weeds and pest species, reduction in biodiversity corridors, and barriers. Mitigation measures to reduce this impact include: minimising use of rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. Refer to Chapter 11: Flora and Fauna of the revised draft EIS for further details on mitigation measures. Additional mitigation and management measures are presented in Chapter 24: Draft Outline Environmental Management Plan. The location of the two non-resident workforce accommodation facilities presented in the revised draft draft EIS have been historically cleared for agricultural production and are of sufficient size to enable impacts to facility infrastructure to be located to avoid or minimise impacts to listed flora and faunas species. Pre-clearance surveys will be carried out prior to clearing commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
103	103.0001	Private	Project scope	Directly impacted landowner	The EIS does not address TOR 11.142. It does not describe the potential risks to people and property that may be associated with the project in the form of a preliminary risk assessment for all components of the project in accordance with relevant standards.	Address TOR 11.142.	<p>As described in Section 21.7, Chapter 21: Hazard and Risk, the initial risk assessment is based on the assumption that the design considerations (or initial mitigation) factored into the revised reference design stage have been implemented. As a result, design solutions for avoiding, minimising or mitigating impacts have been incorporated into the reference design as appropriate and where possible. Mitigation measures and controls that have been factored into the design, or otherwise implemented during the reference design stage for the Project, are summarised in Table 21.15.</p> <p>A compliance check of Chapter 21: Hazard and Risk against TOR 11.142 can be found in Appendix A2: Terms of Reference - Cross Reference Table, which includes references to the applicable sections of Chapter 21: Hazard and Risk.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.7</p> <p>Table 21.15</p> <p>Appendix A2: Terms of Reference - Cross Reference Table</p> <p>TOR 11.143</p>
103	103.0004	Private	Social Impact Assessment	Operational rail noise	International noise guidelines are increasingly stringent despite increasing population pressure because of the growing body of evidence on the burden of disease due to environmental noise. Environmental noise has been linked to post traumatic stress disorder, other mental health issues, cardiovascular disease, and diabetes due to impacts on sleep.	Quantify, describe and avoid the risk of disease due to noise pollution from the project.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational railway noise and vibration to sensitive receptors along the Project alignment. The updated assessments refer to established noise guidelines and criteria that are in place to protect amenity and health.</p> <p>Construction noise impacts, including from blasting, presented in the revised draft EIS are predicted unmitigated worst-case 15-minute noise impacts (Section 6 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). The revised draft EIS construction noise and vibration modelling methodology is conservative and is based on a preliminary construction methodology and worst-case vibration transmission. During detailed design, the construction noise and vibration assessment is to be refined based on a detailed construction methodology, and specific reasonable and practicable construction noise and vibration mitigation measures will be nominated. As per Department of Transport and Main Roads' Transport Noise Management Code of Practice Volume 2, reasonable and practicable measures will be taken to minimise noise and vibration impacts on the community.</p> <p>The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads (DTMR) Interim Guideline - Operational Rail Noise and Vibration (refer to Section 16.8 of Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations). The DTMR Interim Guideline does not require ARTC to provide noise mitigation to comply with international noise guidelines such as the World Health Organisation (WHO) guideline, for instance.</p> <p>However, the potential for sleep disturbance has been assessed as part of the noise impact assessment for the Project.</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options are discussed in Section 16.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>The revised draft EIS Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Appendix W: Noise and Vibration Assessment - Railway Operations, Section 16, and Chapter 16: Noise and Vibration, Section 16.10, provide specific noise mitigation measures proposed to control noise at residences. These measures include physical mitigation (noise fences/noise barriers) and property upgrades to existing residences. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the construction stage and through operations.</p> <p>On the basis that the Project has committed to managing noise in compliance with relevant guidelines and standards that protect human health, and in compliance with the EIS conditions of approval, a study on noise pollution and risk of disease was not pursued.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 16</p> <p>Section 16.4</p>

104	104.0001	Private	Social Impact Assessment	Directly impacted landowner	Submitter outlines the impacts of removing the existing cattle yard crossing on their Angus cattle breeding and fattening enterprise. Removing and replacing the cattle yard crossing will create inefficiencies that would affect the productivity and profitability of the enterprise. See submission for details.	It is essential that the submitter's property maintain two rail-line crossings, one at the sheep yard complex and the second at the cattle yards.	<p>As noted in Chapter 24: Draft Outline Environmental Management Plan, individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p> <p>ARTC is currently in discussions with the submitter regarding their property. The revised draft EIS is unable to comment on the specifics of individual negotiations and agreements.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
104	104.0002	Private	Social Impact Assessment	Directly impacted landowner	Submitter outlines the project elements and potential impact areas that identify them and their enterprise.	Nil.	<p>ARTC appreciates that the time required to undertake the EIS process has led to uncertainty for landowners, and has provided information to landowners and other community members wherever available to reduce uncertainty. ARTC will continue consultation with all directly affected landowners to establish the feasibility of mitigation measures where required e.g. changes to stock crossings.</p> <p>The term 'where possible' in relation to landowners' concerns is used in Appendix X: Social Impact Assessment as follows:</p> <ul style="list-style-type: none"> avoidance of farm infrastructure where possible (Section 8.1.8) If land is required only for the Construction Works stage of the Project, and not for the ongoing operation of the rail Project, where possible it will be leased from landowners (Section 8.4.5, Table 8-11) Project aligned to be co-located within existing rail and road corridors where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure (Section 8 1 5, Table 8-2). <p>This is to acknowledge that multiple factors determine the Project alignment and it is not always possible to avoid farm infrastructure and/or private land (leading to a requirement for compensation under the Acquisition of Land Act 1967 (Qld) (Appendix X: Social Impact Assessment, Section 7.1.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.2</p> <p>Section 8.1.5</p> <p>Section 8.1.8</p> <p>Section 8.4.5</p> <p>Table 8.2</p> <p>Table 8.11</p>
104	104.0003	Private	Noise and Vibration	Operational rail noise	Noise predictions at both properties owned by the submitter are above noise assessment criteria. One of the residences is identified as a sensitive receptor. Both properties are identified by ARTC (via correspondence included in the submission) as requiring a review of reasonable and practicable options for noise mitigation.	For the residence south of the rail line, relocate the house and supporting infrastructure to a safe distance prior to construction commencing. For the residence north of the rail line, treatment of the property and creating a shade line buffer will be required to improve both noise pollution and air quality.	<p>The operational railway noise modelling has been updated in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The submitter should note that the use fo DTMR's guideline may change the predicted noise levels at their dwellings. ARTC will engage directly with impacted property owners on their preferred mitigation measures once the final design is confirmed following project approval.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during the Detailed Design stage. Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p>
104	104.0004	Private	Traffic and Transport	Construction traffic	GTIA state that impact results if traffic exceeds 5%. Current traffic movements on the Yelarbon Kurumbul Road is 21 cars/day. The EIS predicts construction traffic will increase traffic movements on this road by up to 1027.6% in the first year of construction and up to 269.5% in the final year of construction.	Nil.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment applies a detailed assessment in line with the GTIA. In accordance with Table 6.4 of the GTIA, the assessment considers and assesses impacts to road safety, intersection delay (performance), road link capacity, pavement and transport infrastructure, all on the basis of a 5% comparison.</p> <p>As is correctly identified in the submission, this is the case for Yelarbon Kurumbul Road. In the updated EIS Appendix AA: Traffic Impact Assessment, this includes a percentage increase of 279.1% in the first year of construction and a maximum of 390.9% across the construction period. Thus, a full assessment has been completed of Yelarbon Kurumbul Road and is documented throughout Section 5 of the Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5</p> <p>Table 6.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
104	104.0005	Private	Air Quality	Directly impacted landowner	Concerns about fugitive dust emissions, dust generated from construction and emissions from idling and operational locomotives and construction vehicles. The EIS assesses the risk of dust impacts from construction as medium and low due to the rural setting. Submitter states that the risk is high and mitigation measures are necessary.	The house south of the rail line needs to be relocated prior to construction. Mitigation measures listed in Table 11.37 need to be adhered to. The house north of the rail line needs a shade line established along Yelarbon Kurumbul Road to assist in limiting emissions.	<p>The landowners' dwelling has been represented by the sensitive receptors R9 (south) and R10 (north) in the dispersion model developed for the assessment of the Operations stage in Appendix F of Appendix R: Air Quality Technical Report. The construction and operation of the Project will result in air emissions. However, the assessment of the Construction Works and Operations stages has determined that the impact of air emissions to sensitive receptors, including the landholder's dwelling, will not be significant with the inclusion of recommended mitigation measures.</p> <p>Construction dust emissions have been assessed for the potential to impact human health (i.e., airborne dust which can be inhaled) and cause nuisance or amenity impacts (i.e., deposited dust). As discussed in Section 12.3.2 of Chapter 12: Air Quality, gaseous emissions (fumes) from construction vehicles are unlikely to present a risk of significant impact.</p> <p>The Construction Works stage assessment has considered the type of emission sources present during construction, the magnitude of the expected dust emissions, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. With the inclusion of these measures, it is expected that the significance of construction dust impacts to health and nuisance/amenity will be low or negligible based on all factors considered, not just the rural setting of the Project.</p> <p>The assessment of the Operations stage determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in the Chapter 12: Air Quality) within the study area for the Project.</p> <p>Further information on the results of the Construction Works and Operations stage assessments on impacts to air quality are presented in Section 12.8 of the Chapter 12: Air Quality. The recommended mitigation measures are further discussed in Section 12.6.38 of Chapter 12: Air Quality. These mitigation measures are to be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan. The use of shade lines as further mitigation is not required. It is also noted that shade lines are difficult to maintain and are less practical for mitigating construction dust.</p> <p>Based on the results of the air quality assessment, relocation of residential dwellings is not required as predicted pollutant concentrations are all well below the relevant air quality goals at representative receptors.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.3.2</p> <p>Section 12.5</p> <p>Section 12.6.3</p> <p>Section 12.8</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix R: Air Quality Technical Report</p> <p>Appendix F</p>
104	104.0006	Private	Land Use and Tenure	Directly impacted landowner	Proposed level crossing option 1 at the submitter's property will affect the submitter's ability to manage their mixed farming enterprise. There are currently four crossings, the proposal is to remove two or three of them based on 'safety' reasons. See submission for further details about how the closing crossings will impact the submitter's mixed farming enterprise.	Submitter suggests several options for solutions including keeping the crossings and a response to ARTC's proposal to remove two or three crossings.	<p>ARTC acknowledge the closure of existing level crossings on the South Western line will impact the landowners agricultural enterprise.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.2, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties (Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-51).</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences, water storages, groundwater bores and irrigation infrastructure that would be affected and need to be considered in compensation arrangements for the property The potential for changes in access to natural resources, such as groundwater and overland flow. <p>Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis using the market value of the land as at the date of resumption. Refer to Chapter 8: Land Use and Tenure, Section 8.6.2 of the revised draft EIS for further detail.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.2</p> <p>Table 8-51</p>
104	104.0007	Private	Land Use and Tenure	Directly impacted landowner	Concerned about how to manage stock movements over the rail corridor with up to 25 train services predicted per day. Holding animals at a crossing for any length of time, waiting for a train to pass is impossible. The noise of a train's approach and passing at close proximity will startle the cattle, causing them to run away. Lack of design information for private property level crossings.	<ol style="list-style-type: none"> Large holding yard on the southern side of rail corridor at the level crossings. At the level crossing, the ability to prevent access by stock down the rail corridor as they cross the rail line. 	<p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of landowners' needs regarding access to the properties and the closure of private roads (Chapter 8: Land Use and Tenure, Table 8-51).</p> <p>In the event that private stock routes are identified through consultation with landowners, a means of continued stock movement connectivity will be included in the detailed design. Where disruption to private stock movements may occur during construction, appropriate temporary connectivity solutions will be agreed in advance with the relevant landowner.</p> <p>Where large numbers of livestock and high vehicular traffic volumes may coincide, holding yard will be considered during Detailed Design stage. Refer to Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-51 of the revised draft EIS for further detail.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.2</p> <p>Table 8-51</p>
104	104.0008	Private	Groundwater	Flood immunity	Loss of culvert at Queen Street South. All groundwater will flow to culvert C13. After rain events the groundwater's natural flow north to Brigalow Creek is impeded by the rail line. Submitter outlines several flow on impacts on their property and farm infrastructure.	Mitigation will need to be adequate to prevent flooding.	<p>The Inland Rail Reference Design has been informed by a flooding and drainage assessment to ensure that existing flow paths are maintained, and where necessary, diversions are proposed to ensure continuity of flow, as discussed in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The proposed drainage structures are summarised in Appendix B of this report, and show on the civil drawings in Appendix B1: Design Drawings. During the Detailed Design stage of the Project the cross drainage design will be reviewed to further optimise the design and ensure existing flow paths are maintained.</p>	<p>Appendix B1: Design Drawings</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
104	104.0009	Private	Flora and Fauna		The shadelines along the rail corridor are not only of heritage significance but have value in our holistic approach to property management. They provide habitat for animals and protection from the elements for sheep and cattle. Cultivated paddocks at one of the submitter's properties will no longer have any shade.	Re-establish trees in paddocks where they will be removed for the project.	<p>A review of the relevant Commonwealth and State-listed heritage indicated there are no places within 1 km of the rail corridor. There are five locally listed places, one non-statutory QR heritage place and five non-statutory DES Cultural Heritage Information Management System places within 1 km of the Project footprint, two of which are in the impact assessment area. A full list of the registers reviewed are in Section 19.4.2, Table 19-10 of Chapter 19: Cultural Heritage. Identification of Indigenous cultural heritage is occurring in consultation with the relevant Indigenous parties.</p> <p>Chapter 11: Flora and Fauna outlines Project impact mitigation measures which include:</p> <ul style="list-style-type: none"> Minimising the loss of canopy vegetation where possible Clearing extents limited to the area safely and reasonably required for permanent and temporary works, avoiding impacts to native vegetation and habitats, as far as practicable. 	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.4.2</p> <p>Table 19.10</p> <p>Chapter 11: Flora and Fauna</p>
104	104.0010	Private	Land Use and Tenure	Cumulative impacts	Impact of the project on the submitter's property is very high. One residence will be unliveable, and the other residence's liveability will be lessened. The management of their farming business could be unviable. Submitter hopes that the theme of 'respect for people, communities and valued places' and 'being a good neighbour' as described in the Sustainability Chapter will ensure suggested solutions are accepted.	Harm needs to be minimised so the submitter's business can continue on their properties.	<p>This issue is noted. ARTC will continue to consult with affected landowner on mitigation measures and solutions.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.2, where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties.</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises (Chapter 8: Land Use and Tenure, Section 8.6.2). ARTC's strategy to reduce the impacts of property acquisition on landowners, tenants and their families include:</p> <ul style="list-style-type: none"> Consult directly affected landowners and tenants who would need to relocate as the result of the Project's land acquisitions, to identify their specific needs and concerns and refer them to services that can support them in the relocation process if required Confirm property-specific management measures Provision of a relocation support team who will provide information, liaison and if necessary, service referrals to residents who need to relocate <p>Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis using the market value of the land as at the date of resumption.</p> <p>Refer to Chapter 8: Land use and tenure, Section 8.6.2 of the revised draft EIS for further detail.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.2</p>
104a	104.0011	Private	Social Impact Assessment	Directly impacted landowner	ARTC identifies the key economic impacts of disruption to farm management, and changes in accessibility on connectivity to land. The SIA considers landowner amenity and lifestyle and identifies mental health issues. Much of the wording in sustainability initiatives for property owners includes 'where possible', and that is an unsatisfying outcome. Submitter is living with constant concerns about the viability of their property and their liveability. Succession planning involving growing the business to include children is impossible in the climate of uncertainty. Very difficult to make decisions to proceed. Loss of time for farm work due to negotiations with ARTC.	Nil.	<p>ARTC acknowledges that the time required to undertake the EIS process has led to uncertainty for landowners. ARTC is committed to continuing to consult with all directly affected landowners to provide updates on the Project, its potential impacts and make-good arrangements or compensation processes that will apply.</p> <p>Impacts to existing land use are inevitable when delivering a Project of this scale. However, ARTC has endeavoured through development of the revised reference design, to minimise impacts to land use. Such efforts include co-locating the rail alignment with existing transport corridors and aligning the Project adjacent to property boundaries, to the greatest extent possible, thereby reducing potential fragmentation and sterilisation of agricultural land.</p> <p>Land use impacts of the revised reference design have been assessed in Section 8.5.1 (Chapter 8: Land Use and Tenure) and will be confirmed through the Detailed Design and Project Approvals and Corridor Acquisition stages. Where land use impacts are confirmed, individual property management measures will be developed in consultation with the landowner to reduce impacts to an acceptable and agreeable level. Management measures outlined in Section 8.6 of Chapter 8: Land Use and Tenure will include:</p> <ul style="list-style-type: none"> Individual property mitigation measures developed in consultation with landowners/occupants with respect to the development of detailed design and/or the management of construction on, or immediately adjacent to, private properties. The property mitigation measures will detail required adjustments to fencing, access, farm infrastructure, and relocation of any impacted structures, as required. Consultation with landowners will be undertaken to ensure that owners and occupiers are informed about the timing and scope of activities in their area, particularly in relation to potential impacts to access, services, or farm operational arrangements. This consultation will be ongoing throughout construction. Feedback from landowner consultation, including agreed property mitigation measures, will be incorporated into property agreements (or similar), as appropriate. <p>Where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the <i>Acquisition of Land Act 1967</i> (Qld) (AL Act). Assessment of compensation is undertaken in accordance with Section 20 of the AL Act. Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2). In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance. Costs attributable to compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation Costs related to the purchase of replacement comparable land Storage and removal costs Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. 	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p>
105	105.0001	Private	Project alignment		Submitter (a retired railway civil engineer with long experience in railway location in Australia) outlines a shorter, more direct route from Inglewood to Kagaru that would be 50 km shorter than the proposed route and would have fewer environmental impacts and engineering issues. Submitter questions the logic behind placing the alignment west of Toowoomba to service a developing industrial area. Submitter also suggests the Warwick to Bromelton route be reconsidered.	<ol style="list-style-type: none"> All Inland Rail engineering work and land acquisition north of Inglewood be paused pending a review of the route location Commonwealth and Queensland Governments review the agreement covering the Inland Rail route within Queensland to include rail economic considerations with particular reference to the route length An independent expert review the engineering consultant's feasibility studies on a direct route Warwick to Bromelton. 	<p>The industry and freight customers have been consistent in expressing their priorities throughout the route selection process. They highlighted the need for flexibility, interoperability, the importance of suitably located terminals. This feedback is reflected in the service offering, with a clear potential for faster and slower services to meet customer needs (while preserving the core offering of a 24-hour transit time from Melbourne to Brisbane); a clearly specified reliability target of 98%; and clarity around the commitment to interoperability with connections to the NSW Country Rail Network and Queensland narrow gauge network (Chapter 2: Project Rationale, Section 2.4.4).</p> <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney (Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017 (Chapter 2: Project Rationale, Section 2.9.3).</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through the Project phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006 - 2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to the Project and Appendix 4 (pp. 109-116) provide a detailed history of routes via Warwick that have been considered over time.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.4.4</p> <p>Section 2.8.2</p> <p>Section 2.9.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
106	106.0001	Private	Traffic and Transport	Workforce accommodation village	Proposed accommodation at Turallin would be housing the workforce further away from the area in which the rail line is being constructed. The road from the Gore Hwy to Turallin is of low quality, narrow and floods frequently. The workforce would need to be transported to the worksites and Millmerran by bus unless staff had their own vehicles, which would put a strain on the limited parking in Millmerran and also put more traffic on an already busy road.	Build the workcamp closer to the construction area in the vicinity of Millmerran Inglewood Road, which allows ease of travel both to the north and south of Millmerran for construction and does not impact more traffic on a minor road. Off duty staff could be bussed into Millmerran for shopping and recreation, and to the daily work sites.	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
106	106.0002	Private	Social Impact Assessment	Workforce accommodation village	The workforce accommodation village proposed at Turallin should be located closer to Millmerran. Existing accommodation in Millmerran is often fully booked during peak times/events but the need for more permanent accommodation is not there to require another motel or caravan park.	Some or all of the work camp could remain after the project end to assist with housing staff brought into Millmerran for the regular maintenance/shut downs of the Millmerran Power Station. This accommodation could also assist with the overflow of tourists who seek accommodation in Millmerran during big events like Australian Camp Oven Festival, and the Darling Downs Eisteddfod.	<p>ARTC applied several criteria for selecting preferred non-resident workforce accommodation sites, including fatigue management requirements, land area requirements and road access. The previously proposed non-resident workforce accommodation facility in Turallin is not being pursued in the revised draft EIS.</p> <p>There are different viewpoints within the community regarding the location of workforce accommodation. Whilst businesses are keen to see the facility based in Millmerran, residents have also identified potential amenity impacts. Additional community consultation regarding the proposed accommodation facilities was undertaken in May 2023.</p> <p>Appendix X: Social Impact Assessment, Section 6.1, Section 7.3 and Section 8.4, have been updated with additional information regarding the workforce accommodation facilities.</p> <p>ARTC plans further consultation with Toowoomba Regional Council to confirm the suitability of the proposed location for the non-resident workforce accommodation facility in the Millmerran area. The facility would be required to comply with Toowoomba Regional Council's conditions of approval to limit the potential for traffic impacts.</p>	Appendix X: Social Impact Assessment Section 6.1 Section 7.3 Section 8.4
107	107.0001	Private	Land Resources	Contaminated land	Opposed to the use of a specific property on Gilgai Lane for construction laydown area B2G-LDN 144.6 due to the wet nature of the area and permanent damage to the site from contamination and compaction. Reinforced by the impossibility of removing contaminated soil from transient contamination substances including oil, fuel, chemical, ballast, gravel and any other contaminants stored on site.	Relocate laydown area to an appropriate site.	<p>As described in Section 5.6.7 of Chapter 5: Project Description of the revised draft EIS, several laydown areas have been identified along the length of the alignment and positioned to avoid or minimise potential impacts to environmental and social receptors. The locations have been chosen to avoid areas within the 1% AEP floodplains where possible. However, by virtue of the requirement of laydown areas for constructing bridges, some laydown areas must be within flood plains and near watercourses or drainage features. In such instances, the following precautions will be taken:</p> <ul style="list-style-type: none"> ▶ The site will be surveyed prior to site establishment to understand the exact extent of potential flooding impact to facilities and storage areas ▶ The earthworks and temporary drainage will be designed to minimise flooding impacts. <p>Site restoration will be undertaken in accordance with:</p> <ul style="list-style-type: none"> ▶ Inland Rail Environment and Sustainability Policy (Appendix C: Corporate Policies) ▶ Border to Gowrie Rehabilitation and Landscaping Plan ▶ A Rehabilitation and Landscaping Management Plan will be developed for the Project, in addition to location and property-specific reinstatement commitments. It will establish location-specific objectives, timeframes and responsibilities for rehabilitation, reinstatement and/or stabilisation works. Opportunities for beneficial re-use of laydown areas will be investigated through consultation with local governments and relevant stakeholders. Refer to Chapter 24: Draft Outline Environmental Management Plan, that outlines ARTC's approach to environmental management. <p>ARTC acknowledge the concerns of some of the laydown areas proposed along the alignment. The laydown areas have been strategically located for the Project to enable robust construction methodologies. ARTC are committed to ongoing consultations with impacted landowners through the Detailed Design and Construction Works stages with the contractor. This will enable the Project to further develop and implement property-specific mitigation measures to avoid or minimise impacts.</p>	Chapter 5: Project Description Section 5.6.7 Chapter 24: Draft Outline Environmental Management Plan Appendix C: Corporate Policies
107	107.0002	Private	Land Resources	Erosion	Concerned about debris collecting on security fencing of proposed alternative laydown area B2G-LDN 144.6 on neighbouring properties diverting water causing erosion and scouring to surrounding properties.	Nil.	<p>ARTC's Fencing Strategy provides for 1.2 m high chain wire (with four rows of barbed wire) fencing to be installed on the rail corridor boundary for the full extent of the rail corridor, with exceptions for environmentally sensitive areas where boundary fencing would be detrimental (e.g. State forest areas and riparian corridors). Standard fauna exclusion fencing will be provided for directing fauna towards crossing structures in accordance with the Fauna Design Guidelines for the Inland Rail. The exception to this is the Condamine River floodplain which will contain guide posts only to demarcate the rail corridor boundary. This way guide posts will not trap any mobilised debris during flood events and cause adverse impacts to surrounding land. For grazing properties the two lower wires will be replaced with a 7 90 30 tight cross over know mesh and where possible top strands will be plain wire in accordance with the Fauna Design Guidelines. See Appendix P: Fauna Connectivity Strategy for specific details on ARTC's proposed fencing strategy.</p> <p>It is acknowledged that inappropriately placed fencing and/or inadequately designed fencing could cause debris to catch during flood events and impact local drainage performance. Fencing cannot be assessed accurately in hydraulic models to provide meaningful results. During detailed design, specific consideration will be given to this aspect on a case-by-case basis. For example, fencing would not be placed across any culvert/bridge openings, but instead would go up and around the embankment to prevent any obstructions to flood flows. Consultation with affected landowners will be undertaken on a case-by-case basis to ensure that the fencing solution ties in with local farming practices.</p>	Chapter 5: Project Description Section 5.4.12 Appendix P: Fauna Connectivity Strategy
107	107.0003	Private	Land Resources	Contaminated land	Concerned about compaction and contamination of vertosol soils along the rail alignment during construction. These soils are particularly fragile and easily compacted due to its soft nature, especially when wet. The custodianship and care of these highly fertile and uncommon soils cannot be overstated.	Permanent acquisition of land on the construction footprint.	<p>Detailed soil investigations (Appendix I: EMR Search Certificates and Soil Laboratory Certificates) were undertaken for Chapter 9: Land Resources with findings informing soil-specific management measures (including of vertosols) (Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Part B: Soil Management Plan (Section 3)) and to assist detailed design/construction.</p> <p>Contamination risk has also been assessed in Chapter 9: Land Resources, Section 9.5, with mitigation measures to avoid the creation of contaminated land as a result of the Project provided in Section 9.6 (e.g. Contaminated Land Management Plan will be developed by a suitably qualified person, as recognised under the Environmental Protection Act 1994 (ld), and incorporated into the Construction Environmental Management Plan (CEMP)).</p> <p>Site restoration will be undertaken in accordance with:</p> <ul style="list-style-type: none"> ▶ Inland Rail Environment and Sustainability Policy (refer Appendix C: Corporate Policies) ▶ Border to Gowrie Rehabilitation and Landscaping Plan. ▶ A Rehabilitation and Landscaping Management Plan will be developed for the Project, in addition to location and property-specific reinstatement commitments. It will establish location-specific objectives, timeframes and responsibilities for rehabilitation, reinstatement and/or stabilisation works. Opportunities for beneficial re-use of laydown areas will be investigated through consultation with local governments and relevant stakeholders. Refer to Chapter 24: Draft Outline Environmental Management Plan that outlines ARTC's proposed approach to environmental management. 	Chapter 9: Land Resources Section 9.5 Section 9.6 Chapter 24: Draft Outline Environmental Management Plan Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix C: Corporate Policies Appendix I: EMR Search Certificates and Soil Laboratory Certificates
107	107.0004	Private	Surface Water	Erosion	Concerned about erosion and scouring of paddocks below culverts between Pampas and the Condamine River causing a reduction in agricultural production and a dramatic decrease of property valuations.	Ensure design of water entry and exit points of culverts is such to eliminate erosion both up and downstream of culverts make good agreements if erosion and scouring does occur to give landowners confidence.	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIO's, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk (Section 22.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Expert Flood Panel identified additional assessment requirements in relation to managing changes to flood flow velocities. The additional assessments are outlined in Sections 22.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>With respect to ongoing maintenance of culverts ARTC, as the operator of Inland Rail will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf), Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages. ETG-10-01 (Flooding) considers that blockage or partial blockage of waterway 20% loss of area due to debris, rubbish or siltation is a defect. The required response time is within 28 days to repair/restore.</p> <p>Disaster recovery will be carried out in accordance with ARTC's Emergency Management Plan (RLS-PR-044) which provides a work procedure for managing recovery from and investigation of emergencies requiring a significant and co-ordinated response on the ARTC Network. This procedures objective is to ensure that ARTC and Rail Operators have established an integrated strategy for the response to the management of rail emergencies on the ARTC Network (Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 21.3).</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 21.3 Section 22.3
107	107.0005	Private	Surface Water		Gravelled rail line access road, or any other rock material used in construction, washing into surrounding paddocks during flood events. Gravel washed into paddocks creates operational issues and damage to agricultural machinery.	Make good agreements if displacement of construction material does occur to give landowners confidence.	<p>With respect to ongoing maintenance of culverts ARTC, as the operator of Inland Rail will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf), Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages. ETG-10-01 (Flooding) considers that blockage or partial blockage of waterway 20% loss of area due to debris, rubbish or siltation is a defect. The required response time is within 28 days to repair/restore.</p> <p>Disaster recovery will be carried out in accordance with ARTC's Emergency Management Procedure (RLS-PR-004) which provides a work procedure for managing recovery from and investigation of emergencies requiring a significant and co-ordinated response on the ARTC Network. This procedures objective is to ensure that ARTC and Rail Operators have established an integrated strategy for the response to the management of rail emergencies on the ARTC Network.</p> <p>While the property acquisition process does not provide for compensation for indirect impacts such as cost of replacement/repairs to damaged infrastructure/machinery, the proposal would incorporate environmental management and design features to ensure that potential impacts are managed and mitigated as far as practicable, and erosion and sediment control measures will be undertaken as described in Section 5.6.18 of Chapter 5: Project Description of the revised draft EIS.</p>	Chapter 5: Project Description Section 5.6.18
107	107.0006	Private	Surface Water		Concerned about culverts blocking with debris and weeds reducing culvert efficiency and diverting water.	Maintenance program to keep culverts free and open including weed management in consultation with local invested parties inclusion of excess volume capacity in the design of culverts to manage excess water flow when clearing of debris in culverts cannot be accessed during a flood event	<p>With respect to ongoing maintenance of culverts ARTC, as the operator of Inland Rail will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf), Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages. ETG-10-01 (Flooding) considers that blockage or partial blockage of waterway 20% loss of area due to debris, rubbish or siltation is a defect. The required response time is within 28 days to repair/restore.</p>	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
107	107.0007	Private	Surface Water	Erosion	Concerned about the impact of rail line fences and security fences at laydown areas collecting debris and diverting water flow causing erosion and altering overland flow of flood water.	Nil.	<p>To limit access to the Project's rail alignment, fencing will be provided for the majority of the rail corridor as described in Section 5.4.12 and Table 5-19 of Chapter 5: Project Description. Fencing will act to protect adjoining lands from trespass and to prevent livestock from gaining access to the railway. Fencing is to extend between the corridor and private lots or property adjoining the railway. Property or land use specific fencing considerations will be discussed with relevant landowners as part of the detailed design process.</p> <p>As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will typically be provided according to ARTC fencing procedure, Boundary Fencing ETM-17-02 (available on the ARTC Extranet: extranet.artc.com.au). Where ARTC propose to construct within the Queensland Rail corridor for all returned works (South Western Line and Millmerran Branch Line), ARTC shall comply with Queensland Rail standards; this includes new and replacement fencing. All existing fencing is proposed to be removed and replaced. Where ARTC are proposing to construction new railway corridor that coincides with road manager or landowner fencing, this will be replaced typically with ARTC fencing procedure, Boundary Fencing ETM-17-02. Where superior fencing is required (for example where tracks are in close proximity to roads and/or communities, or where trespass is anticipated to occur) a 1.8 m chain link boundary fence may be provided</p> <p>Feedback from adjacent landowners indicates that fencing on the Condamine River floodplain:</p> <ul style="list-style-type: none"> Increases the risk of debris being trapped on the fence and causing blockage, potentially exacerbating the risk of flooding impacts and resulting in ongoing maintenance issues Can be washed away in flood events, causing issues to downstream properties and infrastructure and subsequently requires re-instatement. <p>Based on this consultation feedback, fencing of the rail corridor has not been included in the revised reference design across floodplain areas. Instead, guideposts or other alternative means of rail corridor boundary protection will be installed in order to demarcate the rail corridor and prevent access to the rail corridor. The track elevation through these areas will also act as a deterrent to trespass or livestock access to the railway, where this may otherwise occur.</p> <p>It is acknowledged that inappropriately placed fencing and/or inadequately designed fencing could cause debris to catch during flood events and impact local drainage performance. Fencing cannot be modelled accurately in hydraulic models to provide any meaningful results. During detailed design specific consideration will be given to this aspect on a case-by-case basis. For example, fencing would not be placed across any culvert/bridge openings, but instead would go up and around the embankment to prevent any obstructions to flood flows. Consultation with affected landowners will be undertaken on a case-by-case basis to ensure that the fencing solution ties in with local farming practices.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.12</p> <p>Table 5-19</p>
107	107.0008	Private	Traffic and Transport	Level crossing	Concerned with the proposed Gilgai Lane level crossing; accessibility to the access road leading to the 'Old Grain Shed' behind Pampas Hall; condition of Gilgai Lane and traffic frequency during construction of laydown area; interference to farming operations due to increased traffic frequency and deteriorating condition of Gilgai Lane during construction.	Nil.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>Noting the above, the revised reference design has updated the road rail interface treatment for Gilgai Lane from a level crossing to a grade separation (rail-over-road). This will have a clearance of 5.4 m and a span width of 23 m sufficient for the road reserve. The Project will use Gilgai Lane to access a laydown area for concrete culverts, bridge structures, water, and other construction activities. The intersection is expected to accommodate Over Size Over Mass (OSOM) vehicles to transport precast concrete girders (OSOM mitigations are discussed in Section 5.8.4 of Appendix AA: Traffic Impact Assessment). It is expected that peak right turn construction movements will be approximately 8 vehicles per hour in March 2027, resulting in a total right turn demand of up to 9 vehicles per hour (including background traffic). This intersection will be used for HV construction traffic from 2026-2027 and worker vehicles for the full length of the Construction Works stage of the Project. While this is "temporary", this duration is considered long enough to warrant a permeant upgrade of the intersection to include a short channelised right turn treatment (CHR(s)). This treatment will be further investigated during the Detailed Design stage and confirmed when construction routes and volumes are finalised and take into consideration OSOM turning vehicle requirements.</p> <p>During construction, Gilgai Lane will be subject to a Road Use Management Plan and Traffic Management Plan, which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans include regular assessment of road safety and road conditions to ensure Gilgai Lane is safe for road users. Appendix AA: Traffic Impact Assessment Section 5.2.2 provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p> <p>Section 5.8.4</p> <p>Appendix BT</p>
107	107.0009	Private	Groundwater	Private groundwater bore/s	Concerned about drilling impact of foundation structures intercepting shallow aquifers supplying water to local townships and surrounds, including Pampas, agricultural irrigation, stock water and domestic use.	Nil.	<p>The drilling of foundation pilings associated with bridges is unlikely to cause any permanent impacts to groundwater other than temporary impacts during the Construction Works stage. Pilings will be of a sufficient spacing to prevent permanent impact to groundwater flow and will be constructed using the cast in place (CIP) technique where concrete slurry is pumped through a hollow stem auger concurrently as soil/rock is brought to the surface. Only minor volumes of groundwater are anticipated to be brought to surface using the CIP method (e.g.5 to 10 litres per 20 m deep auger hole). No active dewatering is anticipated (see Chapter 15: Groundwater, Table 15-17).</p> <p>Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (see Chapter 15: Groundwater, Section 15.4.4). The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and Operations stages of the Project (e.g. quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project. The proposed groundwater management and monitoring program (GMMP), outlined in Chapter 15: Groundwater, Section 15.7.3, details the approach to monitoring for impacts during construction.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.4.4</p> <p>Section 15.7.3</p> <p>Table 15-17</p>
107	107.0010	Private	Noise and Vibration	Operational rail noise	Concerned about residential noise pollution of engine and carriages including horn noise at level crossings.	nil.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline Operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS (Section 12.2 of Appendix W: Noise and Vibration Assessment - Railway Operations). The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Section 16.10 Chapter 16: Noise and Vibration, Railway Noise Assessment and Mitigation and Management Measures and Section 17 of of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 12.2</p> <p>Section 17</p>
108	108.0001	Private	Land Use and Tenure	Infrastructure crossings/interaction	Will the controls at road rail interfaces/stock routes allow for the movement of cattle across the rail corridor from grazing paddocks to the stockyards as is the submitter's current practice? See submission for specific property and proposed crossing details.	Respond to submitter query.	<p>The issue is noted. Adjustments may be made during the Detailed Design stage of the Project to consider at-property treatments by the appointed contractor.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>As stated in Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.1, in the event that private stock routes are identified through consultation with landowners, a means of continued stock movement connectivity will be included in the detailed design. Where disruption to private stock movements may occur during construction, appropriate temporary connectivity solutions will be agreed in advance with the relevant landowner.</p> <p>Refer to Chapter 8: Land Use and Tenure, Section 8.6 of the revised draft EIS for further detail. Appendix B2: Stock Routes, Figure 1 - 26, shows the current State stock routes and the proposed mitigation measures for existing State stock route movements.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.1</p> <p>Appendix B2: Stock Routes</p> <p>Figures 1 - 26</p>
108	108.0002	Private	Surface Water	Directly impacted landowner	Part of submitter's property will be resumed for the rail corridor, potentially affecting water access points required for livestock operations.	Confirm whether the submitter will be able to negotiate for change if water access points do not suit their purpose.	<p>Severance and fragmentation of rural properties are considered in Chapter 8: Land Use and Tenure, and the results are summarised in Section 8.5.1 of the revised draft EIS. It is identified that property severance could affect the configuration of a property, affecting efficiency, productivity and viability, for example as a result of changes in access arrangement for the movement of farm machinery or stock to different areas of a property. Other identified property impacts include impeded access and changes to internal roads.</p> <p>ARTC acknowledges this issue, which will continue to be addressed as the design and construction planning progress. In accordance with mitigation measures in Section 8.6 (Chapter 8: Land Use and Tenure), the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners would be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. Where the proposal affects internal property access arrangements, input would be sought from relevant landowners prior to finalising the detailed design. Where changes to internal property access arrangements are required, ARTC will consult with relevant property owners/occupants regarding alternative access arrangements, where feasible alternatives are available and identify feasible and reasonable measures to minimise impacts on existing operational arrangements/properties (Chapter 8: Land Use and Tenure, Section 8.6.3).</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.3</p>
108	108.0003	Private	Surface Water	Directly impacted landowner	Submitter's property is located on both sides of the Millmerran/Inglewood Road. Currently pump water from a creek in one property, under the road, to the other property for stock water and limited domestic use. Water pipes will need to be located under the proposed embankment, which could lead to leakage problems for both the embankment and stock water supplies.	Confirm whether alternative arrangements can be made to ensure stock water is accessible.	<p>The Chapter 8: Land Use & Tenure of the revised draft EIS acknowledges that private services and utilities may be impacted by the Project and that resolution to the impact will determined on an individual case-by-case basis in consultation with landowners during detailed design. The detailed design will be developed to ensure that affected landowners retain access to existing natural resources, including water (Chapter 8: Land Use and Tenure, Section 8.5.1 and Table 8-51).</p> <p>If, following consultation, relocation and/or protection of the water pipe is determined to be the preferred solution, the works will be designed and constructed in accordance with:</p> <ul style="list-style-type: none"> Water Supply Code of Australia (Water Services Association of Australia, 2011) AS/NZS 2566 Buried flexible pipeline: Structural design (Standards Australia, 1998). <p>Alternatively, if impacts to the water pipe cannot reasonably be avoided or mitigated through design, appropriate compensation arrangements will be discussed and agreed with the affected landowner (Chapter 8: Land Use and Tenure, Table 8-51).</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Table 8-51</p>
108	108.0005	Private	Landscape and Visual Amenity	Property Devaluation	Proposed Bringallly Creek Rail bridge and lengthy embankment will have significant visual and financial impact on the value and outlook of submitter's rural residence.	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of potential alternative options that may have been considered. In order to manage and mitigate potential impacts associated with the Project, several mitigation measures have been proposed for implementation in future stages of Project delivery and are detailed in Section 11.2, Appendix K: Landscape and Visual Impact Assessment. Current mitigation measures outlined in Table 95 of Appendix K discuss potential mitigation measures for embankments and bridges.</p> <p>Property owners' concerns about the potential for impacts on the value of their properties is acknowledged in the revised draft EIS Appendix Y: Economic Impact Assessment (Section 5.5). As noted, property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p>
109	109.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
109	109.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
109	109.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4</p>
109	109.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement Section 6.2.4 Section 6.2.5 Section 6.3 Section 6.4 Section 6.6 Table 6.11 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 2 Section 2.1 Section 4 Section 5.3 Section 5.5 Section 6 Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>
110	110.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes, which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>
110	110.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6</p>
110	110.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4</p>

111	111.0001	Private	Traffic and Transport	Level crossing	There are three proposed level crossings within 60 km between Inglewood and Millmerran. Shows no respect for users of this road.	Get on with your decision making as some people may like to move on with life plans.	<p>ARTC want to acknowledge that along the length of Millmerran Inglewood Road there is only one proposed level crossing and not three level crossings as stated in the submission.</p> <p>EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT provides an overview of the assessment methodology for developing road-rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7</p> <p>Appendix BT</p>
111	111.0002	Private	Traffic and Transport	Level crossing	Proposed level crossing on the Inglewood side is not in a good location. A previous group suggested an overpass.	Consider one side of Inglewood-Millmerran Road or the other. Consider overpasses to level crossings.	<p>The Project alignment crosses Millmerran-Inglewood Road three times due to road geometry complexities and its interface with Commodore Mine. ARTC alignment studies revealed significant stakeholder benefits on the eastern side of Millmerran-Inglewood Road:</p> <ul style="list-style-type: none"> Fewest farms affected mid-block Fewest farm operations/dwellings within 200 metres of alignment No direct impacts to feedlots Fewest residences within 200 metres. <p>To achieve these benefits, ARTC selected the most technically optimal crossing location to minimise the skew angle and operational construction impacts to Millmerran-Inglewood Road. This crossing location minimises impacts to Bringally State Forest, as it's located on the eastern edge avoiding severing and thus fragmenting the State forest. Furthermore, the alignment minimises, and reduces State forests':</p> <ul style="list-style-type: none"> Restriction of access Loss of flora and fauna Changes to bushfire management Weeds and pests Changes to drainage and minimising sediment and erosion Changes to interests on the State forests e.g. aparies permits, grazing leases and timber values with the forest. <p>EIS Appendix AA: Traffic Impact Assessment, Section 3.7 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT of Appendix AA: Traffic Impact Assessment provides an overview of the assessment methodology for developing road-rail interface treatments. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles. This will take into account the highspeed road environment and provide sufficient signage and warning mechanisms for approaching vehicles. ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7</p> <p>Section 5.8</p> <p>Section 5.9</p> <p>Appendix BT</p>
112	112.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
112	112.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is not yet available. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
112	112.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration – Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>
112	112.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration and Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration and Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Appendix X: Social Impact Assessment (Section 8), outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p>
113	113.0001	Private	Traffic and Transport	Level crossing	Concerned about road safety associated with the proposed passive level crossing on Sawmill Road/Suttons Road near Yelarbon.	Install an active level crossing at this location.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.2.3 discusses the Construction Works stage road-rail interface assessment and required mitigation.</p> <p>With regard to the level crossing at East Sawmill Road/Suttons Road, the existing crossing is a passive level crossing, with gravel approaches on both sides.</p> <p>Vehicle queueing related crashes or collision with trains may be exacerbated by the Project at the existing passive level crossing based on the existing road alignment, unsealed pavement, and insufficient sight distance available to approaching vehicles. However, an improved road design has been developed to ensure sufficient stacking distance is available to accommodate for the largest design vehicle (36.5 m Road Train). As per AS1742.7 a distance comprising the design vehicle plus a safety factor of 5 m stopped at the intersection without fouling the tracks is required. Stacking of >200 m is available. Existing stacking is sufficient which would have no impact on crashes with railway train or vehicle from opposing direction crashes. Due to the existing geometry and sight lines crash likelihood may increase to likely.</p> <p>The proposed upgraded treatment of the crossing will be a passive control crossing with formalising of the approach roads to required geometrical standards and sight distance requirements. The crossing will also be temporarily closed during the Construction Works stage to upgrade the crossing to the required standards of AS1742.7. The upgraded crossing will allow for sufficient safety features. In addition, road safety audits will also be required to be undertaken based on the design and based on as-constructed conditions.</p> <p>In addition to this specific safety measures for the given location, there a number of project-wide safety requirements for all road rail interfaces which detailed int he remainder of the aforementioned Section of the Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.3</p>
114	114.0001	Private	Traffic and Transport	Road safety	Four lane highway will be too close to three houses. School buses dropping off children will have to manoeuvre another two lanes. The area should be restricted to 60 kph. Traffic has already increased over the last 12 months. There will be no room for mailman to deliver mail if a truck is pulling out of the service station heading to Brookstead.	Highway should be moved over at least 30 m away from homes.	<p>The Harris Road level crossing in Pampas for the draft EIS was developed in consultation with the local community. In July 2019 the Pampas community asked to keep the level crossing as close to its current location as possible to minimise impacts to Pampas Hall, residents and enable continued movement of farming equipment with minimised highway interference. The Project team worked to accommodate these aspects in consultation with road authorities, however further development of the draft EIS reference design found that the Gore Highway required additional turning lanes which resulted in potential road safety and access issues, such as the Caltex service station and properties on the northern side of Gore Highway. See Appendix AA: Traffic Impact Assessment for further details on the traffic and access assessments done on Gore Highway.</p> <p>The Project team proceeded to develop an alternate solution that offers a simpler, safer and less impactful design to landowners, the community and road users. In May 2021 the Project team presented both options to the community;</p> <ul style="list-style-type: none"> Draft EIS reference design including road network updates Alternate solution that reduces extent of works on the Gore Highway A letterbox drop followed the information session and additional community feedback was captured. Feedback from the community indicated a preference for the alternate solution. <p>The operation and works to the Gore Highway is under the jurisdiction of the Department of Transport and Main Roads as the road authority. Modifications outside of the currently proposed Project scope, such as the speed limit, should be submitted to the respective road authority directly (Appendix AA: Traffic Impact Assessment).</p>	<p>Appendix AA: Traffic Impact Assessment</p>
115	115.0001	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> The submitter highlights that the Pampas Rural Fire Brigade shed, access for volunteers to this shed as well as access for a Rural Fire Brigade callout from the shed will be impacted by Inland Rail as the shed lies directly in the Inland Rail Project Footprint. However, the EIS does not acknowledge the Pampas Rural Fire Brigade as an affected Emergency Service and fails to list the Pampas Rural Fire Brigade Shed as a sensitive receptor. The submitter highlights that the Pampas Rural Fire Brigade shed is omitted from the list of Emergency Services listed in the EIS and is also omitted from affected community groups. 	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Pampas region needs to revisit decisions around rail and bridge design in the village of Pampas, road access changes and the impact on residences, local businesses and local support groups, specifically the Pampas Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form, and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form, and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landowners on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Project's proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>An information session was held for the Pampas community at Brookstead Hall on 13 May 2021 to consult the Pampas community on proposed changes to the road design. Attendees to this session included a regional QFES representative who provided verbal feedback on the proposed design. A member of the local QFES also provided verbal feedback via phone after the information session.</p> <p>Consultation with the community and relevant government agencies (including emergency services) will continue through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p> <p>The Project team continues to meet with members of the local community, impacted interest groups, and representatives of the Department of Transport and Main Roads (TMR) and Toowoomba Regional Council (TRC) to determine the design scope and requirements for road networks.</p> <p>The proposed rail alignment for the Border to Gowrie Section of Inland Rail follows the existing Queensland Rail Millmerran branch line through Yandilla and Pampas. In developing the Project's reference design, consideration is given to technical viability, safety, operation restrictions, constructability, the environment, community, and property impacts, and consulted widely with landowners and key stakeholders.</p> <p>The Project's reference design and level crossing in Pampas was developed after consultation with the local community. In July 2019 the Pampas community asked to keep the level crossing as close to its current location as possible to minimise impacts to Pampas Hall, residents and enable continued movement of farming equipment with minimised highway interference. The Project team worked to accommodate these aspects in consultation with road authorities, however further development of the design found that the Gore Highway required additional turning lanes which resulted in potential road safety and access issues, such as the Caltex service station and properties on the northern side of Gore Highway.</p> <p>ARTC develop an alternate solution that offers a simpler, safer and less impactful design to landowners, the community and road users. In May 2021 ARTC presented both options to the community;</p> <ul style="list-style-type: none"> Draft EIS reference design including road network updates Alternate solution that reduces extent of works on the Gore Highway. <p>Within the traffic, transport and access study area, seven diversion locations have been identified which include Ware Street Brookstead and Fysh Road Pampas. For the intersections previously summarised in Section 20.7.7 in Chapter 20: Traffic, Transport and Access that have been analysed, all intersections are found to be performing at a satisfactory level post-diversion. The impact on public transport and active modes are also expected to be negligible, if any.</p> <p>A letterbox drop followed the information session and additional community feedback was captured. Feedback from the community indicated a preference for the alternate solution. The revised draft EIS Appendix E: Consultation Report has been updated to include this engagement.</p> <p>The Construction Traffic Management Plan will identify and include secondary/alternative construction routes which can be used by construction traffic in the event that a primary construction route is blocked by an accident or emergency situation. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>ARTC attends the District Disaster Management Group and presents Project updates regularly to facilitate dialogue about the impact of the alignment on emergency services. In 2023, ARTC proposed a quarterly Emergency Management Working Group, comprising senior members from QAS, QFES and QPS. ARTC will continue to liaise with these stakeholders and schedule regular engagement commencing in 2024. The framework for emergency management across the Project alignment, including operational communication protocols within each agency will also be established as part of this process. (Chapter 6: Stakeholder Engagement, Section 6.6.6).</p> <p>The Communication and Stakeholder Engagement Management Plan (CSEMP) will be developed with consideration to the ongoing community engagement requirements outlined in the SIMP (Appendix X: Social Impact Assessment). The CSEMP includes measures to address engagement with government agencies to develop protocols, confirm the detail of mitigation measures for impacts on social infrastructure and develop joint response arrangements with Queensland Fire Emergency Services (QFES), QPS and QAS (Chapter 6: Stakeholder Engagement, Section 6.7.2).</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.6</p> <p>Section 6.7.2</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.7.7</p> <p>Appendix E: Consultation Report</p> <p>Section 5.5</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
115	115.0002	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> The submitter states that there has been no approach from ARTC to the Pampas Rural Fire Brigade to discuss the impact of rail construction and operation and how this will impact on the local Emergency Services. The submitter highlights that the release of the EIS provides the first concrete evidence from ARTC about the location of the Pampas Fire Brigade shed and facilities in the rail corridor as well as the expected impact on the facilities due to noise and vibration. The submitter expresses that the experience of the Pampas region with ARTC is that they have not listened to community concerns or undertaken the stakeholder Engagement process claimed in Appendix C, EIS; specifically that the Pampas Rural Fire Brigade has not been informed or consulted with in any way. The submitter expresses that the behaviour of ARTC, ignoring adversely affected community groups, especially volunteer Emergency Services, further erodes trust and credibility. 	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Pampas region needs to revisit decisions around rail and bridge design in the village of Pampas, road access changes and the impact on residences, local businesses and local support groups, specifically the Pampas Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form, and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form, and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landowners on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensure that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Project's proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>An information session was held for the Pampas community at Brookstead Hall on 13 May 2021 to consult the Pampas community on proposed changes to the road design. 115	115.0003	Private - Brookstead	Social Impact Assessment		The level crossing design has not been completed, hence the EIS document does not provide the necessary detail for Pampas Rural Fire Brigade to comment on social impacts and safety concerns in the local area.	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Pampas region needs to revisit decisions around rail and bridge design in the village of Pampas, road access changes and the impact on residences, local businesses and local support groups, specifically the Pampas Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form, and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form, and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landowners on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>The Pampas Fire Station is located approximately 70 metres from the rail line.</p> <p>The Project's reference design and level crossing in Pampas were developed in consultation with the local community. In July 2019 the Pampas community asked to keep the level crossing as close to its current location as possible to minimise impacts to Pampas Memorial Hall and residents and enable continued movement of farming equipment. The Project team worked in consultation with road authorities to accommodate these aspects, but it was found that the Gore Highway would require additional turning lanes, with potential road safety issues and impact on access to the Caltex service station and properties on the northern side of Gore Highway. An alternate solution was then developed with both options presented to the community through as letterbox drop and information session in May and August 2021. Feedback from the community indicated a preference for the alternate solution. This engagement is documented in Appendix E: Consultation Report, Section 5.</p> <p>The amenity of homes and the Pampas Memorial Hall may be affected by noise from construction whilst works occur in this area. Exceedance of operational rail noise criteria were predicted for homes in Pampas, requiring at-property noise mitigation treatments. Operational noise impacts relative to the Pampas Rural Fire Brigade shed are being investigated. Appendix X: Social Impact Assessment will be amended to note the location of the Pampas Rural Fire Brigade shed and to identify any impacts expected e.g. noise or changes to road access. The Pampas Pampas Rural Fire Brigade has also been identified a stakeholder for ongoing consultation.</p> <p>Appendix E: Consultation Report has been updated to include all Emergency Services and local community groups as stakeholders, and additional engagement has been undertaken with Queensland Fire and Emergency Services (QFES), Queensland Police Service (QPS), and local police stations along the alignment. One-on-one engagement was conducted with the Regional Director of Policing and an ARTC representative attends the District Disaster Management Group and presents Project updates regularly to increase dialogue about the impact of the alignment on emergency services. Additionally, in early 2023 a quarterly Emergency Management Working Group was established with Queensland Ambulance Service (QAS), QFES and QPS to establish the framework for emergency management across the Project alignment. Details are outlined in Appendix E: Consultation Report, Section 5.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5</p>
116	116.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
116	116.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
116	116.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signaling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 16 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration – Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
116	116.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
117	117.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
118	118.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not provide a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent local government areas to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
118	118.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
118	118.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is explained in Appendix W: Noise and Vibration – Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration – Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (see Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (see Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts (e.g. property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration – Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
118	118.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <ul style="list-style-type: none"> The first meeting in Millmerran: <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. Condamine floodplain: <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. Social Impact survey: <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). Future consultation: <ul style="list-style-type: none"> ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
119	119.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project.
