224	224.0002	Private	Land Use and Tenure		Table 7.39 does not discuss the State Planning Policy (July 2017) Liveable Communities State Interest policy for Infrastructure and Services of (4) Connected pedestrian, cycling and public transport infrastructure networks are facilitated and provided.	This Section needs to recognise and describe how The Project (during its construction, scoping the mitigation measures, and postconstruction) will contribute to these two State Interest policies. Please update/ amend the Section to reflect this.	<p>Chapter 8: Land Use and Tenure, Section 8.5.4 Compliance impact assessment has been updated to consider the consistency of the Project with State Planning Policy (July 2017). An assessment of the Project's consistency with each relevant SPP State interest is provided in Table 8-46.</p> <p>With regards to the State interest of Liveable communities, the Project has committed to a range of measures to mitigate and manage impacts on those community and urban infrastructure that make a community 'liveable', through the implementation of relevant management plans including the SIMP, which includes a Health and Community Wellbeing Management Plan. The Community Wellbeing Plan will provide a framework for cooperation with key stakeholders to implement mitigation measures addressing impacts on quality of life as the result of Project impacts on amenity, character, cohesion or connectivity.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.4</p> <p>Table 8-46</p>
224	224.0003	Private	Land Use and Tenure		Table 7.39 does not discuss the State Planning Policy (July 2017) Transport Infrastructure State Interest policy for All Transport Infrastructure of (5) A road hierarchy is identified that reflects the role of each category of road and effectively manages all types of traffic. Active Transport is included in all types of traffic. This Project risks adversely impacting the nearby communities and towns. Active Transport network permeability/ connectivity and effectiveness.	Ensure that The Projects mitigation measures are scoped to effectively support these two State Interest policies; particularly in the vicinity of impacted nearby communities and towns where the ability for walking and cycling should not be adversely affected by The Project.	<p>Chapter 8: Land Use and Tenure, Section 8.5.4 Compliance impact assessment, has been updated to consider the consistency of the Project with State Planning Policy (July 2017). An assessment of the Project's consistency with each relevant SPP State interest is provided in Table 8-46.</p> <p>With regards to the State interest of Infrastructure integration, the Project supports the expansion of existing infrastructure associated with the introduction of a heavy freight rail between Melbourne and Brisbane. The Project is likely to support current and future industries associated with the Charlton–Wellcamp Enterprise Area, including Toowoomba Enterprise Hub, which is an area of strategic importance in supporting industrial growth in the Toowoomba region.</p> <p>With regards to Transport infrastructure, the Project supports this State interest by using the existing South Western Line and Millmerran Branch rail corridors where possible. Furthermore, the Project has considered and assessed potential impacts to State-controlled roads, local government roads and stock routes within the impact assessment area. This is further discussed and considered in Chapter 20: Traffic, Transport and Access.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.4</p> <p>Table 8-46</p> <p>Chapter 20: Traffic, Transport and Access</p>
224	224.0004	Private	Social Impact Assessment	Road safety	The Qld Walking Strategy and Qld Cycling Strategy are Qld Government documents to enable more walking and more cycling across Queensland for the improved health and transport (reduced carbon emissions) outcomes for Queenslanders and their communities. The Toowoomba Regional Sustainable Transport Strategy (2014) is a Toowoomba Regional Council document which documents a Vision of "... safe and equiTable transport options to support the development of healthy and happy communities ..." and includes a Social Objective of - "Safe, accessible and reliable transport options are available for residents to ensure equity of access and social participation. "Safe and connected walking and cycling networks and facilities are usable by a broad range of citizens and purposes to support active, healthy communities.	Ensure that the accessibility and permeability/ connectivity of walking and bicycling networks are not worsened and, in support of strategic intents (i.e., the Queensland Walking Strategy, the Qld Cycling Strategy & the Toowoomba Regional Sustainable Transport Strategy), are not worsened (improved) to enable more sustainable and healthy transport activities for impacted nearby communities and towns. Ensure that the impacts from the Project's mitigation measures to the road transport network are considered and documented. Ensure that mitigation measures to roads and bicycle/ pedestrian access ways are provided and to contemporary Standards/ Guidelines (e.g. Austroads).	<p>ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards.</p> <p>Chapter 5: Project Description Section 5.4 provides detail on reference design including the Project alignment and road/rail interfaces. This is further supported by the Appendix design drawings Part 1 and 2. Section 20.5.9 of Chapter 20: Traffic, Transport and Access identifies the existing walking and cycling networks impacted by the proposed Project alignment and construction routes.</p> <p>During construction, all road routes will be subject to a Road Use Management Plan and Traffic Management Plan, 224 which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans will require regular assessment of road safety, road conditions and traffic composition including pedestrian and cyclist usage to ensure safety for all road users. Section 5.2.2 of Appendix AA: Traffic Impact Assessment provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.</p> <p>ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/shared user facilities, where the need for that facility remains with relevant local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design. Once agreed, changes to active transport networks will be communicated to active transport users through regular Project channels.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.5.9</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p>
224	224.0005	Private	Landscape and Visual Amenity		It has been recognised and documented that community members near the Project footprint enjoy an active, self-generated outdoor recreation (such as bike riding and trail walking). However, there is no discussion about how these activities are being impacted by the Project's mitigation measures so that Community members can just as readily continue to participate in such activities after construction of the Project.	Ensure that the impacts from the Project's mitigation measures to the road transport network are considered and documented. Ensure that mitigation measures to roads and bicycle/ pedestrian access ways are provided and to contemporary Standards/ Guidelines (e.g. Austroads). Include a response in Table 15.14 under the Amenity and lifestyle Impact area	<p>Chapter 6: Stakeholder Engagement, Section 6.6.6 notes that consultation with active transport users and representative groups, including the Queensland Regional Active and Public Transport Advisory Committee (RAPTAC) and the Toowoomba Regional Bicycle Users Group (TRBUG) was undertaken in May 2022 to discuss the needs of stakeholders represented by these interest groups. ARTC will continue to engage with these active travel user groups as the Project progresses through detailed design and construction to ensure active transport corridors are considered and active transport users, including cyclists and pedestrians, are informed at each stage regarding changes to access and roads.</p> <p>Mitigation measures to roads and bicycle/ pedestrian access ways are provided and to contemporary Standards/Guidelines (e.g. Austroads) and are included in Section 20.6.1 with further detail outlined in Table 20.50 of Chapter 20: Traffic, Transport and Access.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.6.6</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.6.1</p> <p>Table 20.50</p>
224	224.0006	Private	Traffic and Transport	Road safety	It has been recognised and documented that the rate of death from road traffic injuries in the impact assessment area is high compared with rates for Queensland (and) has a bearing on the risks for rail transport and road-based vehicles. However, there is no discussion about how these risks, particularly for vulnerable road users (e.g. bicycle riders) are being mitigated; nor is there details about any mitigation measures for vulnerable road users.	Ensure that mitigation measures to roads and bicycle/ pedestrian access ways are provided and to contemporary Standards/ Guidelines (e.g. Austroads). Ensure that the impacts from the Projects mitigation measures to the road transport network are considered and documented.	<p>Appendix AN and AO of the revised draft EIS Appendix AA: Traffic Impact Assessment details the individual Intersection and road link road safety assessments, each identifying detailed mitigation measures on a case by case basis inclusive of the existing cyclist and pedestrian pathways. Appendix AP and AQ of the Traffic Impact Assessment contain the road-rail interface road safety assessments for construction works stage and operations stage of the Project respectively, both considering pedestrian and cyclist safety risks and detailed mitigation measures where required.</p> <p>The safety assessments carried out in Appendix AA: Traffic Impact Assessment calculated individual risk ratings based on the severity and frequency of historical vehicle crash data as per Section 9 of the DTMR GTIA process.</p> <p>Road safety audits for the permanent road changes for the design of the Project, not necessitated by results of the Appendix AA: Traffic Impact Assessment, will be undertaken as part of the road design development process separate to Appendix AA: Traffic Impact Assessment. These audits will be undertaken as the Project alignment and construction routes are confirmed in detailed design.</p> <p>Where a road safety audit is required, the audit will be undertaken by DTMR accredited road safety auditors who are independent of ARTC. A Feasibility Stage road safety audit will be undertaken in accordance with Austroads Guide to Road Safety Part 6: Road Safety Audit (AGRS06-19) and the DTMR Supplement to Traffic and Road Use Management Manual Volume 2: Guide to Road Safety, Part 6: Road Safety Audit.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Appendix AN</p> <p>Appendix AO</p> <p>Appendix AP</p> <p>Appendix AQ</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
224	224.0007	Private	Traffic and Transport		Sect. 15.8.1.6, Table 15.14 - The Impact area of Connectivity discusses impacts from construction and Operation (of The Rail Project) Delivery phases however there appears to be little consideration or discussion documented of impacts from the Operation from the new road network on road users because of the proposed mitigation measures in particular on walking and bicycling activities. The Traffic Impact Assessment (TIA) (Appendix X) has not sufficiently reviewed the existing cycling or pedestrian networks, nor sufficiently assessed the Project's impacts on bicycling and walking activities, nor provided mitigation measures for any such impacts.	Ensure that the impacts from the Projects mitigation measures to the road transport network are considered and documented. Include a response in Table 15.14 under the Connectivity Impact area. Update the TIA and the EIS to recognise that there are bicycle riders who can access all of the road network, and actually do ride within The Projects impact area.	ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the Project alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards. An assessment of the existing cycling infrastructure is presented in revised draft EIS Appendix AA: Traffic Impact Assessment, Section 2.16.1. Identified impacts and mitigation requirements on the existing cycling and pedestrian network infrastructure are listed in Appendix AA: Traffic Impact Assessment, Section 5.10.7. Cyclist and pedestrian safety has also been considered with cyclist mitigation requirements as per the GTIA guidelines summarised in Appendix AA: Traffic Impact Assessment, Section 5.2.2. During construction, all road routes will be subject to a Road Use Management Plan and Traffic Management Plan, which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans will require regular assessment of road safety, road conditions and traffic composition including pedestrian and cyclist usage to ensure safety for all road users. Section 5.2 provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.	Appendix AA: Traffic Impact Assessment Section 5.2 Section 2.16.1 Section 5.2.2 Section 5.10.7
224	224.0008	Private	Stakeholder Engagement		Sect. 15.9.7, Table 15.26 Table 15.26 (page 15-113) - In response to "Impacts on community/ traffic safety" to be addressed - vulnerable impacted road users (e.g. bicycle riders) have not been included in mechanisms	Under Mechanisms include - engagement with bicycle riders/ cycling groups/ bike shops. Engage with walking and bicycling users' about the impacts and suitable mitigation measures. (* e.g. TRC's Regional Active and Public Transport Advisory Committee, Toowoomba Regional Bicycle Users Group, and/or the Author).	ARTC notes that further consultation with bicycle users and TRC about the potential impact of the Project on cycle connectivity as part of its targeted engagement on road/ rail interfaces was undertaken in February and March 2022, as part of the development of the revised draft EIS. Details of this consultation can be found in Chapter 6: Stakeholder Engagement, Section 6.6.6. ARTC also notes that that road/rail interfaces in the reference design has been developed in consultation with asset owners (TMR and councils) and in accordance with their standards. Consultation will continue into the detailed design stage. Further consultation with active transport individuals and representative groups, including the Queensland Regional Active and Public Transport Advisory Committee (RAPTAC) and the Toowoomba Regional Bicycle Users Group (TRBUG) will be ongoing. ARTC will continue to consult with these active travel user groups as the Project progresses through detailed design and construction to ensure active transport corridors are considered and active transport users, including cyclists and walkers, are informed at each stage regarding changes to access and roads.	Chapter 6: Stakeholder Engagement Section 6.6.6 Appendix E: Consultation Report Section 5.6
224	224.0009	Private	Traffic and Transport		Sect. 15.10, Table 15.29 (page 15-119) Connectivity and travel behaviour - In response to the impact of 3.6 km trains creating longer traffic delays of two to three minutes, it has been stated that - Such delays are common on many rural roads and are likely to be tolerated. This statement seems unfounded as the roads in The Project's impact area would not normally encounter delays of two to three minutes; comments from the communities in the Appendix U clearly state that community members are concerned about the impacts/risks from drivers being delayed at rail crossings.	Undertake an assessment of the impacts to the walking and cycling networks. Ensure that mitigation measures support the More Walking and More Cycling visions of the various governments' intents. Please review the statement, and the proposed measures in the SIMP and Residual risk.	Appendix AA: Traffic Impact Assessment Section 1.1.2 Relevant legislation, policy and guidelines, has been updated to include consideration and discussion of Queensland policies, plans and strategies that support active transport. These policies include: <ul style="list-style-type: none">Queensland Walking StrategyQueensland Cycling StrategyDTMR Cycling Infrastructure PolicyAustroads Guide to Traffic Management Part 4: Network Management StrategiesDTMR Road Planning and Design ManualIPWEQ Street Design Manual: Walkable Neighbourhoods These policies have been integrated throughout the assessment process and will continue to be referenced throughout the construction process as a part of the Traffic Management Plan.	Appendix AA: Traffic Impact Assessment Section 1.1.2
224	224.0010	Private	Traffic and Transport		Appendix U Social Impact Assessment, Sect. 7.1.6 -	It has been stated that Yelarbon residents requested a pedestrian path be provided across the line with a response of the Project design has not included a pedestrian path, citing that because there is no current pedestrian path and There are only two houses north of the proposed alignment as apparent justification for not including a pedestrian access way. No current pedestrian path does not equate to no actual pedestrian activities and dismissing the request. This seems like a very subjective and dismissive decision process which defaults to excluding the provision of Active Transport facilities. The submitter feels that providing this infrastructure will help address the negative community sentiments about the Project.	Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.2 discusses the reference design reviews and updates for the Yelarbon road rail interfaces and the proposed pedestrian crossing facilities. As part of the revised reference design a dedicated active pedestrian level crossing has been added at the existing Cunningham Highway interface location (310-11-E-1) to enable pedestrian movement north/ south of the Yelarbon township. ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/ shared user facilities, where the need for that facility remains in a Third-Party Agreement with local councils. Consultation will continue with local councils regarding pedestrian crossing options during detailed design.	Appendix AA: Traffic Impact Assessment Section 3.7.2
224	224.0011	Private	Traffic and Transport		The DTMR Cycling Infrastructure Policy has not been included/ referenced. The Guide to Traffic Management Part 4: Network Management Strategies (Austroads, 2020) has not been included/referenced. The Guide to Traffic Management Part 4: Network Management Strategies (Austroads, 2020) has not been included/ referenced. The Guide to Traffic Management Part 4: Network Management Strategies (Austroads, 2020) has not been included/referenced.	Include the DTMR Cycling Infrastructure Policy in this Section to provide the reasoning for the provision of facilities/ infrastructure for bicycle riders. Include reference to the DTMR Road Planning and Design Manual. Include reference to the IPWEQ Street Design Manual: Walkable Neighbourhoods.	ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the Project alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards. An assessment of the existing cycling infrastructure is presented in revised draft EIS Appendix AA: Traffic Impact Assessment, Section 2.16.1. Identified impacts and mitigation requirements on the existing cycling and pedestrian network infrastructure are listed in revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.10.7. Cyclist and pedestrian safety has also been considered with cyclist mitigation requirements as per the GTIA guidelines summarised in Appendix AA: Traffic Impact Assessment, Section 5.2.2. The whole of Project mitigation measures recommended for the provision of cyclists make reference to the Austroads Guide to Road Design Part 3, 4, and 4a (2017, 2017, 2014) along with the Austroads Guide to Road Safety Part 6a and 8 (2019c, 2015) and the Austroads Guide to Traffic Management Part 6 and 12 (2020, 2016) as per the DTMR GTIA requirements for active transport. These mitigation measures also follow the Cycling Aspects of Austroads Guides (2017c). The CAoAG references the Guide to Traffic Management Part 4: Network Management Strategies. ARTC will continue to work collaboratively with DTMR and engage with community stakeholders and local councils as detailed design progresses regarding pedestrian and cycle connectivity.	Appendix AA: Traffic Impact Assessment Section 2.16.1 Section 5.2.2 Section 5.10.7
224	224.0012	Private	Traffic and Transport	Baseline/ background sampling	There is no data documented for bicycle trips within The Project's impact area. It is not possible to objectively investigate and assess the impacts on bicycle usage when the base line data for bicycle traffic is not known.	Strava and Global Heatmap may be used to generate the required data on cycling and public exercising activities.	ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the Project alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards. The revised draft EIS Appendix AA: Traffic Impact Assessment has assessed the requirements to accommodate key cycling and walking infrastructure identified in the Principal Cycle Network Plans (PCNPs) in accordance with DTMR design standards. During construction, all road routes will be subject to a Road Use Management Plan and Traffic Management Plan, which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans will require regular assessment of road safety, road conditions and traffic composition including pedestrian and cyclist usage to ensure safety for all road users. Section 5.2.2 provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.	Appendix AA: Traffic Impact Assessment Section 5.2.2
224	224.0013	Private	Traffic and Transport		The TIA and EIS has only considered Principal cycle routes as defined by Queensland Principal Cycle Network Plans (PCNP) for bicycle usage. These routes are for planning purposes and are not representative of where bicycles are currently being ridden.	1. Consult the Strava heatmap to see where bicycle riders are using the road/ street network within The Project area. 2. Undertake assessment of the impacts that The Project will have on these activities.	While app-based heatmaps can provide an indication of spatial variation in recreational activities, they also have inherent biases against, young, elderly, less technically adept or low socioeconomic groups, and user numbers. Generally, Strava is not a data source that is used for traffic impact assessment in Queensland due to these limitations. The TIA assessment has been undertaken to understand impacts on the cycle network consistent with TMR's published PCNP, which have been developed with Local Government to provide a connected and cohesive cycle network. This allows for a consistent approach across the network without implementing unknown bias and is the generally applied process for traffic impact assessment across Queensland. Intersection and road link safety assessments defined in revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.2.2 has identified the mitigation requirements for all roads scoped in detailed design and construction works stages with consideration for cyclist and pedestrian safety. Traffic management plans (TMP) will be in place during construction works stage with provision for cyclist traffic to be developed further as detailed design progresses.	Appendix AA: Traffic Impact Assessment Section 5.2.2
224	224.0014	Private	Social Impact Assessment		The draft EIS has not described all the potential social impacts from rationalising roads/ streets which risk adversely impacting on the permeability/ connectivity of walking and bicycling networks – affecting the social cohesion and connectedness of adjacent communities and towns.	Refer the many suggested solutions/ comments above to ameliorate these issues.	Revised draft EIS Appendix AA: Traffic Impact Assessment provides detailed assessment of changes to pedestrian, cycle and vehicular connectivity. Appendix X: Social Impact Assessment describes changes to public roads and pedestrian connectivity and acknowledges and describes impacts on community cohesion (Section 7.1.7). Mitigation measures for impacts to community values such as connectivity and community cohesion are described in Appendix X: Social Impact Assessment, Section 8.2.4 and 8.5.8, and will be further detailed as part of the Community Wellbeing Plan.	Appendix AA: Traffic Impact Assessment Appendix X: Social Impact Assessment Section 7.1.7 Section 8.2.4 Section 8.5.8
225	225.0001	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the Project.	The SIA Survey should be repeated.	This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope. Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
225	225.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.	Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing. Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry. The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement. ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
225	225.0004	Private - Brookstead	Stakeholder Engagement		<p>ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community.</p> <p>ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders.</p> <p>The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.</p> <p>ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.</p> <p>ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p> <p>The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.</p>	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication.</p> <p>Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses.</p> <p>The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process.</p> <p>draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East Intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway Intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement Section 6 Section 6.2.4 Section 6.2.5 Section 6.4 Section 6.5 Section 6.6 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 2.1 Section 4.1 Section 5.3 Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>
225	225.0005	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits to the industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4</p>
225	225.0007	Private - Brookstead	Traffic and Transport	Level crossing	The submitter states that the proposed route has the rail crossing the Millmerran-Inglewood Road three times. It is noted on Table 15.15 Summary of Rail Bridges that two of these crossing will be rail bridges and on Table 5.15 proposed public road-rail interfaces and proposed treatments included in the reference design has one crossing as active level crossing.	<p>The submitter states that the active level crossing is not consistent with Federal Rail Safety Guidelines and due to the amount of traffic that is diverted through this during accidents and flooding on the Gore Highway (Millmerran-Goonindwindi) this crossing must be changed to a grade separated crossing. It is in the interest of safety and future traffic.</p>	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 3.7.6 discusses the reference design reviews and updates at the proposed Millmerran Inglewood Road Crossing at grade active level crossing. From both a road and rail safety perspective, the overarching objective across Inland Rail is to, in so far as is reasonably practicable, minimise the number of level crossings across the alignment. This has resulted in two of the three interfaces with Millmerran-Inglewood Road proposed to be grade separated as part of the Inland Rail Scope. In consultation with DTMR, the Project team has undertaken extensive reviews and assessed design alternatives for the Millmerran-Inglewood Road interfaces, which included alternative rail alignments and grade separations.</p> <p>The design process has included an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory Transport Ministers. Appendix BT provides an overview of the assessment methodology for developing road-rail interface treatments. This overview provides Office of Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project.</p> <p>The two northern crossings (310-35-P-4 and 310-37-P-12a) are topography-based grade separations, where the rail height, governed by the vertical rail grades, is naturally higher than the existing road level. The rolling hills of Millwood and Millmerran provide an opportunity for the rail line to bridge Millmerran-Inglewood Road, which falls within localised depressions in the landscape. The most southern crossing of Millmerran-Inglewood Road, at Inglewood (310-24-P-2), did not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology. Applying the ONRSR audited methodology, higher order treatments, such as grade separation, are not justified at this location as part of the Inland Rail scope.</p> <p>From a future proofing perspective, ARTC used 2040 road and rail traffic numbers as part of the assessment. These traffic numbers have been reviewed by DTMR and factored in the known growth rates in this area. Noting there is also relatively low train volumes in this area with a forecast approximate 1 train every 2 hours on average when IR is first operational and increasing to around 1 train every hour by 2040. Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment. The analysis found the approximated wait time at the Millmerran Inglewood Road level crossing is 1 minute and 9 seconds. Recorded traffic volumes in the area suggest that this period is likely to effect less than 2 vehicles before the crossing is cleared.</p> <p>The IR scope for this location is to construct an active level crossing will boom barriers and flashing lights. This is the highest form of level crossing control in the Australian Standard (AS1742.7-2016). All level crossings will be designed to meet the relevant Australian, State and Road Authority standards, which include the factors including sighting distances, gradients and approach angles.</p> <p>ARTC will continue to work collaboratively with DTMR as detailed design progresses regarding the proposed level crossing design solution.</p>	<p>Appendix AA: Traffic Impact Assessment Section 3.7.6 Section 5.8 Section 5.9</p>
225	225.0008	Private - Brookstead	Land Use and Tenure		The submitter raises concern regarding severance of prime agriculture land.	<p>The submitter states that consideration should be taken to ensure that any prime agricultural land is acquired by leaving the maximum area possible for the landholder and have minimal impacts to the agriculture land and farming operations. The submitter states that by realignment of the proposed rail line to the boundary, this would save the need to have an underpass/ overpass for the movement of large machinery and stock movement. At present the rail line is proposed to dissect a parcel of land leaving a portion of land to be less production. The submitter states that this would show that ARTC are attempting to work with the landholders to ensure the minimum impact.</p>	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC is committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of good quality agricultural land that cannot be avoided (Chapter 8: Land Use and Tenure, Section 8.6.1).</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>Refer to Chapter 8: Land Use and Tenure, Sections 8.5 and 8.6 of the revised draft EIS for further detail.</p>	<p>Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.1 Section 8.6.2 Table 8-46</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
225	225.0009	Private - Brookstead	Land Use and Tenure		The submitter states that the construction and operating of a heavy duty rail line designed to operate indefinitely, will cause widespread and irreversible impacts on the strategic cropping land. The submitter states that farmers will be losing land to the rail corridor and there will be many parcels of land that are severed and too small or difficult shaped, or no longer accessible for cropping with wide machinery.	The submitter raises that ARTC has stated in the draft EIS that its activities are not regulated activities and it was not affected by Regional Interest Planning Act, that is only partly correct. The submitter states that the State Government should have made a decision on the regulated activities prior to the draft EIS being on display.	<p>The Regional Planning Interests Act 2014 (Qld) regulates areas of regional interest and requires a resource activity or regulated activity proposed to be located in an area of regional interest to obtain a regional interests development approval. As the Project is not a resource activity nor a regulated activity under the Regional Planning Interests Act 2014 (Qld), the Act does not apply. As such, the Regional Planning Interests Act 2014 (Qld), and the alignment's impact on the matters protected under Regional Planning Interests Act 2014 (Qld), do not have a bearing on the EIS process, nor is the approval of the EIS contingent on the assessment of the Project's impact on areas of regional interest. Notwithstanding this, the Project's impact on areas of regional interest protected under the Regional Planning Interests Act 2014 (Qld) has been assessed to provide a comprehensive assessment of the Project's impact on agricultural, environmental and societal values present within both the temporary and permanent disturbance footprints of the alignment (Chapter 8: Land Use and Tenure, Section 8.2).</p> <p>To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9, which provides a total of areas of regional interest in relation to the Project footprints. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Section 8.6.2 of Chapter 8: Land Use and Tenure).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and construction Environmental Management Plan.</p> <p>Refer to Chapter 8: Land Use and Tenure, Sections 8.5.1 and 8.6.2of the revised draft EIS for further detail.</p>	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Table 8-46
225	225.0010	Private - Brookstead	Flora and Fauna	Koala	The submitter raises concern regarding the Koala habitat along the proposed rail line, that Koala scats have been found along the proposed rail line, Koala sitings have been found at Native Dog Creek, Millmerran Powerhouse, along the floodplain trough, the inner Downs foothills and onto Gowrie.	The submitter states that the draft EIS has 2 isolated likely areas from Goondiwindi to Gowrie and that it is inaccurate. The submitter states that the draft EIS requires further on ground studies to have landholders believe the accuracy of the information.	<p>Post the release of the draft Border to Gowrie EIS, ARTC has completed additional detailed field surveys across the Border to Gowrie Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft Border to Gowrie EIS and Appendix M: Draft Koala Management Plan.</p> <p>Active searches for Koalas were undertaken at all assessment sites (refer to Appendix L: Terrestrial and Aquatic Ecology Technical Report). The updated species locations, population counts and ground-truthed suitable habitat within the Project footprint is detailed in Appendix O: Matters of National Environmental Significance.</p>	Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix O: Matters of National Environmental Significance
225	225.0011	Private - Brookstead	Flora and Fauna	Mitigation measures	The submitter raises concern with respect to the Popular Box trees species which grow from Murlaggan to Brookstead and then from Yandilla to Bringallily Forestry. These trees are preferential food trees for Koalas.	The submitter states that removal of these trees during construction will destroy the Koala habitat. The submitter questions what mitigation measures will be required to reduce potential impacts to wildlife arising from light at night during both the construction and operation stage of the proposed Project.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works stage. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Light impacts are discussed in Chapter 11: Flora and Fauna of the revised draft EIS. While construction lighting will be temporary, operational lighting will be long term but it will be localised to infrastructure and transient in nature with vehicle movement. Additionally, mitigation measures for light impacts are outlined in Chapter 24: Draft Outline Environmental Management Plan which include: detailed design to incorporate lighting to the minimal level required to meet operational road and rail safety requirement; attenuation measures to minimise light spillage will be assessed and incorporated into the detailed design such as selection of appropriate light fittings/ shield and/or at receptor treatments; limit the potential for vertical illuminance by selecting luminaries that direct light downwards to avoid lateral glare.</p>	Chapter 11: Flora and Fauna Sections 11.5 Section 11.6 Section 11.7 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
225	225.0012	Private - Brookstead	Air Quality	Mitigation measures	The submitter raises concern with respect to impacts on water quality for domestic and animal welfare, additional air pollution added to water supply (dams) troughs at feedlots/ piggeries as well as run off contamination from roofs and dust emissions.	The submitter questions what mitigation plan has been put forward in relation to air quality for rural/ intensive animals	<p>The assessment investigated potential impacts to tank water quality during the operation of the Project (refer to Section 12.5.2 of Chapter 12). This assessment was completed by predicting the deposition of pollutants of the rooves of residential dwellings within the study area. The concentration of pollutants in a residential water tank was then estimated assuming that all deposited matter was washed from the roof into a water tank. This assessment showed that tank water quality impacts from the Project would be negligible as pollutant concentrations would be well below the concentrations prescribed by the Australian Drinking Water Guidelines (National Health and Medical Research Council and National Resource Management Ministerial Council 2022). Section 12.5.1 of Chapter 12: Air Quality shows that for the worst affected receptor, compliance with the drinking water guidelines is predicted for all pollutants of concern (arsenic, cadmium, lead, nickel, chromium VI), with predicted pollutant concentrations more than a thousand times less than the drinking water guidelines.</p> <p>Based on the results of the tank water assessment (against human drinking water guidelines) no significant impacts to water supplies for livestock are expected. The methodology applied is described for water tanks, however, it is also conservatively applicable for assessment of impacts to water quality for dams, noting that the ratio of the surface area (roof area) to water volumes (e.g. 1,000 L for a tank) would be significantly lower than assumed for the assessment of impacts to water tank quality. Impacts to tank water quality are described in Section 12.5.2 of Chapter 12: Air Quality.</p> <p>Based on the results of the assessment, mitigation measures are not required for rainwater tanks or dams for residential dwellings or agricultural purposes. Mitigation measures to minimise air emissions and limit the potential for impacts to human health and amenity have been recommended for the Project and are included in Section 12.6 of Chapter 12: Air Quality.</p> <p>Air pollution can impact agriculture and the Queensland Environmental Protection (Air) Policy (2019) includes air pollutant criteria to protect the environmental value of agriculture. However, the Project will not emit any pollutants (such as fluoride) that include air quality objectives that protect agricultural land uses. Therefore, it is expected that there would be a negligible impact to agriculture due to air emissions from the Project. Consideration of the potential impact to agriculture as a result of dust deposition during the operation of the Project has been included in the assessment in Section 12.5.2 in Chapter 12: Air Quality. Based on the results of the assessment, it is considered unlikely that significant impacts to agricultural receptors will occur as a result of emissions from the operation of the Project.</p> <p>No mitigation measures are required to protect animals based on the results of the air quality assessment. Mitigation measures to minimise air emissions and limit the potential for impacts to human health and amenity have been recommended for the Project and are included in Section 12.6 of Chapter 12: Air Quality.</p>	Chapter 12: Air Quality Section 12.5.1 Section 12.5.2 Section 12.6
225	225.0013	Private - Brookstead	Air Quality	Terrestrial fauna	The submitter raises concern that the draft EIS has not mentioned the impacts that construction dust will have on animal welfare and states that dust emission on animal eyes causes (blight infections Bovine Keratoconjunctivitis). The submitter states that Dust is a high-risk factor in the primary rural areas	Nil.	<p>The Project acknowledges the submitters concern about the impact of dust, especially during construction. The air quality assessment for the Project assessed dust emissions during the construction works stage of the Project and the potential for impacts to human health and amenity.</p> <p>A qualitative assessment of construction dust impacts assessment was also undertaken for the Project, as presented in the revised draft EIS Chapter 12: Air Quality, Section 12.5.1. The construction dust assessment did not consider impacts to animal welfare as there are no air quality goals for dust prescribed by Commonwealth, State or Local Governments which are set for animal welfare protection. However, the construction dust assessment considered impacts to human health and aesthetic amenity, which have stricter legislated air quality goals than the concentration and deposition levels which are indicated to impact animal welfare (Andrews & Shriskandarajah, 1992; Donham, 1991; and Donham et al., 1995).</p> <p>Recommended mitigation measures to minimise dust emissions from the construction of the Project are presented in Section 12.6 in Chapter 12: Air Quality. These recommended mitigation measures will reduce the risk of significant air quality impacts at sensitive receptors, including animals. The recommended mitigation and management strategies are included in Chapter 24: Draft Outline Environmental Management Plan for the Project.</p> <p>Based on the methodology and outcomes of the assessment, and the mitigation measures which will be implemented, it is considered that the risk that dust emissions from the Project will cause infectious Bovine Keratoconjunctivitis is low.</p> <p>References:</p> <p>Donham, KJ. (1991). Association of environmental air contaminants with disease and productivity in swine. <i>American Journal of Veterinary Research</i> 52, 1723-30.</p> <p>Donham, KJ. (1995). A review - The effects of environmental conditions inside swine housing on worker and pig health. <i>In 'Manipulating Pig Production V'. (Eds DP Jennessy, PD Cranwell.) 225	225.0014	Private - Brookstead	Groundwater		The submitter raises concern with respect to the potential impacts of the Project on the groundwater resources.	The submitter states that no existing bores should be impacted during the construction of the rail line, however, this country has been through the worst drought in years and the EIS has not provided assurance where the water will be coming from and what impact this will have to the underground water supply.	<p>The revised draft EIS has been updated to reflect the revised number of bores anticipated to be impacted by the rail alignment. ARTC has undertaken an additional bore survey to confirm the location/ presence of registered bores (water bores - under the Water Act) and to identify any unregistered bores that may be impacted from the Project. Chapter 15: Groundwater, Section 15.5.4 has been updated accordingly with potentially impacted groundwater users and proposed potential make-good measures are detailed in Section 15.7.4 and Table 15-20. ARTC will further engage with water users/ landholders to determine the appropriate make-good mitigation strategy on a case-by-case basis.</p> <p>The use of groundwater for construction water is not a preferred water source for the Project. Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20). Detailed discussion of ARTCs approach to construction water are outlined in Appendix B5: Construction Water Requirements Report.</p>	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Table 15-20 Appendix B5: Construction Water Requirements Report
225	225.0017	Private - Brookstead	Editorial		The submitter highlights that in Appendix U, Table 5.37 Primary & secondary Education LGA area are incorrect with Millmerran State (P-10) school, St Joseph's School (Millmerran) and Brookstead State School.	The submitter states that the draft EIS is incomplete and errors in the EIS indicates no confidence and shortcomings in the draft EIS.	<p>This issue is noted.</p> <p>The locations of the Millmerran State School, St Josephs School, and Brookstead State school have been reviewed and the local government areas amended the revised draft EIS Appendix X: Social Impact Assessment, Section 5.6.2 (Table 5.36).</p>	Appendix X: Social Impact Assessment Technical Report Section 5.6.2 Table 5.36

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
225	225.0018	Private - Brookstead	Hazard and Risk		<p>The submitter raises concern regarding the spread of noxious weeds which is a biosecurity risk.</p> <p>The submitter was part of the Southern Downs Community Consultative Committee (SDCCC) in Term 1 from December 2017 to December 2019 and was then reappointed for Term 2 in January 2020 to present and states that Biosecurity concerns/ weed management was discussed at the SDCCC meeting (2019) with ARTC engaged with stakeholders to have a weed management policy/washdown policies to be distributed/ followed. The submitter states that ARTC engaged with stakeholders but contractors to date have not been conforming to this outcome from the meeting.</p> <p>The submitter states that vehicles that have been on private property have not used washdown and the SDCCC brought this to the attention of ARTC again at a meeting held in 2021 and an email received from Rob McNamara (ARTC) pre-contracts Direct North (28/04/2021) advised that in relation to the biosecurity concerns, this is something that we are going to take on board and come back to the committee with our proposed solution. A number of our staff are weed and seed accredited and so we may need to replicate this training to ensure all staff travelling in the field can competently was down their vehicles when required. The submitter states that it is obvious that there is no checking on staff and the impacts that this biosecurity risk has with landholders.</p>	<p>The submitter states that there has been a failure of ARTC in their aims and objectives of Stakeholder Engagement to build trust, build credibility and build visibility about the Project and the EIS process (Appendix C, Section 2.1, Table 2.1). The submitter states that the landholders require a guarantee/ condition as part of the EIS to ensure that ARTC will be responsible for the eradication of noxious weeds that have been brought onto the property due to the construction of the rail line. The submitter states that the proponent is to be responsible for the ongoing eradication of such noxious weeds until the eradication of such weeds.</p>	<p>ARTC, engaged with stakeholders and its contractors and consultants have required access to private properties to undertake technical assessments to support development of the revised draft EIS and the revised reference design. Access to private property has been achieved through Land Access Agreements, negotiated with individual landholders. These Land Access Agreements specify each landholder's conditions for permitting access to their property. Such requirements include weed management controls. All personnel undertaking site works have been supplied with copies of approved Land Access Agreements to ensure that property-specific access conditions are understood.</p> <p>In preparation for construction, a pre-construction survey of weeds within the Project footprint will be conducted. This survey will establish a baseline for the location and extent of weed infestations within the Project footprint.</p> <p>A Biosecurity Management Plan will be developed prior to the commencement of construction by the 'Contractor' as a component of the Construction Environmental Management Plan. This Plan will be developed in consultation with relevant stakeholders and affected landholders and will include:</p> <ul style="list-style-type: none"> Maps of the existing extent and severity of weed infestations, confirmed through pre-construction survey. Locations of vehicle washdown (light vehicle and oversize vehicles) and rumble grids. Weed surveillance and treatment measures to be implemented during construction and rehabilitation activities. Requirements in relation to herbicide use, including any limitations on use. Corrective actions should the outcomes not achieve the adopted objectives. <p>The effectiveness of weed hygiene measures will be monitored as a component of the environmental monitoring procedure for the Project.</p> <p>Weed management measures that will be implemented for the Project are detailed under a Biosecurity Management Plan outlined in Chapter 24: Draft Outline Environmental Management Plan in the revised draft EIS.</p>	Chapter 24: Draft Outline Environmental Management Plan
226	226.0001	Private	Noise and Vibration	operational rail noise	<p>The submitter is concerned about the potential operational noise and its long-term impact for an ongoing growing township. His concern is related to Chapter 14 and Appendix T. The proposed embankment extending on either side of the Oakley - Pittsworth Road to the north-west of Pittsworth, will be up to 14 m high to the west of the Oakley-Pittsworth Road. This, and the associated rail over road crossing are of concern regarding operational noise impacts for residents on both sides of the proposed embankment and crossing. Similar concerns exist for the proposed embankment, and rail over road crossing at Lochaber Road north of Pittsworth. The perceived omissions from the operational noise modelling studies, create some doubt as to whether the draft EIS has adequately addressed the relevant Terms of Reference for noise impacts 11.220-11.123 described in Chapter 14. The modelling assumptions appear to be generally conservative, it is feared that the modelling may have underestimated operational noise near Pittsworth. This is of particular concern, given that the current modelling has already indicated that Pittsworth is a problem area in regard to operational noise.</p>	<ol style="list-style-type: none"> The final EIS should further explore options for noise mitigation (on both sides of the proposed alignment) near Pittsworth, particularly those within line of sight of the alignment. The eventual noise mitigation measures should be commensurate with the number of affected people. It is believed that lowering the elevation of the currently proposed rail line to ground level (or below) at the Oakley Pittsworth Road, and Lochaber road crossings would substantially alleviate operational noise impacts. After lower of tracks earthen mounds on both sides of the track can be placed Provide estimate in the EIS of how much additional cost would be incurred by lowering the Section of track passing Pittsworth as described above. 	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The DTMR Interim Guideline only requires an impact area of up to 150 metres from the railway.</p> <p>As noted in Section 2.8 of the Chapter 2: Project Rationale in the revised draft EIS, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, has been updated to include an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
226	226.0004	Private	Social Impact Assessment		<p>Section 6.2: Table 17. Correction required. Please replace St Peters Catholic Church with St Stephens Catholic Church.</p>	<p>Please replace St Peters Catholic Church with St Stephens Catholic Church.</p>	<p>The Project alignment has been revised following public submission of the draft EIS. St. Peters Catholic Church and St Stephens Catholic Church are not mentioned within the revised draft EIS.</p>	N/A
226	226.0005	Private	Landscape and Visual Amenity		<ol style="list-style-type: none"> The proposed embankment extending either side of the Oakley - Pittsworth Road to the north-west of Pittsworth, will be up to 14 m high to the west of the Oakley-Pittsworth Road. This, and the associated rail over road crossing are of concern regarding visual amenity. Section 15.4: The barriers proposed barriers, particularly the option 1 barrier, will likely exacerbate the visual impact. The current modelling indicates that barriers will only be required on the southern side of the track adjacent to Pittsworth. 	<ol style="list-style-type: none"> Lowering the elevation of the currently proposed rail line to ground level (or below) at the Oakley Pittsworth Road, and Lochaber road crossings would substantially alleviate the visual impacts for residents on both sides of the 168-72 km section of proposed alignment passing Pittsworth. 	<p>The Landscape and Visual Impact Assessment (Appendix K: Landscape and Visual Impact Assessment) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of potential alternative options that may have been considered.</p> <p>The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and managers.</p> <p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p>
227	227.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the Project. 	<p>The SIA Survey should be repeated.</p>	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
227	227.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	<p>No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.</p>	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
227	227.0004	Private - Brookstead	Noise and Vibration	operational rail noise	<p>ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.</p>	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
227	227.0006	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East Intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway Intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
228	228.0001	Private	Land Use and Tenure		The submitter is writing on behalf of InterLink Global Logistics Pty Ltd ATF InterLinkSQ Global Logistics Centre Trust and Freight Terminals Pty Ltd ATF InterLink Industrial Park Trust (together Interlink). Interlink is the proponent for the InterlinkSQ intermodal freight terminal and logistics park Project located at Draper Road, Charlton. InterlinkSQ is strategically located at the convergence of the Inland Rail route with the existing QR Western Line and has been designed to integrate with both rail corridors. Isolation of Land Due to the way that the inland rail route approaches the existing railway line immediately to the south of Gowrie Creek, it results in the isolation of small pieces of Lot 33 outside of the resumption boundary. These pieces total an area of 2.23 hectares. Due to the small and irregular shape of these pieces of land and their stranding from the rest of the terminal by both the inland rail route and stormwater easement, they are rendered useless and do not have any value to Interlink. Therefore it is submitted that they should be included in the resumption.	The land should be included in the resumption.	<p>ARTC has been in discussions with Interlink and will continue to work with them through the detailed design stage.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the AL Act.</p> <p>Refer to Chapter 8: Land Use and Tenure, Sections 8.5.1 and 8.6.2of the revised draft EIS for further detail.</p> <p>Details on consultation undertaken through the reference design process is provided within Appendix E: Consultation Report.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p> <p>Appendix E: Consultation Report</p>
228	228.0002	Private	Land Use and Tenure		Conflict with terminal position. A large temporary works zone is proposed to be established in generally the same position as the terminal footprint, which we understand is to be used for equipment and materials storage associated with construction of the railway. However, being in the position that is proposed, it will effectively prevent construction and operation of the terminal via the approved connection to the existing QR narrow-gauge railway. This presents a substantial delay of approximately 3 years to the commencement of the Project and loss of potential income during this period.	It is submitted that the temporary works zone should either be relocated or designed to provide a seamless transition to intermodal operations upon completion of railway construction activities.	<p>ARTC notes the existing rail facility location may not align with Interlinks future use plans and will work with Interlink through the detailed design stage to locate the facility in the most appropriate location on its site. ARTC has been in discussions with Interlink and is aware it is supportive of the facility being located on its site subject to agreement on the final location.</p> <p>ARTC will continue discussions with Interlink. Open channel of communication between ARTC and the operators of InterLinkSQ to establish a shared understanding of construction, operation and maintenance schedules for both Projects. This information sharing will be used to inform in advance of the timing and scope of activities in the area; and potential impacts or interruptions to access or property operational arrangements.</p> <p>Details on consultation undertaken through the reference design process is provided within Appendix E: Consultation Report.</p>	Appendix E: Consultation Report
228	228.0003	Private	Land Use and Tenure		Stormwater impacts. Currently the Inland Rail design assumes that the existing pre-development flow rates and extents will be maintained. However, a stormwater management plan (Approved under Toowoomba Regional Council Planning Approval RAL/2015/1854/F) has been prepared for the InterlinkSQ Project which involves works within the existing stormwater easement to integrate with a realignment of the corridor upstream of the existing QR railway culverts. In addition, a further diversion. Channel is proposed before reaching the QR railway culverts to direct excess flow directly to Gowrie Creek adjacent to the existing railway bridge over this waterway (which avoids the stormwater runoff from crossing below the railway corridor twice).	It is submitted that the culverts and embankments associated with the new railway should be designed to accommodate these stormwater management arrangements.	<p>The hydraulic model for Gowrie Creek has been revised since the publication of the draft EIS, to factor in review comments made by the Independent International Expert Flood Panel, appointed by the Australian Government. The Gowrie Creek model now includes the engineering works associated with the approved Stormwater Management Plan for the InterlinkSQ Project.</p> <p>The revised draft EIS will include the updated modelling results.</p> <p>Where changes to surface water and hydrology are identified, nominated Flood Impact Objectives (FIO) have been developed to provide guidance and consideration to indirect impacts on particular land uses (Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 4.2 and Chapter 13: Surface Water).</p> <p>The Project will target achieving the FIOs for events up to and including the 1% AEP for land, receptors, and/or infrastructure, and where the FIOs are met, it is reasonable to assume there will be no adverse impacts from flooding on the use of land. Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case by case basis, including through consultation with stakeholders and landholders.</p> <p>Flood Impact Objectives (FIOs) were developed in consultation with the International Independent Panel of Flood Experts to provide guidance as to the point at which a more detailed consideration of impacts is required when they are exceeded. The FIOs include guidance with regard to potential changes in flood flow velocities caused by the Project, with reference to Erosive Threshold Velocities (ETVs). The FIOs are presented in Chapter 14: Flooding and Geomorphology.</p> <p>An assessment was carried out to determine FIO exceedances as a result of the Project and is presented in Chapter 14: Flooding and Geomorphology. This assessment also addresses potential velocity exceedances that may lead to an increased risk of erosion and scouring. It is important to note that an FIO exceedance would not necessarily cause an impact.</p>	<p>Chapter 13: Surface Water</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 4.2</p>
228	228.0004	Private	Land Use and Tenure		Loss of access <ul style="list-style-type: none"> There is an existing dwelling located on Lot 29 (167 Draper Road) which presently gains access from the north via a driveway connecting with the existing road reserve running parallel to the QR railway corridor. Both the driveway and the road will be consumed by the inland rail resumption effectively isolating this dwelling from the road network. 	It is submitted that as part of the railway construction works that an alternative driveway access to an equivalent standard be provided between the dwelling and Draper Road to the east, including a suitable crossing of the stormwater easement.	<p>The Project will result in the severance of driveways and informal private access roads to individual properties. Refer to Chapter 8: Land Use and Tenure, Section 8.5.1 for further detail.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-51, the detailed design for the Project will be developed to ensure that legal access for private properties is maintained.</p> <p>ARTC will continue to consult with potentially impacted landowners through the detailed design and Pre-construction Activities and early works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect property access.</p> <p>In cases where the acquisition of the portion of a property will cause land locked, commercially unviable and/or inaccessible parcels of land, ARTC will consider acquiring the unusable portion of the lot to avoid impacts to landowners and mitigate impacts to access. In cases where the severance of property impacts a landowner's access to transport routes or water sources, ARTC will install or reinstate necessary infrastructure to maintain continuity (Chapter 8: Land Use and Tenure, Section 8.6.2).</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p> <p>Table 8-51</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
229	229.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the Project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
229	229.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
229	229.0004	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4
229	229.0006	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East Intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway Intersection, which involved road realignments and a more optimal location of the proposed level crossing. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
230	230.0001	Private	Project alignment		The submitter is a resident of Pittsworth and the comments raised are in relation to this region. He is critical of the proposed Project route. He thinks that the Coordinator General needs to be assured, independently, that the overall route selection is in fact the best option in terms of achieving the Projects objectives and with the least impact on communities that will in essence receive little long-term benefit from the rail line but will be required to bear the bulk of the impact for the indefinite life of the Project.	He proposes an alternative route to save time. He states that a shorter route with lower travel time would be from the border crossing near Yelarbon and then head essentially due east along existing QR rail corridor to near Warwick and then down the range and then directly to Kagaru. This route will probably have less environmental and social impacts for the communities along the rail route.	<p>Consideration has been given to a Warwick alternative alignment.</p> <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/ revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it also became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> ➤ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson ➤ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton ➤ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton ➤ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined 2-km-wide study area is referenced within Section 2.8 of Chapter 2: Project Rationale of the revised draft EIS, which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie.</p>	Chapter 2: Project Rationale Section 2.8 Appendix E: Consultation Report
230	230.0002		Economics		The submitter highlights that the claims made in the draft EIS (i.e. the Project has the potential to stimulate business and industry development at the Toowoomba Enterprise Hub in Wellcamp and has the potential to unlock greater economic activity in the region) are not supported by rigorous/robust modelling justifying the objectives.	Nil.	<p>ARTC notes that the development of intermodal terminals and other supporting freight infrastructure at Wellcamp is outside of the scope of the Border to Gowrie EIS. However, the EIS demonstrates as part of the Inland Rail Program, the Project has the potential to stimulate business and industry development at the Toowoomba Enterprise Hub in Wellcamp by providing efficient transport access to intrastate and interstate markets. As such, the Project may act as a catalyst for further private sector investment in the wellcamp area, particularly for freight and logistics operations and intermodals.</p> <p>For further information on possibilities for regional benefits refer Sections 18.7 and 18.8 in Chapter 17: Economics.</p> <p>Section 18.6 of the revised draft EIS identifies the following benefits from improvements in freight efficiency which may benefit businesses in Wellcamp:</p> <ul style="list-style-type: none"> ➤ Operating cost savings of \$320.07 m (at 7% discount rate) in present value terms as freight shifts from road to rail. ➤ Higher capacity trains and improved transit times resulting in lower rail operating parameters (unit rates drop from \$0.044 – \$0.036 per NTK in the Base Case down to \$0.019 – \$0.018 NTK in the Project Case for agricultural freight. ➤ Freight service availability (\$144.86 m) and reliability benefits of (\$41.03 m) million in present value terms at 7% discount rate. ➤ Freight time savings of \$33.96 m in present value terms at 7% discount rate. <p>These benefits may attract significant investment in freight and logistics to already established precincts such as Wellcamp.</p> <p>In addition, the Australian Government will contribute up to \$10 million for a joint business case to consider the development of an intermodal terminal in Brisbane to support Inland Rail. The Australian and Queensland governments will jointly undertake a detailed business case considering the terminal location and matters including market access/ operating models, financing options and value capture opportunities. Refer to link: https://investment.infrastructure.gov.au/projects?Project_id=111245-20QLD-MRL&-text=The%20Australian%20Government%20will%20contribute,Brisbane%20to%20support%20Inland%20Rail.</p>	Chapter 18: Economics Section 18.7 Section 18.8
230	230.0003		Economics		The Inland Rail is primarily a bulk commodity transport operation – large volumes of bulk agricultural commodities going from the place of production to export ports or centralised processing operations. There is no synergy between a bulk freight operation like inland rail and a niche and high value commodity – e.g. fresh exotic vegetables and fruit, fresh flowers, fresh prime beef cuts etc export operation through Wellcamp. The high value agricultural areas in this region is the Lockyer and Fassifern Valleys and the Granite Belt so it is very unlikely that a fruit and vegetable grower is going to put their produce onto a train and send to it to Wellcamp by rail for subsequent air freight overseas. He also records that a train from Melbourne will not really stop and unload or load containers at a point that is just over an hour (at design speed of 115 km/hr), from the final terminus end of the line, or conversely is a train that has just started its journey from Brisbane going to stop at Toowoomba to take on freight to take down to Melbourne. All these points make him question the economic rationality of the Project in the context of the proposed rail line.	It would be more cost effective to take that commodity directly by road or existing rail direct to Brisbane for loading at the Port of Brisbane or processing. Freight transfer hubs should be arranged t places like Parkes (NSW) and Yelarbon/ Goondiwindi which are at middle of the rail line and producing areas. He does not propose Toowoomba as it is at one end of the line and also on the edge only of the grain and cotton production areas. For a grain and cotton grower from the western Darling Downs, Goondiwindi region and the eastern Maranoa areas it is probably a cheaper exercise to transport their commodities to Yelarbon or similar for transfer to rail than to Toowoomba.	<p>The Inland Rail program meets demand for certain freight types, however it is acknowledged that the broader freight network covers road, rail and air freight. The 2015 Rail Programme Business case identifies the Project will enhance competition between rail and road freight, by providing a credible transport alternative, which will drive further innovation and efficiency. This is supported by the economic analysis undertaken in the revised draft EIS for Border to Gowrie.</p> <p>More recent modelling to identify the potential value of Inland Rail to businesses has been conducted in partnership with CSIRO in the Inland Rail Supply Chain Mapping Technical Report 2022. Key findings can be found here - inlandrail.gov.au/sites/default/files/documents/Inland%20RailSupply%20Chain%20Mapping%20Key%20Findings.pdf. Key findings of the Supply Chain Mapping study revealed that switching supply chains to Inland Rail could save \$213 million on transport costs each year across 22 million tonnes of freight.</p> <p>For existing road-based supply chains, by switching to Inland Rail for at least part of their journey, early results show these supply chains have the potential to capture annual transport cost reductions of about \$170 million. Of this, the annual transport cost reduction for freight moving between Melbourne and Brisbane could be \$75 million, representing a transport cost reduction of around 44%. For existing rail-based supply chains, it is estimated Inland Rail is likely to deliver an annual cost reduction of about \$21 million by switching to Inland Rail for at least part of their route. Of this, the annual transport cost reduction for existing rail freight moving between Brisbane and Melbourne would be about \$15 million, representing a transport cost reduction of about 27%.</p> <p>All assumptions relating to demand modelling, including the connection to intermodal terminals or other supporting freight infrastructure, are considered in the Inland Rail Program Business Case (2015). The EIS reflects the information contained in the Business Case and does not include any new assumptions. As such considering the development of other infrastructure (such as intermodal terminals or supporting freight infrastructure) or Project options is outside the scope of this EIS. It is noted the location of intermodal will have a material impact on the way benefits of Inland Rail are realised.</p> <p>The current reference design for the revised draft EIS for Border to Gowrie does not include sidings at these locations to accommodate the transport of agricultural produce directly to the Port of Brisbane. This does not preclude ARTC or another 3rd party constructing such a facilities at a later date. Such facilities would require a specific business case, a review of the operational efficiencies of the Inland Rail alignment, and be subject to further approvals. Discussions with key stakeholders, including major agricultural producers, can occur a later date should there be identified a future need for such rail infrastructure at these locations.</p> <p>In addition, the Commonwealth government has committed up to \$20 M with a joint funding arrangement with the Qld government to progress the Port of Brisbane Strategic Rail Access Study. The study is expected to be completed in 2023. Refer to link: investment.infrastructure.gov.au/Projects/ProjectDetails.aspx?Project_id=104938-19QLD-MRL</p>	Chapter 18: Economics Section 18.8 Section 18.9
230	230.0008		Economics		One of the stated longer term benefits of the Inland Rail is to move more bulk commodity freight from road to rail. Doing this would provide a reasonable benefit to communities along the Gore Highway as it will hopefully mean that there will be lesser numbers of multi-trailer grain and other agricultural haulage trucks on the road from the grain producing areas to the port and centralised processing facilities. The EIS in its determination of forecast train numbers makes reference to trains with Queensland grain from Yelarbon and Narrabri to Fisherman's Island and trains hauling Queensland cotton. However, despite these movements being included in the train forecasts and presumably in the financial justification for the Project, the development of these freight hubs does not appear to be part of the overall ARTC Project scope and so there is no guarantee or commitment that this bulk grain and cotton haulage will occur with the subsequent reduction in trucks on the road.	Provide some surety that the subsequent benefits will accrue then as a condition of any EIS approval ARTC should be required to include this bulk freight loading and transfer infrastructure in the initial Project construction scope. This will then provide real incentive for ARTC to make this happen and deliver the cost benefit for the producers and the environmental benefit to the communities for the reduction in truck numbers. The EIS and any approvals should stipulate targets for the amount of grain and other commodities transferred to rail haulage on a year by year basis that are transparent to the community and that become a measure of the success of the Project form a regional and impacted community perspective.	<p>The Inland Rail program meets demand for certain freight types, however it is acknowledged that the broader freight network covers road, rail and air freight. The 2015 Rail Programme Business case identifies the Project will enhance competition between rail and road freight, by providing a credible transport alternative, which will drive further innovation and efficiency. This is supported by the economic analysis undertaken in the revised draft EIS for Border to Gowrie.</p> <p>More recent modelling to identify the potential value of Inland Rail to businesses has been conducted in partnership with CSIRO in the Inland Rail Supply Chain Mapping Technical Report 2022. Key findings can be found here - inlandrail.gov.au/sites/default/files/documents/Inland%20RailSupply%20Chain%20Mapping%20Key%20Findings.pdf. Key findings of the Supply Chain Mapping study revealed that switching supply chains to Inland Rail could save \$213 million on transport costs each year across 22 million tonnes of freight.</p> <p>For existing road-based supply chains, by switching to Inland Rail for at least part of their journey, early results show these supply chains have the potential to capture annual transport cost reductions of about \$170 million. Of this, the annual transport cost reduction for freight moving between Melbourne and Brisbane could be \$75 million, representing a transport cost reduction of around 44%. For existing rail-based supply chains, it is estimated Inland Rail is likely to deliver an annual cost reduction of about \$21 million by switching to Inland Rail for at least part of their route. Of this, the annual transport cost reduction for existing rail freight moving between Brisbane and Melbourne would be about \$15 million, representing a transport cost reduction of about 27%.</p> <p>All assumptions relating to demand modelling, including the connection to intermodal terminals or other supporting freight infrastructure, are considered in the Inland Rail Program Business Case (2015). The EIS reflects the information contained in the Business Case and does not include any new assumptions. As such considering the development of other infrastructure (such as intermodal terminals or supporting freight infrastructure) or Project options is outside the scope of this EIS. It is noted the location of intermodal will have a material impact on the way benefits of Inland Rail are realised.</p> <p>The current reference design for the revised draft EIS for Border to Gowrie does not include sidings at these locations to accommodate the transport of agricultural produce directly to the Port of Brisbane. This does not preclude ARTC or another 3rd party constructing such a facilities at a later date. Such facilities would require a specific business case, a review of the operational efficiencies of the Inland Rail alignment, and be subject to further approvals. Discussions with key stakeholders, including major agricultural producers, can occur a later date should there be identified a future need for such rail infrastructure at these locations.</p> <p>In addition, the Commonwealth government has committed up to \$20 M with a joint funding arrangement with the Qld government to progress the Port of Brisbane Strategic Rail Access Study. The study is expected to be completed in 2023. Refer to link: investment.infrastructure.gov.au/Projects/ProjectDetails.aspx?Project_id=104938-19QLD-MRL</p>	Chapter 18: Economics Section 18.8 Section 18.9
231	231.0002	Private	MNES	Koala	In the draft EIS, the MNES map shows essential habitat north-east of Pittsworth and north-west of Southbrook. This map fails to show Essential Habitat that exists west of Pittsworth (similar to the Essential Habitat shown) and any Wildlife Habitat at all, which is completely erroneous. To use existing Nature (Koala) Conservation Plan 2017 mapping for the draft B2G EIS is inappropriate and unsatisfactory - and irrelevant for the Pittsworth and Southbrook Koala populations.	The EIS should incorporate ground relevant mapping and/or include the next version of the Koala habitat map, due for release in April 2021.	<p>Additional surveys were conducted by Cardno and AusEcology in spring, summer and autumn 2021 and by AusEcology in autumn 2022 to verify the presence of REs and threatened ecological communities (TEC) within the Project footprint. Essential habitat is mapped in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p>	Appendix L: Terrestrial and Aquatic Ecology Technical Report Sections 4 and 5
231	231.0004	Private	Flora and Fauna	Koala	The draft EIS outlines the predicted Koala habitat within the impact assessment area (ha) - Table 10.20 shows that Koalas have the largest area of predicted habitat of all fauna species, except two vagrant dispersive birds, the grey falcon and white-throated needletail, neither of which live in the region. The total Koala habitat is listed as 8091 ha, of which 98 per cent is listed 'habitat critical to the survival of the species'. This 8091 ha statistic is a hundredfold contradiction of the statistic in Table 10.13 (Section 10.5.5) which lists only 81.73ha as 'Koala Habitat Areas'. The draft EIS is inconsistent. The error in Table 10.13 lies in the draft EIS reliance on the state government's Nature (Koala) Conservation Plan 2017 mapping, which is incomplete.	Nil.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC) was used to support the development the revised draft EIS. The inconsistencies with reporting Koala habitat mapping in the draft EIS has now been updated in the revised draft EIS to more accurately reflect the more detailed survey data.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix M: Draft Koala Management Plan (DKMP). This will be standalone appendix for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. The DKMP provides additional information Koala habitat and records of the species along the alignment. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p>	Appendix E: Consultation Report Section 4.2 Section 5 Section 5.11 Appendix M: Draft Koala Management Plan
231	231.0005	Private	Flora and Fauna		The draft EIS outlines - Table 10.26 rates the Restoration of Disturbed areas, including revegetation, as causing short-term Duration of Disturbance, which it classifies as 6 to 12 months. The submitter outlines that in the variable low rainfall climate of the Darling Downs, revegetation of disturbed areas is not short-term. Environmental disturbance can take decades to repair and need constant surveillance and maintenance.	The EIS should specify which party will be responsible in terms of monitoring and costs to ensure successful restoration of disturbed areas.	<p>In Chapter 11: Flora and Fauna of the revised draft EIS, the Duration of Disturbance for Restoration of Disturbed areas has been updated to 'Temporary' meaning days to months (e.g. 1 to 2 seasons; 3 to 6 months).</p> <p>Chapter 11: Flora and Fauna proposed mitigation measures includes development of a Rehabilitation and Landscaping Management Plan for the Project, as a component of the CEMP. Reinstatement, stabilisation, rehabilitation and landscaping of disturbed areas will be undertaken progressively as work fronts are completed. The Rehabilitation and Landscaping Management Plan will establish the procedures, timeframes, measurable performance objectives, responsibilities for monitoring the success of rehabilitation and/or reinstatement/ stabilisation areas and proposed corrective actions if the outcomes of rehabilitation and/or reinstatement/ stabilisation are not achieved.</p> <p>Chapter 11: Flora and Fauna provides a summary of the auditing, monitoring and reporting requirements for the Project.</p>	Chapter 11: Flora and Fauna Section 11.6 and 11.7

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
231	231.0006	Private	Flora and Fauna	Koala	DNA investigation would be important to establish if there are substantive links between the Yarranlea, Pittsworth and Southbrook Koalas and other populations south and west of Millmeran and towards the far Eastern Darling Downs. Any such links would be severely impacted by the Inland Rail with permanent and possibly irretrievable consequences. The EIS needs to apply realistic criteria to calculations of Disturbance impacts. The proponent should be required to conduct detailed survey work of Central Downs Koalas, including DNA analysis. Pittsworth Landcare offers to work in partnership with the proponent in such survey work to impart critical local knowledge.	The draft EIS outlines - Table 10.26 rates the Duration of Disturbance caused by Cutting construction during the construction phase as Medium Term (2 to 10 years). The submitters states that construction of a cutting is not a Medium Term Disturbance to Koalas and other wildlife. It is permanent, as are embankments, bridges and re-alignments of roads. Vegetation clearing, fencing and the rail line barrier will destroy connectivity will be lost permanently.	<p>Post the release of the draft EIS for public notification, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated species habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the technical ecological assessment from Ausecology (2022) as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC), was used to support the development of key species management plans. This information is present in Chapter 11: Flora and Fauna.</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report outlines that a review of existing literature and previous studies was conducted which included gathering information on species diversity, abundance and distribution. Field surveys were also conducted to verify the presence of threatened species and ecological communities within the impact assessment area. As noted in Appendix L: Terrestrial Ecology and Aquatic Technical Report, the mapped areas of Koala habitat does not reflect the entire extent of Koala habitat in the Project footprint as there is also vegetation within and surrounding the Project footprint. Mitigation measures and controls have been factored into the Project to reduce the impact on the affected species. In addition, mitigation and management measures have been proposed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>In addition, ARTC has commenced two key research initiatives relating the Koala (<i>Phascolarctos cinereus</i>) to better understand populations, potential impacts and to develop targeted mitigation and management measures. Regarding the proposed solution, ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study Koala genetics that focusses on population genetics and dietary analysis for Koalas across eight of the Inland Rail Projects.</p> <p>The purpose of this study to:</p> <ul style="list-style-type: none"> ➤ Increase baseline data on Koala population resilience and restoration requirements. ➤ Informs Koala conservation controls as required in conditions of approval. ➤ Informs fauna connectivity plans. ➤ Informs Koala offset management decisions. ➤ Contribute to Infrastructure Sustainability Council credits. <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Appendix L: Terrestrial and Aquatic Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p>
231	231.0007	Private	Flora and Fauna	Koala	The draft EIS states - 10.9.2 Fauna Species Injury or Mortality claims that 'larger species with defined territories and movement patterns (e.g. Greater Glider and Koala) are less likely to be at risk to direct mortality where appropriate mitigation measures are applied'. The same paragraph claims this risk will be highest 'during construction'. The submitter states - The risk posed to Koalas by the railway and associated fencing will be permanent and deadly. Koalas climb fences. They will be prone to being stuck on fences, injured by wire or trapped inside fences.	The EIS needs to fully explain how this permanent threat to Koalas will be addressed, and which party will be responsible for, and pay for, the treatment of injured and stranded Koalas.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during this stage. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy)</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p> <p>A standalone fauna management plan (Appendix N: Draft Fauna Management Plan) has been provided in the revised draft EIS. The fauna management plan outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p> <p>Where impacts to threatened species habitat cannot be avoided, mitigation and management measures will be implemented. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, during both the construction works and operations stages. Impact mitigation will include pre-clearance surveys prior to disturbance. Management and mitigation measures to protect vulnerable and endangered species are proposed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>In instances where a significant residual impact as identified by the relevant EPBC Act significant assessment criteria, biodiversity offsets will be secured (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report, Section 8). ARTC will provide biodiversity offsets in accordance with the relevant State or commonwealth legislation and guidelines. ARTC's approach to delivering environmental offset requirements is outlined in Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p>
231	231.0008	Private	Flora and Fauna	Koala	➤ Draft EIS states 'Opportunities for the provision of fauna fencing have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate.' The submitter asks about who will oversee these unknown and unspecified changes to be refined and incorporated, and when and how they are to be assessed as being appropriate and by whom?	These 'opportunities' should be spelled out in the EIS document, not at some later date without proper scrutiny.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft, Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of Appendix P: Fauna Connectivity Strategy.</p> <p>Appendix N: Draft Fauna Management Plan outlines the roles and responsibilities of personnel undertaking management and mitigation measures. 231	231.0009	Private	MNES		Table 10.30 Proposed Mitigation measures Specific to Matters of National Environmental Significance includes - Establish and maintain a fauna management and incident register to record sightings and/or incidents involving fauna species during the undertaking of Project activities'.	Pittsworth Landcare requests that this register be publicly available, updated within 48 hours, and that a quarterly report be generated from the information. As the districts lead organisation in local wildlife and environmental matters, Pittsworth Landcare further requests that its nominee be notified as soon as practicable of all sightings and incidents	As part of the proposed mitigation measures, Chapter 11: Flora and Fauna presents a summary of inspections, monitoring, auditing and reporting to be undertaken for the Project. Inspections, monitoring, auditing and reporting will be undertaken to document compliance with imposed conditions, the CEMP and Operation EMP. Registers will be maintained and made available in accordance to the requirements of the imposed conditions for the Project as well as the CEMP and OEMP.	Chapter 11: Flora and Fauna Section 11.6
231	231.0010	Private	Flora and Fauna		ARTC is committed to implementing ongoing monitoring of the effectiveness of the measures with contingency (under an adaptive management framework) to change/improve management strategies where deleterious impacts to the identified environmental values are observed, or are not minimised, as per the objectives of the proposed measures. The submitter asks how monitoring will be conducted and by whom? Also who will arbitrate the effectiveness of measures?	The EIS should specify the adaptive management framework and the monitoring schedules to be used.	<p>The 'adaptive management framework' (referenced in Chapter 11: Flora and Fauna) will facilitate change and improvement to the management strategies where the objectives of the proposed measures are not met. A Draft Fauna Management Plan has been prepared for the Project (Appendix N: Draft Fauna Management Plan) which identifies specific management, monitoring, reporting and performance requirements for the Project.</p> <p>In addition, Chapter 11: Flora and Fauna notes that as the Project moves into the detailed design and construction works stages, more focused and comprehensive ecological surveys in accordance with the Commonwealth's survey guidelines will be undertaken under the Project's Biodiversity Plan. Targeted surveys will be conducted in parallel to developing the detailed design and will identify the actual occurrence/ extent of threatened ecological communities (TEC) within and adjacent to the Project footprint and the presence of threatened species and/or habitat suitable to supporting the presence of threatened species. Surveys will be carried out as per diagnostic criteria and condition thresholds outlined in community-specific approved conservation advice (for TECs) and relevant survey guidelines (for threatened fauna). The surveys aim to address any changes to the revised reference design and Project footprint, along with informing the design and construction, including specific measures to avoid, mitigate, minimise impacts on a particular species or TECs, along with ongoing monitoring activities.</p> <p>The overarching CEMP for the Project will establish the procedures, timeframes, measurable performance objectives, responsibilities for monitoring and propose corrective actions if performance outcomes are not achieved (Chapter 24: Draft Outline Environmental Management Plan).</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p>
231	231.0011	Private	MNES		EIS terms of reference 11.27 proscribes that the EIS 'should describe any mitigation measures proposed to reduce the impact on the listed threatened species'. To say 'a specific goal might be' is not a measurable condition. Surely the intent is that EIS goals should be specific and measurable, not simply recommended to be so later on.	The EIS needs to include specific goals to measure the effectiveness of wildlife crossing structures and consequences that would follow. Fauna crossings must be provided at regular intervals in the Pittsworth Southbrook area.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy) proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. 231	231.0013	Private	MNES	Offsets	The EIS provision for offsets is so vague as to be non-existent. It is insufficient for an EIS to merely promise a plan sometime in the future.	The EIS needs to include a credible Environmental Offset Delivery Plan and Offset Area Management Plans.	<p>The updated Border to Gowrie Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie has been developed as a standalone Project specific offset strategy to align with both Commonwealth and State environmental offset policies and guiding principles. The Project Environmental Offset Delivery Strategy (EODS) has been amended as part of the revised draft EIS to recognise all approval requirements prior to Project impacts. Appendix Q: Environmental Offset Delivery Strategy details matter specific management intent for each predicted impacted matter (MNES/ MSES) detailed across each of the offset properties being presented.</p> <p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie includes discussion pertaining to OAMPs.</p> <p>OAMPs will be developed for each proposed offset site and submitted for Commonwealth and State Government approval. Approval of each OAMP will be required prior to construction commencement. The goal of the OAMPs will be to achieve habitat quality gains at each offset site for each respective matter, while maximising landscape conservation outcomes by increasing resilience of self-sustaining communities and populations and improving connectivity within the region. Each OAMP will be developed generally in accordance with the Environmental Management Plan Guidelines (Commonwealth of Australia, 2014) and will define as a minimum:</p> <ul style="list-style-type: none"> Offset area details Conservation outcomes and associated management actions for each MNES/ MSES Additional management action requirements for co-located MNES/ MSES Monitoring activities and timeframes Performance criteria to be achieved for each MNES/ MSES and interim milestones Corrective actions and triggers for corrective actions <p>Auditing and reporting.</p>	Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie
231	231.0014	Private	Flora and Fauna	Koala	Table 10.35 Estimation of Potential Magnitude of Disturbance for Sensitive Environmental Receptors rates the percentage disturbance to Koalas as 9.1%, or Moderate (i.e. less than 13%). This table mis-represents the disturbance risk to Central Downs Koalas.	The OCG should request the proponent conduct detailed baseline DNA testing before construction and schedule ongoing DNA testing for 10 years after construction to determine whether gene flow was happening and whether fauna crossings were working or not.	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report outlines that a review of existing literature and previous studies was conducted which included gathering information on species diversity, abundance and distribution. Field surveys were also conducted to verify the presence of threatened species and ecological communities within the impact assessment area. As noted in Appendix L: Terrestrial and Aquatic Ecology Technical Report the mapped areas of Koala habitat does not reflect the entire extent of Koala habitat in the Project area as there is also vegetation within and surrounding the Project footprint. Mitigation measures and controls have been factored into the Project to reduce the impact on the affected species.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan.</p> <p>In addition, ARTC has commenced two key research initiatives relating the Koala (<i>Phascolarctos cinereus</i>) to better understand populations, potential impacts and to develop targeted mitigation and management measures. Regarding the proposed solution, ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study Koala genetics that focusses on population genetics and dietary analysis for Koalas across eight of the Inland Rail Projects. The purpose of this study to:</p> <ul style="list-style-type: none"> Increase baseline data on Koala population resilience and restoration requirements. Informs Koala conservation controls as required in conditions of approval. Informs fauna connectivity plans. Informs Koala offset management decisions. Contribute to Infrastructure Sustainability Council credits. 	<p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5</p> <p>Section 5.11</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
231	231.0015	Private	Flora and Fauna		The Inland Rail line will indisputably have Major residual impact on Pittsworth and Southbrook Koalas, in terms of preventing connectivity, fragmenting habitat, and producing noise and light disturbance. All of these factors place the local Koala population at greater risk of extinction.	The draft EIS be revised in order to present consistent, credible management plans.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS: Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy) proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy).</p> <p>Both the Draft Koala Management Plan and Fauna Connectivity Strategy provide recommendations on the proposed monitoring regime to determine effectiveness of fauna connectivity structures including an adaptive management framework.</p>	<p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5</p> <p>Section 5.11</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
231	231.0016	Private	MNES	Mitigation measures	Draft EIS Table 10.38 (Initial Assessment of Significance of Impacts of the Project on Identified Sensitive Environmental Receptors) rates the Project's residual impact on Koalas during its operation phase as 'Negligible' in magnitude and 'Low' in significance. That assessment is also wrong.	The EIS should prescribe who is responsible to 'make good' or compensate if mitigation processes prove unsuccessful?	Chapter 11: Flora and Fauna of the revised draft EIS outlines that ARTC is committed to implementing ongoing monitoring of the effectiveness of the Project's management measures with contingency (under an adaptive management framework) to change/ improve management strategies where deleterious impacts to the identified ecological values are observed, or are not minimised, as per the objectives of the proposed mitigation measures.	Chapter 11: Flora and Fauna Section 11.5
231	231.0017	Private	MNES		Table 10.39 (Summary of significant impact assessment of EPBC Act controlling provisions of the Project) states that the Project will have 'Likely significant residual impact' on Koalas. This assessment is accurate. Given the vulnerable status of Koalas, the EIS needs to be much stronger.	The EIS needs to be more detailed and more prescriptive of responsibilities to explain how significant residual impacts will be mitigated.	<p>Impacts to ecological values will be avoided where possible and then minimised and mitigated to the greatest extent practicable (see Chapter 11: Flora and Fauna). Residual impacts are those impacts that remain after the implementation of an avoidance hierarchy and mitigation measures.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS: Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>It is expected that environmental offsets will be required and Chapter 11: Flora and Fauna provides discussion on how ARTC proposes to provide its offset obligations for the Project. In addition ARTC's Environmental Offset Delivery Strategy—Qld (Strategy) has been developed for the Project and is provided as Appendix Q: Environmental Offset Delivery Strategy.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Sections 11.5, 11.6 and 11.7</p> <p>Appendix Q: Environmental Offset Delivery Strategy</p> <p>Appendix M: Draft Koala Management Plan</p>
231	231.0018	Private	Stakeholder Engagement	Koala	Given the inadequacies of the Koala surveys that have informed the EIS, Pittsworth Landcare requests that its members be consulted during any further 'detailed ecological surveys'.	The EIS should require the proponent to undertake further Koala surveys, prior to any approvals, inviting the participation of Pittsworth Landcare members and other local residents. The survey results should be publicly available and a consultation period for public comment enacted.	<p>It is acknowledged that the submission identifies numerous inconsistencies in the road rail interface identification and reporting. These inconsistencies have been corrected in the revised draft EIS. Appendix AA: Traffic Impact Assessment, Section 3.6 outlines all proposed road rail interfaces to be used by the Project. This is further broken down into existing road rail interfaces and proposed new road rail interfaces in Section 3.6, respectively. Furthermore, Appendix L Existing Public Road Rail Interfaces of Appendix AA: Traffic Impact Assessment, provides the mapping of the existing road rail interface locations. A Table has been included below with a summary of the interfaces referenced in the submission as evidence that these inconsistencies have been addressed. However, not all of the listed road rail interfaces have changed for the reasons provided.</p> <p>Summary of updates below:</p> <ol style="list-style-type: none"> 310-5-P-1 is an existing road rail interface. Interface ID changed to 310-5-E-2 and listed in the Table of existing road rail interfaces (Table 3.11). 310-8-E-0 is a relocated existing road rail interface and has been listed in the Table of existing road rail interfaces (Table 3.11). This is consistent with other relocated existing road rail interfaces. 310-16-E-1 is a proposed road rail interface. Interface ID changed to 310-16-P-1a and listed in the Table of proposed road rail interfaces (Table 3.12). 310-42-E-0 is a relocated existing road rail interface. 310-42-E-1 has been closed and relocated to this location (310-42-E-0). 310-42-E-0 is listed in the Table of proposed road rail interfaces (Table 3.12). This is consistent coding with other relocated interfaces. With reference to the example provided by QR, 310-11-E-1 is the original Cunningham Highway LX in Yelarbon. 310-11-P-0 is the relocated Cunningham Highway road over rail grade separation to replace LX. This is inconsistent with the coding of other relocated interfaces. Interface ID changed to 310-11-E-0 and listed in the Table of proposed road rail interfaces (Table 3.12). Interface ID 310-24-P-3 and 310-25-P-1 have been listed in Table 18.24 with 'no crossing provided' treatment. Note the stock route at this location is proposed to be realigned parallel to the southern rail corridor boundary. This is consistent with the coding and listing of other existing road rail interfaces and the respective relocated existing road rail interface. 310-43-E-3 is a relocated existing road rail interface and has been listed in the Table of proposed road rail interfaces (Table 3.12). This is consistent with other relocated existing road rail interfaces. 310-43-E-8 is a proposed road rail interfaces. ID changed to 310-43-P-8a and listed in the Table of proposed road rail interfaces (Table 3.12). 310-46-E-1 is a relocated existing road rail interface and is listed in the Table of proposed road rail interfaces (Table 3.12). This is consistent with other relocated existing road rail interfaces. It is however also listed in the Table of existing road interfaces as 310-46-E-1a, which considers the change to the existing intersection location to no longer be provided. <p>Finally, an overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT Inland Rail Road Rail Interface Methodology.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Table 3.11</p> <p>Table 3.12</p> <p>Appendix BT</p>
231	231.0019	Private	MNES	Offsets	Section 10.13.3 Provision of Offsets states "It is expected that environmental offsets will be required for the Project. An Environmental Offsets Delivery Plan will be developed and implemented by ARTC prior to construction. " The submitter outlines that an Offset Plan should be integral part of the EIS and not a promise to do something in the future.	Pittsworth Landcare requests that its members be consulted during the development of an offset plan and that the plan be publicly available and a consultation period for public comment be enacted.	<p>ARTC has engaged with relevant Local Government Area's, Queensland Trust for Nature (QTFN), Heath Land and Water (HLW) and local community groups as well as conducting numerous targeted consultation sessions with groups including the Pittsworth District Landcare Association Inc and the Toowoomba Wilderness Society to discuss conservation management, initiatives and programs. The Queensland Offset Strategy has formed part of these discussions and Appendix Q: Environmental Offset Delivery Strategy has been developed to help facilitate key components of ARTC's management initiatives.</p> <p>The Queensland Offset Program continues to participate in community and stakeholder engagement opportunities not only to help with the identification of offset priorities but also to develop synergies and alignment relating to the long-term management objectives across the Queensland offset property portfolio particularly relating to strategic conservation priorities and actions.</p> <p>The Environmental Offset Delivery Strategy will form part of the revised draft EIS and will be available for comment as part of the public exhibition and consultation phase of the EIS.</p> <p>During detailed design, ARTC will consult with DAF for the development of the final Environmental Offset Delivery Strategy (Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie) and delivery plans to ensure agricultural values are not adversely impacted by environmental offsets.</p>	Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
231	231.0020	Private	Flora and Fauna		Table 10.32 Estimation of Potential Magnitude of Disturbance to Threatened Flora, Fauna Species rates the degree of disturbance to Koalas, using an unspecified mix of 'predictive habitat modelling, field validation and government GIS datasets'. From this unexplained methodology, Table 10.32 estimates there would be a 6.08% disturbance to 'predicted' Koala habitat between Border and Gowrie. This table seriously underestimates the degree of disturbance to Koalas, particularly in areas where they are locally common but vulnerable. This statistic vastly underrepresents the risk to the known habitat of Koalas in the Pittsworth and Southbrook districts. Pittsworth Landcare estimates the magnitude of disturbance to Koalas on the Central Downs as High (up to 50%), not Moderate (less than 13%) as stated.	Nil.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC) was used to support the development the revised draft EIS. The inconsistencies with reporting Koala habitat mapping in the draft EIS has now been updated in the revised EIS to more accurately reflect the more detailed survey data.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix M: Draft Koala Management Plan (DKMP). This will be standalone appendix for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. The DKMP provides additional information Koala habitat and records of the species along the alignment.</p>	Appendix M: Draft Koala Management Plan Section 2.3
232	232.0001	Private	Surface Water	Directly impacted landowner	The submitter raises issues about how the local scale specifically in relation to their property to understand the impact of the rail on surface water and hydrology has not been done. The proposed alignment will remove the only groundwater bore on their property (RN19886). The alignment also removes two existing dams, which are the only surface water collection points on their property.	Nil.	<p>It is acknowledged that the submitter's property will be substantially impacted by the Project. ARTC is in the process of consulting with landholders to determine an appropriate make-good strategy on a case-by-case basis. Through this process, the measures developed for each impacted property will be unique and commensurate with the level of impact realised.</p> <p><u>Groundwater bore</u></p> <p>Where a groundwater bore is expected to be decommissioned or have access/ usage impaired as result of the Project, 'make good' measures will be agreed in consultation with the affected landowners during detailed design. An overview of the draft bore groundwater 'make-good process' is presented on Figure 15-31 and details in Section 15.7.4 of Chapter 15: Groundwater. If the landowner does not accept the 'make good' assessment (either whether there is an impairment in the first place, or the level of impairment), ARTC will:</p> <ul style="list-style-type: none"> Advise the landowner that they are entitled to obtain an assessment from a suitably qualified person (SQP) Advise the landowner that ARTC will pay their reasonable costs Provide ARTC's bore assessment to the landowner for review by the landowner's SQP Advise landowners of their expectations as to the reasonable costs of obtaining a bore assessment. <p><u>Surface water storages</u></p> <p>The detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure (Chapter 13: Surface Water, Section 13.6.2 (Table13-16)). This may also include the usage or relocation of stored water and compensation (if applicable).</p>	Chapter 13: Surface Water Section 13.6.2 Table 13-16 Chapter 15: Groundwater Section 15.7.4 Figure 15-31
232	232.0002	Private	Groundwater	Directly impacted landowner	The removal of all groundwater and surface water sources for our farm effectively renders their farm economically unviable and significantly decreases the value of our property. The submitter states that there should be a zero tolerance policy to the removal of all ground and surface water sources on landholder properties. Mitigation measures have been completely inadequate.	Nil.	<p>ARTC has undertaken a groundwater bore survey to confirm the location/ presence of registered bores and to identify any unregistered bores that may be impacted from the Project (water bores - under the Water Act). This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging, etc (Chapter 15: Groundwater, Section 15.5.4). Real properties (lot/ plan) to be intersected by the Project footprint were targeted and landholders were provided an opportunity to be identified via this survey. Revised draft EIS Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users and potential make-good policy and measures, and are detailed in Table 15.20.</p> <p>Groundwater predictive modelling was undertaken to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts. The indicative cuts were selected as best representing the local geological conditions and worst-case potential impacts (cuts most likely to intersect groundwater). The draft modelling results indicated that the extent of drawdown is predicted to extend 10 m to 43 m from the centre of the Project alignment (from the deepest cuts) during the construction works stage. The modelling was updated and further refined as part of the revised draft EIS, see Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.</p> <p>The results of the bore survey were assessed against the updated predictive modelling to identify/ confirm bores with potential to be impacted by the Project. ARTC is engaged with licenced users/ landholders to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/ substitution make-good solutions are not required.</p>	Chapter 15: Groundwater Section 15.5.4 Section 15.6.2 Section 15.7.4 Table 15-20 Appendix U: Groundwater Section 15.6.2 Section 6
232	232.0003	Private	Stakeholder Engagement	Directly impacted landowner	The level of consultation that has occurred with the submitter as directly affected landholders has been completely inadequate. There was limited information released to them. Initially they were advised that rather than severing properties into two, property boundary lines would be considered. This has completely changed now and there seems to be no consideration to adhere to any property boundary lines as has been indicated by ARTC. They have not been made aware of any consultation until after the decision on the proposed alignment had been made. They are deeply concerned that they have not been advised of opportunities for consultation with the "EIS team" as required by the ToR and Stakeholder Engagement Strategy. Even after many requests, they have not been informed regarding any plans for the temporary or permanent resumption of a large portion of their farm or entire property. Different maps and imagery shows varying areas of impacted land on their property, and ARTC did not confirm which of these is correct.	Nil.	<p>Engagement has been undertaken with directly impacted landowners in the study area, including letter, phone calls, one-on-one meetings, as well as broad-scale community engagement activities such as community information sessions and COC meetings. ARTC's engagement approach with landowners directly impacted by the alignment has been to meet one-on-one where possible. ARTC will continue to consult with landowners during future stages of the Project to ensure they are fully informed of the design process and the proposed mitigation measures specific to their respective properties. This is detailed in Appendix E: Consultation Report, Section 5.1 and Section 5.2.</p> <p>Consultation and engagement of landowners will be ongoing throughout the revised reference design, detailed design, construction works and operations stages of the Project. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners' occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>Since the revised draft EIS and this submission, engagement with this landowner has been ongoing, including a one-on-one meeting with the DTMR regarding property acquisition and compensation. ARTC notes that this submitter has met with DTMR and provided with maps outlining the Project impact and possible outcomes of property acquisition.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 2.1 Section 5.1 Section 5.2
232	232.0004	Private	Groundwater	Directly impacted landowner	The Project will completely remove all groundwater and surface water access from the submitter's property and effectively render it economically unviable, particularly in times of severe drought. It will also reduce future resale value of their farm. The proposed changes to existing road infrastructure, namely the removal of direct access from Paint Mine Road to the Gore Highway presents additional negative economic impacts for their farm business as their business relies on movement of farm machinery between their farm and a nearby farm. The removal of this access will have additional costs for the submitter.	Nil.	<p>ARTC has undertaken a groundwater bore survey to confirm the location/ presence of registered bores and to identify any unregistered bores that may be impacted from the Project (water bores - under the Water Act). This bore survey was comprehensive such that all bores with potential to be impacted could be identified, including bores located in the Project footprint (not related to groundwater impacts) required to be decommissioned to allow for general construction, lay down yards, access tracks, staging, etc (Chapter 15: Groundwater, Section 15.5.4). Real properties (lot/ plan) to be intersected by the Project footprint were targeted and landholders were provided an opportunity to be identified via this survey. Revised draft EIS Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 have been updated accordingly with groundwater users and potential make-good policy and measures, and are detailed in Table 15.20.</p> <p>Groundwater predictive modelling was undertaken to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts. The indicative cuts were selected as best representing the local geological conditions and worst-case potential impacts (cuts most likely to intersect groundwater). The draft modelling results indicated that the extent of drawdown is predicted to extend 10 m to 43 m from the centre of the Project alignment (from the deepest cuts) during the construction works stage. The modelling was updated and further refined as part of the revised draft EIS, see Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.</p> <p>The results of the bore survey were assessed against the updated predictive modelling to identify/confirm bores with potential to be impacted by the Project. ARTC is engaged with licenced users/landholders to determine an appropriate make-good strategy on a case-by-case basis. This may include avoidance through minimising dewatering impacts, such that replacement/ substitution make-good solutions are not required.</p>	Chapter 15: Groundwater Section 15.5.4 Section 15.6.2 Section 15.7.4 Table 15-20 Appendix U: Groundwater Technical Report Section 6
233	233.0001	Private	General Project opinion - negative		Queensland Rail's review has been undertaken cognisant of its obligations under the Queensland Rail Transit Authority (QRTA) Act and the (Rail Safety National Law (Qld) Act 2017). Queensland Rail is concerned that there is inadequate discussion regarding the roles, responsibilities and general interface risks and management approach where the Inland Rail route overlaps or is to be constructed adjacent to the existing Queensland Rail managed rail corridor. The operation of two railways in close proximity presents complex operational and safety issues, which must be addressed prior to design and construction to avoid long term issues.	Provide additional discussion and detail to address Rail Infrastructure Manager interface management approach	<p>As per the draft EIS Chapter 5: Project Description Section 5.3.3 and Appendix B1: Design Drawings, the revised reference design is planned to be constructed to replace (over the top of) 68 km of existing single Queensland Rail (QR) track.</p> <p>This is derived from Inland Rail's intention to improve QR track condition and alignment and minimising impacts to greenfield land. As described throughout Chapter 8: Land Use and Tenure, by utilising the existing rail corridor and upgrading the track, it minimises or eliminates environmental and land impacts, such as, disturbing habitat, houses, roads, utilities, prime agricultural land, townships and more. Noting design, construction and operability challenges, this proposal provides significant benefits to TMR, QR and their rail customers by:</p> <ul style="list-style-type: none"> Upgrading the formation, ballast, sleepers and rail for these sections. This includes the red-boarded track Section through the Condamine floodplain on the Millmerran Branch Line Line Section was washed out and degraded since 2011 major flood event Track and formation design facilitates 30 tonne axle loads Eliminates existing curves less than 1200 m Improves vertical gradients to a maximum of 1:80 Provides track immunity to top of formation across 1% AEP floodplains Turnout connection into existing QR network and upgrades to dual gauge track provides greater interoperability for rail customers in Queensland <p>As part of ARTCs ongoing engagement with QR and TMR, roles and responsibilities regarding the Rail Infrastructure Manager (RIM) obligations during Detailed Design, Construction Works and Operations will be clarified. TMR/ QR/ ARTC are working collaboratively to establish a governance structure to address these matters. Further detail on Rail Infrastructure Manager interface management approach is provided in Chapter 3: Legislation and Project Approvals Process, Section 3.4.25.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.4.25 Chapter 5: Project Description Section 5.3.3 Chapter 8: Land Use and Tenure Appendix B1: Design Drawings
233	233.0002	Private	Land Resources	Contaminated land	Clause 11.150 of the Terms of Reference (ToR) requires the EIS to detail any known or potential sources of contaminated land within or adjoining the Project area identified by landholders. Provide results of searches of EMR and/or CLR for the proposed alignment and disturbance areas. Section 7.2 of the EIS Executive Summary describes the existing environment/potential impacts as having only three non-corridor properties currently listed on the EMR. There is no recognition of the 30 km of EMR-listed properties that are situated within the existing rail corridor Section of the proposed alignment. Accurate notation of potential sources of contamination will assist effective management. QR is aware, via search of the official Department of Environment and Science (DES) EMR/CLR register, of 16 rail corridor properties (which are noted as Impacted Properties in Appendix F) being EMR listed for Hazardous Contaminant reasons. These EMR rail corridor properties are Lot 82, SP104976; Lot 1, RP14231; Lot 121, 104977; Lot 14, SP112652; Lot 5, RP14231; Lot 2, RP37133; Lots 102 and 103, SP113905; Lot 22, SP124720; Lot 413, SP119196; Lot 110, MH807356; Lot 21, 120712; Lots 411 and 413, SP119197 as well as Lots 481 and 483, SP119198. These rail corridor properties are predominantly located in and around the populated centres of Brookstead, Pampas, Yelarbon, Gibinbell and Kurumbul. Parts of the rail corridor between these populate centres will be of equivalent age.	Update information to also describe all existing rail corridor properties listed on the State official EMR register.	<p>For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9-15 and the full results will be presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates.</p> <p>The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM. The investigation included the identification of potential sources of contamination within the impact assessment area through a desktop assessment (Chapter 9: Land Resources, Section 9.4.5) and also included findings from a limited contaminated land investigation completed by Macquarie Geotechnical within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines.</p> <p>Consistent with the requirements of ASC NEPM, the data quality objectives for contaminated land investigations need to be informed by detailed design information (e.g. proposed future re-use of materials). A contaminated land management strategy for any future assessments is provided in Chapter 9: Land Resources, Section 9.6.2 and Figure 9-24.</p>	Chapter 9: Land Resources Section 9.4.5 Section 9.6.2 Table 9-15 Figure 9-24 Appendix G2: Macquarie Geotechnical - Laboratory Results Appendix I: EMR Search Certificates and Soil Laboratory Certificates

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
233	233.0003	Private	Waste and Resource Management	construction waste	Clauses 11.158 and 11.160 of the ToR require the EIS to describe and quantify all expected significant waste stream with respect to Waste Reduction and Recycling Act 2011, EP Regulation 2008, National Waste Policy 2009 and relevant Department of Environment and Science (DES) guideline information. Although the DES document referred to in Appendix 1 has relevance, there are also other applicable DES information sheets. With respect to the EMR rail corridor properties, DES Information Sheet about Overview of Regulated Waste Categorisation, ESR/2019/4749 is also of relevance. Section 2.2 of this DES Information Sheet states this means that the notification, assessment and removal of sites from the EMR CLR will continue to be undertaken against contaminated land assessment criteria only and is not impacted by regulated waste categorisation framework. The waste categorisation provisions of the EP Regulations will not apply to contaminated soil from sites that are on the EMR or CLR. Table 40 of the Executive Summary appears to be inconsistent with this stated intent listing ballast and rail spoil as regulated waste.	Review DES Information Sheet called Overview of Regulated Waste Categorisation to confirm or not whether ballast and rail spoil from EMR listed properties is regulated waste and update Table 40.	<p>Rail spoil has not been classified as a regulated waste within the Executive Summary nor has it been classified as a regulated waste within Chapter 22: Waste and Resource Management (Sections 22.5 Tables 22-6 and 22-8) of the revised draft EIS. It should be noted that Table 22-8 references potentially contaminated solid waste (not spoil, not soil) as a regulated waste. This is to encompass all manner of potentially regulated waste that could arise including sleepers impacted by pesticides, hydrocarbons, heavy metals etc.</p> <p>Ballast is currently the subject of a draft End of Waste (EoW) Code for Recycled Aggregates (ENEW07604819). As a result of ballast's inclusion in the end of waste code it logically follows that it has been classified as a waste. Section 42 of the Environmental Protection Regulation states: Regulated waste is a waste that:</p> <p>(b) is of a type, or contains a constituent of a type, mentioned in schedule 9, part 1, column 1.</p> <p>The list of constituents in schedule 9 is comprehensive and many could be reasonably expected to be attached to ballast should leaks and spills occur or even through the course of general maintenance (e.g. pesticides, oils, PCBs, heavy metals). As a result, ballast that has these contaminants attached may be classified as a regulated waste (Chapter 22: Waste and Resource Management, Tables 22-6 and 22-8).</p> <p>Should ballast not be a waste product (regulated or otherwise) then its inclusion in the draft EoW code is logically incoherent. Furthermore, as ballast could be subject to a contaminant type listed in Part 1 of Schedule 9 of the regulation, the description within the revised draft EIS that ballast may constitute a regulated is wholly consistent with current legislative definitions.</p>	Executive Summary Chapter 22: Waste and Resource Management Section 22.5 Table 22-6 Table 22-8
233	233.0004	Private	Approvals/ conditions/ recommendations	operational rail noise	Section 3.5.10 outlines details on ERAs expected to be necessary, yet there is no corresponding discussion about the relevance of each EPP to the Project. Of particular note, no recognition of any exclusions listed in Section 8 (4) (a) of the EPP (Noise). This EPP (Noise) cross-references matters mentioned in Section 1, Part 1, Schedule 1 of the EP Act (which includes ordinary use of rail transport infrastructure) as being excluded from the Acoustic Quality Objectives. Absence of such details about application of environmental values/ objectives is not consistent with Clause 9.10, ToR to determine the activity scope of ERAs and other EP Act requirements.	Describe all important inclusions and exclusions of applications in the other EP Act subordinate legislation, EPPs and outline their relevance to the Project. This is either from the perspective of ERA decision and conditioning process as well as more generally in application of its environmental quality objectives/ values.	The revised draft EIS has been updated. Environmental assessments in the revised draft EIS have been written to address the requirements of the Terms of Reference and additional information requests. The Chapter summaries and technical reports have outlined how they have addressed the requirements of the ToR and how they have addressed relevant updates based on the addition information request from Office of Coordinator-General (see Appendix A2: Terms of Reference Cross Reference Table).	Appendix A2: Terms of Reference Compliance Table
233	233.0005	Private	Approvals/ conditions/ recommendations		Clauses 9.5 to 9.110 of the ToR requires the EIS to describe all legislation, policies and plans relevant to the Project and identify approvals, licences, permits and other authorisations required for the construction and operations of the Project. This is expected to include rail safety accreditation. To commence the facilitation of the nominated safety-in-design processes, a high level of certainty about roles and accountabilities for delivered and existing assets within the rail corridor is required to ensure applicability of engineering standards and specifications to achieve the outcome of safe operations on all impacted rail (both new and existing) infrastructure and how safety interfaces between Rail Transport Operators will be managed within the context of rail safety legislative framework. In addition to this, the statement made in Section 3.5.24.1 for Project compliance is an oversimplification of the purpose of the RSNL and the obligations it places on an RTO. The safety-in-design process is only one element in supporting compliance with the RSNL and the key issue around multiple accreditation holders and impacts to other RTOs is not discussed/addressed. Section 5.1 (Overview of the Project) outlines that approximately 71.2 km of the current design is brownfield co-existing within the existing rail corridor for which Queensland Rail is the current accredited Rail Infrastructure Manager. No details as to timing or governance mechanisms are provided to provide certainty as to how or if these matters will be addressed prior to the commencement of detailed design/ safety-in-design processes. The absence of such does not provide adequate details for the purposes of Clause 9.7 of the ToR with respect to statutory approvals, permits, licences and authorities (including requirements of any owners consent) for use of land.	Provide additional specific details regarding detailed design and safety-in-design processes clarifying the timing and proposed agreed accountabilities of Rail Infrastructure Manager rail safety accreditation for the brownfield (existing) rail corridor sections. Provide detail of any mechanisms to work through such issues with QR to ensure satisfactory outcomes to mitigate impacts to QR assets and operations.	As part of ARTCs ongoing engagement with QR and TMR, roles and responsibilities regarding the Rail Infrastructure Manager (RIM) and obligations during Detailed Design, Construction Works and Operations will be clarified (Section 3.4.25, Chapter 3: Legislation and Project Approvals Process). TMR/ QR/ ARTC are working collaboratively to establish a governance structure to address these matters. ARTC is committed to safely constructing and operating the Project.	Chapter 3: Legislation and Project Approvals Section 3.4.25 Section 3.4.37 Section 3.4
233	233.0006	Private	Land Resources	Contaminated land	Clause 11.150 of ToR requires the draft EIS to provide the search results of the EMR and/or CLR for the proposed alignment and disturbance areas. Section 8.5.8.2 of the draft EIS outlines that only three properties within the proposed alignment and disturbance areas were listed on the EMR. None of these three properties were on the existing rail corridor parts of the Project. QR is aware, via search of the official Department of Environment and Science (DES) EMR/ CLR register, of 16 rail corridor properties (which are noted as Impacted Properties in Appendix F) being EMR listed for Hazardous Contaminant reasons. These rail corridor properties are Lot 82, SP104976; Lot 1, RP14231; Lot 121, 104977; Lot 14, SP112652; Lot 5, RP14231; Lot 2, RP37133; Lots 102 and 103, SP113905; Lot 22, SP124720; Lot 413, SP119196; Lot 110, MH807356; Lot 21, 120712; Lots 411 and 413, SP119197 as well as Lots 481 and 483, SP119198. These rail corridor properties are predominantly located in and around the populated centres of Brookstead, Pampas, Yelarbon, Gibinbell and Kurumbul. Parts of the rail corridor between these centres will be of equivalent pre-1960 age. Figure 8.1 shows limited soil sampling has been undertaken to date within the existing rail corridor to confirm or otherwise the presence of such contamination, regardless of listing or not given the historical use of the land. Future sampling plans should consider the above noted EMR listed properties and the general risk associated with rail corridor to ensure compliant management of material originating from the existing rail corridor.	Update information to also describe all existing rail corridor properties listed on the State official EMR register. Consider updating the list of future soil samples for contamination to include contamination testing within the existing rail corridor.	<p>For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9-15 and the full results will be presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates.</p> <p>The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM. The investigation included the identification of potential sources of contamination within the impact assessment area through a desktop assessment (Chapter 9: Land Resources, Section 9.4.5) and also included findings from a limited contaminated land investigation completed by Macquarie Geotechnical within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines.</p> <p>Consistent with the requirements of ASC NEPM, the data quality objectives for contaminated land investigations need to be informed by detailed design information (e.g. proposed future re-use of materials). A contaminated land management strategy for any future assessments is provided in Chapter 9: Land Resources, Section 9.6.2 and Figure 9-24.</p>	Chapter 9: Land Resources Section 9.4.5 Section 9.6.2 Figure 9-24 Table 9-15 Appendix G2: Macquarie Geotechnical - Laboratory Results Appendix I: EMR Search Certificates and Soil Laboratory Certificates
233	233.0007	Private	Surface Water	Flood immunity	Clause 11.66 of the ToR details the requirements of flood studies, in particular (b) quantifying flood impacts on upstream and downstream existing infrastructure surrounding the proposed alignment from redirection or concentration of flows. It is not clear what were the data sources for QRs drainage structures (precisely which As Built drawings) adopted within the hydraulic model. There is also no comprehensive description about the impact from the proposed Project embankments and drainage structures on QRs existing infrastructure. This presents risk to QR based on current operations continuing and further information or commitments are required to ensure QR infrastructure and operations are not adversely impacted.	Describe and tabulate list of names and numbers for all As-Built drainage structure drawings sourced from QR. Provide further clarity around impact to QR existing infrastructure and operations, including any mechanisms to work through such issues with QR to ensure satisfactory outcomes for QR assets and operations.	<p>Existing structures included within the hydraulic models have been included in the 'Hydraulic Model Development' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Information obtained and included within the hydraulic models was provided by Queensland Rail (QR) via a Request for Information. Culvert As-Built drawing information was not provided as part of the response from QR.</p> <p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for existing rail infrastructure. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with QR is required to discuss rail impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>All changes on existing rail infrastructure exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood Impacts on existing rail infrastructure' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of rail, including a corresponding summary Table itemising all exceedances associated with the impacted sections of rail. A condensed summary of flood impact objective exceedances on existing rail infrastructure is also provided in Section 14.8.1 of Chapter 14: Flooding and Geomorphology.</p> <p>ARTC will continue conversations with QR in relation to mitigation for flood impacts to rail infrastructure, for further consideration during detailed design. A detailed survey of existing cross drainage infrastructure will be conducted prior to detailed design, and the flood models updated accordingly.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 5 - 17
233	233.0008	Private	Surface Water	Increase in flows	Clause 11.66 of the ToR details the requirements of flood studies. B2G embankment and proposed culverts and bridge structures would alter hydraulic regimes. Limited clarity about whether any such changes in flow regimes from structures would cause worsening effect to existing QR structures. This presents risk to QR based on current operations continuing and further information or commitments are required to ensure QR infrastructure and operations are not adversely impacted.	Detail any significant diversion or interception of overland flow. Include maps of suitable scale showing the location of diversions and other water-related infrastructure relative to existing railway drainage structures. Note any mechanisms to work through such issues with QR to ensure satisfactory outcomes for QR assets and operations.	<p>All changes on existing rail infrastructure exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood Impacts on existing rail infrastructure' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of rail, including a corresponding summary Table itemising all exceedances associated with the impacted sections of rail. A condensed summary of flood impact objective exceedances on existing rail infrastructure is also provided in Section 14.8.1 of Chapter 14: Flooding and Geomorphology.</p> <p>Flood mapping has been provided in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the Digital Platform for each of the Flood Impact Objectives including (but not limited to):</p> <ul style="list-style-type: none"> Change in peak water levels Change in peak velocity Change in time of inundation Change in hazard Change in velocity (with FIO cut-off's applied) Change in hazard (with FIO cut-off's applied) Change in time of inundation (with FIO cut-off's applied) <p>ARTC will continue conversations with QR in relation to mitigation for flood impacts to rail infrastructure, for further consideration during detailed design.</p>	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5 - 17 Appendix T2: Flooding and Hydrology Technical Report - Volume 2
233	233.0009	Private	Surface Water	Increase in peak water levels	Clause 11.66 of the ToR details the requirements of flood studies. Table 12.75 (Change in Peak Water Levels 1% AEP) does not outline what the maximum increase is for existing rail lines. Correspondingly, Figure 12.20b appears to indicate maximum increase in the order of 50 to 100 mm which is compliant with the 100 mm Railways objective (see Table 12.8). However without a tabulated number in Table 12.75, it is difficult to verify colour scaling with certainty.	Quantify the maximum increase in 1% AEP peak water levels for existing Millmerran rail line (both the operational and non-operational sections).	All changes on existing rail infrastructure exceeding the FIO targets within the Condamine River floodplain have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within Section 7.5.3 in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. This Section presents a Figure that visually shows the impacted sections of rail, including a corresponding summary Table itemising all exceedances associated with the impacted sections of rail. A condensed summary of flood impact objective exceedances on existing rail infrastructure is also provided in Section 14.8.1 of Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 7.5.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
233	233.0010	Private	Surface Water	Increase in peak water levels	Clause 11.66 of the ToR details the requirements of flood studies. Table 12.118 indicates the maximum increase in peak water level is 150 mm at Chainage 45 km on the South West Rail Line (as also shown in Figure 12.27b2). This is not compliant with the with the 100 mm Railways objective (see Table 12.8). and poses risk to QR assets and operations. There is insufficient detail to describe how impacts will be managed.	Provide details on any additional proposed measures being considered to reduce the maximum peak water levels to within the nominated Railways flood objectives.	All changes on existing rail infrastructure exceeding the FIO targets in the Macintyre Brook floodplain have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within Section 14.6.3 in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. This Section presents a Figure that visually shows the impacted sections of rail, including a corresponding summary Table itemising all exceedances associated with the impacted sections of rail, including justification and mitigation strategies. A condensed summary of flood impact objective exceedances on existing rail infrastructure is also provided in Section 14.8.1 of Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 14.5.4
233	233.0011	Private	Noise and Vibration	operational rail noise	No discussion about the relevance of EPP (Noise) to the Project separately for construction and operation. Absence of such details about application of environmental values/ objectives is not consistent with Clause 9.10, ToR to determine the activity scope of ERAs and other EP Act requirements.	Provide additional text to describe how Section 8 (4) (a) of the EPP (Noise) decouples the application of acoustic quality objectives separately for construction and operations.	<p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 3, states that the assessment of airborne noise, ground-borne noise and vibration from the Project has been undertaken consistent with ToR and general practice in Queensland with reference to the guidelines published under the Transport Infrastructure Act 1994. Whilst the Environment Protection Act 1994 and Environmental Protection (Noise) Policy 2019 (EPP (Noise)) applies for noise emissions in general, it states that noise from ordinary use/ operations of rail transport infrastructure is not within scope of the EPP (Noise) being an activity listed in Schedule 1 of EP Act (and cross-referenced in Clause 7 (6)(a) of EPP (Noise)). In 2019, the DTMR issued the Interim Guideline operational Rail Noise and Vibration – Government Supported Transport Infrastructure (Interim Guideline). The Interim Guideline is a published standard under the Transport Infrastructure Act 1994, and is the primary document that has been used in the assessment of operational noise and vibration impacts on the Project.</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 3 discusses the relevance of the EP Act and EPP (Noise) to the Project. The assessment of noise and vibration from the construction works stage and post-construction operational road traffic associated with the Project has been completed in accordance with the DTMR Codes of Practice Volume 1 - Road Traffic Noise (CoP Vol 1) and Volume 2 - construction Noise and Vibration (CoP Vol 2). CoP Vol 2 has been gazetted under Section 551 of the EP Act. The CoP Vol 2 has requirements for various stages of Projects and is a means of demonstrating compliance with the general environmental duty under the EP Act. DTMR's Road Traffic Noise Volume 1 is also relevant to the extent that new or modified roads are required in support of the Project.</p> <p>As discussed in Section 3.4.10 of Chapter 3: Legislation and Approvals, there are a number of approvals under the EP Act that are likely to be required following the Coordinator-General's evaluation report. This includes the approval for ERAs that may be required by the Project and will be sought separately to the approval being sought through the EIS process. Appropriate noise and vibration assessments, as required, will be undertaken at a later date to inform the necessary development approval application(s).</p>	Chapter 3: Legislation and Approvals Section 3.4.10 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 3 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3
233	233.0017	Private	Cultural Heritage	Indigenous cultural heritage	Table 17.21 (Initial Mitigation Measures Indigenous Heritage) confirms three CHMPs have been developed and agreed for the Project. Although it is good to acknowledge they are in accordance with ACH Act, there is a lack of clarity regarding the exclusion (or other) of the Existing Railway Corridor operations and maintenance.	Supplement the fifth row of Table 17.21 by describing ARTCs scope of Existing Railway Corridor activities covered by the three CHMPs excludes the maintenance of the existing QR railway.	The current CHMPs cover the construction of new rail infrastructure and associated structures for the Inland Rail Program, as well as operation and maintenance of the rail corridor that will be managed by ARTC. The CHMPs do not extend to activities performed by Queensland Rail. This is now stated in Section 19.1 of Chapter 19: Cultural Heritage.	Chapter 19: Cultural Heritage Section 19.1
233	233.0018	Private	Traffic and Transport	Level crossing	Clause 11.-109 of the ToR requires an impact assessment of the Project on all individual road/ rail crossings. This is irrespective of whether the crossing is public or private occupational crossings. QR has identified the following inconsistencies with how the level crossing are geographically shown compared to how they are reported in Tables 18.23 and 18.24: Coding for Interface ID 310-5-P-1 (refer Figure 18.2a) indicates an existing road rail Intersection but is listed in Table 18-24 Proposed road rail Intersection. This is a stock route crossing i.e. an existing road rail intersect (QR ID 2038). It should it be "E" for existing and listed in Table 18-23. Coding for Interface ID 310-8-E-0 (refer Figure 18.2a) indicates an existing road rail Intersection but is listed in Table 18-24 Proposed road rail Intersection. This is an existing road rail intersect (QR ID 2032). It should it be listed in Table 18-23. Interface ID 310-16-E-1 Whetstone Access Road coding indicates existing road rail Intersection (as per legend on Figure 18.2b). Also listed as proposed public road rail Intersection (Table 18.23). According to the Figure 18.2b, the proposed alignment departs the existing rail alignment before the existing road rail interface location (QR ID2206). Therefore, the crossing of Whetstone Access Road by Inland Rail would be a new level crossing and coding should be P (proposed), not E (existing). Interface ID 310-42-E-0 should be coded "P", not "E" and listed in Table 18-24, as per 310-11-E-1 being replaced by 310-11-P-0 (refer Figure 18.2b) and listed in the respective Tables 18.23 (existing road-rail interfaces) and 18-24 (proposed road rail interfaces)/ Although Interface ID 310-24-P-3 and 310-25-P-1 are shown with symbol for no crossing provided, (refer Figure 18.2c) are not referred to in the Chapter 18 document tables 18.23 and 18.24. All other intersection locations where no crossing is to be provided are listed and indicate treatment. Interface ID 310-42-E-1 (refer Figure 18.2f) is on the existing rail alignment and listed in Table 18.23 (existing interfaces) as no crossing being provided. Road realignment will provide a new crossing nearby at 310-42-E-0 and is listed in Table 18-24 (proposed interfaces). Coding for 310-43-E-3 and 310-43-E-8 indicates existing road rail Intersection (refer Figure 8.2f) but both are listed in Table 18-24 Proposed road-rail interface. Either the crossings should be listed in Table 18-23 or if the proposed alignment veers off the existing alignment, the coding should be "P" instead of "E". Coding for Interface ID 310-46-E-1 (refer Figure 18.2g) indicates existing road -rail Intersection (it is QR crossing ID 2624) but it is listed in Table 18-24 Proposed road - rail Intersection.	Upgrade and address any nominated inconsistencies in level crossing types described in Figures 18.2a to 18.2g and Tables 18.23/18.24.	<p>It is acknowledged that the submission identifies numerous inconsistencies in the road rail interface identification and reporting. These inconsistencies have been corrected in the revised draft EIS. Appendix AA: Traffic Impact Assessment, Section 3.6 outlines all proposed road rail interfaces to be used by the Project. This is further broken down into existing road rail interfaces and proposed new road rail interfaces in Section 3.6, respectively. Furthermore, Appendix L Existing Public Road Rail Interfaces of Appendix AA: Traffic Impact Assessment, provides the mapping of the existing road rail interface locations. A Table has been included below with a summary of the interfaces referenced in the submission as evidence that these inconsistencies have been addressed. However, not all of the listed road rail interfaces have changed for the reasons provided.</p> <p>Summary of updates below:</p> <ol style="list-style-type: none">310-5-P-1 is an existing road rail interface. Interface ID changed to 310-5-E-2 and listed in the Table of existing road rail interfaces (Table 3.11).310-8-E-0 is a relocated existing road rail interface and has been listed in the Table of existing road rail interfaces (Table 3.11). This is consistent with other relocated existing road rail interfaces.310-16-E-1 is a proposed road rail interface. Interface ID changed to 310-16-P-1a and listed in the Table of proposed road rail interfaces (Table 3.12).310-42-E-0 is a relocated existing road rail interface. 310-42-E-1 has been closed and relocated to this location (310-42-E-0). 310-42-E-0 is listed in the Table of proposed road rail interfaces (Table 3.12). This is consistent coding with other relocated interfaces. With reference to the example provided by QR, 310-11-E-1 is the original Cunningham Highway LX in Yelarbon. 310-11-P-0 is the relocated Cunningham Highway road over rail grade separation to replace LX. This is inconsistent with the coding of other relocated interfaces. Interface ID changed to 310-11-E-0 and listed in the Table of proposed road rail interfaces (Table 3.12).Interface ID 310-24-P-3 and 310-25-P-1 have been listed in Table 18.24 with 'no crossing provided' treatment. Note the stock route at this location is proposed to be realigned parallel to the southern rail corridor boundary.This is consistent with the coding and listing of other existing road rail interfaces and the respective relocated existing road rail interface.310-43-E-3 is a relocated existing road rail interface and has been listed in the Table of proposed road rail interfaces (Table 3.12). This is consistent with other relocated existing road rail interfaces. 310-43-E-8 is a proposed road rail interfaces. ID changed to 310-43-P-8a and listed in the Table of proposed road rail interfaces (Table 3.12).310-46-E-1 is a relocated existing road rail interface and is listed in the Table of proposed road rail interfaces (Table 3.12). This is consistent with other relocated existing road rail interfaces. It is however also listed in the Table of existing road interfaces as 310-46-E-1a, which considers the change to the existing intersection location to no longer be provided. <p>Finally, an overview of the process followed in the assessment of road–rail interfaces across the Project and the methodology followed in the development of road–rail interface treatments is outlined in Appendix BT Inland Rail Road Rail Interface Methodology.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Table 3.11 Table 3.12 Appendix BT Appendix L
233	233.0019	Private	Traffic and Transport	operational traffic	Clause 11.109 of the ToR requires an impact assessment of the Project on all individual road/ rail crossings. This is irrespective of whether the crossing is public or private occupational crossings. Second last paragraph states that the analysis indicates that delays at level crossings will, in most instances, be five seconds or less. This is inconsistent with the total wait time listed Table 18.25 for each level crossing. The minimum listed time in Table 18.25 is 78 seconds.	Upgrade and address any nominated inconsistencies in how total wait time or delays has been quantified in Table 18.25 and corresponding text.	<p>Section 5.9.3 of Appendix AA: Traffic Impact Assessment discusses analysis assumptions a lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (volumes are detailed in Section 2.4.1). This Section also details on how the level crossing time delay has been calculated, including factors such trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none">➤ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line➤ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate➤ The time it takes the train to cross the level crossing➤ Design vehicle consisting of a B-double for input parameters. <p>Train speed and train clearance times (s) calculations and assumptions (as obtained from road-rail interface) for the level crossing are as follows:</p> <ul style="list-style-type: none">➤ Train clearance times were calculated based on an assumed maximum train speed of 115 km/h➤ Calculation of the freight train acceleration rate➤ Distance of the level crossing from passing loops➤ Distance required to accelerate to maximum turnout speed (50 km/h)➤ Distance travelled while at constant maximum turnout speed➤ Distance required to accelerate to maximum speed after whole train has passed turnout➤ Total distance required to reach maximum speed for train starting from turnout➤ Total vehicles' wait time with train length of 1,800 m was estimated to be 104 seconds (including boom closure times).➤ The wait times determined for each individual level crossing were calculated based on:➤ Level crossing specific operating speeds which is impacted by topography and curvature of the alignment➤ Time taken for the train to cross the level crossing➤ Distance from train crossing loops➤ Train length➤ Summarise traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons, as per Section 2.4).➤ A sensitivity test (to represent a conservative upper level crossing time delay) has been undertaken based on a maximum train speed of 60 km/h (as opposed to up to 115 km/h) to highlight the variability in closure times. <p>Typical active level crossing sequence for boom gate down time is, after 11 seconds (t=11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (t=22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or Road trains), the delay before the booms commence lowering can be increased by a further 5 seconds to 16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F highway signals become extinguished.</p> <p>As part of the design process, the Project has considered aspects of longer train lengths to allow for future flexibility in use of the network. However, as stated in Section 5.2 of Chapter 5: Project Description, maximum train lengths assessed within the revised draft EIS is 1,800 m long.</p>	Chapter 5: Project Description Section 5.2 Appendix AA: Traffic Impact Assessment Section 2.4.1 Section 5.9.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
233	233.0020	Private	Traffic and Transport	Mitigation measures	Clause 11.109 of the ToR requires an impact assessment of the Project on all individual road/ rail crossings. This is irrespective of whether the crossing is public or private occupational crossings. Specifically, Clause 11.110 requires construction impacts of the Project on public railway level crossings through the ALCAM model. Clause 11.115 continues requiring measures to mitigate impacts on railway level crossings should be in accordance with Queensland Level Crossing Safety Strategy (2012 - 2021) with mitigation strategies to be prepared in close consultation with relevant transport authorities. Table 18.38 outlines the design of road rail intersection s will continue to be developed in consultation with DTMR and QR via pre-construction and construction phase surveys rather than describing the assessment findings within the EIS. Such consultative approach with QR for the pre-construction and construction surveys is appreciative. Using the construction Haul Route maps in Part 2 of Appendix X, QR has identified at least 7 passive control only (without boom gates) level crossings on the Millmerran Branch and 9 level crossings on the South West Line with only one having active control in the form of boom gates. In the absence of any detailed assessment on the adequacy of sight distances and formation/width provided in the EIS, it is however not clear what additional infrastructure mitigation measures is required at each of these level crossings and whether certainty about such mitigation works can be adequately scheduled/funded in time before construction commences. Table 18.34 outlines details about minimum treatment requirements for turning lanes into and out of road Intersection. In addition to this, details about whether the crossing control types need to change has been identified in Tables 18.23 and 18.24. For level crossing assessment, crossing control type is only one of the mitigation variables. There is lack of details specific to each affected level crossing about whether the mitigation works will also involve changes to road/ rail crossing formation and width, sleeper upgrades, resealing road surfaces and lighting to accommodate expected weight/ size of heavy construction vehicles. This is especially with respect to the significant magnitude of increase in heavy vehicle traffic movements listed in Table 18.31. Particular examples of such turning lane upgrade details being provided but not the equivalent rail crossing mitigation measures are at Lindenmayer Road/ Gore Highway (QR level crossing ID 910) and Coolmunda Dam Access Road (QR level crossing ID 2191). The latter will be used for water catering and currently, only passive control with a history of incidents and marginally adequate existing sight distance. Such mitigation works may also impact existing rail services upon which limited assessment of impact types has been described.	Upgrade and address any nominated inconsistencies in level crossing types described in Figures 18.2a to 18.2g and Tables 18.23/ 18.24.	Table 5.66 of Appendix AA: Traffic Impact Assessment nominates the 17 existing levels located along proposed construction routes. Given the track possession during construction of the Project, it is assumed that two sections of the South Western System are proposed to be closed for the duration of construction, including: <ul style="list-style-type: none"> Millmerran Branch Line, between Wymeera and Millmerran South Western Line, between Whetstone and Goondiwindi. Therefore, of the 17 level crossings, only three are proposed to be operating during construction: Cunningham Highway at Whetstone (active level crossing with signals and boom gates), Coolmunda Dam Access Road (Passive Level Crossing) and Alderley Street (Active level crossing (signals only). Specific discussion on the individual operations of these three level crossings is provided within Appendix AA Section 5.8. <p>Section 5.8 of Appendix AA notes that prior to the use of these roads and associated level crossings by construction traffic, further consultation with the existing railway manager (QR) will be required in order to mitigate potential impacts. This consultation and engagement will be required during detailed design and prior to and during construction. This will include consultation on adequate traffic and safety management plans for the level crossings.</p> <p>Section 5.9 of Appendix AA: Traffic Impact Assessment nominates the proposed rail interface mitigation measures for detailed design, preconstruction and construction. For level crossings, including those impacted on the Millmerran Branch and South West Line, the impact mitigation will depend on the specific activity being undertaken, and the location where it is occurring.</p> <p>Road safety audits will be undertaken at level crossings pre and post construction in accordance with the Austroads guidelines. Level crossings will be reviewed to confirm the:</p> <ul style="list-style-type: none"> Level of protection continues to be appropriate Infrastructure is appropriate for the traffic conditions. <p>The proposed road safety audits will confirm adequacy of the available sight distances and formation widths are available, and the suitability of works which are recommended to accommodate construction activities. Scheduling and funding requirements will dictate whether these specific locations are utilised, or if construction movements are rationalised by the construction contractor.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses in detail, works in the existing rail corridor with acknowledgement of the impact on QR and responsibilities for consultation and approval of all works – inclusive of the existing level crossings on the Millmerran Branch and South West Lines. Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>Further consultation with the existing railway manager (QR) will be required to mitigate potential impacts. This consultation and engagement will be required during detailed design and prior to and during construction. This will include consultation on adequate traffic and safety management plans for the level crossings. Furthermore, access to the existing rail corridor at these locations during construction will also need to be managed in consultation with QR and the relevant LGA.</p> <p>It is acknowledged that QR draws note to the Lindenmayer Road/ Gore Highway and Coolmunda Dam Access Road crossings. The former is not expected to be operational during construction of the Project as the Millmerran Branch Line will be closed for duration of Project construction at this Section of the alignment. The latter is individually acknowledged in Section 5.8 with recognition given to the water trucks being used to access the nearby dam. It is expected that only trains relating to the IR construction will use this crossing due to its proximity to Whetstone (end of the line). Depending on proposed traffic volumes in detailed design, an ALCAM may be recommended to be undertaken to determine whether the existing passive level crossing treatment is sufficient for the increased traffic volumes.</p> <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 5.2.2 also defines the safety mitigation measures that are relevant for all road rail interface locations throughout the Project lifetime, regardless of the interface assessment.</p>	Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 5.8 Section 5.9 Table 5.66
233	233.0021	Private	Waste and Resource Management	construction waste	Clauses 11.159 and 11.160 of the ToR require the EIS to describe and quantify all expected significant waste stream with respect to Waste Reduction and Recycling Act 2011, EP Regulation 2008, National Waste Policy 2009 and relevant Department of Environment and Science (DES) guideline/ instructional information. Although the DES document referred to in Appendix 1 has relevance, there are also other applicable DES information sheets. With respect to the EMR rail corridor properties, DES Information Sheet about Overview of Regulated Waste Categorisation, ESR/ 2019/ 4749 is also of relevance. Section 2.2 of this DES Information Sheet states this means that the notification, assessment and removal of sites from the EMR CLR will continue to be undertaken against contaminated land assessment criteria only and is not impacted by regulated waste categorisation framework. The waste categorisation provisions of the EP Regulations will not apply to contaminated soil from sites that are on the EMR or CLR. Section 20.3 does not mention this DES Information Sheet and this interpretation by the Administering Authority of when contaminated soil is or is not regulated waste. Tables 20.6 (construction Waste Quantities), 20.7 (Operation Phase Waste Types and Waste Streams) and 20.12 (Management of Waste Types generated by the Project) in Sections 20.56.3, 20.6.4 and 20.8.3 has also labelled ballast and its spoil as being regulated waste which is inconsistent with the DES Information Sheet quoted above.	Review DES Information Sheet called Overview of Regulated Waste Categorisation to confirm or not whether ballast and rail spoil from EMR listed properties is regulated waste and update Section 20.3, Table 20.6 and 20.7.	Rail spoil has not been classified as a regulated waste within the Executive Summary nor has it been classified as a regulated waste within Chapter 22: Waste and Resource Management (Sections 22.5 Tables 22-6 and 22-8) of the revised draft EIS. It should be noted that Table 22-8 references potentially contaminated solid waste (not spoil, not soil) as a regulated waste. This is to encompass all manner of potentially regulated waste that could arise including sleepers impacted by pesticides, hydrocarbons, heavy metals etc. <p>Ballast is currently the subject of a draft End of Waste (EoW) Code for Recycled Aggregates (ENEW07604819). As a result of ballast's inclusion in the end of waste code it logically follows that it has been classified as a waste. Section 42 of the Environmental Protection Regulation states: Regulated waste is a waste that:</p> <p>(b) is of a type, or contains a constituent of a type, mentioned in schedule 9, part 1, column 1.</p> <p>The list of constituents in schedule 9 is comprehensive and many could be reasonably expected to be attached to ballast should leaks and spills occur or even through the course of general maintenance (e.g. pesticides, oils, PCBs, heavy metals). As a result, ballast that has these contaminants attached may be classified as a regulated waste (Chapter 22: Waste and Resource Management, Table 22-6 and 22-8).</p> <p>Should ballast not be a waste product (regulated or otherwise) then its inclusion in the draft EoW code is logically incoherent. Furthermore, as ballast could be subject to a contaminant type listed in Part 1 of Schedule 9 of the regulation, the description within the revised draft EIS that ballast may constitute a regulated is wholly consistent with current legislative definitions.</p>	Executive Summary Chapter 22: Waste and Resource Management Section 22.5 Table 22-6 Table 22-8
233	233.0022	Private	Flooding - Gowrie Creek	Flood immunity	Clause 11.66 of the ToR details the requirements of flood studies, in particular (b) quantifying flood impacts on upstream and downstream existing infrastructure surrounding the proposed alignment from redirection or concentration of flows. Tables 7.31, 9.36 and 16.23 presents the modelled change in peak water level for the proposed hydraulic structures. There are no corresponding tables for what changes are expected for existing QR infrastructure hydraulic structures. Accordingly, there is uncertainty over what risk is posed to existing QR infrastructure.	Tabulate potential flood impacts (if any) to existing QRs drainage structures.	All changes on existing rail infrastructure exceeding the FIO targets have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided within the 'Flood impacts on existing rail infrastructure' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each Section presents a Figure that visually shows the impacted sections of rail, including a corresponding summary Table itemising all exceedances associated with the impacted sections of rail. A condensed summary of flood impact objective exceedances on existing rail infrastructure is also provided in Chapter 14: Flooding and Geomorphology, Section 14.8.1. <p>ARTC will continue conversations with QR in relation to mitigation for flood impacts to rail infrastructure, for further consideration during detailed design.</p>	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5 - 17
233	233.0023	Private	Flooding - McIntyre Brook	Flood immunity	Clause 11.66 of the ToR details the requirements of flood studies, in particular (b)quantifying flood impacts on upstream and downstream existing infrastructure surrounding the proposed alignment from redirection or concentration of flows. At one location (Chainage 45 km), the predicted change in 1% AEP afflux is up to 150 mm immediately to the east of where the two alignment diverge from each other for a distance of 200 metres along the QR existing line. A change of more than 100 mm does not achieve the Railway flooding objectives nominated in Table 12.8 of Chapter 12. There is no discussion about what additional mitigation is being investigated to address this. This presents risk to QR based on current operations continuing and further information or commitments are required to ensure QR infrastructure and operations are not adversely impacted.	Provide details on additional proposed measures being considered to reduce the maximum peak water levels to within the nominated Railways flood objectives.	All changes on existing rail infrastructure exceeding the FIO targets in the Macintyre Brook floodplain have been identified within Appendix T1: Hydrology and Flooding Technical Report - Volume 1. A summary of this assessment is provided in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 14.6.3. This Section presents a Figure that visually shows the impacted sections of rail, including a corresponding summary Table itemising all exceedances associated with the impacted sections of rail, including justification and mitigation strategies. A condensed summary of flood impact objective exceedances on existing rail infrastructure is also provided in Chapter 14: Flooding and Geomorphology, Section 14.8.1.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 14.5.4
234	234.0001	Private	Land Use and Tenure	Property Devaluation	The submitter is a chartered accountant in Millmerran Inglewood and Texas. He is raising this issue on behalf of Tim Durre's, his client. He is concerned about Mr Durre's irrigation property at Gowrie Toowoomba and how he will be majority affected financially by the Inland Rail Project as it bisects and devalue his property.	Construct rail line through the forestry from Goondiwindi to Gladstone. He acknowledges that it will go through Wagner's airport, but they were the ones that have indirectly made the line past their airfield go through Mr Durre's irrigation property.	ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC is committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided (Chapter 8: Land Use and Tenure, Section 8.6.1). <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>Refer to Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.2of the revised draft EIS for further detail.</p>	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Table 8-46

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
234	234.0002	Private	Stakeholder engagement		The submitter has participated in many consultative meetings arranged by the proponent. However despite many meetings he is of the impression that the proponent was not acknowledging any issues raised by them, or paying attention to these. He finds the consultation process 'pathetic' and 'lip service' with no acknowledgement of local knowledge or time spent in attending meetings.	Nil.	<p>ARTC recognises the contribution that the submitter has made to the development of the Project, since its inception. The alignment selection process was conducted prior to 2017, with early stakeholder consultation and business case stages for this process outlined in the Appendix E Consultation Report, Section 3. Since this date, ARTC has conducted community consultation and reference design works within the 2 kilometre corridor provided by the Australian Government.</p> <p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report of this EIS covers community consultation conducted from November 2018 during the development of this EIS and the reference design. Since this submission the Federal government tabled its response to the Senate Enquiry in December 2021.</p>	Appendix E: Consultation Report Section 2 Section 3
234	234.0003	Private	Flooding		The submitter is concerned on construction railway line over the flood plain from Millmerran onwards.	Rail line should be re-directed from Millmerran to Gladstone through forestry areas.	<p>The revised draft EIS is focused on the chosen alignment selected by the Australian Government.</p> <p>The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Section 2.8 of Chapter 2: Project Rationale. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: infrastructure.gov.au/infrastructure-transport-vehicles/rail/inland-rail</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9.3
234	234.0004	Private	Land Resources	Severance of agricultural land	The submitter is concerned that if the rail line went past Toowoomba and below the range, many more agricultural arable lands would be affected and end up in Acacia Ridge in Brisbane.	Re-direct route from Millmerran to Gladstone and eventually onto Darwin which was the original concept of a Melbourne to Darwin connection.	<p>As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9 of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rail's program of works.</p> <p>The weighted criteria in the MCA tool includes environmental impacts, community impacts, approvals, stakeholder engagement, technical viability, safety, constructability and operations. The option selection and design process considered the issues raised during consultation with relevant stakeholders and the findings of environmental and engineering investigations.</p> <p>The Project has been aligned to be co-located with existing rail and road infrastructure, where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. However, for several reasons, including topography and operational design parameters, a portion of the alignment has to traverse agricultural land. Chapter 8: Land Use and Tenure, Section 8.5.1, has been updated for the revised draft EIS, detailing land to be sterilised due to the revised alignment. ARTC will continue to engage with affected landholders to minimise impacts on existing agricultural practices.</p> <p>Where the loss of agricultural land could not be avoided, refinement of the horizontal alignment was considered (among other environmental, social, cultural, economic and technical constraints) to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible. ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises (Section 8.6 of Chapter 8: Land Use and Tenure).</p> <p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC is committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided (Chapter 8: Land Use and Tenure, Section 8.6.1).</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none">Landowners' needs regarding access to the properties and the closure of private roadsProperty infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring AuthorityThe potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>Refer to Chapter 8: Land Use and Tenure, Sections 8.5.1 and 8.6.2 of the revised draft EIS for further detail.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6 Table 8-46
235	235.0001	Private - Brookstead	Land Use and Tenure		The submitter states that the Darling Downs contains some of the most highly fertile and productive agricultural land in Australia and to resume it for a rail line seems contradictory when as agricultural producers are also being asked by the Australian Government to increase production and feed an increasing population.	The submitter states that there needs to be more research and community consultation into the alignment of the route to avoid resuming highly productive agricultural land.	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC is committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided (Chapter 8: Land Use and Tenure, Section 8.6.1).</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. 235	235.0005	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
235	235.0006	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase.</p> <p>The real social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during the detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
235	235.0007	Private - Brookstead	Social Impact Assessment		<p>The submitter states that as having been a member of the Southern Darling Downs CCC since its inception, the experience has been far from being a 'consultant to my community'.</p> <p>The submitter states that throughout the past couple of year's they have found themselves finding out information about the proposed rail line through others in the community. An example of this was a 2-hour community session held in the town of Brookstead to discuss the closure of roads that would effect accessibility to the township as well as the surrounding community; in this instance, the submitter found out about the meeting 45 minutes before it finished through a community member.</p> <p>The submitter states that ARTC should have provided this information to the CCC to inform the community members.</p>	Nil.	<p>ARTC acknowledges the contribution the submitter has made to the SDDCCC and the Project since its inception. ARTC endeavours to manage communication channels such as the CCCs and public information sessions to ensure all information is distributed in a timely and professional manner. ARTC apologises that, in the situation outlined by the submitter, the information was not distributed at an acceptable level as the township of Brookstead is represented under the Inner Darling Downs CCC. Since this submission, ARTC continues to engage with the submitter and work through their concerns and feedback.</p>	N/A

235	235.0008	Private - Brookstead	Stakeholder Engagement		<p>ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community.</p> <p>ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders.</p> <p>The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.</p> <p>ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.</p> <p>ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p> <p>The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.</p>	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication.</p> <p>Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East Intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway Intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement Section 6 Section 6.2.4 Section 6.2.5 Section 6.4 Section 6.5 Section 6.6 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 2.1 Section 4.1 Section 5.3 Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>
236	236.0001	Private	Land Use and Tenure		No mention is made of the loss of future value of land. Land held as investment property will be completely or severely diminished value in land as a result of the rail. Land with small businesses will have to be moved or closed. People will have to find a new farming enterprise and home, as well as a new place to move their business.	<ol style="list-style-type: none"> Reframe the terms of compensation to include loss of future value and retirement benefits. Include loss of business and compensation for loss and disturbances of business. Reject draft EIS 	<p>Where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld).</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.2, states that assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance.</p> <p>Costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation Costs related to the purchase of replacement comparable land Storage and removal costs Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. 	<p>Chapter 8: Land Use and Tenure Section 8.6.2</p>
236	236.0002	Private	Landscape and Visual Amenity		Landscape will be severely impacted. The draft EIS lacks information about the possible visual amenity impact of the area in which the submitter is located.	<ol style="list-style-type: none"> Redesign the line or move it to another area. Reject the draft EIS as it has failed to realise the full extent of the wildlife, flora and fauna (part of visual amenity) impacts. 	<p>Section 11.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. Development of the revised reference design for the Project has progressed in parallel with the impact assessment process and the revised reference design has been slightly amended for the revised draft EIS, to reflect outcomes of ongoing engagement with the community and key stakeholders. As a consequence, design solutions for avoiding, minimising or mitigating impacts have been incorporated into the reference design and revised EIS design as appropriate and where possible. The revised reference design has been developed in consideration of improving environmental outcomes, contributing to community wellbeing, contributing to social, economic and environmental sustainability, and mitigating impacts to the natural landscape and visual amenity. Among the mitigation measures and controls that have been factored into the design, or otherwise implemented during the revised reference design stage for the Project are as follows:</p> <ul style="list-style-type: none"> The Project has, where possible, avoided impacts on nationally or regionally protected landscape areas such as the Wondul Range National Park and has minimised impacts on State Forests such as Whetstone State Forest by following the edge of the protected area to the greatest extent possible The Project has been intentionally aligned along the eastern boundary of the Rainbow Reserve so as to minimise the extent of encroachment into this reserve, whilst also avoiding severance impacts to agricultural lots to the east of Rainbow Reserve The Project has avoided, where possible, direct impacts on areas noted as being of regional landscape significance defined using the regional scenic amenity methodology (ShapingSEQ) The Project has been aligned to be co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes The alignment has been positioned to reduce the number of crossings and extent of impact on watercourses The Project footprint defined in the revised reference design has aimed to minimise vegetation clearing extents to that required to safely and efficiently construct, operate and maintain the works The alignment has avoided significant settlements to the greatest extent possible to assist in minimising visual impacts (e.g. Inglewood, Millmerran, Pittsworth) except where the alignment is within or adjacent to existing rail corridor (i.e. through Yelarbon, Pampas and Brookstead) The revised draft EIS alignment has changed to minimise impacts in the vicinity of Millmerran. <p>Impacts of lighting on wildlife are not part of the Landscape and Visual Impact Assessment and are addressed separately within the Border to Gowrie Flora and Fauna assessment as detailed in Chapter 11: Flora and Fauna, which summarises there will be limited lighting associated with the construction (i.e. flashing beacons and temporary spot lights in support of short-duration night works, if required) and operation (i.e. head lamp on rollingstock and safety lighting at road-rail interfaces) of the Project. All lighting associated with the construction works stage will be short term in nature and for the operations stage, will exist as pulses of short duration (for rolling stock). Measuring light to assess its effect on fauna is challenging and an emerging area of research and development. There is currently no globally recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species visual system.</p> <p>The LVIA has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and potential impacts associated with the Project, including Project lighting, are identified in Section 6. A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. In addition, an Obtrusive Lighting Assessment (OLA), which is a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>As discussed in the mitigations for Landscape and Visual Amenity in Chapter 24: Draft Outline Environmental Management Plan, while ensuring the construction and operational safety is not compromised, Australian Rail Track Corporation (ARTC) would seek to minimise light emissions from the Project (during construction and operation) by select placement, configuration and direction of lighting to reduce potential impacts to the surrounding environment, where practicable, in accordance with Australian Standards.</p> <p>ARTC will continue to work with impacted landowners and businesses regarding design changes from the revised draft EIS and will continue to consult with key stakeholders during the detailed design stage. This will include ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Chapter 24: Draft outline Environmental Management Plan Appendix AC: Proponent commitments Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 4.10 Section 6 Section 9.2 Section 11 Section 11.2 Appendix 3: Obtrusive Lighting Assessment</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
236	236.0003	Private	Flora and Fauna		The report prepared by ARTC does not show many wildlife species and natural fauna in the submitter's area. The patch scrub on Owens Scrub Road has many animals, which are also located on his dam. The proposed line in this area will negatively impact flora and fauna in the area. The train line will disrupt trees in the corridor. The Belson's panic grass found in the area is a vulnerable grass specie, which will be impacted by the rail.	1. Redesign line 2. Move line area to another area. 3. Reject the draft EIS as it has failed to realise the full extent of impacts on all species in the submitter's area.	Detailed desktop assessments and field surveys were conducted across the proposed alignment and can be found in revised draft EIS Appendix L: Terrestrial and Aquatic Ecology. A detailed assessment on potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Some examples of identified impacts include habitat loss and degradation, displacement of threatened species, barrier/edge effects, lighting, dust, erosion, contamination and more. Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project alignment. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction, construction and operational stages. Belson's panic grass has been identified in Appendix O: Matters of National Environmental Significance Report as a vulnerable flora species. This grass species as requiring a recovery plan, nor has a threat abatement plan been identified as being relevant for this species. The approved conservation advice for the species (DEWHA, 2008) identifies the following threats: <ul style="list-style-type: none"> Habitat loss due to agricultural development and mining Projects overgrazing by livestock weed invasion. The approved conservation advice for the species does not identify important populations or habitat critical for the species (DEWHA, 2008). As outlined in Appendix O: Matters of National Environmental Significance Report, it is considered likely that there is an important population of Belson's panic within the Project footprint, and the Project is likely to lead to a long-term decrease in the size of an important population (as defined under the Significant Impact Guidelines). ARTC will provide biodiversity offsets in accordance with the relevant state or commonwealth legislation and guidelines. ARTC's approach to delivering environmental offset requirements is outlined in Appendix Q: Environmental Offset Delivery Strategy.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Appendix O: Matters of National Environmental Significance Report Appendix Q: Environmental Offset Delivery Strategy
236	236.0004	Private	Flooding - Condamine River		The submitter is severely concerned about the construction of the line over the Condamine floodplain.	Consider finding from outside experts on this area.	The revised draft EIS is focused on the chosen alignment selected by the Australian Government. The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Section 2.8 of Chapter 2: Project Rationale. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: infrastructure.gov.au/infrastructure-transport-vehicles/rail/inland-rail .	Chapter 2: Project Rationale Section 2.8 Section 2.9.3
236	236.0004	Private	Air Quality	Cumulative impacts	The submitter's home is identified as a sensitive receptor. He is concerned about the general train pollution and idling train in the crossing loop and while at maintenance. He is concerned about the cumulative impact of the mine dust that is already located nearby. His property is already shown as in an area with higher-than-average levels of nitrogen.	Move the line or reject draft EIS.	Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes: <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were: <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs multi-criteria analysis (MCA). As noted in Chapter 2: Project Rationale, Section 2.9.3, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.15 Figure 2.14 Appendix E: Consultation Report Section 5.1
236	236.0005	Private	Groundwater	Water quality	The submitter is concerned about the uptake of bores in the area and its long-term effects on the health of the local water resources.	Consider using outside experts on this area.	No long-term or regional groundwater drawdown/ wider impact on the aquifer is anticipated as a result of the Project. The groundwater predictive modelling undertaken as part of the EIS indicates that the horizontal extent of drawdown is to only extend a maximum of 10 m to 43 m horizontally from the rail centreline (from the deepest cuts). This drawdown will be localised around the vicinity of the deep cuts that intersect groundwater only and no regional groundwater drawdown/ wider impact on the aquifer is anticipated (Chapter 15: Groundwater, Section 15.5.4). Currently no bores are anticipated to be impacted by groundwater drawdown from the Project. Revised draft EIS Chapter 15: Groundwater, Section 15.5.4 and 15.7.4 and Table 15-20 and Appendix U: Groundwater Technical Report, Section 8.2 and 8.3.4 have been updated accordingly with groundwater users, the 'make-good' strategy and proposed measures. Baseline groundwater monitoring has been conducted and is ongoing at Project bores along the Project alignment. The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project (see the groundwater management and monitoring program (GMMP) in the revised draft EIS, Chapter 15: Groundwater, Section 15.7.3 for a detailed approach to monitoring for impacts during construction). The use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, trading or purchasing of existing allocated entitlements will be pursued in the first instance through a qualified water broker. The extracted volumes shall therefore be within the existing licencing limits that are calculated to protect groundwater resources. Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements Report.	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Table 15-20 Appendix B5: Construction Water Requirements Report Appendix U: Groundwater Technical Report Section 8.2 Section 8.3.4
236	236.0007	Private	Social Impact Assessment		The submitter has not been informed by the proponent about the latter's mental health partnership initiative for those impacted by the Inland Rail. The submitter was not informed about whom to contact to get this help.	Nil.	ARTC's mental health partnership aims to enable people affected by the proposed Project to access local and independent mental health support services. The partnership with DD&WM PHN has been selected as it is utilising and strengthens existing mental health services rather than replicating and competing with existing providers. The services supported by ARTC are promoted through the PHN's business-as-usual activities, including active communication regarding services available to local GPs.	N/A
236	236.0008	Private	Stakeholder Engagement		The submitter is concerned that the consultation process with the landowners have been secretive and mishandled. The first meeting invitation was received by them a day after the meeting, resulting in them missing the meeting. They were also not told about the crossing loop, maintenance siding and laydown area. The submitter feels that the consultation with community has not been open and honest. The submitter had to obtain information after extensive questioning, enquiry and investigation by themselves, rather than it coming from ARTC people.	Reject draft EIS as a lot of the content has not been openly discussed with the general public and affected parties.	The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2. Design is an iterative process and design details were shared with community members as they became available. ARTC notes that the Project reference design prepared contained an appropriate level of detail for that stage of design. The design will be progressed in the detailed design stage. ARTC notes that this submission refers to a community engagement event held in June 2016. The community engagement associated with the development of the Yelarbon to Gowrie Corridor Options Report (DIRD, 2016) and subsequent corridor selection process was managed by the Federal Department of Infrastructure and Regional Development. The submitter was present at a community engagement event held in October 2020, where one-on-one discussions with Project designers about the road and rail design was held. Since this submission, the Coordinator-General has requested that ARTC prepare a revised draft EIS, which will be subsequently placed on public exhibition for stakeholder feedback. Broad community engagement has been undertaken to inform the revised draft EIS, as detailed in Appendix E: Consultation Report.	Appendix E: Consultation Report Section 2
236	236.0009	Private	Traffic and Transport		1. Concerned about the existence of the railways crossing on the busy Owens Scrub Road which has major traffic to the Millmerran Power Station and mine. 2. Concerned about possible queue length. The estimates for queue length has been done for 1800 m train and not 3600 m. Concerned that the existing traffic analysis does not mention anywhere the effects of a crossing loop and delay of timing as trains slow down at crossing loops and pass one another. 3. Traffic on Owens Scrub Road and Foxwood road will be increased by 47%. Hence has the combined effect with other road traffic been considered? 4. School bus route: Has the full impact of wait times at level crossings been considered for the school buses?	1. Avoid Owens Scrub 2. Line moved somewhere else. 3. The crossing loops and maintenance siding should all be considered for another less busy road. 4. The future proofed design of the crossing loop is flawed and must be moved elsewhere.	As part of the revised reference design, Owen Scrub Road is now proposed as a road over rail grade separation (310-38-P-3b) with surround road upgrades. This replaces the previously proposed active level crossing within the draft EIS. The new crossing loop location is approximately 2.5 km east of Owen Scrub Road, which is now a grade separated road-rail interface. The new crossing loop location is approximately 2.5 km east of Owen Scrub Rd and meets all performance specifications as outlined in Table 5-4 in Chapter 5: Project Description of the revised draft EIS. Therefore no delay for road traffic at this location is anticipated. The revised draft EIS Chapter 5: Project Description, Section 5.2 describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains is not part of the proposal for which approval is being sought.	Chapter 5: Project Description Section 5.2 Table 5-4
237	237.0001	Private	Traffic and Transport		GrainCorp requests the EIS detail the approval process required to permit the commencement of 3,600 m trains on Inland Rail and specify thresholds of incremental change not needing consent/approval.	Nil.	Chapter 5: Project Description, Section 5.2 describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains is not part of the proposal for which approval is being sought.	Chapter 5: Project Description Section 5.2
237	237.0002	Private	Traffic and Transport		GrainCorp is concerned an operational connectivity issue exists for the east-west movement of regional freight traffic and the need to facilitate access to existing and proposed intermodals, industrial areas and GrainCorp sites.	Nil.	The Australian Rail Track Corporation (ARTC) employs a specialised resource to expand its freight-on-rail business, particularly in regional locations. This involves building and maintaining relationships with potential customers, rail freight and terminal owners, as well as other industry stakeholders. The stakeholders located along the existing rail networks are actively engaged as potential users of the Inland Rail, which seamlessly integrates with the regional network. Please refer Chapter 5: Project Description for further details. Chapter 5: Project Description describes the interoperability that has been integrated within the design, which includes turnouts to existing GrainCorp sidings and Queensland Rail network at Kildonan, Whetstone, Millmerran and Yarranlea.	Chapter 5: Project Description
237	237.0003	Private	Traffic and Transport		GrainCorp is of the opinion that insufficient emphasis has been given to the cumulative effects of increased freight traffic and the South East Queensland future passenger demand.	GrainCorp requests the Project proponent provide operational analysis on these forecast interactions through detailed Network modelling utilising existing and future traffic volumes.	It is noted that Projects with spatial and/or temporal overlap can result in cumulative impacts; therefore, the revised draft EIS Chapter 23: Cumulative Impacts Section 23.3.9 addresses cumulative impacts, including the crossover between multiple Inland Rail packages. To enable stakeholders to make informed decisions, consideration has been given to the potential impacts of other major Projects in the area to ensure that the combined impacts of the Project are accounted for. A quantitative cumulative impact assessment has been undertaken considering the complete Inland Rail construction from North Star to Border to Kagaru to Acacia Ridge/ Bromelton. The study area considers the overlap of other Inland Rail packages with the proposed Project construction routes across the complete construction timeframe over the six packages. Several key assessments, which were influenced by traffic volumes, have been reassessed as part of the cumulative impact assessment. These include the assessment of road safety, intersections, road link capacity, and pavement. In cases where there was a change in cumulative year peak-hour volumes, analysis was also undertaken for safety, Intersection, and road link capacity assessments. Any road links and Intersection s with no volume change have been evaluated in the 'Project only' assessment covered in Section 20.5 of Chapter 20: Traffic, Transport and Access. The revised draft EIS Chapter 20: Traffic, Transport and Access has been updated in accordance with the GTIA, and a detailed cumulative impact assessment can be found in Chapter 23: Cumulative Impacts. ARTC remains committed to collaborating with TMR and other road controlling authorities throughout subsequent stages of the Project to mitigate any cumulative impacts that have been identified.	Chapter 23: Cumulative Impacts Section 23.3.9 Chapter 20: Traffic, Transport and Access Section 20.5
237	237.0004	Private	Traffic and Transport	operational traffic	GrainCorp believes the Project is missing an opportunity to create efficient rail logistic pathways to all existing and potential market destinations. operational degradation of regional networks and reduced opportunity for regional traffic is an economic, safety and freight efficiency issue which will not be fully addressed by the proposed connections.	Nil.	The Australian Rail Track Corporation (ARTC) employs a specialised resource to expand its freight-on-rail business, particularly in regional locations. This involves building and maintaining relationships with potential customers, rail freight and terminal owners, as well as other industry stakeholders. The stakeholders located along the existing rail networks are actively engaged as potential users of the Inland Rail, which seamlessly integrates with the regional network. Please refer Chapter 5: Project Description for further details. Chapter 5: Project Description describes the interoperability that has been integrated within the design, which includes turnouts to existing GrainCorp sidings and Queensland Rail network at Kildonan, Whetstone, Millmerran and Yarranlea.	Chapter 5: Project Description
237	237.0005	Private	General Project opinion - positive		GrainCorp is pleased the importance of the connections to existing lines has been recognised and will continue to work with ARTC and the relevant government authorities to ensure these connections are maximised through additional Projects such as the federal Department of Infrastructure, Transport, Cities and Regional Development Inland Rail Interface Improvement Program.	Nil.	ARTC notes this submission and will continue to consult with GrainCorp as a key stakeholder of the Project.	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
237	237.0006	Private	Traffic and Transport		GrainCorp has concerns with regard to the reliance on the successful contractor for detailed design analysis to negotiate traffic and local amenity impacts. The EIS fails to provide a complete assessment of the impact to the regions roads and any subsequent negative outcome for the transport of grain to GrainCorp facilities.	Nil.	<p>Whilst a significant amount of work has been completed to assess the potential road impacts as outline in the Traffic Impact Assessment in Appendix AA: Traffic Impact Assessment of the revised draft EIS, the Contractor is not on board the Project until detailed design and as such the construction routes are not finalised by the Contractor. As a result, a complete Road Use Management Plan cannot be delivered until that time. This is normal process for construction Projects, and is in line with Workplace Health and Safety legislation requirements. This is because many assumptions during the previous stages that will impact on road use management strategies, are not confirmed until detailed design progresses, or construction scheduling allows full visibility of the impact of construction vehicles.</p> <p>Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are considered.</p> <p>Any roads or existing structures located along construction routes that may warrant upgrades to cater for the Project's construction vehicles will be required to be assessed in consultation with the asset owner, the road controlling authority, local councils, ARTC and the construction contractor to determine if the upgrade is warranted as a part of the Project. For further detail see Section 5.7 of Appendix AA: Traffic Impact Assessment.</p> <p>Requirements for roads upgrades to be finalised during detailed design stage as well as updating during the construction works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.</p> <p>ARTC commit to continuing engagement GrainCorp, local councils and TMR to refine construction methodology and verify sources of construction material.</p>	Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 5.7
237	237.0007	Private	Traffic and Transport	construction traffic	GrainCorp disputes the viability of the ballast and capping sourcing strategy and asserts the EIS has failed to adequately demonstrate the traffic and amenity impact of verified sources of construction material.	Nil.	<p>The revised draft EIS Chapter 20: Traffic, Transport, and Access Section 20.3 outlines the assumptions regarding the construction methodology. The draft TIA aims to provide indicative impacts based on the level of assessment appropriate to the assumptions made and the degree of certainty at the time of design. This includes considerations such as construction methodology, material volumes, sources, and transport routes. ARTC will continue to engage with construction contractor, GrainCorp, local councils and TMR to refine construction methodology and verify sources of construction material.</p> <p>Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are considered.</p> <p>Any roads or existing structures located along construction routes that may warrant upgrades to cater for the Project's construction vehicles will be required to be assessed in consultation with the asset owner, the road controlling authority, local councils, ARTC and the construction contractor to determine if the upgrade is warranted as a part of the Project. For further detail see Section 5.7 of Appendix AA: Traffic Impact Assessment.</p> <p>Requirements for roads upgrades to be finalised during detailed design stage as well as updating during the construction works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.</p>	Chapter 20: Traffic, Transport, and Access Section 20.3 Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 5.7
237	237.0008	Private	Traffic and Transport	construction traffic	GrainCorp expects there should be no lasting impacts to the regional road network as a result of the Project. GrainCorp requests that any mitigation and control plan be prepared in consultation with both TMR, local council, GrainCorp and rail operators to minimise transfer of rail freight impacts to the road network and construction traffic impacts on the road network.	Nil.	<p>While a significant amount of work has been completed to assess the potential road impacts as outline in the Traffic Impact Assessment in Appendix AA: Traffic Impact Assessment of the revised draft EIS, the Contractor is not on board the Project until detailed design and as such the construction routes are not finalised by the Contractor. As a result, a complete Road Use Management Plan cannot be delivered until that time. This is normal process for construction Projects, and is in line with Workplace Health and Safety legislation requirements. This is because many assumptions during the previous stages that will impact on road use management strategies, are not confirmed until detailed design progresses, or construction scheduling allows full visibility of the impact of construction vehicles.</p> <p>Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are considered.</p> <p>Any roads or existing structures located along construction routes that may warrant upgrades to cater for the Project's construction vehicles will be required to be assessed in consultation with the asset owner, the road controlling authority, local councils, ARTC and the construction contractor to determine if the upgrade is warranted as a part of the Project. For further detail see Section 5.7 of Appendix AA: Traffic Impact Assessment.</p> <p>Requirements for roads upgrades to be finalised during detailed design stage as well as updating during the construction works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.</p> <p>ARTC commit to continuing engagement GrainCorp, local councils and TMR to refine construction methodology and verify sources of construction material.</p>	Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 5.7
237	237.0009	Private	Traffic and Transport	Level crossing	GrainCorp notes the omission of the passive level crossing located at Yelarbon between Railway Parade and East Sawmill Road. GrainCorp strenuously objects to the closure of this level crossing without mitigation allowing alternatives for truck movements as it would have significant impact on the operation of the site.	GrainCorp requests that the proponent prepares and make public a Level Crossing Report (LCR) for the Project infrastructure, which must be developed in consultation with the relevant road authority. GrainCorp requests the LCR must also include the cumulative impacts of multiple level crossings on transit time throughout the region which may impact the route selection for road traffic, particularly Higher Mass Limits (HML) vehicles during peak harvest, and intercity road freight.	<p>The Project recognises GrainCorp as a key stakeholder and acknowledges the concerns regarding the closure of East Sawmill Rd level crossing. The Project will continue to work collaboratively with GrainCorp to progress potential solutions during detailed design.</p> <p>Stakeholder Engagement with Goondiwindi Regional Council and GrainCorp was arranged in Yelarbon on 9 May 2018. The purpose of the consultation was to inform the optimal railway alignment through the township of Yelarbon.</p> <p>The Project sought to understand the current operations of the Yelarbon Grain Silos and GrainCorp's plans for future operations and potential upgrades. The feedback received from GrainCorp regarding the East Sawmill Rd level crossing noted that there were no issues with closing this level crossing.</p> <p>A follow up meeting was held with GrainCorp on 6 September 2018 to present a number of concept design options, all of which included the closing of East Sawmill Rd level crossing. GrainCorp again indicated that there was no issue with closing this level crossing.</p> <p>Appendix AA: Traffic Impact Assessment, Section 3.7.2, details the reference design updates for the Yelarbon road rail interface and the proposed pedestrian crossing facilities.</p>	Appendix AA: Traffic Impact Assessment Section 3.7.2
237	237.0010	Private	Traffic and Transport	Baseline/background sampling	GrainCorp does not consider the use of a train speed that is the maximum allowable for any train service on Inland Rail to be a valid base assumption to calculate all road traffic delays.	Nil.	<p>Section 5.9.3 of Appendix AA: Traffic Impact Assessment includes a discussion of the lower and upper-level crossing time delay to road traffic and pedestrians for the Project, including consideration of traffic volumes during peak harvest time (volumes are detailed in Section 2.4). This Section also details how the level crossing time delay was calculated, including factors such as trains approaching from both directions, nearby crossing loops, train safe travel speed. Train lengths assessed for the Project are 1,800 m.</p> <p>Section 5.9.1 'Analysis assumption' states, vehicles' wait time at passive crossings were calculated by means of using the Australian Standard 1742.7, Manual of Uniform Traffic Control Devices, Part 7: Railway crossings. The estimated wait time is considered a function of:</p> <ul style="list-style-type: none"> ➤ The distance of the train from the crossing at the point where a driver approaching the rail crossing sights a train, judges a stop is needed, decelerates, and stops at a giveaway line ➤ The time it takes the train to drive along the distance from where the vehicle sees the train and decides to decelerate ➤ The time it takes the train to cross the level crossing ➤ Design vehicle consisting of a B-double for input parameters. <p>Train speed and train clearance times (s) calculations and assumptions (as obtained from road-rail interface) for the level crossing are as follows:</p> <ul style="list-style-type: none"> ➤ Train clearance times were calculated based on an assumed maximum train speed of 115 km/h ➤ Calculation of the freight train acceleration rate ➤ Distance of the level crossing from passing loops ➤ Distance required to accelerate to maximum turnout speed (50 km/h) ➤ Distance travelled while at constant maximum turnout speed ➤ Distance required to accelerate to maximum speed after the whole train has passed turnout ➤ Total distance required for train starting from turnout to reach maximum speed ➤ Total vehicles' wait time for trains of a maximum length of 1,800 m was estimated to be 104 seconds (including boom closure times). <p>The wait times determined for each individual level crossing were calculated based on:</p> <ul style="list-style-type: none"> ➤ Level crossing specific operating speeds which is impacted by topography and curvature of the alignment ➤ Time taken for the train to cross the level crossing ➤ Distance from train crossing loops ➤ Train length ➤ Summaries of traffic volumes (veh/hr) on road links at level crossing locations in the AM and PM peak hours for 2028 and 2040 (including consideration for peak harvest seasons, as per Section 2.4). ➤ A sensitivity test (to represent a conservative upper level crossing time delay) has been undertaken based on a maximum train speed of 60 km/h (as opposed to up to 115 km/h) to highlight the variability in closure times. <p>The typical active level crossing sequence for boom gate down time is, after 11 seconds (t=11) time interval the half-boom barriers commence to lower and after an additional 11 to 13 seconds (t=22-25) they will reach the fully lowered position and one of the warning bells is silenced. Where there are large articulated vehicles (B triples or Road trains), the delay before the booms commence lowering can be increased by a further 5 seconds to 16 seconds. In this instance the minimum warning time would be increased accordingly. After the last train has cleared the level crossing, the booms commence to rise to the upright position and the remaining warning bell will be silenced. The half-boom barriers reach the fully raised position within 10 seconds and the Type F highway signals become extinguished.</p> <p>As part of the design process, the Project has considered aspects of longer train lengths to allow for future flexibility in use of the network. However, as stated in Section 5.2 of Chapter 5: Project Description, maximum train lengths assessed within the revised draft EIS is 1,800 m long.</p>	Chapter 5: Project Description Section 5.2 Appendix AA: Traffic Impact Assessment Section 2.4 Section 5.9.1 Section 5.9.3
237	237.0011	Private	Flooding	Flood immunity	GrainCorp is pleased the results of the Condamine River hydraulic flood modelling demonstrate the Brookstead and Yarranlea sites will not be affected by flood waters.	GrainCorp is willing to assist ARTC with identification of those site locations with a history of negative impacts caused by surface water and soil moisture and their interaction with infrastructure.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for land. The updated FIOs are summarised in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 4.2 of and Chapter 14: Flooding and Geomorphology, Section 14.6.3 (Table 14-4) of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/ LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Events from 20% AEP up to 1% AEP, 1 in 2000, 1 in 10,000 and PMF have been assessed for multiple durations as detailed in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Under the 63% and 39% AEP size of events flows will be contained to existing drainage channels and provision of structures to convey the 1% AEP flows will maintain the flow distribution under these smaller events. Therefore impacts will be minimal. During future design stages the relevance of modelling smaller AEP events as proposed will be assessed, mainly for the purpose of construction planning.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 4.2 Section 5 - 17
237	237.0012	Private	Surface Water	Increase in flows	GrainCorp disputes that the impact of increased moisture retention in soils surrounding the rail alignment and the subsequent impact on grain handling infrastructure has not been adequately addressed.	Nil.	<p>Longitudinal track drainage is proposed for the purpose of removing water that has percolated through the track ballast, and to divert surface runoff to the nearest bridge or culvert location before it reaches the subgrade. Without adequate track drainage, the subgrade may become saturated, leading to weakening and subsequent failure of the subgrade. Track drainage is proposed at specific locations along the Project alignment where the gradient is steep enough to divert surface runoff to the nearest bridge or culvert location. As with culverts, the design and location of track drainage will be refined, if required, during the detailed design stage (revised draft EIS Chapter 5: Project Description, Section 5.4.7). Thus, the provision of track drainage, where feasible and practicable, will also serve to drain water from facilities near to the alignment.</p> <p>A detailed soil assessment was undertaken in accordance with the Coordinator-General's additional requirements at a scale of 1:10,000 mapping scale and reviewed by a Certified Professional Soil Scientist. Land Resources is not best placed to respond to this issue as it is a geotechnical/ design matter; however, based on the soil survey results and assessment of impacts from the proposed rail infrastructure, the Land Resources team would consider it unlikely there will be any significant increase in soil moisture retention in soils surrounding the rail alignment or grain handling infrastructure as it is our understanding that the design spreads the train load minimising compactive forces in the soils beneath.</p>	Chapter 5: Project Description Section 5.4.7

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
237	237.0013	Private	Surface Water	Increase in peak water levels	The submitter is concerned about the surface water affecting concrete structures.	GrainCorp expects that detailed rail embankment design adjacent to GrainCorp facilities be developed considering best practice stormwater management to ensure surface water is rapidly and effectively directed away from susceptible concrete structures	<p>The revised reference design has been developed based on the following embankment slope and benching design:</p> <ul style="list-style-type: none"> ▶ A maximum slope of 1V:2H (0.5 gradient) for earth-fill embankments ▶ A maximum slope of 1V:3H (0.3 gradient) for embankment subject to flood, to reduce the potential for scour and increase the effectiveness of rock protection <p>This is stated in Section 5.4.5 of Chapter 5: Project description.</p> <p>As stated in Section 5.4.7 of Chapter 5, the purpose of longitudinal or track drainage is to remove water that has percolated through the track ballast, and to divert surface runoff to the nearest bridge or culvert location before it reaches the subgrade. Longitudinal drainage will be provided along the rail corridor to convey runoff from the track and to intersect overland flows draining to the rail formation and divert it towards cross-drainage structures or other suitable discharge points. Embankment drains have been designed to convey waters in a minimum 2% Annual Exceedance Probability flood event.</p> <p>Thus, the provision of track drainage, where feasible and practicable, will also serve to drain water from facilities near to the alignment.</p>	Chapter 5: Project Description Section 5.4.5 Section 5.4.7
237	237.0015	Private	Social Impact Assessment	Workforce accommodation village	GrainCorp requests a more robust assessment of the impact on local housing stock and the potential for a detrimental outcome for both GrainCorp employees and the communities in which they live.	Nil.	<p>As outlined in revised draft EIS Appendix X: Social Impact Assessment, Section 8.4.4 the Contractor will be required to develop an Accommodation Management Plan (AMP). The plan will include measures to minimise impacts on rental availability in potentially impacted communities, e.g. by proving accommodation facilities and discouraging single status personnel from renting houses.</p> <p>Appendix X: Social Impact Assessment, Section 7.3.5 states that if rental vacancy rates remain low (as is expected), ARTC would take steps to mitigate negative impacts by requiring workers to take up occupancy in the non-resident workforce accommodation facilities provided, rather than in the rental market or short-term accommodation premises (as appropriate).</p> <p>The AMP requirements Section 8.4.4 of Appendix X: Social Impact Assessment have been updated to clarify that housing baseline data will need to be revised as part of the AMP development.</p>	Appendix X: Social Impact Assessment Section 7.3.5 Section 8.4.4
237	237.0016		Economics		GrainCorp is concerned for its ability, and for that of local grain growers, to afford, attract and retain workers due to the creation of other (possibly higher-paid) employment opportunities.	Nil.	<p>ARTC has recently updated the EIS economic modelling to reflect the current labour market conditions for the revised draft EIS. If labour market conditions at the national and state level remain in the recent range, the Project's construction works stage will be completed in the context of a relatively tight labour market, especially in the market for skilled labour relevant to the construction sector. Refer to Chapter 18, Section 18.6. However, the economic assessment indicates in Section 5.2 (Appendix Y: Economic Impact Assessment) that there is some slack in the Darling Downs – Maranoa labour markets, which provides opportunities for recruiting, training and re-skilling available workforces in the region to supply a significant portion of the workforce requirements of the Project. The ability for the local economy to supply labour to the Project, depends on the specific location of works along the alignment. At the time of construction, local employment is dependent on a number of factors including labour market conditions, skills availability, and the existence of workforce training and participation programs to support local, Indigenous and youth employment.</p> <p>ARTC will implement mitigation measures to ensure impacts to the availability of the local workforce is reduced. These include:</p> <ul style="list-style-type: none"> ▶ Establishing the IR Skills Academy training and capacity building initiatives (to increase the labour pool) ▶ Monitoring labour draw in consultation with key stakeholders ▶ Corrective actions if required, e.g. to recruitment or training strategies 	Chapter 18: Economics Section 18.6 Appendix Y: Economic Impact Assessment Section 5.2
237	237.0017	Private	Hazard and Risk		GrainCorp expects early involvement in development of the Biosecurity Management Plan, and that it will be completed to GrainCorp's satisfaction.	Nil.	A Biosecurity Management Plan will be developed prior to the commencement of construction by the 'Contractor' as a component of the Construction Environmental Management Plan. This Plan will be developed in consultation with relevant stakeholders and affected landholders (Chapter 24: Draft Outline Environmental Management Plan).	Chapter 24: Draft Outline Environmental Management Plan
237	237.0018	Private	Stakeholder Engagement		GrainCorp expects assurance from the proponent that the future consultation process will seek communications with GrainCorp regarding impacts to leased land at which GrainCorp undertakes operations	Nil.	<p>Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report, Section 5.1 and 5.2 details the ongoing stakeholder engagement program with directly impacted landowners and businesses. Since the submission, ARTC has engaged with GrainCorp, including to discuss:</p> <ul style="list-style-type: none"> ▶ stakeholder's concerns regarding the closure of East Sawmill Rd level crossing in Yelarbon ▶ potential interruptions to rail transport on existing rail lines, requiring further engagement with QR and GrainCorp during the programming of construction activities, to minimise impacts on grain haulage by rail ▶ noise mitigation control measures at all sites to ensure WH&S obligations are met ▶ ongoing consultation to ensure revised reference design minimises impacts on GrainCorp's operations wherever possible. <p>ARTC will continue to work collaboratively with GrainCorp to progress solutions on the above concerns, including addressing access to the Yelarbon silos during detailed design. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p>	Chapter 6: Stakeholder Engagement Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 5.1 Section 5.2
237	237.0019	Private	Hazard and Risk	construction traffic	Impacts on emergency services GrainCorp is disappointed that consultation is yet to be undertaken with Toowoomba and Goondiwindi Local Disaster Management Groups. GrainCorp considers that local emergency services will experience real impact as a result of the construction activities and the influx of construction workers.	GrainCorp also expects that the post-approval Workforce Management Plan will contain a specific 'Emergency Services' section, developed with the early involvement of GrainCorp.	<p>ARTC engaged with stakeholders has engaged broadly since public consultation of the revised draft EIS to better understand the risks, revise the reference design and ensure any impact to safety or emergency services is minimised. Engagement through local council representatives, community information sessions and Community Consultative Committee meetings has allowed community members to share information about their safety concerns.</p> <p>An ARTC engaged with stakeholders representative attends the quarterly District Disaster Management Group (DDMG) meetings and presents Project updates to increase dialogue about the impact of the alignment on emergency services. Additional to this, ARTC engaged with stakeholders has participated in a disaster simulation event with the DDMG, which simulated the evacuation of Inglewood in the event of a flood.</p> <p>Details of ARTC's consultation with the DDMG to-date are provided in Appendix E: Consultation Report of the revised draft EIS. ARTC engaged with stakeholders commits to continuing consultation with the DDMG and other local disaster management groups, as relevant, through the detailed design and construction works stages of the Project.</p>	Appendix E: Consultation Report
238	238.0001	State Agency	Approvals/ conditions/ recommendations		The EIS does not address Section 9.10 requirements of the ToR. The draft EIS lists five prescribed Environmentally Relevant Activities (ERAs) that may be triggered however does not identify the relevant thresholds or provide supporting information for the administering authority to decide whether an approval should be granted and if so, what conditions should be applied. The ERAs required for a Project and the relevant supporting information are ordinarily provided in the draft EIS for assessment. The department is not aware of any exemptions for the proponent not to provide all the required assessment and supporting information in the draft EIS.	Update the draft EIS to provide all the required supporting information to allow the administering authority to decide whether an approval should be granted for a prescribed ERA and to recommend relevant conditions. This includes a detailed assessment of all potential Project impacts, the effectiveness of all proposed mitigation and management measures for the likely ERAs and any other environmental approvals triggered by the proposed Project under the EP Act.	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the detailed design and construction works stages (see Chapter 3: Legislation and Project Approvals Process, Table 3-2 and Section 3.2.1).	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Table 3-2
238	238.0002	State Agency	Approvals/ conditions/ recommendations		The draft EIS does not fully address ToR requirement of Section 7.1, 7.29.5 9.7,9.9 and 9.10.	The draft EIS should discuss any applicable exemptions under the EP Act or NC Act. If no relevant exemption applies, the draft EIS should provide detailed site-specific environmental assessment information in accordance with the ToR to allow the department to adequately assess the potential impacts of the Project on identified environmental values and to make an appropriate recommendation to the Coordinator-General on whether the approval should be granted. The draft EIS should include a flow chart indicating the key environment approvals and opportunities for public comment. The draft EIS should provide required information under Section 125 of the EP Act to support relevant ERAs, including information required to assess avoidance investigations, potential Project impacts and the effectiveness of proposed mitigation and management measure and potential offsets, if required, to ensure the proposed Project meets acceptable environmental performance standards.	<p>Chapter 3: Legislation and Project Approvals summarises the Commonwealth and State Government legislation relevant to the Project and identifies the approvals, permits, licences and authorities necessary for the planning, construction works and operations stages of the Project. Chapter 3: Legislation and Project Approvals Process includes a flow chart (Figure 3-2) that sets out the steps in the Coordinated Project process, including the opportunities for public submissions. Secondary approvals have been noted and discussed as relevant in the various specialist chapters, addressing the requirements of Section 7 of the Terms of Reference.</p> <p>The Project falls within the definitions of Government Supported Transport Infrastructure, both as defined under the Transport Infrastructure Act and the Planning Act, and is therefore subject to the statutory provisions and exemptions accordingly.</p> <p>Table 3-2 of Chapter 3: Legislation and Project Approvals Process includes a list of ERAs that may be required for the construction of the Project. Preliminary data on each of the activities associated with the ERAs has been provided as appropriate and where available.</p> <p>However, the revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during detailed design and the construction works stage (Section 3.2.1, Chapter 3: Legislation and Project Approvals Process).</p> <p>The revised draft EIS has been updated to reflect TMR and other State agency comments.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Table 3-2 Figure 3-2
238	238.0003	State Agency	Approvals/ conditions/ recommendations		Section 9.10 of the ToR requires that the draft EIS lists separately any Environmentally Relevant Activities (ERA) to be conducted as part of the proposed Project, with the appropriate ERA number, activity name and required threshold. The draft EIS identifies five prescribed ERAs listed under Schedule 2 of the Environmental Protection Regulation 2019 (EP Regulation) that will potentially be triggered by the Project but not the relevant thresholds, the locations for these activities and their extent have also not been clearly specified. The draft EIS states the ERA thresholds will be determined following refinement of a construction methodology. It is not clear when this would occur within the EIS assessment process. It should be noted that there are certain environmental risks associated with different thresholds of the same ERA. For example, ERA 16-1 (dredging) may have different impacts on the receiving environment than ERA 16-2(extracting) or ERA 16-3(screening)). Therefore, it is important to determine the relevant ERA thresholds to assess these risks appropriately.	Amend the draft EIS to provide a detailed description of all ERAs that are potentially triggered by the Project activities, including their thresholds, locations, scale, and intensity (refer to Schedule 2 of the EP Regulation for a detail description of all prescribed ERAs). This information should include, but not be limited to: a clear description of the land (location) on which the activities will be carried out the volume and type(s) of chemicals proposed to be stored as part of the Project the quantity of material proposed to be extracted and screened in a year as part of the Project (only in relation to the extractive and screening activities that are not subject to the exemption under ERA 16 definition)the quantity of material proposed to be crushed, milled, ground, or screened in a year(that are subject to the ERA 16 exemption) which may instead trigger ERA 33 Crushing, milling, grinding, or screening the number of vehicles that will be used for regulated waste transport and a volume and type(s) of regulated waste proposed to be transported the volume of water that is proposed to be treated in a day as part of the water treatment activity, and details of proposed treatment process. Provide detailed information of the likely impacts to environmental values resulting from the proposed prescribed ERAs and their proposed relevant thresholds, and describe mitigating measures proposed to be implemented to minimise these impacts. It is recommended that the following guidelines for technical information requirements for an EA be consulted: business.qld.gov.au/running-business/environment/licences/permits/applying/technical . Some of the activities identified in the draft EIS contain standard or model conditions. Amend the draft EIS to describe how the proposed Project would meet these standards. These conditions can be found at: business.qld.gov.au/runningbusiness/environment/licences/permits/applying/conditions . Note that ERA 16 includes an exemption clause which will likely apply to some aspects of this Project. Those aspects include the extraction of quarry material that are for the purpose of preparing a site for the construction of railway. However, for these aspects ERA 33 will apply if crushing, milling, grinding, or screening are proposed at the trigger limits. It should be noted that any matter outside this scope of the exemption clause will require ERA 16 if the trigger limits are met.	<p>Chapter 3: Legislation and Project Approvals Process, Section 3.4.13 Forestry Act 1959, has been updated in the revised draft EIS. It states the following:</p> <p>Tenure arrangements, including compensation and offset requirements, for the revocation of State forest land will continue to be progressed during and following the completion of the EIS process in accordance with the operational policy: Revocation of QPWS managed areas (QPW/ 2016/ 1877 v1.03) and in continued consultation with DAF, DES and Department of Resources.</p> <p>To facilitate technical investigations before the partial revocation process, ARTC will obtain, separate to this revised draft EIS and where necessary, approvals for (Chapter 8: Land Use and Tenure, Section 8.6):</p> <ul style="list-style-type: none"> ▶ Investigative works under Section 56 of the Forestry Act ▶ Permits to interfere with State-owned forest products and quarry material under Part 6 of the Forestry Act. <p>The information required to support applications for the above approvals will become available through the detailed design stage. It's noted that following consultation between ARTC and DES (QPWS&P) on 23 September 2021, DES (QPWS&P) advised that an Occupation permit under Section 35 of the Forestry Act would not be the mechanism to access land where ARTC's intention was to partially revoke the land. Where access to land is required before revocation is completed, access will be gained through Minor disturbance works under Section 56 of the Forestry Act.</p> <p>Permits will be obtained by the proponent where required in accordance with the Forestry Act (Chapter 8: Land Use and Tenure, Section 8.6).</p> <p>In addition to the above, a number of 'special leases' have been granted over State forest. If ARTC is unable to negotiate the surrender of these leases it will require DTMR as the constructing authority to make a request to the DoR for the resumption of the special leases by way of order in council under the Land Act.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.13 Chapter 8: Land Use and Tenure Section 8.6

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0004	State Agency	Approvals/ conditions/ recommendations		The following Section of the ToR have not been adequately addressed nor demonstrated in the draft EIS the relevant matters relating to each of the proposed prescribed ERAs triggered and associated locations: Section 6.1 it should be clear the environmental values impacted on for each proposed prescribed ERA and associated locations. Section 6.3 - baseline information relevant to the environmental values that specifically relate to the proposed prescribed ERAs triggered and locations. Section 6.5 and 6.6 need to provide information specifically for the operation of the proposed prescribed ERAs triggered. Section 7.5 - no geographical coordinates provided within respects to the location of each of the proposed prescribed ERAs or site layout plans. Section 6.4 and 7.6 regarding significant residual impact and whether environmental offsets are required. Section 10.8 plans and drawing provided do not detailed locations and layouts of proposed prescribed ERAs triggered and so the department are unable to assess the impacts adequately. Section 11.22 and 11.23 information needs to be included on decommissioning components/rehabilitation of sites, including on how the works are to be undertaken for the proposed prescribed ERAs sites. Section 11.36 to 11.103, 11.118 to 11.176 needs to include information on how they relate to each of the locations where the proposed prescribed ERAs are to be undertaken.	Amend the draft EIS to include all the required information regarding ERAs that will or are likely to be triggered by the Project. Update the ToR Compliance Table to accurately reflect the quality of the assessment information provided in the draft EIS in accordance with the ToR requirements. Furthermore, potential impacts need to accurately quantified and rigorously assessed to ensure best practice environmental impact assessment. The draft EIS by simply stating for example, a best practice mitigation measure without providing the required site-specific detailed supporting information and assessment to test the proposed measures applicability and effectiveness to mitigate the potential Project impact is not considered best practice environmental management. The draft EIS is required to provide site-specific environmental data and associated supporting information in accordance with approved guidelines. The draft EIS should discuss robust evidence-based assessments that are based on good scientific methods. High-level, in-principle descriptions do not demonstrate best practice environmental management in environmental impact assessment and development assessment.	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the detailed design stage and construction works stage. Appendix A2: Terms of Reference Cross Reference Table is used as a guide to direct readers to where terms of reference items have been addressed in the revised draft EIS.	Appendix A2: Terms of Reference Cross Reference Table
238	238.0005	State Agency	Approvals/ conditions/ recommendations		Section 5.4.1.4 indicates that ERA 16 extractive and screening will be required for the proposed Project, and that the Project will involve the construction of 20 new bridges over watercourse crossings (refer to Section 5.2.5 of the draft EIS). The new bridge structures will require installation of concreted piers within the bed of waterways. This could potentially trigger a need for ERA 16(1) dredging. Insufficient site-specific information has been provided to determine if this is the case.	Review the proposed bridge construction methodology and confirm whether ERA 16(1) dredging will be triggered for the construction of 20 new over watercourse crossings (bridges). If this ERA is triggered, provide detailed information on the volume and quality of material that will be removed from the bed of waterways in a year, the impacts to environmental values resulting from the proposed activity (contaminants of concern that are expected to be generated by the activity, both on and off site) and a time and duration of the instream works), and mitigating measures proposed to be implemented to address these risks. Chapter 3 and 5 (and other relevant chapters) will need to be amended accordingly to capture ERA 16(1) for dredging. The following guidelines should be used in undertaking the necessary assessment: - National Assessment Guidelines for Dredging environment.gov.au/system/files/resources/877b675b-4d5b-4ce7-b81e1959649203a6/files/guidelines09.pdf - Stormwater Guideline-environmentally relevant activities environment.des.qld.gov.au/_data/assets/pdf_file/0028/89119/pr-gl-stormwaterguideline-era.pdf	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the detailed design and construction works stages (see Chapter 3: Legislation and Project Approvals Process, Table 3-2 and Section 3.2.1).	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Table 3-2
238	238.0006	State Agency	Approvals/ conditions/ recommendations		Sections 5.3.1, 5.3.6, 5.3.9, 5.4.11, 5.4.21, 11.8.1.2 of the draft EIS indicate that ERA 63 sewage treatment, will be required as part of the proposed Project. The draft EIS states that three non-residential workforce accommodations (300 bed capacity each) housing initially 300 equivalent persons (staff) in the vicinity of the townships Yelarbon, Inglewood and Millmerran (Turallin) are proposed to be constructed. It is proposed to install and operate a temporary package sewage treatment at each of the three sites. It is unclear how the disposal of treated sewage will be disposed. Insufficient information has been provided in the draft EIS for the department to decide whether an approval should be granted.	Confirm whether ERA 63 will be triggered as part of the proposed Project. If the activity is required, amend the draft EIS to provide the information required under Section 125 of the Environmental Protection Act 1994 to support the Projects application for ERAs in accordance with Section 9.10 of the Tor. Provide detailed information of the likely impacts to environmental values resulting from the proposed prescribed ERA and its proposed relevant thresholds, and describe mitigating measures proposed to be implemented to minimise these impacts. It is recommended that ARTC request a pre-lodgement meeting with the department's technical specialist to discuss the technical information requirements for ERA 63. The following resources have also been identified as relevant to this activity: - Assessing applications for sewage treatment works Assessing applications for ERA 63 threshold 2 sewage treatment works (des.qld.gov.au)	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the detailed design and construction works stages (see Chapter 3: Legislation and Project Approvals Process, Table 3-2 and Section 3.2.1).	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Table 3-2
238	238.0007	State Agency	Approvals/ conditions/ recommendations		ERA 16 and 33 would apply if those activities are proposed at the trigger limits. The location, scaler and extent of the proposed extraction activities has not been adequately described in the draft EIS.	Review the scale and locations of the proposed earthworks and determine which cutting and filling activities associated with the proposed Project would be exempt under Schedule 2 of the EP Regulation, and which would require an approval for ERA 16-2 (extracting), ERA 16-3 (screening) and ERA 33 (crushing, milling, grinding, or screening) approvals. Specify the location, scale and duration of all extractive and screening activities that will trigger an ERA 16 and ERA 33 assessments. Chapter 3 and 5 (and other relevant chapters) will need to be amended accordingly to capture ERAs 16 and 33, where appropriate.	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the detailed design and construction works stages (see Chapter 3: Legislation and Project Approvals Process, Table 3-2 and Section 3.2.1).	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Table 3-2
238	238.0008	State Agency	Approvals/ conditions/ recommendations		Section 3.5.10.2 of the draft EIS indicates that ERA 41 cement manufacturing may be triggered by the proposed Project. In accordance with Schedule 2 of the EP Regulation, ERA 4 cement manufacturing consists of manufacturing 200 t or more of cement in a year, or calcining 200 t or more of limestone. Based on a description of the proposed activity that is included in Section 5.4.8, it appears that the proposed Project will involve the construction of several concrete batching sites rather than cement manufacturing facilities. In 2013, amendments under the Environmental Protection Regulation removed low risk threshold ERAs such as concrete batching plants. A development approval under the Planning Act 2016 may be require for this activity. Note: An environmental code of practice has been prepared by the department to provide guidance to operators to help them comply with the EP Act by meeting their general environmental duty and outlines the environmental best management practices in the industry.	Confirm whether ERA 41 will be triggered as part of the proposed Project. If the activity is required, amend the draft EIS to provide the information required under Section 125 of the Environmental Protection Act 1994 to support the Projects application for ERAs in accordance with Section 9.10 of the ToR. The following resources have also been identified as relevant: - Emission estimation technique manual for Cement manufacturing npl.gov.au/system/files/resources/6c9f88a4-55a7-4714-7528-44621b78f612/files/cement.pdf - Stormwater Guideline-"environmentally relevant activities" environment.des.qld.gov.au/data/assets/pdf_file/0028/89119/pr-gl-stormwaterguideline-era.pdf - Code of Practice for the Concrete Batching Industry Code of practice for the concrete batching industry EM1305 (des.qld.gov.au)	Table 3-2 of Chapter 3: Legislation and Project Approvals Process has been amended by removing the reference to ERA 41 Cement manufacturing from the list of ERAs that may be required for the Project. The environmental code of practice for concrete batching operations (since updated to 2023) is noted.	Chapter 3: Legislation and Project Approvals Process Table 3-2
238	238.0009	State Agency	Approvals/ conditions/ recommendations		Section 5.4.7, 5.4.9 and 5.4.10 of the draft EIS indicates that ERA 08 Chemical storage will be carried out as part of the construction phase of the proposed Project. The draft EIS indicates fuel (diesel) is to be stored at laydown areas along the proposed Project alignment as well as construction chemicals. Table 5.30 simply provides an indicative list of dangerous goods and hazardous substances and some quantities to be used. There is no information on the total quantities of each type of chemical to be used. Therefore, it is not certain if ERA 08 will be triggered. The necessary detailed assessment information should be provided the in the draft EIS.	Review the description of ERA 08 chemical storage prescribed in Schedule 2 of the EP Regulation and confirm whether ERA 08 will be triggered as part of the construction phase of the proposed Project. Should the ERA be triggered, specify the relevant ERA threshold(s) required for the Project and provide detailed information on the impacts to environmental values resulting from the proposed activity and describe relevant mitigation measures to be implemented to address these risks. Chapter 3 and 5 (and other relevant chapters) will need to be amended accordingly regarding ERA 08. The following guidelines may assist in undertaking the necessary assesment: - Stormwater Guideline- environmentally relevant activities environment.des.qld.gov.au/_data/assets/pdf_file/0028/89119/pr-gl-stormwaterguideline-era.pdf	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the detailed design and construction works stages (see Chapter 3: Legislation and Project Approvals Process, Table 3-2 and Section 3.2.1).	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Table 3-2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0010	State Agency	Surface Water		The draft EIS discusses the location of bridge structures on waterway crossings. However, the draft EIS does not provide an adequate water quality risk assessment of waterway crossings. The draft EIS should identify site-specific information on local aquatic ecosystems features (e.g. pools, riffles, channel form, bank stability, instream flora and habitat features) and environmental values that should be protected and enhanced. The draft EIS states proposed Project activities may concentrate water flows, redirect water flows, increased water velocities, change the duration and frequency of inundation of some Project areas and increase water depth. The draft EIS states that modification to riparian zone and works within waterways and wetland during construction phase of the Project will occur. However, the draft EIS does not identify the location of where temporary and permanent diversion and impoundment of drainage line and waterways would directly impact the ecological integrity, ecological health, including water quality of the of aquatic and associated riparian habitats. The potential impacts of construction activities at various waterway crossings, including effective mitigation measures and water quality monitoring strategy for these locations is not adequately discussed in the draft EIS.	The draft EIS should provide sufficient site-specific information to assess the potential risk of construction on environmental values, including stream water quality, ecological habitats, and aquatic ecosystem values, particularly at environmentally sensitive locations like waterway crossings. Assesses background/ ambient water quality at stream crossing locations and describe how water quality will continue to be protected. For example, if waterways are perennial or have water flowing during the time of construction, risks are likely to be higher, as compared to construction during periods with dry bed and banks. Stormwater sediment runoff and erosion, as well as contamination during construction and operations, is likely to be a potential risk at all waterway crossing locations. Each waterway crossing should be identified and assessed based on the local physical attributes and the type of disturbance likely to occur. Location specific risks should be identified and measures/ controls that will be taken to minimise and manage risks should be clearly described. This information should be included in the draft EIS, and well before any specifications and contracts are sought for detailed design and construction. The draft EIS should provide a detailed assessment of erosive velocities for existing waterways. If there are signs of current erosion in areas identified as exceeding an accepted threshold then accepting no increase in existing velocities may not be acceptable and an alternative approach may be required. Detail the approach to mitigation measures for high velocities, particularly if proposed engineering solutions are not feasible. The draft EIS should detail and assess the propensity for scour, erosion, and geomorphological changes to occur within any watercourses or overland flow paths affected by proposed Project. The draft EIS should describe the location temporary and permanent diversion and impoundment of drainage line and waterways, specific erosion and sediment controls. It should have due consideration of, but not be limited to: local site conditions, the ecological function and integrity of the site (e.g. in-stream flora and fauna habitats) riparian habitats and the season. Effective site-specific mitigation measures, particularly regarding the stability of watercourses should be developed to reduce the potential environmental risks at identified locations. These measures should be adequately described and assessed in the draft EIS. Update Appendix P, Section 7.2 Proposed mitigation measures, and Chapter 10 and 12 to reflect the site-specific assessments.	The revised draft EIS Chapter 13: Surface Water, Section 13.5 provides a description of the surface water quality impact assessment for the Project, including an assessment of the quality of water and the existing uses of surface waters (environmental values), as well as the water quality objectives that have been established to protect these values. The existing environment is described, and an assessment is made of the potential impacts of the Project. Potential short and long-term impacts on local and regional surface waterways have been assessed based on a review of the Project's construction works and operations stages. The results of the impact assessment and recommended mitigation measures have been outlined in Section 13.6 of Chapter 13: Surface Water. There is potential for contaminants and pollutants associated with the construction and operation of the Project to enter aquatic environments, resulting in the alteration or loss of potential habitat for terrestrial and aquatic species (Chapter 11: Flora and Fauna). The disturbance and modification of some riparian zones and works within watercourses/ wetlands during the construction works stage of the Project, as well as during temporary and permanent diversions of drainage lines/ watercourses, has the potential to reduce the ecological integrity of the watercourse, thereby impacting on structural aspects that support breeding and foraging requirements of aquatic species. The detailed design will be developed to ensure that the potential for diversion of watercourses, (as defined under the Water Act 2000), and waterways (as defined under the Fisheries Act 1994) are minimised Chapter 11: Flora and Fauna. As outlined in Chapter 11: Flora and Fauna, a Surface Water Management Plan will be developed as a component of the CEMP in consultation with the Department of Regional Development, Manufacturing and Water and DES (Chapter 13: Surface Water). The Plan will provide a surface water monitoring framework for the Project that establishes: <ul style="list-style-type: none">Additional monitoring and sampling required to establish baseline water quality conditions, as a continuation of data collected during development of the revised draft EISWatercourse-specific water quality values, based on baseline data, Australian and New Zealand Guidelines for Fresh and Marine Water Quality (Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand (ANZECC & ARMCANZ), 2018), QWQG and relevant Water Quality Objectives (WQO) under the Environmental Protection (Water and Wetland Biodiversity) Policy 2019.In situ water quality parameters (pH, electrical conductivity, dissolved oxygen, temperature, oxidation-reduction potential and total dissolved solids) and laboratory analysis required for samples collected at each sampling locationQuality assurance and quality control requirements for surface water sampling and analysisA risk management framework for evaluation of the risks to surface water quality and ecosystems in the receiving environment.	Chapter 13: Surface Water Section 13.5 Section 13.6 Chapter 11: Flora and Fauna
238	238.0011	State Agency	Surface Water	Baseline/ background sampling	The draft EIS does not adequately address the criteria outlined in Sections 11.37, 11.38 and 11.39 of the ToR. Baseline monitoring strategy - Insufficient background water quality sampling is provided in the draft EIS. Baseline in-situ water quality sampling outcomes presented in this Section have some limitations. The draft EIS discussion of surface water impact assessment methodology is inadequate. The department notes the proposed rail alignment crosses many waterways in the Condamine and Borders River Basins. More specifically, water quality samples were collected from 43 sites from various watercourses, waterways and other drainage features over the period of one year from June 2018 to May 2019. Approximately five samples per location were collected to establish the background water quality along, with some limited effort to capture the seasonal variability. Although the results based on 5 sampling rounds provide a valuable initial understanding of the local water quality at various locations, this data have limitations. At least 12-24 samples over the period of 1 to 2 years are typically required to capture the local background or reference levels of these indicators as per the Queensland Water Quality Guidelines (2009).	The department recommends the water quality sampling program continue in accordance with the Queensland Water Quality Guidelines (2009) requirements. The department notes that rainfall events in Q1 2021 would typically provide flow events in watercourse at the Project's monitoring locations. The results of the ongoing sampling should be included in the draft EIS and presented in the WQMP as committed to in the Section 7.3 of the Appendix P, Surface Water Technical Report Part 1 of 2. Useful recommended references include: - QWQG (2009), Department of Environment and Heritage Protection (2009) Queensland Water Quality Guidelines, Version 3, ISBN 978-0-9806986-0-2 hor360.com.au/wordpress/uploads/Irrigation/Irrigation%20Sustainability/QLd%20Water%20Quality%20Guidelines%202009.pdf - Water Quality Australia (2018) - The National Water Quality Management Strategy, Department of the Environment, Australian Government - Website: agriculture.gov.au/water/quality/hwqms	Additional baseline water quality monitoring commenced in late 2020 and obtained data over a 12-month period to late 2021. Section 7.3.1 of Appendix S: Surface Water Quality Technical Report has been updated to reflect this. These additional data were sufficient to develop interim site-specific WQOs. The updated construction timing is reflected in Section 5.3.6 of Chapter 5: Project Description of the revised draft EIS and in Appendix S: Surface Water Quality Technical Report to remove any ambiguity about the inclusion of the baseline monitoring program to construction impact assessment. Baseline water quality monitoring data applicable for inclusion within the revised draft EIS has been incorporated to further establish existing environment conditions and water quality objectives for identifying any instance of impact from construction. The results of the 12-month sampling program, carried out in accordance with the Queensland Water Quality Guidelines (2009) requirements, have been included in the revised draft EIS and presented in the WQMP as committed to in the Section 7.3 of the Appendix S: Surface Water Quality Technical Report.	Chapter 5: Project Description Section 5.3.6 Appendix S: Surface Water Quality Technical Report Section 7.3 Section 7.3.1
238	238.0012	State Agency	Surface Water	Baseline/ background sampling	The draft EIS does not adequately address the criteria outlined in Section 11.47 of the ToR. Baseline water quality outcomes - The draft EIS summarises the water quality results of baseline monitoring in the Table 12.6 and illustrated in Figure 12.1. The department notes several exceedances to pH, turbidity, electrical conductivity, dissolved oxygen and chlorophyll-a have occurred for each indicator when compared to the respective water quality objectives for the Condamine and Borders River Basins. The draft EIS indicates patterns of water quality degradation in the observed waterbodies based on 5 sampling occasions. These samples were collected during low flow conditions, or whenever water was available at the watercourses, as per the discussions in Appendix P. As mentioned above, due to the limited number of samples collected for each water quality indicator, any conclusion about stream condition should be made cautiously. Note: Samples should not be taken if a stream is not flowing. Furthermore, the department notes widespread rainfall events in the Project area during Q1 2021. The department expects the baseline sampling program to have continued to capture local background or reference levels in accordance with the Queensland Water Quality Guidelines.	As discussed above, site-specific water quality objectives should be derived in accordance with the Queensland Water Quality Guidelines, once enough samples over a period of 1-2 year is collected. The finding, patterns of water quality degradation at majority of water bodies as compared to the respective regional water quality objectives in the current version of the draft EIS should be re-evaluated once sufficient baseline data is collected and should be presented in the amended draft EIS.	Additional baseline water quality monitoring commenced in late 2020 and obtained data over a 12-month period to late 2021. Section 7.3.1 of Appendix S: Surface Water Quality Technical Report has been updated to reflect this. These additional data were sufficient to develop interim site-specific WQOs. The updated construction timing is reflected in Section 5.3.6 of Chapter 5: Project Description of the revised draft EIS and in Appendix S: Surface Water Quality Technical Report to remove any ambiguity about the inclusion of the baseline monitoring program to construction impact assessment. Baseline water quality monitoring data applicable for inclusion within the revised draft EIS has been incorporated to further establish existing environment conditions and water quality objectives for identifying any instance of impact from construction. The results of the 12-month sampling program, carried out in accordance with the Queensland Water Quality Guidelines (2009) requirements, have been included in the revised draft EIS and presented in the WQMP as committed to in the Section 7.3 of the Appendix S: Surface Water Quality Technical Report.	Chapter 5: Project Description Section 5.3.6 Appendix S: Surface Water Quality Technical Report Section 7.3 Section 7.3.1
238	238.0013	State Agency	Surface Water	Water quality	The draft EIS does not adequately address the criteria outlined in Section 11.45 of the ToR. Potential impact monitoring strategy - The draft EIS does not include sufficient detail on the water quality monitoring strategy at various stream crossings during construction. Potential direct and indirect impacts to the surface water quality during construction activities are presented in the Appendix P, Section 6.4.1.1, Table 6.25. Sediment loading, increased salinity from disturbance of saline soils, nutrient loading and elevated levels of contaminants (including toxicants) to waterways at multiple locations, are the main risks identified during the Project construction stage. These risks may vary from site- to-site depending upon the scope and scale of construction activities. However, in-stream monitoring strategies, and potential impact monitoring at various waterway crossings, are not adequately described in the draft EIS.	The draft EIS should provide site-specific information to assess the potential risks of construction on stream water quality. For example, if waterways are perennial or have water flowing during the time of construction, risks are likely to be higher, as compared to construction during periods with dry bed and banks. Each waterway crossing should be assessed based on the local attributes of the creek or river and the type of disturbance likely to occur, to develop a risk rating for each location. This information should be adequately described in the draft EIS. In accordance with the requirements of the Section 11.45 of the ToR, Table 7.1 - Surface Water Quality Mitigation Measures and Monitoring and Section 7.3.2 should be updated with site- specific mitigation measures proportional to the risks presented by the proposed construction activities.	The revised draft EIS has been updated to include an additional 12 months of surface water data collected from December 2020 to November 2021, in addition to the data collected from June 2018 to May 2019. These additional data were sufficient to develop interim site-specific WQOs. The data has been re-evaluated and presented in the revised draft EIS in Appendix S: Surface Water Quality Technical Report, Sections 3.1.2 and 5.5, and Chapter 13: Surface Water, Section 13.3.3 and 13.4.5. In addition to extra water quality data, a geomorphological assessment of all water features intersected by the Project has been conducted (Appendix H: Geomorphology Report) and site-specific erosion threshold velocities have been derived (Appendix T2: Hydrology and Flooding Technical Report - Volume 2) to better inform the design of infrastructure at watercourse crossing locations. A summary of the aquatic ecosystem values at each monitoring site is provided in the Chapter 11: Flora and fauna and EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report, including a description of the physical environment, aquatic habitat, flora and fauna at the site and existing local impacts. The additional data and assessments conducted since release of the draft EIS have resulted in a more robust assessment of potential impacts to water features, including water quality, throughout the revised draft EIS.	Chapter 13: Surface Water Section 13.3.3 Section 13.4.5 Appendix H: Geomorphology Assessment Appendix S: Surface Water Quality Technical Report Section 3.1.2 Section 5.5 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
238	238.0014	State Agency	Surface Water	Water quality	The draft EIS does not adequately address the criteria outlined in Section 11.43 of the ToR. Mitigation measures during construction phase - The draft EIS simply states that a Surface Water Management Plan will be developed in future. It does not elaborate on the receiving environment water quality monitoring program (REMP) required to assess the effectiveness of the mitigation measures in place to protect the surface water quality prior to the commencement of construction activities. Furthermore, the draft EIS states that various upstream and downstream locations were included during the baseline sampling. However, it does not detail how these upstream and downstream monitoring points would be utilised to monitor the potential Project construction impacts. In contrast, the construction monitoring in the Section 7.3.2 of the draft EIS focuses on the baseline monitoring, data quality control, data management and reporting. Similarly, no in-stream water quality monitoring measures are proposed when discussing the impacts to the water morphology (see Section 6.4.2).	The draft EIS should detail a suitable receiving environment monitoring program (at all major creek/ waterway system locations) to effectively manage identified impacts from proposed construction activities at waterway crossings. This is particularly important at those locations where baseline data has been collected, provided these locations are suitable and downstream of the activities potentially affecting water quality. The draft EIS should identify proposed monitoring locations, monitoring frequency and indicators of surface and groundwater quality. The water quality indicators and relevant sampling timing for the monitoring should be detailed in the draft EIS as per the requirements of the Section 11.43 of the ToR. The department would expect localised stresses on the creek systems along the rail construction corridor. The department recommends including at least one downstream receiving environment monitoring point at these creeks to ensure minimum potential impacts on the waterways, and protection of water quality and environmental values.	ARTC has commenced a surface water monitoring program (equivalent to a REMF) for the Project (Section 13.6.3 of Chapter 13: Surface water). This Program consists of baseline surface water monitoring (commenced to inform the EIS) and construction surface water monitoring. The locations, frequency and parameters of interest for water quality sampling during construction will be subject to confirmation as part of the CEMP, to be reviewed and accepted by the Environmental Monitor. Surface water monitoring locations will be reviewed prior to commencement of construction to ensure that locations of potential impact are appropriately represented in the construction works stage of the surface water monitoring program.	Chapter 13: Surface Water Section 13.6.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0015	State Agency	Surface Water	Water quality	The draft EIS does not adequately address the criteria outlined in sections 11.41, 11.42, 11.43, 11.45, 11.46, 11.47 and 11.48 of the ToR. Selection of water quality indicators for the impact monitoring during construction phase The department notes that that to determine the existing baseline water quality at each location, a range of in-situ physicochemical parameters is being monitored. Furthermore, a range of contaminants of concern are analysed in the laboratory as per sections 4.2.1.3 and 4.1.2.4 of the draft EIS. Salinity hazard is perceived along the rail alignment are outlined in the Section 5.10 of the Appendix P. Even though a range of risks to the water quality during construction has been identified in the draft EIS; appropriate and suitable water quality indicators that would assist in maintaining/ or improving the quality of the water at various stream crossing has not been addressed in the Section 7.2, Proposed Mitigation measures of the draft EIS. The department notes the draft EIS simply commits to monitor a broader suite of water quality indicators before construction. However, it refrains from putting forward a robust water quality monitoring strategy during the relatively high-risk construction phase. Depending on the operations, treatment, and discharge of wastewater to the water bodies, monitoring of hydrocarbons in the discharged waters may also be required. The department also recommends monitoring some basic metals/metalloids in the receiving waters. Total and dissolved concentrations of metals/metalloids may be required to assess the potential Project impacts on environmental values, including aquatic ecosystems, stock watering, drinking water and recreational values.	In accordance with the requirements of Section 11.41, 11.42, 11.43, 11.45, 11.46, 11.47 and 11.8 of the ToR the draft EIS should adequately assess potential Project impacts on environmental values, including but not limited to, aquatic ecosystems, stock watering, drinking water and recreational values, and propose effective mitigation and management measures, as required. The draft EIS should describe a robust water quality monitoring strategy and consider physiochemical water quality indicators including, but not limited to: - electrical conductivity, dissolved oxygen turbidity/ total suspended solids, temperature, and pH - a metal/ metalloid monitoring strategy. Metals/ metalloid monitored during baseline water quality monitoring should be included for potential water quality impacts during construction phase - potentially nutrient fractions such as total nitrogen total phosphorus, ammonia, and NOx- potentially hydrocarbons.	ARTC has commenced a surface water monitoring program (equivalent to a REMP) for the Project (Section 13.6.3 of Chapter 13: Surface water). This Program consists of baseline surface water monitoring (commenced to inform the EIS) and construction surface water monitoring. The locations, frequency and parameters of interest for water quality sampling during construction will be subject to confirmation as part of the CEMP, to be reviewed and accepted by the Environmental Monitor. Surface water monitoring locations will be reviewed prior to commencement of construction to ensure that locations of potential impact are appropriately represented in the construction works stage of the surface water monitoring program.	Chapter 13: Surface Water Section 13.6.3
238	238.0016	State Agency	Surface Water	Water quality	Insufficient information is provided in the draft EIS on the environmental values of the receiving waters potentially impacted by Project construction activities, particularly at waterway crossings. In addition to the general information about the Project area environmental values the following key information should be provided in the draft EIS, including but not limited to: - topographical contours at suitable increments, shown with respect to Australian Height Datum - identify the direction(s) of surface water runoff and drainage lines that pass through, or are near, the site and any surface waters potentially impacted by construction activity (including rivers, creeks, wetland or drainage lines) that are within or adjacent to the disturbance site - any existing or proposed water bores or groundwater monitoring wells within or on land adjacent to the site - the location of waste storage and disposal locations, including details of the relevant storage facilities - a detailed description of hydrogeological features of the site which includes details of soil and rock types (including porosity, permeability) and stratigraphy (including faulting and fracture propensity) - identify the environmental values of surface waters on or adjacent to the site and water quality objectives to protect or enhance these values - derive local water quality objectives using Queensland water quality guidelines procedures for deriving regional or sub-regional guidelines for aquatic ecosystem protection in accordance - see requirements of the EPP (Water) - identify all environmental values of potentially affected surface water and groundwaters - provide details of the background quality of surface water, specifically in relation to contaminants of concern from the proposed construction activities - monitoring and reporting requirements.	Identify the environmental values of surface waters on or adjacent to stream crossing sites, and water quality objectives to protect or enhance these values. The draft EIS should provide following detail information at all stream crossing locations including, but not limited to: - topographical contours at suitable increments, shown with respect to Australian Height Datum (AHD) - identify the direction(s) of surface water runoff and drainage lines that pass through, or are near, the crossing sites and any surface waters potentially impacted by construction activity (including rivers, creeks, wetland or drainage lines) that are within or adjacent to the disturbance footprint - any existing or proposed water bores or groundwater monitoring wells within or on land adjacent to the site - the location of waste storage and disposal locations, including details of the relevant storage facilities - a detailed description of hydrogeological features of the site which includes details of soil and rock types (including porosity, permeability) and stratigraphy (including faulting and fracture propensity) - identify the environmental values of surface waters on or adjacent to the site and water quality objectives to protect or enhance these values - derived local water quality objectives using Queensland water quality guidelines procedures for deriving regional or sub-regional guidelines for aquatic ecosystem protection in accordance - see requirements of the EPP (Water) - identify all environmental values of potentially affected surface water and groundwaters- provide details of the background quality of surface water, specifically in relation to contaminants of concern from the proposed construction activities - monitoring and reporting requirements.	The revised draft EIS has been updated to include an additional 12 months of surface water data collected from December 2020 to November 2021, in addition to the data collected from June 2018 to May 2019. These additional data were sufficient to develop interim site-specific WQOs. The data has been re-evaluated and presented in the revised draft EIS in Appendix S: Surface Water Quality Technical Report, Sections 3.1.2 and 5.5, and Chapter 13: Surface Water, Section 13.3.3 and 13.4.5. In addition to extra water quality data, a geomorphological assessment of all water features intersected by the Project has been conducted (Appendix H: Geomorphology Assessment) and site-specific erosion threshold velocities have been derived (Appendix T2: Hydrology and Flooding Technical Report - Volume 2) to better inform the design of infrastructure at watercourse crossing locations. The additional data and assessments conducted since release of the draft EIS have resulted in a more robust assessment of potential impacts to water features, including water quality, throughout the revised draft EIS. Additional details requested by the submission are located in: <ul style="list-style-type: none"> Appendix B1: Design drawings Appendix U: Groundwater Technical Report Appendix G1: Geotechnical Reports - Investigation Results Appendix G2: Macquarie Geotechnical - Laboratory Results. 	Chapter 13: Surface Water Section 13.3.3 Section 13.4.5 Appendix B1: Design Drawings Appendix G1: Geotechnical Reports - Investigation Results Appendix G2: Macquarie Geotechnical - Laboratory Results Appendix H: Geomorphology Assessment Appendix S: Surface Water Quality Technical Report Section 3.1.2 Section 5.5 Appendix T2: Hydrology and Flooding Technical Report - Volume 2 Appendix U: Groundwater Technical Report
238	238.0017	State Agency	Land Resources		The draft EIS does not adequately address Section 11.150-11.153 of the ToR, particularly regarding the risks associated with the disturbance and excavation of land and disposal of soil, particularly contaminated land and saline soils.	The draft EIS should adequately assess whether land is likely to be contaminated, including risks posed by contamination from past, existing and future land uses. Where assessment determines that some form of site remediation is required, the draft EIS should describe in sufficient detail how the assessment, management and/or remediation would be undertaken in accordance with the contaminated land guidelines. The draft EIS should detail the risks and management of saline soils, particularly in highly salinity/ sodicity areas.	For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9-15 and the full results are presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates. ARTC has updated Chapter 9: Land Resources to assess (as much as practicable) potential sources of contaminated land within the Project footprint, including an assessment of whether land is likely to be contaminated, and risks posed by contamination from past, existing and future land uses. The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM and also included findings from a limited contaminated land investigation completed by Macquarie Geotechnical within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines. Section 2.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides details on disposal and reuse of soil including contaminated material.	Chapter 9: Land Resources Section 9.4.5 Table 9-15 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 2.2 Appendix G2: Macquarie Geotechnical - Laboratory Results Appendix I: EMR Search Certificates and Soil Laboratory Certificates
238	238.0018	State Agency	Land Resources		The draft EIS does not adequately address Section 11.150-11.153 of the ToR, particularly regarding the contaminated land assessment methodology. The draft EIS states that a targeted contaminated land investigation will be undertaken following completion of detailed design, where the Project footprint intersects areas of medium-to-high contamination risk, to determine the occurrence of contaminated soils, the potential for risk to human health and the environment and required management measures. No information is provided in the draft EIS that defines what constitutes a medium or high contamination risk, nor who would be responsible for completing this assessment.	The draft EIS should provide define what constitutes a medium or high contamination risk, and who would be responsible for completing the assessment.	For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9-15 and the full results are presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates. The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM. The investigation included the identification of potential sources of contamination within the impact assessment area through a desktop assessment (Chapter 9: Land Resources, Section 9.4.5) and also included findings from a limited contaminated land investigation completed by Macquarie Geotechnical within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines. Consistent with the requirements of ASC NEPM, the data quality objectives for contaminated land investigations need to be informed by detailed design information (e.g. proposed future re-use of materials). A contaminated land management strategy for any future assessments is provided in Chapter 9: Land Resources, Section 9.6.2 and Figure 9-24.	Chapter 9: Land Resources Section 9.4.5 Section 9.6.2 Figure 9-24 Table 9-15 Appendix G2: Macquarie Geotechnical - Laboratory Results Appendix I: EMR Search Certificates and Soil Laboratory Certificates
238	238.0019	State Agency	Land Resources		The draft EIS does not adequately address Section 11.150 of the ToR, particularly regarding potential sources of contaminated land within or adjacent to the Project area. EMR/ CLR searches appear to have only been completed on allotments that were identified to have an existing ERA or mining lease. This rational is erroneous.	The draft EIS should assess all potential sources of contaminated land. The draft EIS ignores the potential for land to be included on the EMR/ CLR for alternative reasons such as: - land subject of a notifiable activity that does not require an ERA and or a mining lease (e.g. service stations) - land that was historically the subject of an ERA/ notifiable activity, however, no longer holds a licence - land that is included on the EMR due to the presence of a hazardous contaminant. Such occurrences are evidenced by EMR searches, provided by Queensland Rail, that identify land in the railway corridor that is currently listed on the EMR for the presence of a hazardous contaminant. Land that is included on the EMR/ CLR must be managed in accordance with the contaminated land provisions described in the EP Act. These requirements, if not properly managed, can cause Project delays and potentially restrict the reuse and disposal of soil (spoil management) and water.	For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9-15 and the full results will be presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates. ARTC has updated Chapter 9: Land Resources to assess (as much as practicable) potential sources of contaminated land within the Project footprint, including an assessment of whether land is likely to be contaminated, and risks posed by contamination from past, existing and future land uses. The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM and also included findings from a limited contaminated land investigation completed by Macquarie Geotechnical within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines. Section 2.2 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides details on disposal and reuse of soil including contaminated material.	Chapter 9: Land Resources Section 9.4.5 Table 9-15 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 2.2 Appendix G2: Macquarie Geotechnical - Laboratory Results Appendix I: EMR Search Certificates and Soil Laboratory Certificates

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0020	State Agency	Land Resources		<p>The draft EIS does not adequately address Section 11.150 of the ToR, particularly regarding potential sources of contaminated land within or adjacent to the Project area. The draft EIS does not include EMR/ CLR searches of the existing railway corridor, based on the rational that railway lines are not listed as a notifiable activity. Rather the Project proposes to use a precautionary approach, whereby land within the rail corridor will be assumed to be contaminated until proven otherwise. It is recognised in the draft EIS that the existing railway corridor is a potential source of contamination, due to the potential for hazardous contaminants being used during the construction and maintenance of the railway. As outlined above, land that is included on the EMR/CLR will be subject to the contaminated land provisions of the EP Act and will likely require further investigation to inform appropriate management and potential reuse options for both water and soil. These additional requirements could impact on the Project's schedule and the spoil management aspects of the Project. The department notes that railway lines in Queensland have been listed on the EMR. Limited information is provided in the draft EIS that details how the precautionary approach would be implemented such as, but not limited to:</p> <ul style="list-style-type: none"> what investigations would be undertaken to inform the contamination status of the land would an intrusive sampling program be required what standard would these investigations be completed too who would complete the investigations. 	<p>The draft EIS must include EMR/ CLR searches of the existing railway corridor due to the potential for hazardous contaminants to have been used during the construction and maintenance of the railway. Land that is included on the EMR/ CLR will be subject to the contaminated land provisions of the EP Act and will likely require further investigation to inform appropriate management and potential reuse options for both water and soil. These additional requirements could impact on the Project's schedule, the spoil management aspects of the Project and consequently should be adequately assessed in the draft EIS.</p>	<p>For completeness, all lots that interface with the Project footprint are being searched on the EMR and CLR (including existing QR corridor properties). Search results will be included in Chapter 9: Land Resources, Table 9-15 and the full results will be presented in Appendix I: EMR Search Certificates and Soil Laboratory Certificates.</p> <p>ARTC has updated Chapter 9: Land Resources to assess (as much as practicable) potential sources of contaminated land within the Project footprint, including an assessment of whether land is likely to be contaminated, and risks posed by contamination from past, existing and future land uses. The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM. Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines.</p> <p>Section 2.2 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides details on disposal and reuse of soil including contaminated material.</p>	<p>Chapter 9: Land Resources Table 9-15</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 2.2</p> <p>Appendix I: EMR Search Certificates and Soil Laboratory Certificates</p>
238	238.0021	State Agency	Land Resources		<p>The draft EIS does not provide adequate information about the disturbance of existing contaminated land, including historical uses. Limited information has been provided in the draft EIS that outlines what further investigations would be undertaken to identify and manage potential contaminated land, including how these investigations would identify land that may be impacted due to historical use (e.g. historical cattle dip) however may not be listed on the EMR. Note: Contaminated soil that is proposed to be reused or managed on-site (e.g. encapsulation) is likely to require the preparation and submission of a draft Site Management Plan in accordance with the requirements of the EP Act.</p>	<p>The draft EIS should adequately describe what further investigations would be undertaken to identify and manage potential contaminated land, including how these investigations would identify land that may be impacted due to historical use (e.g. historical cattle dip) however may not be listed on the EMR. The draft EIS should describe contaminated soil that is proposed to be reused or managed on site (e.g. encapsulation) and likely require the preparation and submission of a draft Site Management Plan in accordance with the requirements of the EP Act.</p>	<p>ARTC has updated Chapter 9: Land Resources to assess potential sources of contaminated land within the Project footprint, including an assessment of whether land is likely to be contaminated, and risks posed by contamination from past, existing and future land uses.</p> <p>The assessment has included a Preliminary Site Investigation (desktop contaminated land assessment) in accordance with ASC NEPM. The investigation included the identification of potential sources of contamination within the impact assessment area through a desktop assessment (Chapter 9: Land Resources, Section 9.4.5) and also included findings from a preliminary contaminated land investigation completed by Macquarie Geotechnical within the existing Queensland Rail corridor (Chapter 9: Land Resources, Section 9.4.5 and Appendix G2: Macquarie Geotechnical - Laboratory Results). Any future assessment, management and/or remediation would be undertaken in accordance with the contaminated land ASC NEPM guidelines.</p> <p>Consistent with the requirements of ASC NEPM, the data quality objectives for contaminated land investigations need to be informed by detailed design information (e.g. proposed future re-use of materials). A contaminated land management strategy for any future assessments is provided in Chapter 9: Land Resources, Section 9.6.2 and Figure 9-24.</p> <p>Section 2.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides details on disposal and reuse of soil including contaminated material.</p>	<p>Chapter 9: Land Resources Section 9.4.5</p> <p>Section 9.6.2</p> <p>Figure 9-24</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 2.2</p> <p>Appendix G2: Macquarie Geotechnical - Laboratory Results</p>
238	238.0022	State Agency	Land Resources		<p>The draft EIS does not adequately address Section 11.152 of the ToR, particularly regarding management of contaminated land within or adjacent to the Project area. The stockpiling of contaminated material on land that is not contaminated is unlikely to be approved by the department. The movement of contaminated soil (from a site on the EMR) outside of the allotment boundary would require a soil disposal permit. The draft EIS defers the provision of relevant specific information on the construction methodology to the 'detailed design stage'. The draft EIS should include this information to ensure the Project identifies all contaminated land within the Project footprint that will be disturbed by Project activities, including the existing rail corridor. These sites are likely to require specific management actions that are not adequately assessed nor described in the draft EIS. The risks and potential impacts on environmental values should be described. The draft EIS does not adequately address Section 11.150 and 11.153 of the ToR, particularly regarding details and potential impacts, management and decommissioning (if required) of the proposed diesel fuel depots.</p>	<p>The draft EIS should adequately describe the stockpiling of any contaminated material. The draft EIS should describe the movement of contaminated soil (from a site on the EMR) outside of the allotment boundary that would a soil disposal permit. The draft EIS should provide appropriate characterisation of soil across the Project area. It should also provide a suitable contaminated land risk assessment, including an outline of a preliminary contaminated site investigation requirements, including but not limited to, describing suitable management options should contaminated soils be identified or be required for reuse during construction or operations. The draft EIS should provide adequate details on the proposed bulk storage of diesel fuel. The draft EIS states that diesel fuel depots would be located at approximately 20 km intervals along the Project alignment and would provide 40,000L bulk storage of diesel. Fuel storage of this quantity would likely trigger Notifiable Activity 29 (Petroleum product or oil storage) and would require notification (under Section 320 of the EP Act) by the landholder and may result in the land parcel being included on the EMR. The draft EIS should detail what investigations, if any, would be undertaken at the proposed diesel fuel depots following the completion of their use.</p>	<p>Limited contaminated land investigations for the existing QR corridor and soil investigation works for the Border to Gowrie disturbance footprint have been undertaken and incorporated in Chapter 9: Land Resources to inform management of soil. Section 9.6.3 provides mitigation measures around movement of contaminated soil from an EMR listed site and limited investigations have been undertaken within the existing QR corridor (refer Section 9.5 of Chapter 9: Land Resources and Appendix H: Geomorphology Report).</p> <p>Any off-site disposal of contaminated material to a licenced landfill will require a waste classification to be undertaken by a suitable qualified person and a landfill acceptance letter to be obtained prior to disposal. A soil disposal permit from DESI will also be required for the transportation and disposal of contaminated soil from a lot listed on the EMR/ CLR by a licenced service provider to an appropriately licenced facility/ location. Soil located on a lot listed on the EMR/ CLR that is not contaminated, does not require a soil disposal permit to be moved to another lot (refer Section 9.5 of Chapter 9: Land Resources).</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Section 2.2 and 2.3 outlines that the limited contaminated land investigation reported contaminant concentrations below threshold values for the most sensitive (residential) land use setting. The materials tested have been interpreted as nominally "clean" and suitable for re-use within the earthworks depending on its physical characteristics (i.e. Type A to E material). Should contaminated soils be encountered during execution of the works, it has been assumed that the volumes will be small and that they will be managed in accordance with the spoil management hierarchy. Contaminated materials will be separated, stockpiled and banded or contained, in accordance with the Soil Management Plan (see Section 2.2, Appendix AB: Draft Earthworks Strategy and Soil Management Plan).</p> <p>Further investigations to determine the location and extent of contamination is required. Sampling, testing and compliance of materials will be undertaken in accordance with the appropriate contamination methods and criteria, e.g. National Environment Protection (Assessment of Site Contamination) Measure 1999 guidelines. Where appropriate, the feasibility of encapsulating contaminated material within zoned embankments will be investigated (see Section 2.3, Appendix AB: Earthworks Strategy and Draft Soil Management Plan).</p> <p>Waste storage areas will be located and managed to ensure that risks to the environment are avoided or minimised. As required, designated areas will be made available for the storage of general waste and contaminated material (refer Section 22.4 Section 22.6.2 of Chapter 22: Waste and Resource Management).</p> <p>Section 2.2 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan provides details on disposal and reuse of soil including contaminated material.</p>	<p>Chapter 9: Land Resources Section 9.5</p> <p>Section 9.6.3</p> <p>Chapter 22: Waste and Resource Management Section 22.6.2</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 2.2</p> <p>Section 2.3</p> <p>Appendix H: Geomorphology Assessment</p>
238	238.0023	State Agency	Groundwater	Baseline/ background sampling	<p>The draft EIS does not outline the methodology used to collect the initial groundwater samples for analytical testing. Furthermore, the draft EIS should confirm that groundwater sampling was undertaken in accordance with approved departmental and industry best practice guidelines.</p>	<p>The draft EIS should provide sufficient information to confirm that groundwater sampling was undertaken in accordance with department's Monitoring and Sampling Manual - Environmental Protection (Water) Policy 2009 and industry best practice guidelines.</p>	<p>Section 15.7.3 (Chapter 15: Groundwater) does include the guideline and others adopted for monitoring. Site-based groundwater monitoring events are on hold until the detailed design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (Chapter 15: Groundwater, Section 15.4.4). The baseline groundwater monitoring and sampling is being conducted in accordance with the Monitoring and Sampling Manual (Department of Environment & Science, 2018) and Groundwater Sampling and Analysis: A Field Guide (Sundaram et. al., 2009).</p> <p>Section 15.7.3 (Chapter 15: Groundwater) does include the guideline and others adopted for monitoring.</p>	<p>Chapter 15: Groundwater Section 15.4.4</p> <p>Section 15.7.3</p>
238	238.0024	State Agency	Groundwater		<p>The department notes that extraction of groundwater (e.g. dewatering, seepage) may occur during the construction and operational stage of the proposed Project. The draft EIS does not provided a suitable risk assessment of potential groundwater impacts from contaminated soil. The draft EIS did not identify nor assess if groundwater, from land that could be potentially contaminated, would be extracted. If so, what groundwater investigations would be undertaken to confirm the absence/ presence of groundwater contamination at these locations and what management controls would be used to prevent environmental harm.</p>	<p>The extraction of groundwater (e.g. dewatering, seepage) would likely occur during the construction and operational phase of the Project. The draft EIS should detail if groundwater, from land that could be potentially contaminated, would be extracted. If so, what groundwater investigations would be undertaken at these locations and what management controls would be used to prevent environmental harm.</p>	<p>Existing contamination in the form of cattle dips, waste facilities, etc encountered within the rail corridor will be removed and the sites remediated during construction such that these sources of contamination will not be present to contaminate groundwater where groundwater will be extracted.</p> <p>As part of ARTC's construction water planning process, construction water procurement studies are ongoing including options analysis. The extraction of groundwater is not a preferred construction water source for the Project. If groundwater is to be sourced for construction water, trading or purchasing of existing allocated entitlements will be pursued in the first instance. Due diligence will be conducted prior, to ensure suitable quality and prevent use of impacted groundwater. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements Report.</p>	<p>Appendix B5: Construction Water Requirements</p>
238	238.0025	State Agency	Groundwater	Baseline/ background sampling	<p>The draft EIS contaminated land and water quality risk assessment is inadequate. The draft EIS does not provide sufficient detail on baseline groundwater quality.</p>	<p>The draft EIS should assess the potential for existing groundwater contamination to be present in the Project area and the implications for the Project. The draft EIS should provide further information that details how many groundwater sampling events and over what timeframe sampling was undertaken to inform baseline groundwater quality. The draft EIS should confirm that groundwater data has been collected in accordance with approved sampling and analysis methods. Groundwater trigger values should be derived in accordance with the department's Guideline -Using monitoring data to assess groundwater quality and potential environmental impacts (DES 2021).</p>	<p>Potential for groundwater drawdown resulting from seepage and impacts to groundwater quality relating to contamination events are discussed in Section 15.6, Chapter 15: Groundwater of the revised draft EIS. Potential mitigation measures relating to groundwater seepage and groundwater quality are presented in Section 15.7.1 and Table 15-20.</p> <p>Consideration of potential for groundwater contamination has been incorporated in the Tier 1 preliminary contamination assessment in Chapter 9: Land Resources, Section 9.4.1, including a site history study and limited soil and groundwater sampling and analysis. The sites subject to potentially contaminating activities identified as part of the Tier 1 preliminary contamination assessment have been reviewed in the context of potential for groundwater contamination and potential for extraction of groundwater as part of the Project (i.e. groundwater seepage into deep cuts) in that area. Where areas with potential for groundwater contamination have been identified, the location of potential contamination in relation to deep cuts with potential to intercept the groundwater table, was reviewed. The revised draft EIS was updated to reflect the findings of the contamination assessment. See Chapter 15: Groundwater, Section 15.6.3 and Appendix U: Groundwater Technical Report, Section 4.7.3. Further, analysis of a broad suite of contaminants has been included as part of the baseline groundwater monitoring program and the GMMP. Section 15.7.4 and Table 15-20 of the revised draft EIS was updated to detail the revised baseline monitoring program.</p>	<p>Chapter 15: Groundwater Section 15.6.3</p> <p>Section 15.7.1</p> <p>Section 15.7.4</p> <p>Table 15-20</p> <p>Appendix U: Groundwater Technical Report Section 4.7.3</p> <p>Chapter 9: Land Resources Section 9.4.1</p>
238	238.0026	State Agency	Air Quality		<p>The draft EIS does provide sufficient information regarding Project's contribution to Greenhouse Gas (GHG) emissions. The Queensland Government has committed to achieving zero net emissions by 2050 with an interim target of 30% reduction on 2005 levels by 2030.</p>	<p>The draft EIS should provide adequate information to assess the Projects impact on the alignment with the states climate targets. See further specific comments below.</p> <ul style="list-style-type: none"> The Project proponent broadly refers to potential sources of emission, but does not provide specific information on Projected emissions data The draft EIS, as a minimum, should provide an inventory of Projected annual emissions for each relevant greenhouse gas, with total emissions expressed in Carbon Dioxide equivalent terms. 	<p>ARTC will provide a long-haul freight solution that is time and cost competitive when compared to road freight. Consequently, Inland Rail will replace some of the long-haul road freight tasks, resulting in reduced road congestion and fewer vehicular greenhouse gas emissions. Greenhouse gas emissions from the operation of freight rail have not been estimated at this point in time. However, ARTC has estimated that transportation of freight on Inland Rail is expected to use approximately one-third of the fuel when compared to transportation of the same volume of freight via existing road routes. Reduction in fuel consumption, and the resulting reduction in greenhouse gas emissions, will aid the achievement of the State's climate targets.</p> <p>Chapter 7: Sustainability, Section 7.3 reports that Greenhouse gas emissions have been estimated for the construction of the Project and regular maintenance of the Project during operation:</p> <ul style="list-style-type: none"> Greenhouse gas emissions during the construction works stage (in total) are estimated to be in the order of 474,300 tonnes of carbon dioxide equivalent (t CO2-e), including emissions generated by land use change. The largest contributors to greenhouse gas emissions during the construction works stage are earthworks activity (approximately 45%) and land use change (approximately 25 per cent). Emissions resulting from maintenance activities during the operations stage are estimated to be in the order of 20,700 t CO2-e annually. The largest contributors to greenhouse gas emissions for maintenance activities are earthworks activity (approximately 69 per cent) and vehicle inspections (approximately 20 per cent). <p>The Project commitments in respect of greenhouse gas emissions are reported in Chapter 12: Air Quality, Section 12.6.3 (Table 12-36).</p>	<p>Chapter 7: Sustainability Section 7.3</p> <p>Chapter 12: Air Quality Section 12.6.3</p> <p>Table 12-36</p>
238	238.0027	State Agency	Hazard and Risk		<p>The ToR requires the revised draft EIS to assess the potential risks to people and property associated with the Project. The revised draft EIS does not provide information on Climate Change Risk Assessments that have been undertaken, if any. The revised draft EIS does not provide any analysis on climate transition risks (i.e. potential of stranded assets).</p>	<p>The revised draft EIS should include:</p> <ul style="list-style-type: none"> information of any climate risk assessment undertaken, including the use of specific methodologies or risk assessments tools (i.e., the IS rating tool, Infrastructure Australia Guideline or any other available climate risk tools) information on climate risk reduction and management actions included in the Project plan consideration and analysis of assets losing value or becoming stranded due to inability to adapt to global decarbonisation and market demands. <p>The revised draft EIS should also consider the potential implications of the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) (see fsb-tcfd.org/); and advice on climate risk disclosure from the Australian Securities and Investments Commission (see asic.gov.au/regulatory-resources/corporate-governance/corporate-governance-articles/disclosing-climate-risk/).</p>	<p>The Inland Rail Program is being progressed as a registered Project with the Infrastructure Sustainability Council of Australia, with the objective of achieving a delivering performance that is equivalent to the 'Excellent' level as measured by the IS v1.2 rating tool. 'Excellent' rating of performance against Version 1.2 of the Infrastructure Sustainability Rating Scheme The climate adaptation requirements of Version 1.2 of the Infrastructure Sustainability Rating Scheme are as follows:</p> <ul style="list-style-type: none"> ClI-1: Climate Change Risk Assessment which aims to reward the assessment of climate change risks. ClI-2: Adaptation measures which aims to reward the assessment and implementation of climate change adaptation measures. <p>Future climatic scenarios that have been considered in developing the revised draft EIS are discussed in Section 21.6.2 of Chapter 21: Hazard and Risk. Potential impacts to the Project as a consequence of climate change are also discussed in the same section.</p> <p>Details on how the revised reference design has been developed to account for climate change Projections are provided in Section 7.5.2 (Table 7.4) of Chapter 7: Sustainability.</p>	<p>Chapter 7: Sustainability Section 7.5.2</p> <p>Table 7.4</p> <p>Chapter 21: Hazard and Risk Section 21.6.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0028	State Agency	Air Quality		The draft EIS lacks comprehensive information on mitigation measures proponent would use and how these measures would minimise emissions.	<p>The draft EIS should assess the potential impacts of the Project on the state and national greenhouse gas inventories and propose greenhouse gas abatement measures, including:</p> <ul style="list-style-type: none"> a description of the proposed measures (alternatives and preferred) to avoid and/or minimise greenhouse gas emissions directly resulting from activities of the Project, including such activities as transportation of products and consumables, and energy use by the Project an assessment of how the preferred measures minimise emissions and achieve energy efficiency a comparison of the preferred measures for emission controls and energy consumption with best practice environmental management in the relevant sector of industry a description of the proposed plan to abate fugitive emissions, including technologies and methods to be used and amount of emissions expected to be abated - a description of proposed plan to purchase carbon credits to offset yearly emissions including the amount of credits, type of credit (i.e., Australian Carbon Credit Units), planned time frames for purchase of the credits a description of any identified opportunities and proposed plans for further offsetting GHG emissions through indirect means. <p>The draft EIS should include a specific module to address greenhouse abatement in any appropriate management plan. That module should include:</p> <ul style="list-style-type: none"> commitments to the abatement of greenhouse gas emissions from the Project with details of the intended objectives, measures and performance standards to avoid, minimise and control emissions periodic energy audits with a view to progressively improving energy efficiency - a process for regularly reviewing new technologies to identify opportunities to further reduce emissions and energy use, consistent with best practice environmental management any voluntary initiatives or research into reducing the lifecycle and embodied energy the Project's processes or products opportunities to reduce greenhouse emissions through renewable energy use commitments to monitor, audit and report on GHG emissions from all relevant activities and the success of abatement and offsetting measures. 	<p>Mitigation measures for the Project for air quality and greenhouse gas are presented in Chapter 12: Air Quality, Section 12.6. Greenhouse gas mitigation measures included in Section 12.6.3 (Table 12-36) include the following:</p> <ul style="list-style-type: none"> Procure energy efficient construction equipment, when appropriate and subject to availability Minimise waste from construction by procuring pre-fabricated products, where possible Where possible, use low-energy intensity materials instead of high-energy intensity building materials. <p>A number of the mitigation measures recommended for air quality are also applicable for greenhouse gas emissions. For example, the design of the Project has considered the location of construction areas and haul routes to reduce vehicular emissions (reduced diesel consumption), and the design of the rail alignment to avoid steep terrain and reduce locomotive emissions (diesel consumption).</p> <p>Additional mitigation measures and commitments relevant to reducing greenhouse gas emissions have been added to Chapter 12: Air Quality, Section 12.6.</p> <p>The Terms of Reference for the Project does not include reference to greenhouse gas emissions and therefore a greenhouse gas emissions inventory is not included in the EIS. However, additional greenhouse gas abatement measures have been recommended for the Project in Chapter 12: Air Quality Section, 12.6 and Table 12-36 to minimise greenhouse gas emissions. The additional mitigation measures include the following:</p> <p>Construction works stage:</p> <ul style="list-style-type: none"> Maintain construction equipment and vehicles to ensure engine efficiency and minimise fuel use and resulting emissions Procure energy efficient construction equipment, when appropriate and subject to availability Minimise waste from construction by procuring pre-fabricated products, where possible Where possible, will use low energy intensity materials instead of high energy intensity building materials Reduce third party (Scope 3) emissions by sourcing imported materials from local areas, minimising travel distances Reduce travel distances and fuel consumption onsite by planning construction haul roads and staging of related activities efficiently Minimise as much as possible the idling time of plant and equipment, and switch engines off when not in use Minimise the extent of vegetation cleared during construction due to the clearing limits required, and Recycle any waste produced where feasible. <p>Operations stage:</p> <ul style="list-style-type: none"> Investigate opportunities for reducing fuel consumption, e.g. through the use of electric vehicles Maintain support vehicles and equipment to increase engine efficiency and minimise fuel use and resulting emissions Plan and stage maintenance activities considering efficiency and fuel consumption Investigate opportunities to reduce greenhouse emissions through the use of renewable energy Regular auditing of operational performance with a view to progressively improving efficiency and reducing emissions through reduced fuel consumptions (e.g. reduced train idling time at crossing loops) Periodic energy audits with a view to progressively improving energy efficiency Monitor, audit and report on greenhouse gas emissions from relevant significant activities and emission sources, and the success of abatement measures Develop a process for regularly reviewing new technologies to identify opportunities to further reduce emissions and energy use, consistent with best-practice environmental management. <p>Reduction of greenhouse gas emissions is a major benefit of the Project. It is estimated that the transportation of freight via the Inland Rail Program is expected to use approximately one-third of the fuel when compared to transportation of the same volume of freight via existing road routes. Reduction in fuel usage for freight will result in an overall reduction in greenhouse gas emissions.</p>	Chapter 12: Air Quality Section 12.6 Table 12-36
238	238.0029	State Agency	Hazard and Risk		Climate Risk Management of the revised draft EIS does not provide any information on the climate tools used to predict climate hazards.	<p>The revised draft EIS should describe and assess the potential impacts of climate hazards on the Project. The risk assessment process should be consistent with ISO 31000 (risk management). There are tools and resources available that can assist ARTC engaged with stakeholders to conduct an appropriate risk assessment process (e.g. Climate Compass at environment.gov.au/climatechange/adaptation/publications/climate-compass-climate-risk-management-framework)</p> <p>The assessments of future climate risk should employ the most relevant climate Projection datasets. The Queensland Government has developed new dynamically downscaled high resolution climate Projection data for Queensland (~10 km grid). The Queensland Future Climate Dashboard provides a map interface to the Projection data allowing users to explore, visualise and download the new Queensland high-resolution climate Projection data. The data available via the Dashboard covers more than mean climate data, and includes indices for heatwaves, extreme temperatures, extreme precipitation, drought and flood.</p>	<p>Future climatic scenarios that have been considered in developing the revised draft EIS are discussed in Section 21.6.2 of Chapter 21: Hazard and Risk. Potential impacts to the Project as a consequence of climate change are also discussed in the same section.</p> <p>Details on how the revised reference design has been developed to account for climate change Projections are provided in Section 7.5.2 (Table 7.4) of Chapter 7: Sustainability.</p>	Chapter 7: Sustainability Section 7.5.2 Table 7.4 Chapter 21: Hazard and Risk Section 21.6.2
238	238.0031	State Agency	Cultural Heritage	Non-Indigenous cultural heritage	The non-Indigenous cultural heritage assessment is adequate.	<p>The draft EIS non-indigenous heritage assessment recommendations are supported. The establishment of cultural Heritage Sub-plan is supported to manage potentially significant artefact finds pursuant to Section 89 of the Queensland Heritage Act 1992, prior to construction and operational activities commencing.</p>	ARTC acknowledges the adequacy of the non-indigenous cultural heritage assessment, as stated by DES in the submission dated 4 May 2021.	N/A
238	238.0032	State Agency	Air Quality		The air quality assessment is adequate.	<p>The draft has been prepared in accordance with the requirements of the ToR and provides sufficient information to satisfy the departments interests (other than for the required prescribed ERA components). The cumulative air quality assessment predicted a singular exceedance for 24-hour average PM10 (50.1 micrograms per cubic metre compared to the EPP (Air) objective of 50), at Receptor R186 when assessed on a cumulative impact basis (see Chapter 12, page 11-76, Table 11.33). R186 is between the proposed rail corridor and the existing Commodore coal mine. ARTC has stated that ambient air quality monitoring would be undertaken close to the location. Information from the further monitoring would be used to refine ground-level impact assessment. The draft EIS states that this information would provide during the detailed design stage. All other Project-related air contaminants were predicted to comply with relevant assessment criteria. Risk to water tank drinking water was also assessed, with predicted levels of contaminants shown to comply with relevant drinking water criteria. Mitigation measures to ensure air quality values were provided in the draft EIS. These are considered to represent industry standard measures. Should the proposed Project be approved, EA conditions for Air could be drawn from the departments Model/ Common Conditions. Notwithstanding the above air quality assessment comments, if triggered, an air quality assessment would be required for the assessment of ERA 15 Fuel burning.</p>	<p>It is noted that Queensland Government's Department of Environment and Science advises the air quality assessment within the draft EIS is adequate.</p> <p>Ambient air quality monitoring has been undertaken at 524 Millmerran Inglewood Road, Millmerran, referred to in the revised air quality assessment as the Millmerran Air Quality Monitoring Station (Millmerran AQMS) (Chapter 12: Air Quality, Section 12.4.2). Air quality monitoring data obtained has been used in the revised air quality assessment for the Project to refine the ground-level impact assessment. Monitoring data is presented in Chapter 12: Air Quality and Appendix R: Air Quality Technical Report. Section 4.2 of Appendix R: Air Quality Technical Report presents the monitoring data in detail. As discussed in Section 4.2 of Appendix R: Air Quality Technical Report, measured concentrations of particulate matter less than 10 micrometres (PM10) and particulate matter less than 2.5 micrometres (PM2.5) were typically well below air quality goals for these species, with the exception of during exceptional regional air quality events.</p> <p>Detailed discussion of the approach used to consider the Millmerran AQMS data and the refinements to the assessment of Commodore Mine is provided in Section 12.4.2 of Chapter 12: Air Quality.</p> <p>Modelling results for receptor R435 (previously R186) from the revised assessment have been provided in Appendix F of Appendix R: Air Quality Technical Report.</p> <p>Using the monitoring data obtained from the Millmerran AQMS, the revised air quality assessment did not predict exceedances of air quality goals at any sensitive receptors, including receptor R435 (previously R186). Based on the results of the revised air quality assessment, significant impacts to air quality are not expected as a result of the Project.</p>	Chapter 12: Air Quality Section 12.4.2 Appendix R: Air Quality Technical Report Section 4.2 Appendix F
238	238.0033	State Agency	Flora and Fauna		The draft EIS does not adequately address the requirements of Section 7.2 and 9.5 of the ToR. The draft EIS identifies several permits and management plans that may be required by the proposed Project under the NC Act. The draft EIS does not provide sufficient information to enable the department to decide if an approval should be granted. The draft EIS does not provide sufficient site-specific Project information, including permission locations, for which species or actual extent of disturbance/ clearing required. Detailed site-specific flora and fauna surveys, ecological investigations and assessments have not been provided in the draft EIS. Adequate supporting information and assessment information is required on environmental values, avoidance measures, potential impacts, the effectiveness of proposed mitigation and management measures to enable the department to make any suitable recommendation to the Coordinator-General on the acceptability of Project impacts.	<p>Provide information to demonstrate that all reasonable measures have been taken to avoid all known and predicted impacts to flora and fauna values. If Project impacts cannot be avoided, provide sufficient detailed information and assessment in accordance with the ToR requirements. This information needs to be sufficient to allow the assessment of all relevant potential impacts and the effectiveness of proposed mitigation measures for all NC Act permissions and management plans required by the proposed Project. While it may be appropriate to provide the detail in Chapter 11, an overview/ summary of site-specific impacts and the effectiveness of proposed mitigation and management measures should be provided in Chapter 3 for clarity and further site-specific information in the flora and fauna chapter, and in the offsets chapter, if required.</p>	<p>A detailed assessment of Potential Impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Some examples of identified impacts include Habitat loss and degradation, Displacement of threatened species, Barrier/Edge effects, Lighting, Dust, Erosion, Contamination and more.</p> <p>Additional ecology surveys were also undertaken by Cardno (2021) and AusEcology (2022), which ground-truthed the Project footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction works stage of the Project. Results of these surveys including locations and quantification of ecological values, including threatened species, is provided in the revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Mitigation measures have been considered to reduce the potential impacts on flora and fauna within the Project alignment. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction activities and early works stage, construction works and operations stages.</p> <p>Chapter 24: Draft Outline Environmental Management Plan provides further context and the framework for implementation of these proposed mitigation and management measures.</p>	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Chapter 24: Draft Outline Environmental Management Plan Appendix L: Terrestrial and Aquatic Ecology Technical Report

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0034	State Agency	Flora and Fauna		<p>The draft EIS does not adequately address the requirements of Section 7.2 and 9.5 of the ToR. The draft EIS should consider the following general regulatory, protected plant and animal authority requirements under the NC Act. Relevant matters and assessment information should be included in the draft EIS. Much of Queensland's native wildlife is protected by legislation to ensure its survival and to protect biodiversity. All native birds, reptiles, mammals and amphibians are protected in Queensland, along with a limited range of invertebrates and fish. The breeding places of some animal species are also protected from being tampered with or destroyed. All plants that are indigenous to Australia are protected. The type of approvals required depends upon several things, including:</p> <ul style="list-style-type: none">▶ The nature and purpose of your proposed activity▶ The location and tenure of the area in which you intend to undertake your activity▶ The species of wildlife concerned. <p>The department is afforded a statutory 40 business day (bd) timeframe to decide on an application for a permit or licence associated with protected plants and animals. Should an application contain insufficient information, the department may request further information from the proponent within 20 bd of receiving the application. When the department requests further information the proponent is afforded 20 bd to respond to the request. If a response is not received within 20 bd, the application is deemed withdrawn. If a response is received within 20 bd the department is afforded an additional 40 bd to decide the application. ARTC is encouraged to factor these timeframes in when undertaking Project planning.</p>	<p>Unless a person is otherwise exempt, an approval would be required from the department to conduct an activity involving the take, keep and use of a protected plant or animal. Clearing of Protected Plants All plants indigenous to Australia are considered protected plants in Queensland. When protected plants are in the wild, the departments protected plant framework captures clearing and harvesting and growing activities that pose a significant risk to plant biodiversity. For clearing protected plants, a flora survey trigger map will identify if an area to be cleared is within a 'high risk area' (where threatened plants or near threatened plants are known or likely to be present). When a non-exempt clearing activity is proposed within a high-risk area, the proponent is required to complete a flora survey of the 'clearing impact area' (the area to be cleared plus a buffer 100 m in width), prior to commencement of clearing. A flora survey is also required if the area to be cleared is outside of a high risk area and the proponent has knowledge of the presence of threatened plants or near threatened plants. If the flora survey identifies that threatened plants or near threatened plants do not exist within the clearing impact area, the proponent can submit a copy of the flora survey report to the department to be eligible for an exemption from the requirement for a clearing permit. Where threatened plants or near threatened plants are present in the clearing impact area and cannot be avoided, a clearing permit will be required. The application will need to include specific information including impact management strategies that will be assessed against the departments Protected Plants Assessment Guideline. Useful references and information for clearing of protected plants can be found at: qld.gov.au/environment/plants-animals/plants/protected-plants/clearingFlying-foxes Queensland's flying-fox management framework seeks to strike a balance between the need to respond to the impacts flying-foxes have on residents and business and the need to conserve flying-fox species in part due to the role they play as essential pollinators. Flying-fox roosts are protected from being destroyed and flying-foxes occupying a roost are protected from being disturbed or dispersed. Management activities including roost destruction and disturbance or dispersal of flying-foxes while occupying a roost will usually require a Flying-fox Roost Management Permit (FFRMP) from the department. Local Governments have a right to manage flying-foxes and their roosts within designated urban areas in a non-lethal code compliant way without a FFRMP. Local Government will require a FFRMP when roost management is to be undertaken at a non-urban roost or the management actions at an urban roost are not code compliant. All persons undertaking low impact activities such as weeding, mulching, mowing or minor tree trimming in or adjacent to roosts are exempt from requiring a FFRMP when the activity is undertaken in a code compliant way. Useful references and information for flying-fox management can be found at: environment.des.qld.gov.au/wildlife/animals/living-with/bats/flying-foxes/roost-management Animal Breeding Places The breeding places of protected animals are protected from being tampered with or destroyed. Animal breeding places include obvious structures such as bird nests and tree hollows, as well as more cryptic places such as amphibian or reptile habitat where breeding takes place. An approved Species Management Program (SMP) is required to tamper or destroy an animal breeding place. One of two SMPs are available, depending on the identified protected animals. The SMP low risk of impacts relates to protected animals classed as least concern and where the impacts are unlikely to affect the broader population. The SMP high risk of impacts relates to protected animals where the broader population is at a greater risk from impacts and includes least concern wildlife that are colonial breeders and wildlife prescribed as extinct in the wild, critically endangered, endangered, vulnerable, near threatened, or a special least concern animal. An application for an SMP would typically:</p> <ul style="list-style-type: none">▶ assess the threats to native animal breeding places resulting from a planned activity▶ incorporate management actions that will avoid or minimise both the immediate and the long-term impact of removing or altering an animal breeding place▶ set monitoring and reporting requirements that demonstrate the management actions in the SMP are effectively implemented and produce the intended results. Useful references and information regarding SMPs can be found at: environment.des.qld.gov.au/licences-permits/plants-animals/species-managementprogram Relocation of Protected Animals All animals indigenous to Australia are protected in Queensland. An unauthorised person must not take (e.g. kill, wound, injure, trap) or keep (e.g. have in one's possession) a protected animal. The department licences wildlife spotter catchers under a Rehabilitation Permit and their role it is to catch and then relocate animals to suitable habitat, prior to the animals existing habitat being destroyed. While engaging a licenced wildlife spotter catcher is not a mandatory requirement for construction and development activities, it has become an industry standard and is one way that those undertaking development activities can demonstrate they have made a reasonable attempt to avoid taking wildlife in the event injuries or mortalities occur. Further information about Rehabilitation Permits can be found here: environment.des.qld.gov.au/licences-permits/plants-animals/rehabilitation/rescue-and-rehabilitationWildlife Research Often construction and development activities require ecological surveys to support approval processes and present an opportunity to undertake scientific research involving wildlife populations or management techniques. Ecological surveys or research activities involving invasive techniques such as animal trapping, spotlighting, handling, luring, fitting of tracking devices and tagging or banding can be accommodated under a Research Permit. Research Permit proponents need to be associated with a scientific research institution or have appropriate qualifications in the area of study. Further information about wildlife research can be found here: qld.gov.au/environment/plants-animals/wildlife-permits/science-education	<p>The revised draft EIS does address Section 7.2 and 9.5 of the ToR (Appendix A2: Terms of Reference Compliance Table) by assessing the requirements of the NC Act and the approvals required. Chapter 11: Flora and Fauna and Appendix N: Draft Fauna Management Plan outline the applicability of the NC Act and the permits and management plans that may be required for the Project including: Wildlife Movement Permits, Clearing Permits, Rehabilitation Permits, Damage Mitigation Permits and Species management plan.</p>	<p>Chapter 11: Flora and Fauna Section 11.2</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Section 3</p> <p>Appendix A2: Terms of Reference Cross Reference Table</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0035	State Agency	Flora and Fauna		The draft EIS does not adequately address the requirements of Section 10.10 and 11.48 and 11.101 of the ToR. The draft EIS states that borrow pits are not included in the Project footprint as approval to establish and use borrow pits would be sought separately to the EIS approvals process. The draft EIS should identify borrow pit locations and quantity of material to be used in construction. The department notes that borrow pits are typically located close or adjacent to construction sites and would likely provide the Project with building materials such as gravel and soil. New borrow pits may vary in size depending on the quantity of material taken. Borrow pits disturbed land (including any new access tracks), typically impact vegetation communities, wildlife habitats, surface water and groundwater and require site clearing and rehabilitation to a safe, stable and non-polluting condition. The draft EIS should detail all potential impacts, rehabilitation methodologies and techniques, including monitoring to ensure rehabilitation milestones and management are being achieved. Site rehabilitation should ensure that all disturbed areas caused by construction and maintenance activities are restored, leaving a stable environment that is conducive to the establishment of landscapes characteristic to the local area.	The draft EIS should identify all borrow pit locations, including access tracks and the quantity and characterisation of the material to be used in construction. Update cut/ fill mass balance calculations accordingly. The draft EIS should identify site-specific environmental values, potential Project impacts, proposed mitigation and management measures, including site rehabilitation, monitoring and offsets (if required) associated with borrow pit excavations activities. In accordance with the ToR requirements, update the relevant draft EIS chapters accordingly.	Chapter 5: Project Description, Table 5-29 has been updated to identify borrow pit locations and include access track information. Details regarding cut and fill masses are outlined in Table 5-30. Proposed mitigation and management measures associated with borrow pit activities are outlined in Appendix AD: Borrow Pits Preliminary Environmental Assessment, Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report.	Chapter 5: Project Description Table 5-29 Table 5-30 Chapter 11: Flora and Fauna Appendix AD: Borrow Pits Preliminary Environmental Assessment Appendix L: Terrestrial and Aquatic Ecology Technical Report
238	238.0036	State Agency	Flora and Fauna		The draft EIS uses ambiguous phrases such as: 'as appropriate', 'as far as practicable', 'may occur', 'where possible', 'as soon as possible', 'where practically possible', 'where practical', 'when finalised' and 'when known' and 'maybe'. The draft EIS should specify when, where and why the actions associated with these statements will occur. The draft EIS should discuss the consequence or potential environmental risk if the action does not occur. The draft EIS should clearly describe the proposed activity and assess the potential impacts, environmental risks and propose effective mitigation and management measures of the consequential action.	The draft EIS should specify when, where and why the actions associated with these statements will occur (e.g. as appropriate, as far as practicable, may occur, where possible, as soon as possible, where practically possible, where practical, when finalised and when known and maybe). The draft EIS should describe the consequence or potential environmental risk if the action does not occur, and the consequential action that would be required.	The revised draft EIS included updating the Potential Impacts and Mitigation Measures for the Project in Chapter 11: Flora and Fauna to describe the consequence or potential environmental risks related to Project activities. A detailed assessment on Potential Impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project alignment. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction and construction, and operations stages outlined in Chapter 11: Flora and Fauna. The Chapter also provides a summary of the auditing, monitoring and reporting requirements for the Project. The Construction Environmental Management Plan (CEMP) will establish the procedures, timeframes, measurable performance objectives, responsibilities for monitoring the success of rehabilitation and/or reinstatement/ stabilisation areas and proposed corrective actions if the outcomes of rehabilitation and/or reinstatement/ stabilisation are not achieved. These are further detailed in Chapter 24: Draft Outline Environmental Management Plan.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Chapter 24: Draft Outline Environmental Management Plan
238	238.0037	State Agency	Flora and Fauna		The draft EIS should accurately describe the actual extent of TECs potentially impacted by Project by undertaking the required field investigations in accordance with the requirements of Section 11.2, 11.25-11.32, 11.95 of the ToR. Update the RE mapping, as required. Revised the impact assessment based on the extent of verified investigation and mapping within the Project area. The draft EIS should provide the required comprehensive and targeted ecological field surveys along the Project footprint in accordance with the ToR requirements to determine the actual occurrence and extent of, for example, TECs (and any associated fauna). The draft EIS should provide an adequate assessment of the actual extent and quality of habitat and identify any new populations within the Project area.	The draft EIS primarily relies on desktop vegetation (RE) mapping. The draft EIS does note the limitations in the mapping. Consequently, the draft EIS does not provide that verified extent of TECs (and any impacted fauna) nor provide the required impact assessment based on site-specific surveys and investigations. Consistent with the Project's EIS methodology, a comprehensive and targeted field surveys are required to identify the actual occurrence and extent of, for example, TECs within the Project area. Furthermore, those surveys would provide a suitable basis for impact assessment, describe the extent and quality of habitat, and identify any new populations.	Since the draft Environmental Impact Statement (EIS) was released for public submission, ARTC has undertaken additional ecology surveys which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods of these survey efforts are available in Chapter 11: Flora and Fauna. The full survey reports are available in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix A Appendix O: Matters of National Environmental Significance Appendix A
238	238.0038	State Agency	Flora and Fauna	Koala	The draft EIS does not adequately assess the effectiveness of proposed mitigation and management measures. The draft EIS simply describes the theory behind evaluating the effectiveness of proposed mitigation measures, rather than evaluating and providing an evidence-based assessment of the site-specific mitigation or management measure applicable to each location.	The draft EIS should evaluate and provide the required evidence-based information to support the assessment, location, design and effectiveness of site-specific mitigation and management measures (e.g. fauna movement structures, fencing, underpasses and overpasses). The draft EIS should describe how when undertaking the clearing of habitat/ vegetation within the construction footprint, what specific measures would be undertaken when the clearing activities coincide with the known October-May Koala breeding season.	Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project footprint. A detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction and construction, and operational stages is outlined Chapter 11: Flora and Fauna. Species specific mitigation measures for MNES and MSES flora and fauna species are also provided in Chapter 11: Flora and Fauna. Opportunities for the provision of fauna exclusion fencing and fauna movement solutions have been identified in the Appendix P: Fauna Connectivity Strategy. These include fencing strategies to guide species such as Koala to safe movement opportunities and will be refined through the detailed design process. Additional detailed mitigation measures, including measures to protect fauna, including specific measures for the Koala, during clearing of vegetation and habitat are addressed in Appendix N: Draft Fauna Management Plan and Appendix M: Draft Koala Management Plan.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
238	238.0039	State Agency	Flora and Fauna		The draft EIS should accurately describe the actual occurrence and extent of fauna species, including threatened and near threatened species predicted to occur and would be potentially impacted by Project. The draft EIS should undertake the required field investigations consistent with the stated EIS methodology and in accordance with requirements of Section 11.2, 11.25-11.32 and 11.95 of the ToR. Revised the impact assessment should be based on the extent of verified investigation and mapping within the Project area.	The draft EIS relies on predicted habitat mapping. The draft EIS should provide site-specific evidence that verifies the occurrence and extent of fauna species, and the required impact assessment based on site-specific surveys and investigations.	Since the draft Environmental Impact Statement (EIS) was released for public submission ARTC has undertaken additional ecology surveys which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods and results of these survey efforts are available in Chapter 11: Flora and Fauna. The full survey reports are available in Appendix A of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix A Appendix O: Matters of National Environmental Significance Appendix A
238	238.0040	State Agency	Flora and Fauna		The draft EIS should identify those sites where land access issues were identified and inhibited the required on site-specific survey effort to validate for example, desktop predictive vegetation and habitat mapping, and soil characterisation. The draft EIS should discuss why land access was denied and what strategies, efforts, plans and future actions are proposed by ARTC to access those sites for the purpose of undertaking the required surveys to support the impact assessment investigations, including: <ul style="list-style-type: none"> What strategies/ plan are proposed to access the land for the purpose of site-specific surveys and impact assessment investigations What strategies/plans are in place to verify the predicted mapping/soil characterisation within site investigation areas should land access continues to be denied Amend Chapter 4 Assessment Methodology of the draft EIS to ensure land access is adequately considered in the EIS assessment methodology, particularly when the draft EIS is unable to deliver the required environmental assessment and supporting information in accordance with the ToR requirements. 	The draft EIS states that parts of the rail corridor Project footprint/ survey study area were not accessible due to land access issues. No specific information was provided as to why land access was denied and what strategies, efforts, plans and future actions are proposed to access those sites to undertake the necessary survey effort to support the impact assessment investigations, including: <ul style="list-style-type: none"> what continuing effort is being made to survey those sites what plans are in place to undertake the required surveys to verify the predicted mapping/ soil characterisation within site investigation areas should land access continue to be denied. Amendment Chapter 4 Assessment Methodology of the draft EIS to ensure land access is adequately considered in the EIS assessment methodology, particularly when the draft EIS is unable to deliver the required environmental assessment and supporting information in accordance with the ToR requirements. 	Since the draft Environmental Impact Statement (EIS) was released for public submission ARTC has undertaken additional ecology surveys which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods and results of these survey efforts are available in Chapter 11: Flora and Fauna. The full survey reports are available in Appendix A of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix A Appendix O: Matters of National Environmental Significance Appendix A
238	238.0041	State Agency	Flora and Fauna		The draft EIS should clearly describe, assess and propose rehabilitation objectives, indicators and completion criteria, having regard to the hierarchy for rehabilitation. The draft EIS should demonstrate that the construction activities would avoid and minimise disturbance of land in order to limit the area requiring rehabilitation. The draft EIS should demonstrate that proposed rehabilitation success criteria can be achieved and describe suitable monitoring and contingency procedures for rehabilitation maintenance and redesign (if required). Correct ToR Compliance Table reference 22.10.2 to reflect the correct draft EIS section. Check all other Response Table references in Appendix B Compliance Table for accuracy.	The draft EIS does not adequately address sections 10.10(p), 11.50, 11.97 of the ToR. It is not sufficient for the draft EIS to state general best practice rehabilitation principles, outcomes and objectives of the rehabilitation hierarchy. Detailed information is required. The draft EIS does not provide sufficient information on specific rehabilitation objectives, indicators and completion criteria to demonstrate that identified environmental values would be protected. As a minimum, the draft EIS should: <ul style="list-style-type: none"> demonstrate that construction activities would avoid and minimise disturbance of land that would require rehabilitation describe the completion criteria to enable the success of rehabilitation to be measured, including monitoring indicators that can be measured, trigger and contingency procedures for rehabilitation maintenance and redesign (if required). Appendix - ToR compliance table, draft EIS. Response reference 22.10.2 is incorrect. Section 22.10.2 does not exist and Section 22.10 discusses construction hours, rather than landscaping and rehabilitation matters. Correct reference to reflect correct draft EIS Section and check all other Response reference in Appendix B. 	A Rehabilitation and Landscaping Management Plan will be developed for the Project as a component of the Construction Environmental Management Plan (CEMP). Details of the environmental outcomes, performance criteria, proposed mitigation measures, monitoring and adaptive management for this plan are contained in the Chapter 24: Draft Outline Environmental Management Plan, Chapter 11: Flora and Fauna, Appendix L: Terrestrial and Aquatic Ecology Technical Report. The plan will contain location-specific reinstatement commitments. As a minimum, it will establish the following: <ul style="list-style-type: none"> Location-specific objectives, indicators, and success criteria, for rehabilitation, reinstatement and/or stabilisation based on the hierarchy for rehabilitation Procedures, timeframes, measurable performance objectives and responsibilities for monitoring the success of rehabilitation and/or reinstatement/ stabilisation areas Consideration for maintenance or performance issues of rehabilitation, e.g. use of groundcover that does not grow and obscure signals or impact the longevity of rail infrastructure, and suitable monitoring and contingency procedures for rehabilitation maintenance and redesign if required Objectives and timeframes for rehabilitation and/or reinstatement/ stabilisation works (including biodiversity, vegetation establishment and erosion and sediment control outcomes to be achieved) Where appropriate, how the objectives align with relevant recovery plans, threat abatement plans, conservation advice, or policy guidance for target species in areas identified for rehabilitation Details of the actions and responsibilities to progressively rehabilitate, regenerate, and/or revegetate areas, while minimising the duration of exposure in disturbed areas Corrective actions if the outcomes of rehabilitation and/or reinstatement/stabilisation are not achieved. 	Chapter 11: Flora and Fauna Chapter 24: Draft Outline Environmental Management Plan Appendix L: Terrestrial and Aquatic Ecology Technical Report
238	238.0042	State Agency	Approvals/ conditions/ recommend-ations		There is no reference in draft EIS to relevant State and local government policies and procedures, e.g. DES operational policy: Revocation of QPWS managed areas.	The draft EIS should provide a thorough review of the relevant State and local government policies and procedures required to adequately describe their significance to, and implications for, the Project and its potential impacts, particularly regarding the revocation of QPWS managed areas	As stated at Section 3.1 of Chapter 3: Legislation and Approvals Process summarises the Commonwealth Government and Queensland Government legislation relevant to the Project and identifies the approvals, permits, licences and authorities necessary for the detailed design, construction works and operations stages of the Project. References to relevant State and local government policies and procedures, including the DES operational policy on the Revocation of QPWS managed areas, have been noted and discussed as relevant in the specialist chapters.	Chapter 3: Legislation and Project Approvals Process Section 3.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0043	State Agency	Approvals/ conditions/ recommendations		To date, ARTC has not requested approval from relevant State agencies for any works that would be subject to secondary approvals. The draft EIS states these approvals would be sought separately during detailed design phase.	The EIS provide enough detail to inform decision-makers as to the suitability of Project design and its implementation to ensure consistency, of approvals. The EIS should be specific about any required secondary approvals for proposed works.	As stated at Section 3.1, Chapter 3: Legislation and Project Approvals Process summarises the Commonwealth Government and Queensland Government legislation relevant to the Project and identifies the approvals, permits, licences and authorities necessary for the planning, construction works and operations stages of the Project. Secondary approvals have been noted and discussed as relevant in the various specialist chapters, addressing the requirements of Section 7 of the Terms of Reference for the EIS. Further discussion of secondary approvals is contained within the specialist chapters. Table 3-2 of Chapter 3: Legislation and Project Approvals Process includes a list of ERAs that may be required for the construction of the Project. Preliminary data on each of the activities associated with the ERAs has been provided as appropriate and where available. The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during detailed design and the construction works stage.	Chapter 3: Legislation and Project Approvals Process Section 3.1 Table 3-2
238	238.0044	State Agency	Approvals/ conditions/ recommendations		There is no discussion in the draft EIS as to the type of interests that may be required to be compulsorily acquired, e.g. Land Act 1994 leases over State forest.	A thorough review of the requirements of the Acquisition of Land Act 1967 is required to ensure the draft EIS adequately describes its significance to the Project. The issue of compensation for affected Land Act 1994 lease interests on State forests should be adequately addressed if State forests are to be acquired (usually by revocation).	Chapter 8: Land Use and Tenure has been updated in the revised draft EIS. It states the following: Where the Project requires land to be acquired for the permanent footprint within a State forest, partial revocation of the State forests in accordance with the <i>Forestry Act 1959</i> (Qld) will be required to enable the future gazettal of rail corridor over the same land. The request for revocation of State forest triggers the need for an application for Protected Area Estate Revocation under the <i>Forestry Act 1959</i> (Qld) and requires a compensation ratio of 5:1 for tree removal. The statutory application process for seeking the revocation of part of each State forest is discussed in Section 8.6.2, Chapter 8: Land Use and Tenure. Compensation is payable to DES for the market value of the land at the relevant ratio as set out in the operational Policy: Revocation of QPWS managed areas (QPW/ 20161877 v1.03). A number of term leases under the <i>Land Act</i> (known as a special leases) have been granted over State forest. If ARTC is unable to negotiate a surrender of these leases, it will require a constructing authority to make a request to the Department of Resources to progress the resumption of the special leases by way of order in council under the <i>Land Act</i> (Chapter 8: Land Use and Tenure, Section 8.5.1).	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2
238	238.0045	State Agency	Approvals/ conditions/ recommendations		Table 3.3 Tenure within the Project footprint is incorrect.	State forest is not a lands lease. Update the State forest tenure in the EIS.	The submitter mentioned Section has been updated in the revised draft EIS. Revised draft EIS Chapter 8: Land Use and Tenure, Table 8-19 (Section 8.4.2) has been updated to detail tenure types as follows: <ul style="list-style-type: none">▶ Freehold▶ Lands lease (other than State forest)▶ Reserve▶ State forest▶ State land▶ Road type parcel▶ Unlinked parcel▶ Watercourse.	Chapter 8: Land Use and Tenure Section 8.4.2 Table 8-19
238	238.0046	State Agency	Approvals/ conditions/ recommendations		Temporary and permanent access to State forest cannot be undertaken in accordance with the Land Act 1994.	Update the draft EIS to accurately describe temporary the approvals and appropriate conditions for access to State forests that may be granted under the Forestry Act 1959 (FA).	Chapter 3: Legislation and Project Approvals Process, Section 3.4.13 Forestry Act 1959, has been updated in the revised draft EIS. It states the following: Tenure arrangements, including compensation and offset requirements, for the revocation of State forest land will continue to be progressed during and following the completion of the EIS process in accordance with the operational policy: Revocation of QPWS managed areas (QPW/ 2016/ 1877 v1.03) and in continued consultation with DAF, DES and Department of Resources. To facilitate technical investigations before the partial revocation process, ARTC will obtain, separate to this revised draft EIS and where necessary, approvals for (Chapter 3: Legislation and Project Approvals Process, Section 3.4.13): <ul style="list-style-type: none">▶ Investigative works under Section 56 of the Forestry Act▶ Permits to interfere with State-owned forest products and quarry material under Part 6 of the Forestry Act. The information required to support applications for the above approvals will become available through the detailed design stage. It's noted that following consultation between ARTC and DES (QPWS&P) on 23 September 2021, DES (QPWS&P) advised that an Occupation permit under Section 35 of the Forestry Act would not be the mechanism to access land where ARTC's intention was to partially revoke the land. Where access to land is required before revocation is completed, access will be gained through Minor disturbance works under Section 56 of the Forestry Act. Permits will be obtained by the proponent where required in accordance with the Forestry Act (Chapter 3: Legislation and Project Approvals Process, Section 3.4.13). In addition to the above, a number of 'special leases' have been granted over State forest. If ARTC is unable to negotiate the surrender of these leases it will require DTMR as the constructing authority to make a request to the DoR for the resumption of the special leases by way of order in council under the Land Act.	Chapter 3: Legislation and Project Approvals Process Section 3.4.13
238	238.0047	State Agency	Approvals/ conditions/ recommendations		There is no mention of the Fire and Emergency Services Act 1990 in the draft EIS. Reference to the cardinal principle of management of State forests at Section 33 of the Forestry Act 1959 (FA) should be included in the draft EIS. There is inadequate discussion about commercial timber resources or other State forest users, e.g. Land Act 1994 lessees in the draft EIS. Section 25 of the FA is irrelevant in this instance, Section 26 however is relevant in relation to revoking part of the forestry estate.	The draft EIS should describe the requirements of the Fire and Emergency Services Act 1990 and any implications of the requirements of this Act on the proposed Project. The draft EIS should acknowledge that that the management of State forests should be focused on the permanent reservation of such areas for the purpose of producing timber and associated products in perpetuity and of protecting a watershed therein. The EIS should demonstrate how these principles were considered in the location and carrying out of activities associated with the Project. Any proposed actions inconsistent with these principles should be identified, and proposed measures to compensate for the loss of these values should be Described. A thorough review of the FA is required to adequately describe its significance to, and implications for, the Project and the potential impacts from a tenure and user perspective.	The revised draft EIS acknowledges the potential impact the Project may have to the management of State forests. In Section 8.5.1 (Chapter 8: Land Use and Tenure) it states the Project will impact on the operation and management of the State forests by Queensland Parks and Wildlife Service and Partnerships (QPWS&P) and Queensland Fire and Emergency Service (QFES), specifically to the severance of existing access tracks throughout the State forests and through bushfire risks associated with construction works. The risks that have been identified include: <ul style="list-style-type: none">▶ Delayed response to emergency situations during construction driven by potential closure of access tracks, additional traffic on public roads, and temporary alterations to driving conditions (e.g. reduced speed limits, traffic controls, etc.)▶ Delayed response to emergency situations during operation driven by severance of access roads▶ Hot works conducted as part of the construction works in State forest areas has the potential to cause ignition. Proposed mitigation measures for Management of State Forest identified in Chapter 8: Land Use and Tenure, Section 8.6.2. The Project will result in changes to QPWS&P and QFES's management of the Bringally and Whetstone State forests, as described in Section 8.5.1. To mitigate the identified impacts, a series of mitigation measures are proposed. Impacts to QPWS&P and QFES response time to emergency situations are expected as a result of the severing of existing access roads throughout the State forests. To manage these impacts, appropriate access and egress solutions throughout the Bringally State forest will be incorporated into the detailed design of the Project. Additionally, all rail maintenance access roads incorporated into the rail corridor will be designed with emergency response vehicle specifications in mind, so that these roads can be used by response vehicles in emergency situations (Chapter 8: Land Use and Tenure, Section 8.6.2 and Table 8-51). To mitigate bushfire risks associated with the construction of the rail corridor, all 'hot-works' will only be undertaken in periods where the Bureau of Meteorology's (BoM) fire risk is less than 'extreme'. In the case that 'hot-works' are required to be carried out during 'extreme' fire risk periods, all works will be undertaken in accordance with ARTC's Total Fire Bans Procedure, and in accordance with relevant QFES permits. Bushfire management and response measures will be implemented into the Project Construction Environmental Management Plan (CEMP) (Chapter 8: Land Use and Tenure, Section 8.6.2). Once constructed, the rail corridor will be kept free of woody vegetation to provide a firebreak between the severed areas of the State forests. Additionally, management policies, including communications strategies with QPWS&P and QFES, and existing ARTC management plans will be adopted to manage risk associated with the operation of the Project.	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2 Table 8-51
238	238.0048	State Agency	Approvals/ conditions/ recommendations		The draft EIS states that to facilitate technical investigations prior to revocation, various permits would be obtained, including an occupation permit under Section 35 of the Forestry Act 1959.	From discussions previously held with ARTC, QPWS may grant an Occupation Permit for areas of land in the State forests where the land is not permanently required for the Project, for example, for turn-around areas or areas where erosion and sediment control measures need to be implemented temporarily. A Section 56 is the permit that may be issued for investigative works. Ministerial In-Principle Approval for the revocation would be required prior to issuing an occupation permit/ s prior to works commencing to ensure that a decision of the Minister is not pre-empted. Therefore, the reference to occupation permits as an arrow point under 3.5.13.3 should be removed or at least qualified with wording such as where Ministerial in principle approval for any State forest revocation has been obtained. Further details and sufficient supporting information are required to be provided in the draft EIS.	Section 3.4.13 (Chapter 3: Legislation and Project Approvals Process) has been updated in the following manner: Tenure arrangements, including compensation and offset requirements, for the revocation of State forest land, will continue to be progressed during and following the completion of the EIS process in accordance with the operational policy: Revocation of QPWS managed areas (QPW/ 2016/1877 v1.034) and in continued consultation with DAF, DES and Department of Resources, leaseholders and the BNTAC. Chapter 8: Land Use and Tenure describes land tenure arrangements for construction and operation of the Project. To facilitate technical investigations before the partial revocation process, ARTC will obtain, separate to this revised draft EIS and where necessary, approvals for (Chapter 3: Legislation and Project Approvals Process, Section 3.4.13): <ul style="list-style-type: none">▶ Investigative works under Section 56 of the <i>Forestry Act</i>▶ Permits to interfere with State-owned forest products and quarry material under Part 6 of the <i>Forestry Act</i> The information required to support applications for the above approvals will become available through the detailed design stage. It's noted that following consultation between ARTC and DES (QPWS&P) on 23 September 2021, DES (QPWS&P) advised that an Occupation permit under Section 35 of the Forestry Act would not be the mechanism to access land where ARTC's intention was to partially revoke the land. Where access to land is required before revocation is completed, access will be gained through Minor disturbance works under Section 56 of the <i>Forestry Act</i> (Chapter 3: Legislation and Project Approvals Process, Section 3.4.13). Permits will be obtained by the proponent where required in accordance with the <i>Forestry Act</i> .	Chapter 3: Legislation and Project Approvals Process Section 3.4.13
238	238.0049	State Agency	Approvals/ conditions/ recommendations		This Section is severely depauperate in detail and glosses over the significance of the Land Act 1994 in relation to tenure and relevant authorities, e.g. Land Act 1994 leases over State forest, and statutory processes and procedures.	A thorough review of the Land Act 1994 is required to ensure the draft EIS adequately describes the significance of impacts on matters dealt with in the Act to the Project. The issue of compensation for affected Land Act 1994 lease interests on State forests should be addressed if State forests are to be acquired by revocation.	Chapter 8: Land Use and Tenure Section 8.6 has been updated in the revised draft EIS providing further detail on obtaining tenure for the Project and State forest revocation.	Chapter 8: Land Use and Tenure Section 8.6
238	238.0050	State Agency	Approvals/ conditions/ recommendations		Table 3.5 is severely depauperate in detail or otherwise incorrect: <ul style="list-style-type: none">▶ no mention of relevant ERAs (see page 43) - State forest revocation is undertaken in accordance with Section 26, not Section 32AA (see page 44)▶ with the exception of quarry resources, most of the matters mentioned are the responsibility of DES as the administering authority, not DAF (see page 44)	A thorough review of the Forestry Act 1959 is required in relation to the Project to ensure the draft EIS adequately describes its significance to and implications for the Project, including relevant approvals. Further details and sufficient supporting information are required to be provided in the draft EIS.	Chapter 8: Land Use and Tenure Section 8.6 has been updated in the revised draft EIS providing further detail on obtaining tenure for the Project and State forest revocation.	Chapter 8: Land Use and Tenure Section 8.6
238	238.0051	State Agency	Land Use and Tenure		At 65 km chainage - Intersecting Bringally State Forest a portion of State forest would be alienated from the larger portion of State forest. An exclusion fence is proposed by GRC on one side of the ARTC rail corridor. The department notes that depending on the final alignment and severance (smaller fragment) area size, QPWS would seek to have not only the rail easement included as part of the revocation area, but also the severance area. Its purpose for timber production may not be lost, but ecosystem function such as fauna movement and water shed protection and on-ground management generally would be severely compromised.	Further details and sufficient supporting information are required to be provided in the draft EIS.	This issue is noted. The revised draft EIS has been updated to include detail that ARTC will update the revocation application and revoke the rail easement and the severance area in Bringally State Forest. Further discussion is presented in Chapter 8: Land Use and Tenure, Section 8.6. Applications for State forest partial revocation under the Forestry Act 1959 (Qld) for the Whetstone and Bringally State forests were submitted to DES on 4 December 2019 and then subsequently updated revocation letters submitted to DES in May 2022. Consultation with QPWS&P, DES, DAF (Forestry), and DoR will continue through the detailed design process. The State forest revocation application will be supported by finalised land acquisition plans for the Project. Following submission of these Protected Area Estate Revocation applications, the further stages, in accordance with Section 26(2) of the Forestry Act 1959 (Qld). Ministerial in-principle approval for the State forest partial revocation will be required to be obtained prior to the Coordinator-General accepting the final EIS. To ensure that no areas of State forest are alienated as a result of the Project, ARTC will revoke any areas which may be 'left-over' after the severance. Any cases where this was to occur based on the current alignment have been integrated into the State forest partial revocation application. Tenure arrangements, including compensation as offset requirements for the revocation of State forest land, will continue to be progressed through the constructing authority during and following the completion of the EIS process and in continued consultation with DAF, DES, DoR, leaseholders and The Bigambul Native Title Aboriginal Corporation (Chapter 8: Land Use and Tenure, Section 8.5.2). Offsets for the revocation of State forest areas will be provided via financial compensation to DES, via Department of Transport and Main Roads as constructing authority, in accordance with the operational Policy: Revocation of QPWS managed areas (Chapter 8: Land Use and Tenure, Section 8.6.2). A special lease over State forest may be resumed by way of an order in council under the Land Act. Every person who has a lawful interest in a resumed lease (or part of a resumed lease) has a right to claim compensation as prescribed under the Acquisition of Land Act 1967 (Qld).	Chapter 8: Land Use and Tenure Section 8.5.2 Section 8.6 Section 8.6.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0052	State Agency	Land Use and Tenure		The draft EIS wording in the seventh down mentions forest reserves.	Forest reserves are a Nature Conservation Act 1992 tenure. The draft EIS should clarify which forest reserve/ s if any are or likely to be impacted by the Project.	Wording in Chapter 8: Land Use and Tenure, has been updated to discuss state forests. There are no mapped forest reserves, as defined under the Nature Conservation Act, within the Project footprint.	Chapter 8: Land Use and Tenure
238	238.0053	State Agency	Land Use and Tenure		First paragraph from the top incorrectly references Section 7.4.2.	The draft EIS should amend the reference to Section 7.4.2 to correctly reference Section 7.4.3 in the first paragraph.	Noted. Chapter 8: Land Use and Tenure as a whole has been updated, including content, references and numbers throughout this document.	Chapter 8: Land Use and Tenure
238	238.0054	State Agency	Land Use and Tenure		Draft EIS Figure 7.2 does not identify State lands (except stock routes).	Sufficient detail (at the appropriate scale) is required to illustrate significant land uses such as State forests and relevant tenure.	This issue is noted. Land tenure, including state land, is illustrated in Chapter 8: Land Use and Tenure, Figure 8-8. Chapter 8: Land Use and Tenure, Figures 8-1 and 8-8 have been updated in accordance with the DES proposed solution to provide clarity over the locations of State forest tenure.	Chapter 8: Land Use and Tenure Figure 8-1 Figure 8-8
238	238.0055	State Agency	Land Use and Tenure		Draft EIS Table 7.3 does not identify State forests. There are no forestry plantations within the Project area. Within the heading Farming, is pasture production a surrogate for grazing, or does it mean genuine pasture production, e.g. lucerne?	The draft EIS should include State forest in the item for Environment. The draft EIS should differentiate between 'Parks and Protected Areas under the item Environment e.g. Protected areas meaning under the NC Act, and Parks meaning Land Act 1994 reserves managed by local government. The draft EIS should clarify whether this line was meant to mean native forestry. The draft EIS should clarify what the intended meaning of pasture production is.	This issue is noted. Land tenure, including state land, is illustrated in Chapter 8: Land Use and Tenure, Figure 8-8. Chapter 8: Land Use and Tenure, Figures 8-1 and 8-8 have been updated in accordance with the DES proposed solution to provide clarity over the locations of State forest tenure.	Chapter 8: Land Use and Tenure Figure 8-1 Figure 8-8
238	238.0056	State Agency	Land Use and Tenure		The draft EIS does not adequately describe the other route alignments that were investigated but eventually discarded in favour of the preferred rail alignment.	The draft EIS should describe in sufficient detail the other route alignments that were investigated but eventually discarded in favour of the preferred alignment. Further supporting information should be provided in the draft EIS.	Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes: <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.9.3) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were: <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs multi-criteria analysis (MCA). As noted in Chapter 2: Project Rationale, Section 2.9.3, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Figure 2.15 Figure 2.14 Appendix E: Consultation Report Section 5.1
238	238.0057	State Agency	Land Use and Tenure		The draft EIS definitions are inaccurate. Second down is incorrect State forest is a tenure, not a type of lands lease. Third down State land is more than unallocated State land.	ARTC should note that State forest is a tenure, just like freehold. It may be leased e.g. under the Land Act 1994, or have some other form of authority granted over it. State forests are declared, not dedicated, under the Forestry Act 1959. This definition in the draft EIS, as that for State forest, requires rewording to ensure it is not misleading and is accurate.	This issue is noted. Corrections have been made for the revised draft EIS. Chapter 8: Land Use and Tenure, Section 8.5 has been reviewed and updated with consideration of DES proposed solution. Land Tenure, including state forests, is illustrated in Figure 8-8 of Chapter 8: Land Use and Tenure.	Chapter 8: Land Use and Tenure Section 8.5 Figure 8-8
238	238.0058	State Agency	Land Use and Tenure		Draft EIS Table 7.4 is incorrect.	See above comment regarding State forest and State land tenure definitions. State forest should be of treated as its a standalone type of tenure in this Table and in the draft EIS generally. Amend the draft EIS accordingly. Land Act 1994 leases granted over State forest would need to be further investigated and described accordingly e.g. there are four Land Act 1994 leases on Bringally State Forest with a total of 94.19 ha within the permanent Project footprint (see Appendix F). The issue of compensation for affected Land Act 1994 lease interests on State forests should be adequately addressed if State forests are to be acquired by revocation.	Tenure within the Project footprint has been updated within Chapter 8: Land Use and Tenure, Section 8.4.2, Table 8-19. The tenure of State forests is further outlined in Section 8.5.1, Table 8-37. Chapter 8: Land Use and Tenure, Section 8.5.1 and Section 8.6.2 discuss the potential impacts and proposed mitigation measures relating to the revocation of State forest. Chapter 8: Land Use and Tenure, Section 8.6.2 states, tenure arrangements, including compensation as offset requirements for the revocation of State forest land, will continue to be progressed through the constructing authority during and following the completion of the EIS process and in continued consultation with DAF, DES, DoR, leaseholders and The Bigambul Native Title Aboriginal Corporation. Offsets for the revocation of State forest areas will be provided via financial compensation to DES, via DTMR as constructing authority, in accordance with the operational Policy: Revocation of QPWS managed areas. A special lease over State forest may be resumed by way of an order in council under the Land Act. Every person who has a lawful interest in a resumed lease (or part of a resumed lease) has a right to claim compensation as prescribed under the AL Act.	Chapter 8: Land Use and Tenure Section 8.4.2 Section 8.5.1 Section 8.6.2 Table 8-19 Table 8-37
238	238.0059	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient information on mining tenures on State forest. Some information is incorrect.	The department notes that Bringally State Forest contains an Exploration Permit for Coal EPC 970 (New Hope Exploration Pty Ltd) and an Exploration Permit for Minerals EPM27546 (Fiddler's Creek Mining Company Pty Ltd). Implications for affected mining tenures on State forests should be adequately addressed in the draft EIS if State forests are to be acquired by revocation.	Coal exploration permits EPC970 and EPM27546 are no longer active or have been completed according to Environmental Protection Act Public Register and GeoResGlobe. Appendix E: Consultation Report, Table E-16, E-18 and E-50 in the draft EIS contain information on the consultation undertaken to date regarding the existing mining exploration permits in place. This information has since been reviewed. The revised draft EIS has been updated to correctly identify the relevant exploration permits over Bringally State Forest, taking into consideration the slight alterations to the alignment and how these will impact the permit areas.	Appendix E: Consultation Report Table E-16 Table E-18 Table E-50
238	238.0060	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient information on native title matters and the implications for the Project.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project on (but not limited to): <ol style="list-style-type: none"> identify all First Nation peoples potentially impacted by the proposal include figures illustrating application, claim and determined native title areas identify the eight reserve and two State land parcels likely to have continued native title rights and interests (there is no detail provided to identify the affected 10 properties) the native title parties should have already been notified or consulted, not the parties that would need to be notified for the Project are the draft EIS should provide details about any relevant native title consultation and engagement to date. 	A detailed Native Title assessment has been undertaken for the Project, in accordance with the State's native title work procedures. The revised draft EIS has been amended to state that a detailed native title assessment has been carried out, and the results have been outlined in Chapter 8: Land Use and Tenure. ARTC is in the process of engaging with the relevant parties where native title has not been extinguished on land within the Project footprint regarding the process and approach to the surrender or acquisition of the native title rights and interests in question.	Chapter 8: Land Use and Tenure Section 8.4.2 Section 8.5.2 Figure 8-8
238	238.0061	State Agency	Land Use and Tenure		Draft EIS figures 7.4e and 7.4f do not distinguish between Whetstone State Forest and Land Act 1994 lease over State forest.	The draft EIS should be amended to improve the legend to differentiate between State forest tenure and Land Act lease. The maps as illustrated in Figures 7.4e and 7.4f are misleading. Whetstone State Forest is located on either side of the proposed alignment. However, this is not clear in the figures illustrated. The State forest should be labelled and/or colour coded the same on either side of the alignment, to reflect the impact to the State forest and State interest.	This issue is noted. This matter has been resolved through updates on the figures. Chapter 8: Land Use and Tenure, Figures 8-1 and 8-8 have been updated in accordance with the DES proposed solution to provide clarity over the locations of State Forest tenure.	Chapter 8: Land Use and Tenure Figure 8-1 Figure 8-8
238	238.0062	State Agency	Land Use and Tenure		Draft EIS figures 7.4h - 7.4j-k do not distinguish between Bringally State Forest and Land Act lease over State forest.	The draft EIS should be amended to improve the legend to differentiate between State forest tenure and Land Act lease. The maps as illustrated are misleading. The State forest is not represented accurately in shading and the legend. The Lands lease shading covers the representation of the State forest. The use of hatching would be appropriate to represent a Lands lease that is granted over a State forest. The Lands lease does not displace the State forest	Chapter 8: Land Use and Tenure Figure 8-5a-w has been updated in accordance with the DES proposed solution of hatching the lands lease to provide clarity over the locations where it is overlaid with state forest tenure.	Chapter 8: Land Use and Tenure Figure 8-5a-w
238	238.0063	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient information nor adequate discussion on the provision of alternative alignments.	The draft EIS should adequately discuss why the preferred alignment option has been chosen and provided sufficient information about those alternative routes investigated that illustrates why they were not chosen.	Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. Project Rationale, Section 2.7 provides a summary of the main alignment option assessments that were undertaken during the reference design and EIS development stage of the Project, from early 2018 to the present. The revised draft EIS Chapter 2: Project Rationale, Section 2.7 has been updated to include relevant information to justify the location of the Project in relation to the State forests.	Chapter 2: Project Rationale Section 2.8 Section 2.9 Appendix E: Consultation Report Section 5.1
238	238.0064	State Agency	Land Use and Tenure		Draft EIS Table 7.9 does not provided sufficient detail.	The draft EIS should clarify the State forest revocation area (assume production forestry to be surrogate). It is unclear in the draft EIS what is the nature conservation area of 16.05 ha?	Chapter 8: Land Use and Tenure, Section 8.5.1 provides details on the proposed revocation of State forest. The Project proposes the revocation of revocation 108.4 hectares of State forest (80.47 hectares - Bringally State Forest and 27.93 hectares - Whetstone State Forest) (Chapter 8: Land Use and Tenure, Table 8-37). The Project requires land to be acquired for the permanent footprint within a State forest. This results in the proposed, partial revocation of the State forests in accordance with the Forestry Act 1959 (Qld) to enable the future gazettal of rail corridor over the same land. The total includes a reduced overall impact to State forest by 3.53 ha since the draft EIS as a result of the revised reference design (Chapter 8: Land Use and Tenure, Section 8.5.1).	Chapter 8: Land Use and Tenure Section 8.5.1 Table 8-37

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0065	State Agency	Land Use and Tenure		Draft EIS Table 7.11 chainage and Figure references are unclear.	Review Table 7.11 chainage and Figure references for Whetstone and Bringally State Forests for accuracy.	Chapter 8: Land Use and Tenure, Table 8-3 to 8-6 detail prominent land uses and the associated chainages for the following Project extents: <ul style="list-style-type: none"> NSW/QLD border to Whetstone (Ch 30.6 km (NS2B) to Ch 44.5 km) Whetstone to Millmerran (Ch 44.5 km to Ch 140.0 km) Millmerran to Yarranlea (Ch 140.0 km to Ch 154.65 km) Yarranlea to Gowrie Junction (ch 154.65 km to Ch 208.22 km) Relevant land use areas and localities are identified in Figure 8-4 and 8-5 at their relevant chainages. The prominent land uses identified in these tables are further detailed with their associated impacts summarised in Table 8-28.	Chapter 8: Land Use and Tenure Table 8-3 Table 8-4 Table 8-5 Table 8.6 Table 8-28 Figure 8-4 Figure 8-5
238	238.0066	State Agency	Land Use and Tenure		The draft EIS sub-heading title is incorrect in this Section State forests are not protected areas. Leases, and other authorities, may be granted over State forests. The meaning of sub-leases is unclear, misleading and incorrectly used in the draft EIS.	ARTC should note that protected areas are classes of land under the Nature Conservation Act 1992 - remove Protected and replace with Forestry or State forests. The draft EIS should clarify what is trying to be expressed conveyed using the term sub-lease. Amend the draft EIS replace sub-lease with Licences and permits to be consistent with what may be granted under the Forestry Act 1959.	Appendix L: Terrestrial and Aquatic Ecology Technical Report notes that the Project footprint does not overlap with, and therefore will not have a significant residual impact on any Protected Areas. Reference to protected areas has been removed from Chapter 8: Land Use and Tenure. Reference to sub-lease has been removed from Chapter 8: Land Use and Tenure.	Chapter 8: Land Use and Tenure Chapter 11: Flora and Fauna Section 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 7.2
238	238.0067	State Agency	Land Use and Tenure		Draft EIS Table 7.20 is unclear. Why is forestry a Tourism interest verses Agriculture, Extractive Resources or Biodiversity? The purpose for which the State forests are declared is inadequate.	The draft EIS should clarify why Tourism is the appropriate State interest category. State forests are relevant to both "Environment and heritage and Agriculture State interests under the SPP. Ensure the purpose for which the State forests are declared is clear in the draft EIS - refer or paraphrase from the long title of the Forestry Act 1959, e.g. to provide for forest reservations, the management, silvicultural treatment and protection of State forests, and the sale and disposal of forest products and quarry material. The draft EIS should also include a reference to The cardinal principle to be observed in the management of State forests shall be the permanent reservation of such areas for the purpose of producing timber and associated products in perpetuity and of protecting a watershed therein. Update the relevant sections of the draft EIS accordingly.	Chapter 8: Land Use and Tenure, Section 8.4, Table 8-24 has been updated accordingly to ensure State forests are addressed by the Agriculture State interest and reference to them being a tourist interest has been removed.	Chapter 8: Land Use and Tenure Section 8.4 Table 8-24
238	238.0068	State Agency	Land Use and Tenure		The draft provides insufficient detail and an inadequate overview of potential impacts on State forests.	The draft EIS should be amended to demonstrate that the draft EIS has facilitated genuine stakeholder appraisal, consideration and feedback, including but not limited to: <ol style="list-style-type: none"> potential impacts to forestry production, apiary sites, or grazing leases on State forests the meaning of what is Change to notable land uses - see Table 7.32. additional properties may also be acquired where - this should be a known quantity and if not, that should be adequately discussed it is unacceptable that the extent of land acquisition will be confirmed following completion of the detailed design. Assessment in the draft EIS requires potential impacts and required acquisitions of land to be defined clearly described. there is no detail provided for the proposed laydown area within Bringally State Forest. Update relevant draft EIS chapters accordingly. 	Mitigation and management measures for the State forest have been included throughout the revised draft EIS in order to provide more detailed information for assessing the impacts of the Project. <ol style="list-style-type: none"> Appendix C of the draft EIS has been updated and is now called Appendix E: Consultation Report with information regarding stakeholder engagement between ARTC and State agencies on forestry production, apiary sites, and grazing leases on state forest land Chapter 8: Land Use and Tenure has been updated to clarify the term change to notable land uses Chapter 8: Land Use and Tenure, Section 8.5 has been updated to clarify the statement regarding additional properties that may be required. Chapter 8: Land Use and Tenure, Section 8.4 has been refined in order to contain greater confidence of the Projects that will be impacted by the Project. Appendix B3: Changes to Reference Design since draft EIS, details the laydown area within Bringally State Forest is proposed to be moved to an area within the road reserve. A second laydown area adjacent to the State forest has been reduced and a buffer added to minimise impacts to the State forest. 	Chapter 8: Land Use and Tenure Section 8.4 Section 8.5 Appendix B3: Changes to Reference Design since draft EIS Appendix E: Consultation Report Section 5.7
238	238.0069	State Agency	Land Use and Tenure		Draft EIS Table 7.24 is incorrect.	See comment above for Chapter 7, Section 7.5 Existing environment, 7.5.1 Land tenure, Page 34. Clarification is required as to what lands leases are affected e.g. leases over State forest verses other Land Act 1994 leases impacted by the proposal.	Chapter 8: Land Use and Tenure, Tables 8-36 and 8-38 have been reviewed and updated with latest numbers based on review of available data.	Chapter 8: Land Use and Tenure Table 8-36 Table 8-38
238	238.0070	State Agency	Land Use and Tenure		The draft EIS states "The Request for Revocation of State forest triggers the need for an Application for Protected Area Estate under the Forestry Act 1959 (Qld) and requires a compensation ratio of 5:1 for tree removal. This statement is incorrect for the following reasons: <ol style="list-style-type: none"> The State forests subject to this Project are classed as QPWS Managed Areas (State land) and are not protected areas (e.g. National Parks) see definition. As part of the revocation process, a compensation ratio for the land component is required. Other compensation components may be required, for example by DAF, for the loss of the commercial timber component. Compensation is required at a ratio of 5:1 for the loss of the QPWS managed area and the inherent attributes of the land and is calculated at 5 times the land value. The compensation is not for tree removal, this is considered a separate matter which ARTC would need to negotiate with DAF separate to the revocation process. 	The draft EIS should provide sufficient detail to justify why a State forest revocation is required, including adequate stakeholder engagement (e.g. lessees, and the statutory processes required to give effect to a State forest revocation). The desire by the department as a stakeholder, as was expressed in formal communications to ARTC, to avoid impacts to State forests is not discussed nor adequately addressed in the draft EIS. The revocation proposal would be for a State forest, not a Protected Area Estate. Revocation compensation is required at a ratio of 5:1 for State forests based on land value. This is separate to the issue of tree removal prior to any revocation. Additional compensation may also apply for economic losses relating to lost timber and other forest production (see Section 7.7.2.1). Amend the draft EIS so that the information is correct by using the department's operational Policy for Revocation of QPWS Managed Areas. In addition, protected area means any of the following under the Nature Conservation Act 1992: <ol style="list-style-type: none"> a national park (scientific) a national park a national park (Aboriginal land) a national park (Torres Strait Islander land) a national park (Cape York Peninsula Aboriginal land) a conservation park a resources reserve a special wildlife reserve. 	This issue is noted. Compensation for impacts to State forest areas have been reviewed and discussed during consultation with the relevant state departments in Section 2.8 of Chapter 2: Project Rationale. The revised draft EIS has been amended so that the information is in accordance with the department's operational Policy for Revocation of QPWS Managed Areas. Furthermore, additional detail has been included in Chapter 2: Project Rationale that justifies the location of the Inland Rail alignment.	Chapter 2: Project Rationale Section 2.8 Appendix E: Consultation Report Section 5.7
238	238.0071	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on State forest land fragmentation, access and impacts on infrastructure.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project on: <ol style="list-style-type: none"> land fragmentation and disruption to access and infrastructure should be considered and adequately addressed land fragmentation is not addressed for State forests. The Project proposes further fragmentation of State forests. Fragmentation would affect management and operations of State forests, including, but not limited to access arrangements and fire management, as well potential impacts on environmental values. The draft EIS should be specific and clear as to how the State forests would be further fragmented and where the Project does not align with existing corridors that already fragment the State forest.	In May 2021 ARTC provided DES additional information pertaining to the requests for the partial revocation of Bringally and Whetstone State forests. In Chapter 6: Stakeholder Engagement, Section 6.9 details outcomes of stakeholder engagement, Chapter 20: Traffic, Transport and Access Section 20.5 and Section 20.6 details impacts to access and provides mitigation measures by maintaining or consolidating public roads and ecological impacts from fragmentation of habitat in State forests is discussed in Chapter 11: Flora and Fauna. ARTC's fencing strategy is described in Chapter 5: Project Description, Section 5.4.12 and Appendix P: Fauna Connectivity Strategy, Chapter 21: Hazard and Risk details biosecurity impacts and mitigations to the wild dog check fence and wildfires (Section 8.6.2, Table 21-16). ARTC will prepare a Sediment and Erosion Control Plan as per Chapter 24: Draft Outline Environmental Management Plan and will prepare an operational Environmental Management Plan. Each road interface within the State forest has been reviewed and a proposed interface treatment identified in consultation with QPWS and DAF. All formed public roads are proposed to be treated with level crossings or grade separations so as to maintain the continuity of access throughout the State forests as much as reasonably possible. These are all detailed in Chapter 8: Land Use and Tenure Section 8.6.2 and Table 8-50.	Chapter 5: Project Description Section 5.4.12 Chapter 6: Stakeholder Engagement Section 6.9 Chapter 21: Hazard and Risk Section 21.6.2 Table 21-16 Chapter 8: Land Use and Tenure Section 8.6.2 Table 8-50 Chapter 20: Traffic, Transport and Access Section 20.5 Section 20.6 Chapter 24: Draft Outline Environmental Management Plan Chapter 11: Flora and Fauna Appendix P: Fauna Connectivity Strategy

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0072	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on State forest agricultural uses and activities.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project on apiary activities, including potential impacts on this forest agricultural use and any discussions and outcomes with DAF, QPWS&P and apiarists.	ARTC engaged with QPWS&P and Office of Coordinator-General on 17 March 2023 to discuss the wild dog check fence and wildfire management. Outcomes from this meeting include ARTC to establish communication protocols with emergency services and a commitment that any Safety or Traffic management plan should consult with emergency services and QPWS. Engagement with DAF and DES (QPWS&P) occurred in Q2 2022 on State forest uses, including apiary leases, forestry activities and grazing leases. Additional engagement with Queensland Beekeepers on apiary activities occurred in 2021. Consultation with DAF and Queensland Beekeepers Association has determined that the Project will have no impact on apiary activities. Chapter 8: Land Use and Tenure has been updated based on the results of consultation undertaken with regulators and is outlined in Appendix E: Consultation Report.	Chapter 6: Stakeholder Engagement Section 6.6 Chapter 8: Land Use and Tenure Appendix E: Consultation Report Section 5.7
238	238.0073	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on wild dog barrier fence.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project on the wild dog barrier fence, including potential impacts and proposed alignments, discussions and outcomes with GRC, QPWS&P and DAF.	Throughout the development of the revised draft EIS, ARTC has had ongoing engagement with GRC regarding the wild dog check fence. An in-principal agreement has been reached to retrofit the wild dog check fence with structures to enable fauna crossing and permeability of the fence. Engagement on this matter will continue into detailed design. Additional engagement with DAF and DES was undertaken in June 2022 regarding wildfire mitigation and impacts. Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report have been updated to reflect this consultation and outcomes. Chapter 8: Land Use and Tenure has been updated based on the results of consultation undertaken with regulators outlined in Appendix E: Consultation Report.	Chapter 6: Stakeholder Engagement Section 6.6 Chapter 8: Land Use and Tenure Appendix E: Consultation Report Section 5.8
238	238.0074	State Agency	Land Use and Tenure		Table 7.32 - The draft EIS states. As the permanent footprint is located along the boundary of the State Forest The proposed route dissects Whetstone State Forest, despite the route following an existing road reserve corridor. ARTC may have misunderstood that a Land Lease to the south is not State forest when in fact both are State forest tenure. As this route follows the existing route it should not cause any concern for land management of the State Forest.	Amend the draft EIS wording to clarify the road reserve corridor.	This issue is noted. Wording around State forest and land tenure has been reviewed and updated based on comments received from DES. Chapter 8: Land Use and Tenure, Section 8.4 has been reviewed and updated as indicated in the submission.	Chapter 8: Land Use and Tenure Section 8.4
238	238.0075	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on State forest access and crossings.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project on: 1. potential impacts on access State forest areas 2. the outcomes of access/ crossings discussions with QPWS&P and DAF.	Each road interface within the State forest has been reviewed and a proposed interface treatment identified in consultation with QPWS&P and DAF. All formed public roads are proposed to be treated with level crossings or grade separations so as to maintain the continuity of access throughout the State forests as much as reasonably possible. These are all detailed in Section 8.6.2 and Table 8-50.	Chapter 8: Land Use and Tenure Section 8.6.2 Table 8-50 Appendix E: Consultation Report Section 5.7
238	238.0076	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on proposed mitigation measures, including regarding wildfire mitigation, wild dog barrier fence impacts and proposed alignment and proposed revocation of State forest areas.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project on: 1. Wildfire mitigation 2. Wild dog barrier fence impacts and proposed alignments should have already been considered and addressed with GRC, QPWS&P and DAF, and 3. An application to revoke parts of the QPWS managed estate has been made (but is awaiting a detailed response from ARTC).	ARTC engaged with QPWS&P and Office of Coordinator-General on 17 March 2023 to discuss the wild dog check fence and wildfire management. Outcomes from this meeting include ARTC to establish communication protocols with emergency services and a commitment that any Safety or Traffic management plan should consult with emergency services and QPWS. Engagement with DAF and DES (QPWS&P) occurred in Q2 2022 on State forest uses, including apiary leases, forestry activities and grazing leases. Additional engagement with Queensland Beekeepers on apiary activities occurred in 2021. The revised draft EIS has been updated to include details of consultation and discussions held with government agencies and community groups since the publication of the draft EIS. Further information has been included regarding the approach that will be taken with regard to impacts to individually consulted landholders. Chapter 8: Land Use and Tenure has been updated based on the results of consultation undertaken with regulators and is outlined in Appendix E: Consultation Report.	Chapter 8: Land Use and Tenure Appendix E: Consultation Report Section 5.7
238	238.0077	State Agency	Land Use and Tenure		ARTC to note: State Forest tenure would not require locked mitigation measures to prevent the movement of people through gates. Gates on access points will have of a wild dog check fence and would be required to meet biosecurity standards for the prevention of wild dog movement and be permanently shut when vehicles are not traversing the area.	Update the draft EIS proposed locked mitigation measures to reflect appropriate access requirements.	ARTC will review locked gate mitigation measures to reflect appropriate access requirements on State Forests. ARTC commits to consultation with leaseholders and QPWS&P regarding locked gates (Chapter 8: Land Use and Tenure, Section 8.6.2).	Chapter 8: Land Use and Tenure Section 8.6.2 Appendix E: Consultation Report Section 5.7
238	238.0078	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on Land Act 1994 lease mitigation measures, including appropriate compensation and stakeholder engagement.	The draft EIS should describe that Land Act 1994 leases may also be acquired under the ALA. The draft EIS should discuss how lessees on State forest who are losing some of their interest in the land be compensated. The draft EIS should describe facilitated actions, genuine stakeholder appraisal, consideration and feedback	Chapter 8: Land Use and Tenure, ARTC plan to negotiate either the partial or whole surrender of these impacted grazing leases interests under the Land Act 1994. If unsuccessful, the impacted grazing leases will be required to be compulsorily acquired through Department of Transport and Main Roads. Under the Acquisition of Land Act 1967 (Qld), every person who has a lawful interest in a resumed lease (or part of a resumed lease) has a right to claim compensation. Section 8.5.1 states, in some instances, appropriate tenure or interest in State land that supports the proposed development will be secured by ARTC under the Land Act 1994. In these cases, contact will be made as soon as reasonably practicable with the Department of Resources Land Administration and Acquisition Team to discuss options and to begin proceedings under the Land Act 1994.	Chapter 8: Land Use and Tenure Section 8.5.1 Appendix E: Consultation Report Section 5.7
238	238.0079	State Agency	Land Use and Tenure		The draft EIS provides insufficient detail, is factually incorrect and pre-empt's a decision of the Minister and Parliamentary Counsel. The draft EIS does not adequately address the requirements of Section 11.76 of the ToR. The ToR requires the draft EIS to provide a description of the impacts on existing uses of State land, including State forest and uses either allowed by current tenures or publicly proposed by government at the time of preparation of the EIS. This information should be provided in the draft EIS.	The draft EIS does should fully address the requirements of Section 11.76 of the ToR. The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project. Details provided in the draft EIS on the revocation process are limited and is not considered sufficient in order to assess whether In-Principle Approval would be considered for the revocation of the State forest land. Is it unknown whether ARTC propose a cash payment, land exchange or a combination would be provided as compensation? Before In-Principle Approval can be given, DAF have requested in writing, confirmation of what would occur as a result of changing access for large tree-harvesting equipment and movement. This is to ensure that tree-harvesting equipment can move in and out of the State forests without causing excess haulage costs. Furthermore, from a safety perspective, it is to ensure that in the event of any fire hazards, that people can exit the State forest safely. The department understands that these DAF matters have been raised with ARTC, however DAF has not received confirmation that the matters raised have been adequately address. The draft EIS should describe any changes to existing access arrangements and ensure that any new access required would be constructed and paid for by ARTC. Sufficient supporting information should be provided in the draft EIS to address these matters.	In May 2021, ARTC provided DES additional information pertaining to the requests for the partial revocation of Bringally and Whetstone State forests. Further information on the State forest revocation process is provided in Sections 8.5.1 of Chapter 8: Land Use and Tenure. In context of the EIS process, included that Ministerial in-principle approval for the State forest revocation is required to be obtained prior to the Office of Coordinator-General accepting the final EIS. The process for State Forest revocation is detailed in Chapter 3: Legislation and Project Approvals Process, Section 3.4.13.	Chapter 3: Legislation and Project Approvals Process Section 3.4.13 Chapter 8: Land Use and Tenure Section 8.5.1 Appendix E: Consultation Report Section 5.7
238	238.0080	State Agency	Land Use and Tenure		Draft EIS Table 7.38 does not provide sufficient detail on stakeholder appraisal and engagement.	The draft EIS should detail the facilitated actions, genuine stakeholder appraisal, consideration and feedback of the proposed Project.	The revised draft EIS details the stakeholder engagement activities undertaken for the Project. Since the draft EIS, ARTC has undertaken additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.	Appendix E: Consultation Report Section 4
238	238.0081	State Agency	Land Use and Tenure		The draft EIS does not provide sufficient detail on future land use intent and development.	See comment above regarding Chapter 7, 7.5.3 Future land use intent and development activity, Page 7-147 why is forestry a Tourism interest verses Agriculture, Extractive Resources or Biodiversity?	This issue is noted. Additional advice has been received from the department regarding a way forward. Updates have been made to Chapter 8: Land Use and Tenure, Section 8.5.4 and any other sections relating to State Planning Policy. Sections have been updated with State forests changed from tourism state interest to Agriculture.	Chapter 8: Land Use and Tenure Section 8.5.4
238	238.0082	State Agency	Flora and Fauna		The draft EIS should include site-specific data to support the impact assessment that based on actual data from ecological surveys and not only desktop assessments.	The draft EIS includes many comments which are not definitive e.g. 'These communities may provide habitats for a number of threatened flora and fauna species'.	Since the draft Environmental Impact Statement (EIS) was released for public submission ARTC has undertaken additional ecology surveys which ground-truthed the Project disturbance footprint. The purpose of these surveys was to validate desktop-based mapping to identify baseline conditions to inform the detailed design of the Project. At each terrestrial sampling location, a vegetation survey, a fauna habitat assessment, active searches for cryptic fauna and opportunistic observations were undertaken as a minimum (Chapter 11: Flora and Fauna). A total of thirty-two regional ecosystems (REs) were ground-truthed within the Project footprint, comprising 'Least Concern', 'Of Concern' and 'Endangered' communities under the Vegetation Management Act 1999 (QLD) (Appendix L: Terrestrial and Aquatic Ecology Technical Report). A detailed assessment on Potential Impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Some examples of identified impacts include Habitat loss and degradation, Displacement of threatened species, Barrier/ Edge effects, Lighting, Dust, Erosion, Contamination and more.	Chapter 11: Flora and Fauna Section 11.5, 11.6 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report
238	238.0083	State Agency	Flora and Fauna		The draft EIS should detail the location of any proposed wash-down facilities and how weeds would be managed to prevent spread into and out of the State forests during the construction phase. The location would need to be agreed upon prior to construction. A Biosecurity Management Plan should be submitted as part of this draft EIS which provides sufficient details as to how pest species would be managed and locations of any washdown facilities.	The draft EIS identified Mother-of-Millions as a noxious weed in the impact assessment area as well as other weeds. Chapter 19, Hazard and Risk, should outlined in sufficient detail how the State forests would be protected from the noxious weed e.g. outline where the wash-down facilities would be located.	Chapter 11: Flora and Fauna details the specifications that will be included in the Biosecurity Management Plan of the Construction Environmental Management Plan (CEMP) which will be developed by the contractor in the detailed design. This will include locations of vehicle washdown and weed management requirements.	Chapter 11: Flora and Fauna Section 11.6

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0084	State Agency	Flora and Fauna	operational rail noise	The draft EIS should assess whether the increase in noise from train traffic would affect any native fauna species. A description of any potential impacted on fauna values in the State forests was not detailed in the draft EIS. The draft EIS only describes construction noise impacts on fauna, however operational noise impacts on fauna have not been adequately assessed, particularly in State forest areas and on listed threatened species. The draft EIS identifies cumulative impacts as having the potential to affect ecological values, however the potential impacts on any specific fauna species was not addressed in the draft EIS. This information should be provided in the draft EIS.	The draft EIS has not adequately addressed Section sections 11.117 and 111.120 of the ToR. The potential impacts on fauna from an increase in train noise has not be adequately addressed in the draft EIS. The department notes that several bat species were recorded as well as other fauna species that may be affected by the increase in noise due to train traffic. The ToR requires cumulative impacts and general impacts on fauna be adequately assessed.	<p>The Project has been revised to include an assessment of potential noise and vibration impacts to native fauna and considers both construction and operational noise impacts. Refer to Chapter 11: Flora and Fauna and Chapter 16: Noise and Vibration.</p> <p>The assessment of construction noise determines that noise associated with construction activities will be short-term in duration and it is likely that fauna will temporarily move out of areas that are subject to high levels of noise. Construction noise will be perceivable by fauna species within the area as the harmonic ranges produced by construction overlap with the hearing range and frequency of birdsong with species that occur in the area. This can potentially affect communication including calling to attract mates, territory defence, and warning of predators.</p> <p>Operational noise may lead to some fauna species temporarily vacating/ avoiding nearby habitat until the temporary noise (pulse) passes. The duration and frequency of the operational noise is unlikely to result in significant changes to species behaviour or avoidance of the area.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Chapter 16: Noise and Vibration.</p> <p>Potential impacts from construction activities, including blasting activities, and railway operations were assessed in the revised draft EIS, in accordance with the Department of Transport and Main Roads (Qld) Codes of Practice (Volume 1 and 2) and their Interim Guideline (2019). Refer to Chapter 16: Noise and Vibration and Appendix V: Noise and Vibration Assessment – Construction and Road Traffic and Appendix W: Noise and Vibration – Railway operations. DTMR's publications do not provide any guidance on assessing noise and vibration impacts to domestic livestock or native fauna. There are no current Australian guidelines or standards requiring the assessment noise and vibration impacts to domestic livestock or native fauna and nor are they assessable under the final Border to Gowrie EIS terms of reference. Reasonable and practical mitigation and management measures have been presented in the revised draft EIS, Chapter 16: Noise and Vibration and Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5 and 11.7</p> <p>Chapter 16: Noise and Vibration</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p>
238	238.0085	State Agency	Flora and Fauna		Clarification: Bringally and Whetstone State Forests are not classed as Protected Areas under the Forestry Act 1959. Protected areas are dedicated or declared under the Nature Conservation Act 1992. State forests are declared under the Forestry Act 1959. State forests are not MSES of themselves as protected areas are, however, State forests may contain a matter that is MSES.	See comment above regarding Protected Areas. The SPP mapping incorrectly labels State forests as Protected Areas (Estate) instead of a State forest. Update the draft EIS accordingly. Note: An offset may still be required, and these areas may still contain Matters of State Environmental Significance such as Wildlife Habitat, Regulated Vegetation (Cat B and Cat C), essential habitat and may contain high ecological value waters which would require consideration for an offset.	Appendix L: Terrestrial and Aquatic Ecology Technical Report has been updated to correctly identify State forests.	Appendix L: Terrestrial and Aquatic Ecology Technical Report
238	238.0086	State Agency	Land Use and Tenure		See comment above State forests are not classed as Protected Areas.	For accuracy and to not be misleading, all draft EIS references to Protected Areas in relation to the State forests in the draft EIS will need to be amended.	Noted and EIS to be amended accordingly. Mention of protected area has been removed from Chapter 8: Land Use and Tenure.	Chapter 8: Land Use and Tenure
238	238.0087	State Agency	Flora and Fauna		All the sub-plans as a component of the CEMP should be included as part of the draft EIS to allow the department to adequately assess the potential Project impacts and the effectiveness of proposed mitigation and management measures.	In particular, the draft EIS should include: - the biodiversity management plan - flora and fauna plan - soil management plan - surface water management plan - fauna movement provision and fencing strategy - rehabilitation and landscape management plan - biosecurity management plan and environmental management plan. Details should be provided in the draft EIS on the locations for wash down facilities, fauna passages and fauna fencing, access track relocation and use, and erosion and sediment control measures. These matters would need to be agreed upon with QPWS&P.	Chapter 24: Draft Outline Environmental Management Plan details the specifications that will be included in each Plan of the Construction Environmental Management Plan (CEMP). The Plans will be developed by the contractor in the detailed design.	Chapter 24: Draft Outline Environmental Management Plan
238	238.0088	State Agency	Flora and Fauna		Detailed ecological surveys should be provided in the draft EIS. The survey results and detailed assessment should be provided in the draft EIS along with the location and design of fauna movement structures and information to support relevant sub-plans as part of the CEMP.	The draft EIS states that ARTC is committed to undertaking detailed ecological surveys and these will be conducted throughout the Project and in parallel to the development of the detailed design.	<p>Since the draft Environmental Impact Statement (EIS) was released for public submission ARTC has undertaken additional ecology surveys which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods and results of these survey efforts are available in Chapter 11: Flora and Fauna.</p> <p>A fauna connectivity strategy has also been prepared for the Project (Appendix P: Fauna Connectivity Strategy) which identifies the location of proposed fauna crossing opportunities for species such as Koala (<i>Phascolarctos cinereus</i>). These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process.</p>	Chapter 11: Flora and Fauna Appendix P: Fauna Connectivity Strategy
238	238.0089	State Agency	Hazard and Risk		Detail Design Section under Hazard Type Natural/ Bushfire dot Point 1. This should be agreed to and designs provided in the revised draft EIS. Dot Point 2. This aspect of the design will be supported by consultation with DAF to ensure sufficient access is available for emergency access and firefighting activities.	<p>The revised draft EIS should provide further detail information to support:</p> <ol style="list-style-type: none"> Consult with DAF and QPWS to ensure agreement of the access has been negotiated and agreed upon Amend the statement to also include QPWS (not only DAF) with regards to emergency access for firefighting activities. Agreement and details about access for timber harvesting equipment should be agreed upon and included in the revised draft EIS. 	<p>ARTC engaged with stakeholders has continued to consult with DAF and QPWS (DES) on these matters since the release of the revised draft EIS for public consultation. Examples of such consultation include:</p> <ul style="list-style-type: none"> 15 November 2021 - ARTC engaged with stakeholders met with DAF and QPWS to understand local use of the forest, and impact on timber harvesting operations, apiary licencing and use and fire tracks and access. 2 June 2022 – ARTC engaged with stakeholders met with DAF and the Office of the Coordinator-General to discuss: <ul style="list-style-type: none"> Compensation and engagement framework for impact to forest interests, including timber harvesting Access requirements and emergency and fire mitigation measures 17 March 2023 - ARTC engaged with stakeholders continued to consult with QPWS on how the Project has maintained access to enable emergency vehicle access for firefighting activities and ARTC engaged with stakeholders and 'Contractors' protocols and committed to future consultation with QPWS, DAF, Queensland Fire and Emergency Services and on the establishment of a Disaster Management Committee. <p>In addition, ARTC engaged with stakeholders continues to consult regularly with Queensland Fire and Emergency Services and the District Disaster Management Group regarding emergency access arrangement.</p> <p>Consultation undertaken to inform the revised reference design and revised draft EIS are documented in Appendix E: Consultation Report. Feedback from these consultation sessions has been incorporated into the revised reference design and the revised draft EIS. Drawings of the revised reference design are provided as Appendix B1: Design Drawings to the revised draft EIS.</p> <p>Section 21.6.2 of Chapter 21: Hazard and Risk has been updated with hazard/ risk reduction measures of bushfires including consultation with DAF, QFES and QPWSP regarding access for timber harvesting and firefighting activities. Proposed mitigations for this hazard are discussed in Section 21.6.2, Table 21-16 of Chapter 21: Hazard and Risk.</p>	<p>Chapter 21: Hazard and Risk Section 21.6.2</p> <p>Table 21-16</p> <p>Appendix B1: Design Drawings</p> <p>Appendix E: Consultation Report</p>
238	238.0090	State Agency	Flora and Fauna		The draft EIS should assess how fauna may escape during a fire event if a new fence or the rail corridor blocks their path. The draft EIS should provide sufficient detailed information on the proposed fauna corridors and linkage between newly separated sections of State forest.	As a result of the change to the landscape from fencing and the rail corridor within the State forest, during a bushfire, fauna may have difficulty escaping if barriers are in the way or cause fauna to become trapped.	<p>Since the submission of the draft Environmental Impact Statement (EIS), ARTC has developed the following key document: Appendix P: Fauna Connectivity Strategy. This document will be standalone appendices for the revised draft EIS and was developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010 respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised draft Appendix P: Fauna Connectivity Strategy).</p> <p>The existing Wild Dog Check Fence already provides a physical barrier to the ability of native fauna to cross through the landscape, while preventing the wild dogs moving to declared "clean dog free areas".</p> <p>In relation to potential impacts from bush fires, the draft Fauna Connectivity Strategy proposes to mitigate the barrier effect of the Wild Dog Check Fence by implementing the following strategies:</p> <ul style="list-style-type: none"> Installing 'Koala escape poles', which are 'n' shaped poles that straddle the fence and allow Koalas and possums to climb up and over the fence in both directions. Koala escape poles may also allow the movement of Spot-tailed Quolls across the fence, were they to encounter the fence. Escape poles should be located at 250 m intervals in Koala habitat. Include mesh with larger aperture at ground level that prevents movement of dogs but allows movement of smaller animals (e.g. frogs, reptiles, small mammals) through the fence. Sections of larger mesh should be 3 m in length and be positioned every 50 m along the fence. Install a short Section of perpendicular fence mid-way on each Section of mesh to direct small animals to use the mesh to pass through the fence. Install canopy bridges to allows possums and gliders to traverse the fence. Canopy bridges may not be needed in areas with both glider poles and Koala escape poles or in areas where canopy connectivity is maintained above the fence. Install glider poles to allow gliders to safely glide above the fence. Glider poles are not required where canopy connectivity is maintained above the fence. For all other species (e.g. Emu, Kangaroos) remain impacted by the wild dog fence as there are no mitigation measures for these species that do not also allow the movement of wild dogs. 	<p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5</p> <p>Section 5.11</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix P: Fauna Connectivity Strategy</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
238	238.0091	State Agency	Flora and Fauna		The draft EIS does not provide adequately addresses the ToR offset requirements, nor provide adequate ground-truthing to determine impacts with sufficient accuracy. The department notes that Strategy is an overall framework document, and that delivery detail would come sometime later, that some estimates of feasibility have been made but no clear study or Information of commercial costs has been done, and only a small amount of consultation with local landholders has occurred and only on a theoretical basis in local areas where potential offsets are to gauge informal interest. Despite its detailed outline of potential offset sites in Table 4, it is unclear how likely it is that landholders would agree to offset activities or would want to sell to ARTC, and there is no approximate cost for land-based offsets provided in the draft EIS. Therefore, this Strategy does not appear to effectively outline the extent, risks or costs associated with the Strategy, if implemented. Nor what would occur if costs for Strategy implementation were prohibitive or where ineffective at addressing potential offsets.	The draft EIS should provide researched costings and probability of success for implementing the Strategy, including detail of landholder consultation and/or previous sales data.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated species habitats. This field-verified data has been used to classify threatened species habitat mapping in accordance with State and Commonwealth guidelines and policies. The most recent field data from the technical ecological assessment from Ausecology (2022) and recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC), was used to support the development the revised draft EIS and key species management plans and to determine potential offset requirements.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works stage. As outlined in Chapter 11: Flora and Fauna, these mitigation measures have been selected based on the best available information including government guidelines and similar Projects. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation, and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Ecology and Aquatic Ecology Technical Report.</p> <p>Where impacts to threatened species habitat cannot be avoided, mitigation and management measures will be implemented. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, during both the construction works and operations stages. Impact mitigation will include pre-clearance surveys prior to disturbance. Management and mitigation measures to protect vulnerable and endangered species are proposed in Chapter 24: Draft Outline Environmental Management Plan and Chapter 11: Flora and Fauna.</p> <p>In instances where a significant residual impact as identified by the relevant EPBC Act significant assessment criteria, biodiversity offsets will be secured (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report). ARTC will provide biodiversity offsets in accordance with the relevant state or commonwealth legislation and guidelines. ARTC's approach to delivering environmental offset requirements is outlined in Appendix Q: Environmental Offset Delivery Strategy.</p> <p>To deliver the offset requirements for the Project, ARTC has developed a property portfolio which includes selected properties along or near the alignment, that could be used to acquit the required offsets for MNES and MSES matters. The selection of potential offset properties was facilitated through a purpose-built Inland Rail – Multi-Criteria Decision Support Tool (MCDS tool). The MCDS tool is a spatial tool designed to rank properties in an area of interest for offset potential. The tool ranks properties based on their position in the landscape and assesses their suitability for a range of MNES and MSES using vegetation mapping that identifies unmapped regrowth, advanced regrowth, and remnant ecosystems from a vegetation base layer. This is driven by the species association with different regional ecosystems (REs). RE associations for each matter were determined based on the species ecological requirements and were consistent with the impact assessment process. The MCDS tool provides a consistent, transparent, and repeatable approach to assessing properties and identifying those that may offer the greatest offset potential from a desktop perspective. The highest-ranking properties can then be assessed through rapid and detailed field surveys to confirm their suitability. Detailed field-based assessments have been performed across each proposed offset property outlined in Appendix Q: Environmental Offset Delivery Strategy (EODS) including assessment of bio condition, habitat suitability assessments, ground truthed vegetation mapping as well as incidental and targeted flora and fauna survey.</p> <p>The Border to Gowrie Offset Program has contributed to and participated in comprehensive consultation process through involvement in general and targeted Community Consultative Committee (CCC) information sessions, community ecology workshops, as well as regular and recurring consultation with stakeholders including Local Government Authorities and other organisations involved in protection and land management initiatives such as Queensland Trust for Nature and Healthy Land and Water. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>The Border to Gowrie EODS provides a detailed risk assessment which includes costs and probability of success for both acquisition and management to achieve offset objectives. ARTC are looking to progress securing key offset properties with negotiations and further investigations underway. Progress to date directly addresses validated costings and probability of success (acquisition). If properties are to be directly acquired to secure environmental offsets for the Project, ARTC will negotiate with the respective property owners or their representatives in good faith, and any subsequent acquisitions or partial acquisitions, will consider current market values for similar land. Specific financial details on property acquisitions remain "Commercial in Confidence".</p> <p>For each property that is secured for an environmental offset, ARTC will develop a site-specific Offset Area Management Plan (OAMP) and it will submitted for Commonwealth and State Government approval. Approval of each OAMP approval will be required prior to construction commencement. The goal of the OAMPs will be to achieve habitat quality gains at each offset site for each respective matter, while maximising landscape conservation outcomes by increasing resilience of self-sustaining communities and populations and improving connectivity within the region. Each OAMP will be developed generally in accordance with the Environmental Management Plan Guidelines (Commonwealth of Australia, 2014).</p> <p>All offset areas identified in the approved Border to Gowrie Environmental Offset Delivery Strategy and respective OAMP's will be legally secured under a legally binding mechanism. There are several options for legally securing an offset site, including an offset protection area under the EO Act, a voluntary declaration under the VM Act, a protected area under the NC Act, statutory covenants under the Land Title Act 1994 or provisions under the EPBC Act. All options will be considered, and the final instruments chosen will depend on the specific circumstances of each offset site. Due to the permanent nature of the impacts from the Project, legal security will be in perpetuity and the type of enduring covenants will be negotiated depending on the circumstances and matters to be protected for each offset site.</p> <p>Following the Ecology workshop held in November 2023, DCCEEW confirmed the Department does not require the offset costs to be included in the EIS, however the department will require the offset costs (outside the EIS is considered acceptable) in the circumstance where an indirect offset is to be proposed, and the direct offset costings influences the monetary Figure to be input as indirect offset. The Coordinator General has also confirmed that the detailed costings are only required in those circumstances where indirect offsets are being proposed.</p> <p>The Border to Gowrie EODS does not proposed indirect offset strategies for listed matters however acknowledge the requirement in the event that indirect offsets may be proposed in the future.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p> <p>Appendix Q: Environmental Offset Delivery Strategy</p>
238	238.0091	State Agency	Land Use and Tenure		The draft EIS does not adequately address the requirements of Section 11.76 of ToR, particularly impacts on existing uses of State land including State forest. The draft EIS does not provide sufficient detailed information to allow the department to properly consider the potential impacts of the proposed Project on State forests. The department notes that its correspondence dated 2/9/2020 has not be responded to by ARTC. Furthermore, the department also notes that correspondence from the Office of the Coordinator-General to ARTC dated 1/9/2020, which raised similar issues of inadequate detail regarding State forest revocation, consultation, and a number of other matters.	The draft EIS should provide the detailed design, route and impact information to enable proper consideration of draft EIS and the Project as a whole, and better consideration of the related State forest revocation proposals.	Further information on the State forest revocation process is provided in Sections 8.5.1 of Chapter 8: Land Use and Tenure. In context of the EIS process, Ministerial in-principle approval for the State forest revocation is required to be obtained prior to the Office of Coordinator-General accepting the final EIS. The process for State Forest revocation is detailed in Chapter 3: Legislation and Project Approvals Process, Section 3.4.13.	<p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.4.13</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p>
238	238.0092	State Agency	Flora and Fauna		The draft EIS states that the overarching Offset Strategy is to deliver a strategic, primarily land-based offset portfolio that would seek to deliver conservation outcome that improves/ maintains viability of MSES etc. However, as above, as costings and likelihood of success of the Strategy's implementation has not been addressed nor provided, there appears to be a risk of the success of its implementation, which not only may impact on overall Project costs but also may have impacts on the environmental values the Strategy seeks to improve/maintain.	The draft EIS should provide researched costings and probability of success for implementing the Strategy, including detail of landholder consultation and/or previous sales data.	<p>Following the Ecology workshop held in November 2023, DCCEEW confirmed the Department does not require the offset costs to be included in the EIS, however the department will require the offset costs (outside the EIS is considered acceptable) in the circumstance where an indirect offset is to be proposed, and the direct offset costings influences the monetary Figure to be input as indirect offset. The Coordinator General has also confirmed that the detailed costings are only required in those circumstances where indirect offsets are being proposed.</p> <p>The Border to Gowrie EODS does not proposed indirect offset strategies for listed matters however acknowledge the requirement in the event that indirect offsets may be proposed in the future.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.1</p> <p>Section 5.10</p>
239	239.0001	Private	Flora and Fauna		Provision made for broad stakeholder consultation in the design and management planning of fauna movement corridors. Stakeholders likely to include but not be limited to GRC, TRC, First Peoples, Redleaf Environmental (who have done wildlife corridor mapping for at least the TRC region) and Southern Queensland Landscapes. Planning to include links to regional wildlife corridors and management to include weed and pest management.	Generic information only provided in this early stage.	<p>Since the submission of the draft EIS, ARTC has developed the following key document: Appendix P: Fauna Connectivity Strategy. This document will be a standalone appendix for the revised draft EIS and was developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the pre-construction and construction, and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures for pest and weed management.</p> <p>The Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy) identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised draft Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy) proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have been prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy).</p> <p>ARTC will continue to engage with key stakeholder groups including the Toowoomba and Goondiwindi Regional Councils, community, conservation and Indigenous groups during the detailed design stage.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
239	239.0002	Private	Surface Water	construction water supply	The submitter raises the issue that the Rail Corridor is in close proximity to Macintyre Brook which may enable access to allocation water from Coolmunda Dam. Similarly northern Section proximity to the Condamine River may enable access to allocation water from Leslie Dam.	<p>Note (1) that if works are required to enable access to water from Macintyre Brook, consideration could be given to rehabilitation works linking to landholder efforts and possible Northern Basin funding to manage stock and other threats to high value aquatic ecosystems. Of iconic value here is mentioned by several landholders of Platypus in the Brook with some concern around reduced frequency of sightings in recent times. Note (2) that in the Condamine River the rail crosses between Lemon tree and Yarramalong weirs. These have been identified in Northern Basin Toolkit investigations as significant native fish movement barriers. ARTC could give consideration of contributing to fish passage works as Project environmental offset works.</p>	<p>ARTC recognises water sourcing and availability is critical to supporting the construction program for the Project. Sources of construction water will be finalised as the construction approach is refined during the detailed design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>Appendix S: Surface Water Quality Technical Report, Section 1.4.5 states:</p> <p>ARTC recognises that water sourcing and availability is critical to supporting the construction program for the Project. Sources of construction water will be finalised as the construction approach is refined during the detailed design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>The ultimate water sourcing strategy for the Project will be documented in a construction Water Plan, developed in consultation with local and state government representatives, as well as potential water suppliers. Further detail regarding water sources for the Project is outlined Appendix B5: Construction Water Requirements Report.</p> <p>An assessment of the suitability of each source will need to be made for each construction activity requiring water, based on the following considerations as outlined in Section 1.4.6 of Appendix S: Surface Water Quality Technical Report:</p> <ul style="list-style-type: none"> Available volume from identified source Legal access Volumetric requirement for the activity Water quality requirement for the activity Source location relative to the location of need. 	<p>Appendix B5: Construction Water Requirements</p> <p>Appendix S: Surface Water Quality Technical Report</p> <p>Section 1.4.5</p> <p>Section 1.4.6</p>
239	239.0003	Private	Cultural Heritage	Indigenous cultural heritage	The submitter states that p.32 proposed mitigation measures that seek the extinguishment of native title rights. This default approach does not respect First Nation Peoples and puts those who are struggling to rediscover and retain traditional knowledge and cultural history at a disadvantage.	Support First People in documenting attachments to country in the impacted areas and grant the same privileges to affected Peoples as will be granted to the Bigambul People in areas where they hold native title. Peoples to be consulted should include but may not be limited to Bigambul, Githabul, Giabul/ Jarowair. Given recent interest and development of Aboriginal Ranger programs, establishment, support and/or utilisation of these programs in rail corridor maintenance, biodiversity corridor management and decommissioning works (landscaping and rehabilitation) should be considered.	As outlined in Chapter 19: Cultural Heritage, Section 19.3.3 and Table 19-20, indigenous cultural heritage will be managed under a Cultural Heritage Management Plan (CHMP). These have been developed between ARTC and the Bigambul People, Western Wakka Wakka people and the Endorsed Aboriginal Parties for the unclaimed area in 2018 (CLH017009 with identification numbers 329, 330 and 331) and approved under the Aboriginal Cultural Heritage Act 2003. In developing the CHMPs, ARTC engaged with the relevant Aboriginal Parties (as defined under the ACHA) to establish methods for investigating indigenous cultural heritage, that may be affected by the Project.	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.3.3</p> <p>Table 19-20</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
240	240.0005	Private	Social Impact Assessment		With the highway changes outside the submitters' house, they expect that access to the front entrance could become dangerous, with the numbers of heavy vehicles which travel this road. Many vehicles travel well over the town speed limits with no concern for the local people. They have personally experienced just how dangerous this is through a B-double losing control and putting a trailer through their shed, just missing their home and demolishing 4 cars parked under the shed. As a result they are constantly concerned with the speed of the heavy traffic causing extreme Anxiety and Mental stress.	There would be a need to clean a thoroughfare through property to permit safe front entrance and exit from rear of property. Need to provide safe parking at the front of the submitters' home for disability support workers at both entrance and exit if possible. Supply front gate opening.	ARTC notes that the reference design does not necessitate altering any access arrangements for this property. The reference design includes a proposal to extend the highway; however, the Section outside this property would be posted at 60 km/hr. ARTC notes there is back lane access to this property. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.	N/A
240	240.0006	Private	Surface Water		Concerns regarding proposed water drainage considerations upon building of both railway and highway. Insurance Liability Protection, if or when flooding occurs due to redevelopment of road and rail.	Ongoing Insurance Compensation for increased premiums on insurance policies regarding flood, should flood insurance increase as a result of the rail/road construction.	The Project's land requirements are detailed in the revised draft EIS Appendix F: Impacted Properties. The extent of these impacts will be confirmed during detailed design with compensation to be provided in accordance with the Acquisition of Land Act 1967 (Queensland). The impact of the Project on the existing flood regime will be compared against the flood impact objectives in Annexure A. Acceptable localised impacts with respect to flood sensitive receptors and land uses will ultimately be determined on a case-by-case basis with interaction with stakeholders/ landholders through the community engagement process using these objectives as guidance As noted in the Appendix E: Consultation Report Section 5.3, in June 2020, the Australian and Queensland governments established an Independent International Panel of Experts for Flood Studies (the Flood Panel) in Queensland to provide advice on the flood models and structural designs developed by ARTC for Inland Rail in Queensland. The Flood Panel released its draft report on 25 March 2021, and final report in October 2022. Following the release of the final report and as part of additional assessment and studies conducted for this revised draft EIS, ARTC has assessed all local catchments against the new Flood Impact Objectives (FIOs) and updated Chapter 14: Flooding and Geomorphology and Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 accordingly. The FIOs determine the acceptable parameters within which the Project can change or increase the existing flood conditions, including afflux, time of inundation, velocity, hazard and flow directions.	Chapter 14: Flooding and Geomorphology Appendix E: Consultation Report Section 5.3 Appendix F: Impacted Properties Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
240	240.0007	Private	Air Quality		construction and operational phases along with maintenance phases will result in ongoing dust, dirt and pollutants affecting the site. Water quality in tanks will be contaminated due to the pollutants from both dust and heavy metals from trains and heavy transport. Potential pollution of land, making growing of clean crops for personal consumption difficult if not impossible.	11.6.5 It is suggested to implement a Rainwater collection system, this should have first flush devices to divert potentially contaminated water off roof and away from tank. This should be installed prior to commencement of works. Implementation of filtration system on water tank with feed to home kitchen. It should also be noted that the Solar panels will be impacted by the increased dust and dirt especially during the construction phase, this will lead to a need for increased cleaning and maintenance fortnightly/ monthly. Evaporative cooler battens/ filters will need to be cleaned or replaced and due to increase in pollutants.	The construction and operation of the Project will result in emissions to air. However, the assessment of the construction works and operations stages has determined that the impact of air emissions to sensitive receptors, as a result of air emissions will not be significant with the inclusion of recommended mitigation measures. Construction dust emissions have been assessed for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust). As discussed in Section 12.5.1 of Chapter 12: Air Quality, gaseous emissions (fumes) from construction vehicles are unlikely to present risk of significant impact. The assessment of construction has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. The significance of construction dust impacts for impacts to health and nuisance/ amenity will be low or negligible with the implementation of mitigation measures. On this basis, regular (fortnightly/ monthly) cleaning and maintenance of solar panels or evaporative cooler battens/ filters is not expected to be required (Chapter 12: Air Quality, Section 12.5.1). The operational air quality assessment determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in Chapter 12: Air Quality, Section 12.4.5) for all pollutants. In the dispersion model developed for the assessment of the operations stage in Appendix F of Appendix R: Air Quality Technical Report, the submitter's residence is represented by receptor R120. Further information on the results of the construction works and operations stage assessment on impacts to air quality are presented in Section 12.5 of Chapter 12: Air Quality. Section 12.6 Table 12-36 of Chapter 12: Air Quality presents the mitigation measures which have been recommended for the Project. These mitigation measures are to be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan, and, when implemented, impacts to sensitive receptors are not expected to be significant. In addition to assessing impacts on air quality at households, the assessment also investigated potential impacts to tank water quality during the operation of the Project (Section 12.5.2 of Chapter 12: Air Quality and Appendix R: Air Quality Technical Report, Section 5.3.7). This assessment was completed by predicting the deposition of pollutants of the rooves of residential dwellings within the study area. The concentration of pollutants in a residential water tank was then estimated assuming that all deposited matter was washed from the roof into a water tank. This assessment showed that tank water quality impacts from the Project would not be significant as pollutant concentrations would be well below the concentrations prescribed by the Australian Drinking Water Guidelines (National Health and Medical Research Council and National Resource Management Ministerial Council, 2022). Air pollution can impact crops and agriculture. The <i>Environmental Protection (Air) Policy 2019</i> (Qld) includes air quality objectives to protect these environmental values. However, the Project will not emit any pollutants (such as fluoride) for which air quality objectives are prescribed to protect agriculture values. The revised air quality assessment has investigated the potential for impacts to agricultural uses using assessment criteria adopted from scientific literature, and prescribed for the protection of ecosystems. Section 12.5.2 of Chapter 12: Air Quality and Appendix R: Air Quality Technical Report, Section 7.4, presents the assessment of impacts to agriculture. Based on the dispersion modelling undertaken for the assessment of the operations stage of the Project, air quality impacts to agricultural uses such as crops are not expected to be significant.	Chapter 12: Air Quality Section 12.4.5 Section 12.5.1 Section 12.5.2 Section 12.6 Table 12-36 Appendix R: Air Quality Technical Report Section 5.3.7 Section 7.4 Appendix F Chapter 24: Draft Outline Environmental Management Plan
240	240.0008	Private	Land Use and Tenure	Property Devaluation	Changes to the access of property and movement of highway to directly out front of his home will impact upon the value of his house, refer 7.2.2.1 Change in Land Tenure and Loss of Property. Impacts on accessibility to property. Adjusting to fencing and access. Access to the highway via the front entrance will be quite dangerous due to the traffic being free flowing and normally travelling over the recommended speeds. Due to extreme pain in the submitter's legs and back along with other disabilities he has support people attend him on a regular basis. It can be dangerous for his carers to park out the front of my home due to the heavy traffic. He expects that his carers will find it even more unsafe with changing the highway to park directly out the front of his home and with heavy traffic constantly moving at speeds in excess of the local speed limits.	1. Install electric gates for safer entrances. 2. Clean thoroughfare through property to permit safe front entrance and rear exit of property. 3. Need safe parking either at the front of his house. 4. Supply front/ rear gate opening. 5. Speed cameras for traffic coming into town to help slow them down. 6. Make it safer to enter and leave streets gateways and entrances. 7. Ensure there is a generous wide area allowed for parking out the front of homes to make it safer for the submitter's carers for pickup and drop off. 8. Help to make accessibility safe for all from both front and rear entrances.	The detailed design for the Project will be developed to ensure that legal access for private properties is maintained. ARTC will continue to consult with potentially impacted landowners through the detailed design and Pre-construction Activities and early works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect property access. In cases where the acquisition of the portion of a property will cause land locked, commercially unviable and/or inaccessible parcels of land, ARTC will consider acquiring the unusable portion of the lot to avoid impacts to landowners and mitigate impacts to access. In cases where the severance of property impacts a landowner's access to transport routes or water sources, ARTC will install or reinstate necessary infrastructure to maintain continuity (Chapter 8: Land Use and Tenure, Section 8.6). The construction works and operations stage provision of suitable private property access will form a component of property-specific management agreements developed in consultation with landowners. Changes to individual property access onto and across properties may be offset by consolidating access in key locations, which may be facilitated through underpasses for stock and vehicles at appropriate locations. These solutions will be developed in consultation with affected landowners (Chapter 8: Land Use and Tenure, Section 8.6.3).	Chapter 8: Land Use and Tenure Section 8.6 Section 8.6.3
241	241.0001		Economics		The submitter is concerned about property devaluation.	The submitter wants higher compensation	The construction Authority for the Inland Rail Project in Queensland, will be the Qld Department of Transport and Main Roads (DTMR). DTMR will be responsible for all land acquisition and resumptions required for the construction of the Project. Compensation for loss of land and interests in land will be assessed in accordance with the <i>Acquisition of Land Act 1967</i> .	Chapter 18: Economics Section 18.9
241	241.0002	Private	Air Quality		The submitter is concerned about dust in manufacturing shed.	The submitter wants air conditioning facility	In the dispersion model developed for the assessment of the operations stage in Appendix F of Appendix R: Air Quality Technical Report, the landholder's dwelling has been represented by sensitive receptor R774. The construction and operation of the Project will result in emissions to air. However, the assessment of the construction works and operations stages has determined that the impact of air emissions to sensitive receptors, as a result of air emissions will not be significant with the inclusion of recommended mitigation measures. Construction dust emissions have been assessed for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust). The assessment of construction has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households) (Chapter 12: Air Quality, Section 12.5.1 and Appendix R: Air Quality Technical Report, Section 6.1). The assessment has also recommended mitigation measures to reduce construction dust emissions and minimise the potential for significant impacts. With the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts to health and nuisance/amenity will be low or negligible (Chapter 12: Air Quality, Section 12.6 and Appendix R: Air Quality Technical Report, Section 8.3). The operational air quality assessment determined that the adopted air quality goals can be achieved for all households (referred to as sensitive receptors in Chapter 12: Air Quality, Section 12.4.5) for all pollutants. Further information on results of the construction works and operations stage assessment on impacts to air quality is available in Section 12.5 of Chapter 12: Air Quality. Section 12.6 of the Chapter and Section 8.3 of Appendix R: Air Quality Technical Report present the mitigation measures which have been recommended for the Project. The recommended mitigation and management strategies will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan, and, when implemented, impacts to sensitive receptors are not expected to be significant. Based on the results of the air quality assessment for the submitter's residence the installation of air conditioning at the submitter's property, including the manufacturing shed, is not required to mitigate air quality impacts.	Chapter 12: Air Quality Section 12.4.5 Section 12.5 Section 12.5.1 Section 12.6 Chapter 24: Draft Outline Environmental Management Plan Appendix R: Air Quality Technical Report Section 6.1 Section 8.3 Appendix F
241	241.0004	Private	Groundwater		The submitter is concerned about bore hole disruption as a result of the construction.	The submitter wants new hole near house.	As modelling has indicated drawdown will likely be isolated around deep cuts and only extend a maximum of 43 m horizontally, impacts to bores outside the groundwater investigation area are unlikely (Chapter 15: Groundwater, Section 15.6). Groundwater monitoring will continue throughout the construction works and part of operations stage of the Project to monitor for potential impacts as a result of the Project. Bores required to be decommissioned within the Project footprint or access restricted as a result of the Project will have 'make good' measures agreed in consultation with the landholder to ensure the agreed make-good solution is commensurate with the level of impact anticipated (see Section 15.7.4 of Chapter 15: Groundwater).	Chapter 15: Groundwater Section 15.6 Section 15.7.4
241	241.0005		Economics		The submitter is concerned about the cost of freight in construction for him to move goods and export.	The submitter wants compensation.	The Economic Impact Assessment (EIA) for the revised draft EIS recognises the impacts to local businesses during construction related to disruptions to traffic and transport. These impacts have been described qualitatively in the EIA. During construction, broader accessibility impacts due to changes in the surrounding road network may impact businesses. Roadworks, re-alignments and changes to travel distances may affect businesses through increases in travel times, resulting in increased operating costs. Disruptions to access during construction will be addressed through temporary diversions and onsite traffic management in consultation with the road managers, local community and landowners, where appropriate. It is out of scope of the EIA to quantify the impacts of traffic disruption on individual businesses. The construction Authority for the Inland Rail Project in Queensland, will be the Qld Department of Transport and Main Roads (DTMR). DTMR will be responsible for all land acquisition and resumptions required for the construction of the Project. Compensation for loss of land and interests in land will be assessed in accordance with the <i>Acquisition of Land Act 1967</i> .	Chapter 18: Economics Section 18.9.4
241	242.0001	Private - Brookstead	Noise and Vibration	operational rail noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents due to the on-going noise and vibration from the rolling stock combined with additional signals form alarm bells and train horns, resulting in daytime disruptions and night-time sleep disturbance. The height of structures over the Oakley to Pittsworth Road and Lochabar Road will mean that operational Noise will be disturbingly audible to more residents than have been identified in the Noise Abatement Section of the EIS Appendix T 15.4.4. The 5 laybys of varying area to be located in close proximity to the township, will result in considerable machinery movements, another source of noise and dust and a potential impediment to the movement of local traffic. Vibration of a train of the length and tonnage has not been quantified. Vibration and noise that will affect the entire town population, during the driving of piles to the required depth.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area. The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Section Chapter 24: Draft Outline Environmental Management Plan. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians; however, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Section 16.8 and Section 16.10 within Chapter 16: Noise and Vibration, Railway Noise Assessment. Ground borne vibration is assessed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 13. It is identified that any receivers with 12 metres from the alignment has potential to exceed the human comfort criteria. Further assessment of these impact is recommended during the detailed design stage to verify the screening assessment outcomes. ARTC acknowledges that during the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well-being, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.	Chapter 2: Project Rationale Section 2.8 Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Chapter 17: Social Chapter 24: Draft Outline Environmental Management Plan Appendix W: Noise and Vibration Assessment - Railway Operations Section 13 Section 17

244	244.0001	Private	Noise and Vibration	operational rail noise	The proposed route extends along the entire northern boundary of the township of Pittsworth consisting of a population of 3,294. The submitter raises concern that the close proximity of the rail line and township will severely impact all residences during the construction and operational phase. These will include vibration from rolling stock combined with additional signals and alarm bells.	Nil.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The DTMR Interim Guideline only requires an impact area of up to 150 metres from the railway.</p> <p>operational noise and vibration mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project and installed prior to Inland Rail operations commencing, where it is deemed reasonable and practicable. Compliance noise and vibration monitoring will be undertaken within 6 months of Project opening to ensure that mitigation measures are adequate. If the results of monitoring indicate additional exceedances of the operational noise and vibration criteria, then additional reasonable and practicable mitigation will be implemented in consultation with affected property owners.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns (refer to Section 16.10 of Chapter 16: Noise and Vibration, Railway Noise Assessment and Mitigation and Management Measures). The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
245	245.0001	Private	Flooding	Increase in peak water levels	The submitter opposes the Inland Rail Project going through Brookstead and Pittsworth. It is a rich agricultural land and has the potential of severe flooding. He also outlined that some wealthy influential and powerful people with financial gains are behind the proposed route.	Consider alternative route - Inglewood, as the area around it has large grass and tree area and not prone to flooding as the current proposed route.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1,000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.7) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">▶ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)▶ approvals and stakeholder engagement: 12.5 per cent▶ technical viability: 17 per cent▶ safety: 16.5 per cent▶ constructability: 12.5 per cent▶ operations: 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/ revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined 2-km-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2021 (ARTC, 2022) document, where pages 92 to 103 relate specifically to Border to Gowrie. inlandrail.wpenginepowered.com/wp-content/uploads/2020/05/route-history-2006-2021-may-22.pdf.</p> <p>The revised draft EIS revised reference design has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3. To support design and construction of the Project, Construction Environmental Management Plans will be developed during detailed design. Ongoing consultation will continue during all future stages of the Project.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Panel) to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel draft and final reports are publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au).</p> <p>The Queensland and Australian governments have accepted the Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The final report presents the outcomes of the Panel's review of the flood models and reference designs developed by ARTC for the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Project sections.</p> <p>ARTC has undertaken a substantial amount of work to identify existing flooding characteristics and to assess and mitigate potential impacts associated with the 4 Project sections. This work includes responding to the issues raised by the Panel in its respective draft reports. ARTC has responded to all issues raised in the draft reports, including:</p> <ul style="list-style-type: none">▶ Providing additional information which addressed the queries raised▶ Completing additional work to address issues and committing to incorporating the revised results in future documentation (specifically revised draft EIS documentation)▶ Committing to undertake additional works to address the Panel's comments and incorporating the results in future documentation (specifically revised draft EIS documentation)▶ Recommending that some issues raised are dealt with at detailed design stage. <p>A detailed summary of these issues and ARTC's responses are presented in the Issues Management Register (IMR) in Appendix A to Appendix D in the final report.</p> <p>Next steps:</p> <ul style="list-style-type: none">▶ ARTC has committed to implement the Panel's six recommendations outlined in the Final Report.▶ ARTC's flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event.▶ Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project approvals and corridor acquisition, detailed design, construction works, operations).▶ A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions.▶ Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>Revised draft EIS Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in revised draft EIS Appendix T1: Hydrology and Flooding Technical Report (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Figure 2.14 Figure 2.15 Chapter 5: Project Description Section 5.3.3 Chapter 14: Flooding and Geomorphology Section 14.4 Appendix E: Consultation Report Appendix T1: Hydrology and Flooding Technical Report Appendix A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
246	246.0001	Private	Flooding - Condamine River		The submitter is worried about flooding in the area of the proposed alignment.	1. Shift the inland rail away from flood plain. He gives maps to substantiate his argument and marks his proposed alternative route in black. 2. Minimise road crossings.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2-km-wide study area to a focused area of investigation (varying between 150 metres (m) to 1,000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and State government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.7) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering construction and operating costs Multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the <i>Corridor Options Report</i> (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) Approvals and stakeholder engagement: 12.5 per cent Technical viability: 17 per cent Safety: 16.5 per cent Constructability: 12.5 per cent operations: 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/ revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a 2-km-wide study area was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined 2-km-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS, which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. ARTC's flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event. Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project approvals and corridor acquisition, detailed design, construction works, operations). A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions. Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>Extracts from tmr.qld.gov.au/Projects/inland-rail/independent-panel-of-experts-for-flood-studies-in-queensland.</p> <p>Revised draft EIS Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in revised draft EIS Appendix T1: Hydrology and Flooding Technical Report (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Figure 2.14 Figure 2.15 Chapter 5: Project Description Section 5.3.3 Chapter 14: Flooding and Geomorphology Section 14.4 Appendix E: Consultation Report Appendix T1: Hydrology and Flooding Technical Report Appendix A
247	247.0001	Private	Flooding - Condamine River	Modelling	The submitter is concerned about the proposed rail route on the Condamine river floodplain. They have serious concerns about the flood modelling and hydrology assumptions that ARTC relied on. They rely on arguments put forward by the Independent Flood Panel Report which states that the technical report is not sufficiently comprehensive to meet the Panel's TOR. Similarly, they agree with the Toowoomba Regional Council submission that the draft EIS has not provided information regarding the expected increase in water level as a result of rail construction in an intense flood plain area. The submitter has explained to the Senate Committee members who visited their property that ARTC's computer modelled flood predictions are different to observed flood level on the Condamine River Floodplain. Despite these concerns being repeatedly raised ARTC has not addressed this concern.	Not approve the draft EISARTC should address concerns and information gaps Include an alternative route in draft EIS and open it for public consultation and comments should examine the recommendations and findings of the Senate Inquiry and final report of the Flood Panel in assessing the draft EIS.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2
247	247.0002	Private	Stakeholder Engagement		1. The submitter outlines that ARTC's approach to stakeholder engagement has been extraordinarily deficient with: 2. No consultation objectives for Condamine Floodplain 3. Poor conduct of ARTC staff during consultation 4. Consultation has not informed Project design. 5. No consultation on worker accommodation site selection or impacts 6. Future consultation with affected individuals	Nil.	<p>ARTC notes that Chapter 6: Stakeholder Engagement, Section 6 has been updated to include the consultation objectives for the Condamine floodplain. Significant consultation has been ongoing with landowners across the Condamine Floodplain including an independent review commissioned by the Southern Darling Downs Community Consultative Committee.</p> <p>ARTC employees are bound by a Code of Conduct and take complaints such as this seriously. Complaints regarding poor conduct of staff can be made through the complaints grievance process outlined on the Inland Rail webpage.</p> <p>The revised draft EIS Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report outlines the significant changes that have occurred to date due to ongoing engagement. Community engagement has influenced the development of the reference design. The Condamine floodplain crossing design has been updated to incorporate community feedback. Key changes include:</p> <ul style="list-style-type: none"> extending the proposed bridge over the North Branch by approximately 250 m north moving the proposed Yandilla rail bridge further south and combining with the proposed Grasstree Creek bridge increasing the number of proposed culverts near Yandilla grain silos to ensure the drainage channel to the south of the silos has sufficient culverts to convey flood water. <p>ARTC has carried out additional community engagement and community information sessions in relation to the three proposed non-resident workforce accommodation facilities. Details of this consultation is provided in Appendix E: Consultation Report, Section 5.11.</p> <p>As noted in Appendix T1: Hydrology and Flooding, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing changes due to Inland Rail, as well as other relevant tasks.</p>	Chapter 6: Stakeholder Engagement Section 6 Appendix E: Consultation Report Section 5.12

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
248	248.0001	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> The submitter highlights that the Brookstead Rural Fire Brigade shed, access for volunteers to this shed as well as access for a Rural Fire Brigade callout from the shed will be impacted by Inland Rail as the shed lies directly in the Inland Rail Project Footprint. However, the EIS does not acknowledge the Brookstead Rural Fire Brigade as an affected Emergency Service and fails to list the Brookstead Rural Fire Brigade Shed as a sensitive receptor. The submitter highlights that the Brookstead Rural Fire Brigade shed is omitted from the list of Emergency Services listed in the EIS and is also omitted from affected community groups. 	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Brookstead region needs to revisit decisions around rail and bridge design in the village of Brookstead, road access changes and the impact on residences, local businesses and local support groups, specifically the Brookstead Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landholders on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>ARTC notes that the QFES is included in the list of Queensland Government department and agencies in Section 2 of the Appendix E: Consultation Report. ARTC has, however, updated the SIA to include the Brookstead Rural Fire Brigade in the list of emergency services.</p> <p>The shed has not been included in the list of sensitive receptors because it does not meet the definition of such under the Environmental Protection (Noise) Policy 2019. ARTC notes that the reference design does not directly impact on the shed or access to the shed.</p> <p>Subsequent to the submission of the draft EIS, in December 2020, ARTC carried out further consultation with Brookstead stakeholders regarding proposed changes to the local road network and road/ rail interface.</p> <p>An independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>Design is an iterative process and the Project revised reference design prepared contains an appropriate level of detail for this stage of the design. ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p>	Appendix E: Consultation Report Section 2
248	248.0002	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> The submitter states that there has been no approach from ARTC to the Brookstead Rural Fire Brigade to discuss the impact of rail construction and operation and how this will impact on the local Emergency Services. The submitter highlights that the release of the EIS provides the first concrete evidence from ARTC about the location of the Brookstead Fire Brigade shed and facilities in the rail corridor as well as the expected impact on the facilities due to noise and vibration. The submitter expresses that the experience of the Brookstead region with ARTC is that they have not listened to community concerns or undertaken the stakeholder Engagement process claimed in Appendix C, EIS; specifically that the Brookstead Rural Fire Brigade has not been informed or consulted with in any way. The submitter expresses that the behaviour of ARTC, ignoring adversely affected community groups, especially volunteer Emergency Services, further erodes trust and credibility. 	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Brookstead region needs to revisit decisions around rail and bridge design in the village of Brookstead, road access changes and the impact on residences, local businesses and local support groups, specifically the Brookstead Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landholders on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>ARTC notes that a representative from the Brookstead Rural Fire Brigade was represented on the Inner Downs CCC and involved in discussions regarding the design. It further notes that it met with QFES representatives in January 2019 specifically to discuss design development, and has regular ongoing contact thorough the district disaster management coordination group.</p> <p>As detailed in Appendix T1: Hydrology and Flooding, building condition/dilapidation surveys will be undertaken at receptors that are expected to exceed the structural damage vibration criteria. ARTC notes that the revised reference design does not directly impact on the shed or access to the shed.</p> <p>Subsequent to the submission of the draft EIS, in December 2020, ARTC carried out further consultation with Brookstead stakeholders regarding proposed changes to the local road network and road/ rail interface. Engagement with emergency services has been ongoing. Maintaining access and minimising wait times at crossings for emergency services is a key concern for the community. As such, ARTC has engaged broadly to better understand the risks, refine reference design and ensure the Project minimises any impact to safety or emergency services. Engagement through local council representatives, community information sessions and CCC meetings has allowed community members and local road users to share information about how they currently use the existing road network and where they experience safety concerns.</p> <p>Appendix AC: Proponent Commitments notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>Appendix E: Consultation Report notes that the consultation approach for the Project is guided by the International Association of Public Participation (IAP2) engagement principles - also referred to as core values - which define the expectations and aspirations of the community engagement process. Design is an iterative process and the Project revised reference design prepared contains an appropriate level of detail for this stage of the design. As noted in Appendix T1: Hydrology and Flooding, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p>	Chapter 6: Stakeholder Engagement Section 6.3 Section 6.6
248	248.0003	Private - Brookstead	Social Impact Assessment		<p>The level crossing design has not been completed, hence the EIS document does not provide the necessary detail for Brookstead Rural Fire Brigade to comment on social impacts and safety concerns in the local area.</p>	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Brookstead region needs to revisit decisions around rail and bridge design in the village of Brookstead, road access changes and the impact on residences, local businesses and local support groups, specifically the Brookstead Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landholders on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>ARTC notes that a representative from the Brookstead Rural Fire Brigade was represented on the Inner Downs CCC and involved in discussions regarding the design. It further notes that it met with QFES representatives in January 2019 specifically to discuss design development, and has regular ongoing contact thorough the district disaster management coordination group.</p> <p>Building condition/ dilapidation surveys will be undertaken at receptors that are expected to exceed the structural damage vibration criteria. ARTC notes that the reference design does not directly impact on the shed or access to the shed.</p> <p>Subsequent to the submission of the draft EIS, in December 2020, ARTC carried out further consultation with Brookstead stakeholders regarding proposed changes to the local road network and road/ rail interface. Engagement with emergency services has been ongoing. Maintaining access and minimising wait times at crossings for emergency services is a key concern for the community. As such, ARTC has engaged broadly to better understand the risks, refine reference design and ensure the Project minimises any impact to safety or emergency services. Engagement through local council representatives, community information sessions and CCC meetings has allowed community members and local road users to share information about how they currently use the existing road network and where they experience safety concerns.</p> <p>Chapter 24: Draft Outline Environmental Management Plan notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>Appendix E: Consultation Report notes that the consultation approach for the Project is guided by the IAP2 engagement principles, also referred to as core values, which define the expectations and aspirations of the community engagement process. Design is an iterative process and the Project reference design prepared contains an appropriate level of detail for this stage of the design. As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required.</p> <p>The Office of Coordinator-General determined that the EIS complied with the Terms of Reference, Appendix X: Social Impact Assessment includes a comprehensive and detailed assessment of impacts to emergency services.</p> <p>Departmental representatives from QFES, SES, QAS and QPS were involved in EIS consultation (see Appendix X: Social Impact Assessment, Section 6.2). The Project will invite the Brookstead Fire Brigade to participate in future consultation (see Appendix X: Social Impact Assessment, Section 8.5.2).</p> <p>Appendix X: Social Impact Assessment, Section 8.2 notes that local Councils will be consulted about the detailed design of road-rail interfaces during the detailed design stage.</p>	Appendix X: Social Impact Assessment Section 6.2 Section 8.2 Section 8.5.2 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report
249	249.0001	Common-wealth Government	MNES		<p>The proponent has not adequately addressed DAWE's previous comments on defining habitat and identifying residual significant impact.</p>	N/A	<p>Field surveys have now been undertaken for the Project, see Chapter 11: Flora and Fauna. The revised draft EIS has been updated with refined habitat mapping for Matters of Nationals Environmental Significance (MNES) that aligns with the Commonwealth definitions of habitat, see Appendix O: Matters of National Environmental Significance Report. The detailed habitat mapping method is provided in Appendix J of Appendix O: Matters of National Environmental Significance Report.</p> <p>The revised draft EIS Chapter 11: Flora and Fauna, summarises assessment of the potential for significant residual impacts as a result of the Project on the EPBC Act controlling provisions of the Project. Assessment has been undertaken using the relevant criteria outlined in the Matters of National Environmental Significance: Significant impact guidelines 1.1– EPBC Act. Full assessment in accordance with the guidelines is provided in Appendix O: Matters of National Environmental Significance Report.</p>	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix O: Matters of National Environmental Significance Report Sections 3.4 and 7

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
249	249.0002	Common-wealth Government	MNES		Based on the information available in the latest draft EIS, the Department considers the proponent has still not adequately addressed Department's previous comments on defining habitat and identifying residual significant impact (see previous comments attached). The Department is therefore of the view that the draft EIS is inadequate to allow the Minister to determine the acceptability of the impacts of the proposed action on relevant MNES under the EPBC Act.	N/A	Further field assessments have been undertaken as part of the revised draft EIS to target threatened species, reassess the likelihood of occurrence and refine habitat mapping. The detailed methodologies employed in field surveys and habitat mapping are provided in the updated methodology Chapter 11: Flora and Fauna and Appendix O: Matters of National Environmental Significance Report. This additional information was then used to update and refine the Impact Assessments for significant residual impacts to Matters of Nationals Environmental Significance (MNES) as provided in Chapter 11: Flora and Fauna. The detailed assessments for MNES are provided in Appendix O: Matters of National Environmental Significance Report.	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix O: Matters of National Environmental Significance Report
249	249.0003	Common-wealth Government	MNES	Modelling	DAWE notes issues identified in the draft independent flood panel report relating to potential flooding impacts on habitat for listed threatened species and communities.	The draft EIS must include more information on how findings of the flood panel review impacts potential habitat within the Condamine floodplain and associated habitat for the MNES and how these impacts have been considered in the draft EIS.	Significant impact assessments have been undertaken in accordance with the EPBC Act Significant Impact Guideline 1.1, see Appendix O: Matters of National Environmental Significance Report. Flood impacts are considered as part of impact assessments for threatened ecological communities (TEC), threatened flora and fauna species. The revised draft Environmental Impact Statement (EIS) Chapter 11: Flora and Fauna discusses potential flooding impacts to Matters of State Environmental Significance (MSES) and Matters of National Environmental Significance (MNES). Impacts associated with flooding were assessed and three MNES flora species were determined to have a medium or high susceptibility and required detailed assessment, namely hairy-joint grass (<i>Arthraxon hispidus</i>), winged peppergrass (<i>Lepidium monoplacoides</i>), and small-flowered westringia (<i>Westringia parvifolia</i>). No other flora habitat, fauna habitat, or TECs were triggered for further assessment. Quantification of potential significant impacts for these three flora species represented relatively small areas of habitat outside of the Project footprint. Therefore, it is unlikely that there will be residual significant impacts on any of these three species as a result of changes to flood conditions.	Chapter 13: Surface Water Chapter 11: Flora and Fauna Appendix O: Matters of National Environmental Significance Report Section 11.3 and 11.5
249	249.0004	Common-wealth Government	MNES	Predictive habitat modelling	DAWE notes that ARTC is currently undertaking on-ground surveys.	DAWE strongly recommends use of the habitat descriptions in accordance with Commonwealth definitions to inform habitat assessments where the EPBC Act listed threatened species and ecological community are likely to be or will be impacted by the proposed action.	Habitat definitions were prepared for each threatened species with a known, likely or potential occurrence within the Project footprint, and were reviewed by species experts and underwent refinement where advised. These final habitat descriptions and mapping rules were utilised by Ausecology to produce species specific maps, which were reviewed by Ausecology, ERM, ARTC and/or species experts until all consultants were satisfied with the final mapping. The detailed habitat mapping methodology undertaken is provided in rdEIS Appendix L: Terrestrial and Aquatic Ecology Technical Report and rdEIS Appendix O: Matters of National Environmental Significance Report.	Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 3.4 and Appendix G Appendix O: Matters of National Environmental Significance Report. Section 3.4 and Appendix F
249	249.0005	Common-wealth Government	MNES		A decision on whether or not the proposed action can be approved under the EPBC Act will occur following receipt of the State's assessment report.	If the Minister believes on reasonable grounds that she does not have enough information to make an informed decision on whether or not to approve the proposed action, the Minister may request further information during the assessment period.	Noted. ARTC acknowledges that a referral under the EPBC Act will be made to the Australian Government Minister for the Environment, following which a decision on whether or not the proposed action can be approved under the EPBC Act.	N/A
249	249.0006	Common-wealth Government	MNES		The current assessment is based on 1,800 m train lengths, however the draft EIS describes the action to include a corridor of sufficient width to accommodate future possible upgrades of the track to accommodate 3,600 m trains.	Clarify the extent of clearing in the draft EIS. Identify whether clearing and ecological surveys will be undertaken for passing loops for 1,800 m trains or 3,600 m trains.	The extent of clearing for the Project is limited to the development consistent with the proposal being assessed as described in Chapter 5: Project Description, Section 5.2 and 5.3, and does not include the provision for crossing loops to accommodate 3,600 m trains. The Project Description describes the operation of double stacked rollingstock up to 1,800 m long and does not include longer trains, which would be driven by market demand and subject to applicable approvals for the corresponding change including increased lengths of crossing loops and changes to the signalling systems. The proposal being assessed as part of the Border to Gowrie revised draft EIS including the extent of clearing associated with crossing loops does not include 3,600 m trains.	Chapter 5: Project Description Section 5.2 Section 5.3
249	249.0007	Common-wealth Government	MNES		The draft EIS states that pre-construction activities and early works will commence in 2021. Early works must not commence until the Commonwealth Minister for the Environment determines whether or not to approve the action.	Include what activities will form part of the early works and pre-construction activities and proposed timing for those activities. Clarify if early works form part of the referred action.	The submitters issue is noted and confirmed. Chapter 5: Project Description of the revised draft EIS has been updated to include details regarding staging activities. Staging activities are further detailed according to the respective technical requirements in each technical chapter, Chapters 8-22.	Chapter 5: Project Description Chapters 8-22
249	249.0008	Common-wealth Government	MNES	Survey effort/ field investigation data	The draft EIS indicates that the location of terrestrial and aquatic survey sites was dictated by land access agreements with landholders and that this has significantly reduced the areas that were accessible to ecological investigations.	Provide more information on how mapping was validated when access to identified habitats was not permitted and how it has been addressed to identify potential impact on MNES. The departments position regarding inability to access an area due to landholder requirements, is that if habitat is present, species presence is assumed, unless there is evidence to justify otherwise.	Additional ecology surveys were undertaken which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods of these surveys are detailed in Chapter 11: Flora and Fauna. The full survey reports are available in Appendix A of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.	Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix A Appendix O: Matters of National Environmental Significance Appendix A
249	249.0009	Common-wealth Government	MNES	Survey effort/ field investigation data	Figures 3.3 (a-d) include survey locations that are outside of the impact assessment area and targeted surveys have not been undertaken to confirm the presence/ absence of habitat or species. The draft EIS does not have enough information on how the habitat was defined during those previous investigations and whether survey methodologies were adequate in accordance with the Commonwealth/State guidelines.	The department considers that in the absence of onground survey data and for the purposes of assessment under the EPBC Act, the assessment should take a precautionary approach to identifying all potential habitat for protected matters and assume that listed species (or their habitat) and ecological communities are present within the action site until surveys are undertaken to confirm or rule out relevant habitats based on habitat type or quality. Provide previous field investigations including habitat assumptions and survey guidelines that were used to develop the predictive habitat modelling as part of the draft EIS.	Additional ecology surveys were undertaken which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build on the studies undertaken for the draft EIS, and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods of these surveys are detailed in Chapter 11: Flora and Fauna. The full survey reports are available in Appendix A of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix A Appendix O: Matters of National Environmental Significance Appendix A
249	249.0010	Common-wealth Government	MNES	Predictive habitat modelling	Section 5.2.1.15 states that potential hydrology and flooding changes are not expected to impact habitat for MNES species or TECs in more than a minor and transient manner. However the draft independent flood panel report noted multiple instances of increases in level occurring that are well in excess of the acceptable limits nominated as flood impact objectives. This report further identified issues with flood modelling, estimation of flows and impacts on local catchment areas. The department notes that the Project crosses the Condamine River Floodplain which provides habitat for several listed threatened species and communities, based on the conclusions of the draft independent flood panel report the department considers that there is potential that the draft EIS has not identified all potential impacts from flooding on MNES.	Further information is needed to justify conclusions reached on whether or not the proposed action will result in surface water and hydrology, and groundwater impacts on the Condamine River Floodplain and the habitat present for the MNES.	Significant impact assessments have been undertaken in accordance with the EPBC Act Significant Impact Guideline 1.1, see Appendix O: Matters of National Environmental Significance Report. Flood impacts are considered as part of impact assessments for threatened ecological communities (TEC), threatened flora and fauna species. The revised draft Environmental Impact Statement (EIS) Chapter 11: Flora and Fauna discusses potential flooding impacts to Matters of State Environmental Significance (MSES) and Matters of National Environmental Significance (MNES). Impacts associated with flooding were assessed and three MNES flora species were determined to have a medium or high susceptibility and required detailed assessment, namely hairy-joint grass (<i>Arthraxon hispidus</i>), winged peppergrass (<i>Lepidium monoplacoides</i>), and small-flowered westringia (<i>Westringia parvifolia</i>). No other flora habitat, fauna habitat, or TECs were triggered for further assessment. Quantification of potential significant impacts for these three flora species represented relatively small areas of habitat outside of the Project footprint. Therefore, it is unlikely that there will be residual significant impacts on any of these three species as a result of changes to flood conditions. The Project impacts on hydrology and flooding are further discussed in the revised draft EIS Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2.	Chapter 11: Flora and Fauna Sections 11.5 and 11.7 Chapter 13: Surface Water Appendix T1: Hydrology and Flooding Technical Report - Volume 1
249	249.0011	Common-wealth Government	MNES	Survey effort/ field investigation data	Mapping of threatened ecological communities is based on State based RE mapping and the draft EIS did not ground-truth these REs. Section 3.2.5 states that analogous vegetation communities (i.e. remnant and regrowth REs were identified which were then used to spatially map out the extent of each of the identified TECs and Table 3.3. <ul style="list-style-type: none"> Identified TECs and the analogous REs (both remnant and high value regrowth) were used to map each of the TECs. The department notes that the commonwealth definition may include broader areas than regrowth and HVR vegetation. The draft further notes that key diagnostic characteristics and condition thresholds in the SPRAT and conservation advice for respective Commonwealth listed TECs have not been considered in identifying all TECs present within the Project disturbance footprint (please refer to department's comments previous comments attached). Section 4.3.1.3 states that Weeping myall woodlands and Poplar box woodlands TECs occur within the impact assessment area and Project footprint, however the occurrence of these communities could not be confirmed due to a lack of property access at the time of Project surveys. The draft EIS concludes that some TECs are unlikely to be impacted despite of their presence within the impact assessment area. For example, the Natural Grassland TEC and White Box-Yellow Box-Blakely's Red Gum Grassy Woodland TEC are indicated as occurring within the impact assessment area but not within the Project footprint. The draft EIS must include on-ground surveys to confirm the TECs are not present within the Project footprint. Table 8.4 states that if the absence of this TEC is confirmed by surveys, the Project will not reduce the extent of an occurrence of this community. Please note: the threshold at which impacts must be considered and either mitigated or offset is where there is a non-trivial risk that the impact may occur. Uncertainty is not grounds for dismissing an impact nor for deeming the risk of its occurrence trivial. If the draft EIS cannot demonstrate that the risk of a particular impact is trivial, the department will need to assume the impact is likely to occur. 	Include an assessment against key diagnostic criteria and condition thresholds in the SPRAT and conservation advice for respective TECs in the draft EIS to confirm presence or absence of each ecological community. Please clarify whether key diagnostic characteristics and condition thresholds in the SPRAT and conservation advices for respective TECs were considered in identifying the extent and presence of all TECs within the Project disturbance footprint. Include a series of maps in the draft EIS showing: <ul style="list-style-type: none"> ground-truthed regional ecosystems including areas of respective REs The Project area and all surrounding environments(vegetated and non-vegetated), with the outline of the Project area encompassing all components (temporary as well as permanent); and Site topography and all known or anticipated drainage routes, for both the pre-construction and post-construction states of the Project site (including drainage from any offsite supporting infrastructure, such as access roads); All areas both on site and in the surrounding area comprising or potentially comprising a listed ecological community or habitat for a listed threatened species, regardless of the quality or intactness of those areas; All survey plots and locations (including but not limited to Bio Condition transects, the route of any site meanders, any trapping locations, etc.); A quantification in hectares of each area required to be mapped above. 	The revised draft Environmental Impact Statement (EIS) includes an assessment against the key diagnostic criteria and condition thresholds as defined in the SPRAT and conservation advice for relevant threatened ecological communities (TEC) see Appendix I of Appendix O: Matters of National Environmental Significance Report. Areas of ground-truthed TEC) are discussed in Appendix O: Matters of National Environmental Significance Report. A discussion of potential impacts to threatened ecological communities (TECs) is presented in Appendix O: Matters of National Environmental Significance Report.	Appendix O: Matters of National Environmental Significance Report Section 3.2, 4.2 and 7.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
249	249.0012	Common-wealth Government	MNES	Survey effort/ field investigation data	<p>The department considers that without demonstration that field surveys are adequate (i.e. conducted in accordance with recommended survey guidelines, and across the entire proposed action site), it is not appropriate to use occurrence records to determine (or exclude areas as) potential habitat for a species.</p> <p>▶ The department notes that 'potential habitat' has been defined on the basis of the presence of individuals or species records. However, the department notes that potential habitat should also consider the availability of suitable habitat (not only the presence of species) for foraging, breeding, dispersal etc activities by species.</p> <p>▶ Habitat has not been defined in accordance with Commonwealth guidelines. Furthermore, habitat critical/ important population has not been defined in accordance with Commonwealth guidelines for some of the species. Please refer to department's previous comments for example (attached).</p> <p>▶ In accordance with the EPBC Significant Impact Guidelines, habitat critical to the survival of the species refers to areas that are necessary:- for activities such as foraging, breeding, roosting, or dispersal- for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators) - to maintain genetic diversity and long-term evolutionary development, or for the reintroduction of populations or recovery of the species or ecological community. As such, the department considers that there may be instances where the total habitat areas for protected matters may be greater than what is estimated in Table 4.4. Nonetheless, for the purposes of assessment under the EPBC Act, the 'total habitat areas' (where it met Commonwealth definition) presented in the draft EIS will be used as part of the department's assessment of impacts on protected matters until detailed on-ground surveys have been undertaken to confirm the presence or absence of species and communities against Commonwealth guidelines. Such habitat may be, but is not limited to, habitat identified in a recovery plan for the species or ecological community.</p> <p>▶ And as previously advised, the Queensland Regional Ecosystems can be used to inform what is considered potential habitat however the extent of habitat present must be determined against relevant Commonwealth definitions (please see department's previous comments attached for examples).</p>	<p>Revise and update the draft EIS to include definition of habitat for impacted matters in accordance with Commonwealth definition. This definition must be considered during on-ground surveys. Review the draft EIS and provide references where local extinction has been used. The department notes that in the absence of a definition for critical habitat for the species important population has been defined by applying a 1 km buffer on known records that intersect potential habitat for several species. For example, <i>Macrozamia machinii</i>. The draft EIS states that Project may impact 77.22 ha of potential habitat, however Table 8.16 states that no habitat critical to the survival of the species has been identified (under the approach used for this assessment) and that there will be no significant impact to the species. The Conservation Advice for <i>Macrozamia machinii</i> states that there are eight known populations of <i>M. plurinervia</i> occurring near Inglewood, in the Darling Downs district of south-eastern Queensland. the Conservation Advice does not define important population, therefore all habitat must be considered. It is noted that the survey efforts did not identify any records. Where survey results have been used to determine absence/ presence of a species, detailed survey efforts must be included to enable the review of the adequacy of those survey efforts. Table 2.1 concluded some species unlikely to occur however does not include evidence/ justification for this conclusion. For example, Table 2.1 states that <i>Macrozamia conferta</i> is unlikely to occur, only known from very restricted small populations located outside the range of the Project. The Conservation Advice for <i>Macrozamia conferta</i> states that this species occurs within the Condamine (Queensland) Natural Resource Management region. Please provide more information whether the Project site is located within the Condamine (Queensland) Natural Resource Management region. The Conservation Advice further identifies three known population, where is the Project footprint in relation to these known population. The Conservation Advice further states that distribution of this species overlaps with the White Box-Yellow Box-Blakelys Red Gum Grassy Woodland and Derived Native Grassland EPBC Act-listed threatened ecological community. Where the draft EIS concluded that a species is unlikely to occur evidence/ justifications must be included in the draft EIS to support this conclusion. The draft EIS notes that this TEC is present within the impact assessment area. Please review and update the draft EIS accordingly. Table 4.4 included habitat within the Project footprint for several species that has not been considered as significantly impacted. For example, Grey-headed Flying-fox, Greater Glider, Tara Wattle, Grey Falcon (please see departments previous comments on some of these species). The department notes that Recovery Plan for Grey-headed Flying-fox came into effect on 19 March 2021 the draft EIS needs to update to address the recovery plan for the species.</p>	<p>Field surveys have now been undertaken for the Project, see Chapter 11: Flora and Fauna. The revised draft Environmental Impact Statement (EIS) has been updated with refined habitat mapping for MNES that aligns with the Commonwealth definitions of habitat, see Appendix O: Matters of National Environmental Significance Report. The detailed habitat mapping method is provided in Appendix J of Appendix O: Matters of National Environmental Significance Report.</p> <p>The revised draft EIS Chapter 11: Flora and Fauna, summarises assessment of the potential for significant residual impacts as a result of the Project on the EPBC Act controlling provisions of the Project. Assessment has been undertaken using the relevant criteria outlined in the Matters of National Environmental Significance: Significant impact guidelines 1.1– EPBC Act. Full assessment in accordance with the guidelines is provided in Appendix O: Matters of National Environmental Significance Report.</p>	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix O: Matters of National Environmental Significance Report
249	249.0013	Common-wealth Government	MNES	Terrestrial flora	<p>Section 8.2.2 states that an initial assessment was undertaken to determine whether an 'important population' is present in the impact assessment area. Where an 'important population' is considered not to be present an assessment against the Significant impact guidelines was not undertaken. The department acknowledges that the significant impact criteria for vulnerable species in the EPBC Act Significant Impact Guidelines 1.1 includes a number of criteria that refer to 'important populations'. An 'important population' for vulnerable species is defined as a population that is necessary for a species' long-term survival and recovery, which may include populations identified as such in recovery plans. However, the department notes that only three out of the nine significant impact criteria for a vulnerable species refers to impacts on 'important populations'.</p>	<p>Please ensure that conclusions made about the presence/ absence of important populations are supported by evidence, best available scientific literature and survey data. For all vulnerable species that may, or are likely to occur, within or adjacent the action area, please ensure that the draft EIS includes an assessment for these species. Whilst the department notes there may reasonable justification that some species are unlikely to be impacted by the proposed action. However, in the absence of on-ground survey data or sufficient information to demonstrate absence, the Department considers that, for the purposes of assessment under the EPBC Act, it is appropriate assume that those listed species are present and may be impacted.</p>	<p>Field surveys have now been undertaken for the Project, see Chapter 11: Flora and Fauna. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements.</p> <p>The revised draft Environmental Impact Statement (EIS) Chapter 11: Flora and Fauna, summarises assessment of the potential for significant residual impacts as a result of the Project on the EPBC Act controlling provisions of the Project. Assessment has been undertaken using the relevant criteria outlined in the Matters of National Environmental Significance: Significant impact guidelines 1.1– EPBC Act. Full assessment in accordance with the guidelines is provided in Appendix O: Matters of National Environmental Significance Report.</p>	Chapter 11: Flora and Fauna Appendix O: Matters of National Environmental Significance Report
249	249.0014	Common-wealth Government	MNES		<p>The MNES Chapter had concluded that significant impacts are unlikely on a number of species. This assessment was undertaken against the Significant Impact Guidelines, however there is not enough justification or evidence that supports the conclusion (please refer to Department's previous examples in attached comments). In the absence of on-ground survey data to confirm whether the species is present within the Project footprint and the extent of habitat available, the department considers that a precautionary approach should be taken in assessing potential impacts. Please note that residual significant impacts are the residual impacts following avoidance and mitigation measures. For example, if significant impacts are likely on 200 ha of habitat but impact on 50 ha is avoided through avoidance and mitigation, the residual significant impact is 150 ha.</p>	<p>As noted above, the total habitat areas will be considered as the area of potential habitat (where it met Commonwealth definition) to be impacted in the absence of detailed on-ground surveys. Therefore, Table 1.1 may not be an accurate reflection of the residual significant impacts on species. The department further notes that Table 1.1 considered significant residual impact on potential habitat for some species and considered only habitat critical for some species. As mentioned above, habitat critical has not been defined in accordance with the statutory documents in many cases therefore, there is a potential that the draft EIS has underestimated the impact on habitat present within the Project footprint.</p>	<p>Field surveys have now been undertaken for the Project, see Chapter 11: Flora and Fauna. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements.</p> <p>Significant residual impact assessments have been revised based on field survey results. The revised draft Environmental Impact Statement (EIS) Chapter 11: Flora and Fauna, summarises assessment of the potential for significant residual impacts as a result of the Project on the EPBC Act controlling provisions of the Project. Assessment has been undertaken using the relevant criteria outlined in the Matters of National Environmental Significance: Significant impact guidelines 1.1– EPBC Act. Full assessment in accordance with the guidelines is provided in Appendix O: Matters of National Environmental Significance Report.</p> <p>Project impacts and the significant residual impact and habitat quality scoring per matter for the Border to Gowrie Project are detailed in Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie.</p>	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix O: Matters of National Environmental Significance Report Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie
249	249.0015	Common-wealth Government	MNES		<p>The draft EIS defines permanent impact that will last in excess of 21 years.</p>	<p>Please note that any potential listed threatened species and/or ecological communities that may occur and are potentially impacted in the Project area must be considered in the draft EIS regardless of the duration. The department strongly recommends removing this definition from the draft EIS.</p>	<p>The definition for permanent impact has been revised to in excess of 100 years in accordance with classifications provided in <i>Preparing an environmental impact statement: Guideline for proponents</i> (DSDI, 2024) as no such schedule is listed in the Commonwealth documentation.</p>	Appendix O: Matters of National Environmental Significance Report
249	249.0016	Common-wealth Government	MNES	Offsets	<p>The department notes that the offsets Strategy in the draft EIS refers to the residual significant impact summary for protected matters (Table 2 Potential MNES values impacted within Brigalow Belt and South East Queensland Bioregions).</p> <p>Please note that the assessment of impacts will be undertaken against relevant Commonwealth guidelines and definitions. Residual significant impacts as a result of this assessment may differ from the conclusions reached by ARTC in the report, and therefore offset requirements may be less or greater than what is predicted in the report</p>	<p>Please update the offsets strategy to address department's comments.</p>	<p>The updated Border to Gowrie Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie (EODS) has been developed to align with both Commonwealth and State environmental offset policies and guiding principles. The Border to Gowrie EODS has been developed to predict the likely offset obligations and requirements based on the predicted Significant Residual Impacts (SRI) for MNES and MSES in conjunction with habitat quality (impact and offset) and those relevant assessment metrics and calculations for each respective Commonwealth and State matter. A Project Habitat Quality Assessment Report is included in the revised draft EIS and will inform assessment methodologies for both Matters of National Environmental Significance (MNES) and Matters of State Environmental Significance (MSES) across impact and offset matters.</p>	Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie
250	250.0001	Private	Groundwater		<p>Inland Rail has advertised in a border magazine about supplying water from farmers and others up to 20 km. The submitter thinks that it is better to install bores on dams every 20 km or less on rail route. This way to cart water would then be there for future use.</p>	<p>Nil.</p>	<p>As part of ARTC's construction water planning process, construction water procurement studies are ongoing including options analysis (Chapter 5: Project Description, Section 5.6.24). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements Report. As part of these works, estimates of water usage are being calculated.</p> <p>Currently the hierarchy of options for construction water supply prioritises non-potable sources to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20 and Table 8.2 of Appendix U: Groundwater Technical Report).</p>	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Table 15-20 Appendix B5: Construction Water Requirements Report Appendix U: Groundwater Technical Report Table 8.2
251	251.0001	Private - Brookstead	Social Impact Assessment	Modelling	<p>▶ The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.</p> <p>▶ The SIA survey does not represent views of the community members who may be impacted by the Project.</p>	<p>The SIA Survey should be repeated.</p>	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
251	251.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during the detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
251	251.0004	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix V: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>
251	251.0006	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD, 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, Section, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East Intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway Intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 4</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Section 6.4</p>
252	252.0001	Private - Brookstead	Flora and Fauna	Koala	<ul style="list-style-type: none"> The EIS fails to identify the extent and significance of the known habitat of Koalas that exist adjacent to the proposed IR corridor from Millmerran to Gowrie – B2G. The oldest residents of this district can confirm, that there have always been significant numbers of Koalas at Yarranlea. On either side of the proposed IR corridor, thriving communities of Koalas have been identified and noted by members of the Pittsworth Landcare groups, and interested individuals at numerous locations from Millmerran to Gowrie. Their findings have been sent to relevant groups to be officially recorded. 	<p>The draft EIS submitted by ARTC should be rejected on the grounds that it does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. A review should be made of the entire alignment of the Millmerran to Gowrie route to have it rerouted and avoid the possible destruction of a vulnerable/ endangered species like the Koala.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report outlines that a review of existing literature and previous studies was conducted, which included gathering information on species diversity, abundance and distribution. Field surveys were also conducted to verify the presence of threatened species and ecological communities within the impact assessment area. As noted in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report, a species-specific impact assessment approach has been developed to assess impacts on Koala populations for the Queensland sections of the Inland Rail Project. This approach guided the identification of Koala habitat within the Project footprint, refined habitat mapping, key threats and impacts associated with the Project to inform the significant impact assessment for the species. Mitigation measures and controls have been factored into the Project to reduce the impact on the affected species.</p> <p>Since the submission of the draft Environmental Impact Statement (EIS), ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan.</p> <p>In addition, ARTC has commenced two key research initiatives relating the Koala (<i>Phascolarctos cinereus</i>) to better understand populations, potential impacts and to develop targeted mitigation and management measures. Regarding the proposed solution, ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study of Koala genetics that focuses on population genetics and dietary analysis for Koalas across eight of the Inland Rail Projects. The purpose of this study to:</p> <ul style="list-style-type: none"> Increase baseline data on Koala population resilience and restoration requirements. Informs Koala conservation controls as required in conditions of approval. Informs fauna connectivity plans. Informs Koala offset management decisions. Contribute to Infrastructure Sustainability Council credits. 	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5, 11.6 and 11.7</p> <p>Appendix E: Consultation Report</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
252	252.0002	Private - Brookstead	Flora and Fauna	Mitigation measures	<ul style="list-style-type: none"> The submitter states that animals like Koalas have adapted to the vegetation species found in their individual territory and in other parts of Australia, it has been shown that attempts to relocate this species, have resulted in high mortality rates. The submitter states that the EIS has not identified mitigation measures that they would adopt to maintain the well-being of fauna impacted by the IR in this locality. 	<p>The draft EIS submitted by ARTC should be rejected on the grounds that it does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. A review should be made of the entire alignment of the Millmerran to Gowrie route to have it rerouted and avoid the possible destruction of a vulnerable/ endangered species like the Koala.</p>	<p>Revised draft EIS Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report provide strategies that have been used to minimise impacts through the design stage of the Project to avoid habitat for threatened species wherever possible. As the Project moves into the detailed design and construction stages, more focused and comprehensive ecological surveys will be undertaken. Along with informing the design and construction, these will include specific measures to avoid, mitigate, minimise impacts on Koala, along with ongoing monitoring activities (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report).</p> <p>Opportunities for the provision of fauna movement solutions have been identified in Appendix P: Fauna Connectivity Strategy. These include fencing strategies to guide species such as Koala to safe movement opportunities and will be refined through the detailed design process.</p> <p>Additional detailed mitigation measures, including measures to protect fauna, including specific measures for the Koala, during clearing of vegetation and habitat are addressed in Appendix N: Draft Fauna Management Plan and Appendix M: Draft Koala Management Plan.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
252	252.0003	Private - Brookstead	Flora and Fauna		<ul style="list-style-type: none"> The draft EIS submitted by ARTC should be rejected on the grounds that it does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. A review should be made of the entire alignment of the Millmerran to Gowrie route to have it rerouted and avoid the possible destruction of a vulnerable/ endangered species 	<ul style="list-style-type: none"> The submitter highlights that species such as the grey kangaroo and several different wallabies of the 9 species found on the Eastern Darling Downs, can be found in this location as well. Their movements noted are often seasonal. The submitter states that they have observed movements of the grey kangaroos and wallabies to and from the upland areas to the east and south of the Yarranlea siding, in the decades they have lived at 'Oak Park'. The submitter highlights that the uplands have been identified as an area of extreme cutting and filling by IR, which will destroy the landscape and vegetation features familiar to them. 	<p>Since the submission of the draft Environmental Impact Statement (EIS), ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages.</p> <p>Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures to protect vulnerable and endangered species.</p> <p>Appendix P: Fauna Connectivity Strategy, Section 3 and Section 6 identify the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingleswood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-Sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: Volume 1 and 2 (DTMR, 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete; however, five different mitigation scenarios have been proposed and evaluated as part of the revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy).</p> <p>The Draft Koala Management Plan (DKMP) provided specific details how ARTC propose to deal with Koalas that are located within the construction footprint. Translocation of Koalas to new areas will not be used as a preferred strategy. Additional management and mitigation measures are outlined in Chapter 24: Draft Outline Environmental Management Plan. The standalone Draft Fauna Management Plan (Appendix N: Draft Fauna Management Plan) outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p> <p>Regarding the proposed solution, the preferred location for the proposed Project rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering construction and operating costs Multi-criteria analysis (MCA), including detailed environmental considerations. <p>As described in Section 2.8 and 2.9 of Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in revised draft EIS, Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale Section 2.8</p> <p>Section 2.9</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 10</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
252	252.0004	Private - Brookstead	Flora and Fauna		<ul style="list-style-type: none"> The draft EIS submitted by ARTC should be rejected on the grounds that it does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. A review should be made of the entire alignment of the Millmerran to Gowrie route to have it rerouted and avoid the possible destruction of a vulnerable/ endangered species like the Koala. 	<p>The submitter highlights the concern of severe impact by the bank to be built by Inland Rail from Longhurst Lane to the overpass over the Yarranlea Road which is a huge structure that will split the habitat and potentially cause severe soil degradation to farms in this area. The submitter states that it will affect the movement of particularly the Koala, but also the other native species.</p>	<p>Since the submission of the draft Environmental Impact Statement (EIS), ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages.</p> <p>Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures to protect vulnerable and endangered species.</p> <p>Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingleswood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-Sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: Volume 1 and 2 (DTMR, 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete; however, five different mitigation scenarios have been proposed and evaluated as part of the revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy).</p> <p>The Draft Koala Management Plan (DKMP) provided specific details how ARTC proposes to deal with Koalas that are located within the construction footprint. Translocation of Koalas to new areas will not be used as a preferred strategy. Additional management and mitigation measures are outlined in Chapter 24: Draft Outline Environmental Management Plan. The standalone Draft Fauna Management Plan (Appendix N: Draft Fauna Management Plan) outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p> <p>Regarding the proposed solution, the preferred location for the proposed Project rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering construction and operating costs Multi-criteria analysis (MCA), including detailed environmental considerations. <p>As described in Section 2.8 and 2.9 of Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in revised draft EIS, Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale Section 2.8</p> <p>Section 2.9</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 10</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
252	252.0005	Private - Brookstead	Flora and Fauna	Mitigation measures	<ul style="list-style-type: none"> The draft EIS submitted by ARTC should be rejected on the grounds that it does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. A review should be made of the entire alignment of the Millmerran to Gowrie route to have it rerouted and avoid the possible destruction of a vulnerable/ endangered species like the Koala. 	<p>The EIS does not include any reference to Exclusion fencing in this location.</p>	<p>Since the submission of the draft Environmental Impact Statement (EIS), ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages.</p> <p>Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures to protect vulnerable and endangered species.</p> <p>Appendix P: Fauna Connectivity Strategy identify the location of proposed fauna crossing opportunities for species such as Koala. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
253	253.0001	Private - Brookstead	Noise and Vibration	operational rail noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents due to the on-going noise and vibration from the rolling stock combined with additional signals from alarm bells and train horns, resulting in daytime disruptions and night-time sleep disturbance. The height of structures over the Oakley to Pittsworth Road and Lochabar Road will mean that operational Noise will be disturbingly audible to more residents than have been identified in the Noise Abatement Section of the EIS Appendix T 15.4.4. The 5 laybys of varying area to be located in close proximity to the township, will result in considerable machinery movements, another source of noise and dust and a potential impediment to the movement of local traffic. Vibration of a train of the length and tonnage has not been quantified. Vibration and noise that will affect the entire town population, during the driving of piles to the required depth.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment – Railway operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. See Section 16.8 and Section 16.10 within Chapter 16: Noise and Vibration, Railway Noise Assessment.</p> <p>Ground borne vibration is assessed in Appendix W: Noise and Vibration Assessment – Railway operations, Section 11. It is identified that any receivers with 12 m from the alignment has potential to exceed the human comfort criteria. Further assessment of these impact is recommended during the detailed design stage to verify the screening assessment outcomes.</p> <p>ARTC acknowledges that during the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well-being, ARTC has partnered with various private health networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 16: Noise and Vibration Section 16.8 Section 16.10 Chapter 17: Social Chapter 24: Draft Outline Environmental Management Plan Appendix W: Noise and Vibration Assessment - Railway Operations Section 13 Section 17
253	253.0004	Private - Brookstead	Social Impact Assessment	Property Devaluation	Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. Families with young children living on the northern side of the town will be impacted by real estate devaluation.	Review the entire alignment, this route is not suitable.	<p>The Terms of Reference for the Border to Gowrie EIS require that the selected alignment is assessed.</p> <p>The revised draft EIS is unable to provide advice on individual property values. Property owners' concerns about the potential for impacts on the value of their properties is acknowledged in revised draft EIS Appendix X: Social Impact Assessment, Section 7.1.9. As noted, property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to, e.g. employment centres.</p>	Appendix X: Social Impact Assessment Section 7.1.9
253	253.0005	Private - Brookstead	Stakeholder Engagement		ARTC has failed to engage with residents and inform them of the impacts of the train noise and vibration.	<p>The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.</p>	<p>Stakeholder engagement regarding noise and vibration is ongoing as ARTC continues to progress noise modelling, noise impact assessments and baseline monitoring as part of developing the revised draft EIS and design for the Project.</p> <p>In October 2019, ARTC held targeted engagement across the alignment on the draft reference design which included noise impacts of the Project. The engagement campaign delivered nine community information sessions attended by 193 stakeholders, individualised letters and phone calls to all identified sensitive receptors, two CCC meetings, a factsheet and an ENews story.</p> <p>Updated noise modelling has been undertaken as part of the updates for the revised draft EIS. This updated modelling will be supported by an engagement plan and will include the delivery of updating noise modelling information to all sensitive receptors and one on one meetings with sensitive receptors as required.</p> <p>This engagement will enable stakeholders to better understand the noise levels at their specific location, and ask questions about mitigation measures which will be further developed during detailed design.</p> <p>A summary of these tools is detailed in Appendix E: Consultation Report, Section 5. ARTC will continue to develop and refine the construction methodology to minimise noise and vibration impacts to sensitive receptors. The results of refined construction noise and vibration modelling will be communicated to potentially affected residents and occupants (sensitive receptors) where noise criteria is exceeded.</p>	Appendix E: Consultation Report Section 5
254	254.0001	Private - Brookstead	Flora and Fauna	Koala	<ul style="list-style-type: none">▶ The EIS fails to identify the extent and significance of the known habitat of Koalas that exist adjacent to the proposed IR corridor from Millmeran to Gowrie – B2G.▶ Historically Koalas have been in the Yarranlea and it has been identified that on either side of the proposed corridor there is a significant Koala habitat, described as a thriving community.▶ Recent surveys/studies of the identified habitat revealed that their movement from a possible breeding zone to other locations within the area proves the importance of the location to their survival as a species.▶ The Pittsworth Landcare and observations of local residents, have identified the extent of their habitat and the significance of numbers residing in close proximity to the IR corridor and these findings have been forwarded to appropriate groups to be officially recorded for future reference.▶ The submitter states that much of the Darling Downs is treeless plain therefore it is imperative that any Koala habitat is preserved, not destroyed by a proposed Project such as IR.	Failure to reroute the alignment of the Inland Rail will lead to the destruction of the habitat of the Koalas for some 100 kilometres of identified corridor through which the rail line is proposed. All attempts must be made to preserve the territories of this vulnerable/ endangered species. Development of this magnitude will surely lead to high mortality rates and their ultimate demise in the identified locality.	<p>Appendix O: Matters of National Environmental Significance. of the revised draft EIS, outlines the assessment undertaken to determine the degree of significance of impacts on Koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements.</p> <p>Post the release of the draft Environmental Impact Statement (EIS), ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ Ability to enhance the Inland Rail service offering▶ construction and operating costs▶ Multi-criteria analysis (MCA), including detailed environmental considerations. <p>As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9 of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in EIS, Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works stage. 254	254.0003	Private - Brookstead	Noise and Vibration	Koala	The submitter highlights that Movement, noise of trains and the machinery during the construction phase, will severely impact on Koala movements. Because of the close proximity of the habitat to the designated corridor, there would also be destruction of the vegetation which provides their food, creating an unviable environment to ensure their survival. The submitter highlights that there will be severe impact on Koala's movements north and south of the line, whilst the noise will be extremely alien to the relatively quiet rural environment to which they are accustomed as a result of the 11 trains per day and 8 per night, predicted in 2026.	Failure to reroute the alignment of the Inland Rail will lead to the destruction of the habitat of the Koalas for some 100 kilometres of identified corridor through which the rail line is proposed. All attempts must be made to preserve the territories of this vulnerable/endangered species. Development of this magnitude will surely lead to high mortality rates and their ultimate demise in the identified locality.	<p>The revised draft EIS has been updated to assess the potential impacts to native fauna from noise and vibration generated during both construction works and operations stages.</p> <p>Chapter 16: Noise and Vibration, Section 16.8 states, the relevant noise and vibration codes of practice, standards and guidelines that apply to Inland Rail do not provide criteria, limits, or procedures to assess noise and vibration impacts to native fauna during the construction and operation of the Project.</p> <p>To provide a detailed assessment of noise and vibration impacts to fauna, an assessment which identified levels of expected noise and vibration, hearing range for multiple species and a review of behavioural responses available from published literature was carried out and is discussed in Section 5.2 of Appendix O: MNES Report and Section 16.8 of Chapter 16: Noise and Vibration.</p> <p>The review provided discussion on the amplitude (loudness), duration (pulse) and intensity (dB) characteristics of construction and ground-borne vibration to describe how such emissions could impact native fauna. The assessment determined that, whilst noise and vibration can be a source of possible impact, the effects of any impacts were not significant due to the low duration and intensity of the noise. Refer to Chapter 16: Noise and Vibration, Section 16.8 and Chapter 11: Flora and Fauna, Section 11.5 and Section 11.6.</p>	Chapter 11: Flora and Fauna Sections 11.5, 11.6 Chapter 16: Noise and Vibration Section 16.8 Appendix O: MNES Report Section 5.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
254	254.0004	Private - Brookstead	Flora and Fauna	Mitigation measures	<ul style="list-style-type: none">The submitter highlights that the relocation of Koalas cannot be done without causing severe mortality, so any proposal to use offsets as a mitigation measure would not be a viable option.The submitter highlights that in many instances a site for relocation would be many kilometres from their existing ecosystems and such attempts at relocation in other parts of Australia have resulted in high mortality rates to this vulnerable species.The submitter states that ARTC fails to identify the details of the design of structure that they contend would facilitate their movement in the EIS.The submitter highlights that wild-life carers, express the importance of native fauna returning to its own territory and that the ecosystem of the Yarranlea area and other sites along the route from Millmeran to Gowrie in the B2G section, contains a diversity of vegetation that provides food to which Koalas have adapted, proving the importance of the unique biodiversity of their territory.	Failure to reroute the alignment of the Inland Rail will lead to the destruction of the habitat of the Koalas for some 100 kilometres of identified corridor through which the rail line is proposed. All attempts must be made to preserve the territories of this vulnerable/ endangered species. Development of this magnitude will surely lead to high mortality rates and their ultimate demise in the identified locality.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures to protect vulnerable and endangered species.</p> <p>Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: Volume 1 and 2 (DTMR, 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete; however, five different mitigation scenarios have been proposed and evaluated as part of the revised Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy).</p> <p>The Draft Koala Management Plan (DKMP) provided specific details on how ARTC proposes to deal with Koalas that are located within the construction footprint. Translocation of Koalas to new areas will not be used as a preferred strategy. Additional management and mitigation measures are outlined in Chapter 24: Draft Outline Environmental Management Plan. The standalone Draft Fauna Management Plan (Appendix N: Draft Fauna Management Plan) outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p> <p>Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">Ability to enhance the Inland Rail service offeringconstruction and operating costsMulti-criteria analysis (MCA), including detailed environmental considerations. <p>As described in Chapter 2: Project Rationale, Section 2.8 and 2.9 of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
254	254.0005	Private - Brookstead	Flora and Fauna	Koala	The submitter states that ARTC lacks credibility with respect to the statement in the EIS that cleared land for agricultural and pastoral purposes has led to the situation where fauna like Koala have vacated the area and the insinuation that the rail line will not make things worse.	Failure to reroute the alignment of the Inland Rail will lead to the destruction of the habitat of the Koalas for some 100 kilometres of identified corridor through which the rail line is proposed. All attempts must be made to preserve the territories of this vulnerable/ endangered species. Development of this magnitude will surely lead to high mortality rates and their ultimate demise in the identified locality.	<p>Notwithstanding that the preferred location for the proposed Border to Gowrie rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community (Chapter 2: Project Rationale, Section 2.8 of the revised draft EIS), since the draft EIS, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to Reference Design since draft EIS to reflect the alignment maturity.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works stage. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p>	Chapter 2: Project Rationale Section 2.8 Appendix B3: Changes to Reference Design since draft EIS Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
256	256.0001				Description of the identified bushfire hazard areas within the area of impacts assessment, including potential future hazard based on SPP IMS BPA map. Summary of potential impacts, mitigation measures, risk assessment and residual risk management sections.	Measures are reasonable, identifying potential impacts and mitigation measures, including the approach to reference design and consultation regarding restrictions/ disruptions to access.	ARTC acknowledges the submitters feedback and has carried information through to the revised draft EIS.	N/A
256	256.0002				Services will use a combination of public road networks and private access while responding. Additionally, complementary estate management and response activities conducted by QPWS and QFES and other entities (hazard reduction burning, back burning etc) rely on trail networks in effected areas - Whetstone and Bringally State Forests. Potential disruptive impacts to this infrastructure have been addressed through an impact assessment and reference design for the Project to maintain connectivity across estates and to essential public and private roads. At location where level crossings of the rail alignment are provided, wait times of 199 seconds may be experienced, during train passage. This may result in increase in emergency response times in localised instances.	QFES South West Regional leadership team met with ARTC Project director 2021. Matters discussed included impacts on the townships of Goondowindi and Yelarbon. During the construction stage, a worker's camp will be located outside the town of Yelarbon and QFES will be reviewing emergency response procedures for the camp. The SES regional manager has attended a number of consultation meetings regarding Inland Rail and any matters about flooding, access etc have been raised at these forums. The proposed rail line is also 70 metres to the east of the Pampas Rural Fire Brigade. Members of the brigade have raised concerns about vibration and noise form the trains affecting volunteers who may be in the station at the time.	<p>An assessment of potential delays to road traffic at level crossing was undertaken as detailed in EIS Appendix AA: Traffic Impact Assessment, Section 5.8 and 5.9. The modelling undertaken within this assessment provides an accurate representation of the impacts to vehicles, using traffic vehicle numbers and the calculated wait times for specific level crossings.</p> <p>All active level crossings have been analysed in the peak periods, accounting for the individually calculated wait times, in order to determine queue lengths and resultant impacts to traffic. Table 5.69 in Appendix AA: Traffic Impact Assessment provides the individual wait times for the level crossing locations along the alignment. The wait times determined for each individual level crossing were calculated based on;</p> <ul style="list-style-type: none">Level crossing specific operating speeds (up to maximum design speed of 115 km/hr). The operating speed is impacted by topography and curvature of the alignmentTime taken for the train to cross the level crossingDistance from train crossing loops and hence time taken for the train to accelerate from standstill.Train lengthBoom gate and signal operating times. <p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Project's proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Appropriate access and egress solutions throughout Whetstone and Bringally State Forests will be incorporated into the design and continued access will be allowed for in the construction methodology.</p> <p>ARTC has taken feedback from stakeholders, including the Pampas Rural Fire Brigade, from previous information sessions. Consultation with the community and relevant government agencies (inc. emergency services) will continue through the detailed design and construction planning process to ensure that safety concerns and issues are addressed. ARTC will continue to work collaboratively with DTMR and local councils as detailed design progresses regarding the proposed level crossing design solution and any road closures either permanently or temporarily. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet/.</p> <p>ARTC acknowledges the concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during both construction and railway operations. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessments have identified the Pampas Rural Fire Brigade as a sensitive receptor for noise and vibration and applied noise criteria to assess potential impacts. Where potential impacts have been identified, the development and implementation of mitigation measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p>	Appendix AA: Traffic Impact Assessment Section 5.8 Section 5.9 Table 5.69 Appendix E: Consultation Report Section 5.6
256	256.0003				Potential increase in Bushfire hazard through the rehabilitation of any proposed environmental offset delivery areas.	A bushfire management plan should be developed as part of the offset delivery plans.	<p>Bushfire prevention and response procedures will be incorporated into the CEMP to reduce the likelihood and impact of bushfires ignited or exacerbated by the Project. This will include the provision and positioning of appropriate fire-extinguishing equipment.</p> <p>With respect to the earthworks areas associated with the permanent and temporary development footprints, the Inland Rail will be developed in the detailed design stage. The plan will take into consideration operational rail corridor design to be free of woody vegetation, thereby acting as a potential firebreak in bushfire risk areas, e.g. Whetstone and Bringally State Forests. This aspect of the design will be supported by consultation with DAF to ensure sufficient access is available for emergency access and firefighting activities.</p> <p>This strategy will be carried out throughout all stages of the Project, thus having regard to operational requirements, as well as impact management requirements such as erosion control, overland flow and water quality management, bushfire hazards, and fauna connectivity (see Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan
257	257.0001		Economics		The Project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the Project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none">not accept the draft EIS as the final EISrequest additional information from ARTC to be included in a revised draft EIS to be released for public commentthe requested additional information in the revised draft EIS to be released for public comment should include:<ol style="list-style-type: none">detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcampa detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only'require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government.	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondowindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the detailed design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none">Direct impacts on properties, e.g. severance and loss of productive landImpacts on property accesses and connectivity, including the location of level crossings on private roadsImpacts on the movement of stock, water, produce and equipment. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 14.4 of Chapter 14: Flooding and Geomorphology. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. 261	261.0001		Economics		The Project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the Project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none"> not accept the draft EIS as the final EIS request additional information from ARTC to be included in a revised draft EIS to be released for public comment the requested additional information in the revised draft EIS to be released for public comment should include: <ol style="list-style-type: none"> detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcamp a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only' require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government. 	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the detailed design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> Direct impacts on properties, e.g. severance and loss of productive land Impacts on property accesses and connectivity, including the location of level crossings on private roads Impacts on the movement of stock, water, produce and equipment. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 14.4 of Chapter 14: Flooding and Geomorphology. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. 267	267.0001		Economics		The Project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the Project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none"> not accept the draft EIS as the final EIS request additional information from ARTC to be included in a revised draft EIS to be released for public comment the requested additional information in the revised draft EIS to be released for public comment should include: <ol style="list-style-type: none"> detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcamp a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only' require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government. 	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the detailed design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> Direct impacts on properties, e.g. severance and loss of productive land Impacts on property accesses and connectivity, including the location of level crossings on private roads Impacts on the movement of stock, water, produce and equipment. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 14.4 of Chapter 14: Flooding and Geomorphology. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. The assessment of the Project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none"> not accept the draft EIS as the final EIS request additional information from ARTC to be included in a revised draft EIS to be released for public comment the requested additional information in the revised draft EIS to be released for public comment should include: <ol style="list-style-type: none"> detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcamp a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only' require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government. 	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the detailed design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> Direct impacts on properties, e.g. severance and loss of productive land Impacts on property accesses and connectivity, including the location of level crossings on private roads Impacts on the movement of stock, water, produce and equipment. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 14.4 of Chapter 14: Flooding and Geomorphology. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. 279	279.0001		Economics		The Project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the Project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none">1. not accept the draft EIS as the final EIS2. request additional information from ARTC to be included in a revised draft EIS to be released for public comment3. the requested additional information in the revised draft EIS to be released for public comment should include:<ol style="list-style-type: none">a) detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcampb) a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only'c) require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government.	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the detailed design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none">➤ Direct impacts on properties, e.g. severance and loss of productive land➤ Impacts on property accesses and connectivity, including the location of level crossings on private roads➤ Impacts on the movement of stock, water, produce and equipment. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 14.4 of Chapter 14: Flooding and Geomorphology. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. 285	285.0001		Economics		The Project's economic impact assessment does not address TOR items 11.21(e) and 11.141. The assessment of the Project's impact on the agricultural industry does not consider the value of individual commodities produced per lot or the value-added activities which contribute to the gross value of agricultural production in the region. The dEIS suggests an assessment of the composition of agricultural production by lot and commodity may be undertaken following detailed design.	<p>The CG should:</p> <ol style="list-style-type: none"> not accept the draft EIS as the final EIS request additional information from ARTC to be included in a revised draft EIS to be released for public comment the requested additional information in the revised draft EIS to be released for public comment should include: <ol style="list-style-type: none"> detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcamp a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only' require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government. 	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the detailed design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> Direct impacts on properties, e.g. severance and loss of productive land Impacts on property accesses and connectivity, including the location of level crossings on private roads Impacts on the movement of stock, water, produce and equipment. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 14.4 of Chapter 14: Flooding and Geomorphology. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. 287	287.0001	DA Hall employee proforma	Flooding	Flood immunity	The Project's flood impact assessment does not address TOR items 11.64 and 11.68. The flood panel's draft report confirms that existing culverts are missing from the flood model, which may affect the results of modelling the impact on frequent flood events. Furthermore, the submitter has not been consulted by ARTC as a directly affected stakeholder who uses the Gore Highway to travel to work.	<p>The CG should:</p> <ol style="list-style-type: none"> not accept the draft EIS as the final EIS request additional information from ARTC to be included in a revised draft EIS to be released for public comment the requested additional information in the revised draft EIS to be released for public comment should include: <ol style="list-style-type: none"> detailed analysis of the 'forestry route' alternatives - via Cecil Plains to join the existing QR line west of Kingsthorpe and via Cecil Plains to Mount Tyson, and then via a Greenfields route to join the reference design route near Wellcamp a detailed analysis of the impact on the agricultural sector, rather than the 'indicate estimate only' require updated flood modelling to address issues identified in the Flood Panel draft report, its final report, as well as the findings and recommendations of the Senate Inquiry into Management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government. 	<p>Matters raised by the Expert Flood Panel in the International Panel of Experts for Flood Studies of Inland Rail in Queensland - Final Report, dated 6 September 2022 have been addressed in Sections 5 to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Expert Flood Panel's 'Issues Management Register' has been included in Sub-Appendix T1: Hydrology and Flooding Technical Report - Volume 1, with a statement against each comment demonstrating where ARTC has addressed these issues within the revised documentation. The impact assessment documented in both Chapter 14: Flooding and Geomorphology (Section 14.8) and Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 through to 17) has been updated on a catchment by catchment basis to account for comments made by the Expert Flood Panel as well as incorporating revised Flood Impact Objectives (FIO) developed in consultation with the Expert Flood Panel. Mitigation measures have been provided against each FIO exceedance.</p> <p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages. Details regarding the stakeholder and community sessions undertaken are documented in Appendix E: Consultation Report, and the consultation process to inform the hydrology and flooding assessment is described in Section 14.5 of Chapter 14: Flooding and Geomorphology. Section 14.4 also includes a summary of consultation undertaken with directly impacted landholders in Oct/Nov 2022, prior to the second public release of the EIS for consultation. The Oct/Nov 2022 consultation campaign covered the following topics:</p> <ul style="list-style-type: none"> Project update and timing Flooding and hydrology information that will be covered in the revised draft EIS Outline of what Flood Impact Objectives are, how its applied and exceedances calculated, and what it means if there is an exceedance A summary of property-specific FIO exceedances, and potential associated impacts (specific to the landholder consulted with) Discussions with landholders regarding how areas affected by FIO exceedances are currently being used, and what flood sensitive receptors might be impacted Possible mitigation measures Examples of mitigation measures ARTC's commitment to continue working with affected landholders to further mitigate FIO exceedances during the next design stages. <p>Section 14.5 also summarises the feedback received from the one-on-one meetings that will be fed back into the detailed design process.</p> <p>The process to determine site-specific mitigation measures during the detailed design stage is outlined in Section 14.9.1 of Chapter 14: Flooding and Geomorphology, supported by ARTC's Flooding & Hydrology Mitigation Framework, which illustrates a four-step mitigation approach: (1) Design development and refinement, (2) Design treatments, (3) Property treatments and (4) Monitor. To demonstrate the effectiveness of proposed mitigation measures, a representative sample of culvert sites which currently experience a range of FIO exceedances, including afflux, time of inundation, velocity and hazard, were selected and TUFLOW simulations conducted at these locations with a varying degree of mitigation applied. The outcomes of this assessment are detailed in Section 22.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.5</p> <p>Section 14.8</p> <p>Section 14.9.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 5 - 17</p> <p>Section 22.3</p> <p>Appendix A</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
001f	001f.0001	Private	Groundwater		The impacts of ground water from cut and fill activities are well known. These activities upset the natural flow of water and disrupt both the recharge of the underground systems and the water levels in existing bores. The Inner Downs is very dependent on bores as the black soil is porous resulting in dams not being a viable water storage option as they won't hold water. ARTC has stated that the inland rail cut and fill will dissect the water table.	Nil.	Land use change (rail footprint) is not likely to influence recharge based on the area of the Project footprint related to the aquifer. Ongoing monitoring will confirm and assess natural groundwater fluctuation (recharge to the aquifer). As part of the revised draft EIS, predictive groundwater models were developed to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the deep cuts. Modelling results in the revised draft EIS indicate only localised drawdown around the vicinity of deep cuts that intercept groundwater, with a predicted maximum extent of drawdown extending up to 43 m from the rail centreline. Modelling indicates impact to be wholly contained within the Project footprint, with no regional groundwater drawdown/ wider impact on the aquifer as a result of the Project. For more information, see revised draft EIS Chapter 15: Groundwater, Section 15.6.2. Mitigations to limit the magnitude of temporary localised drawdown are provided in revised draft EIS Section 15.7. As stated in the revised draft EIS, there is potential for groundwater mounding to occur below significant embankments and compressible material. However, the depth to groundwater along the Project alignment is typically > 10 m BGL, which reduces the likelihood of mounding. Site-based groundwater monitoring events are on hold until the detailed design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (Chapter 15: Groundwater, Section 15.4.4). The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of groundwater changes.	Chapter 15: Groundwater Section 15.4.4 Section 15.6.2 Section 15.7
001f	001f.0002	Private			Problem with cut and fill in existing bores - Destruction of water bores cannot be rectified by simply drilling new holes as there may be no underground water streams at the new drill site. In cases such as this, farmers having their underground water eliminated would mean they are not be able to continue operations. Without water, properties simply become non-viable. Anecdotal evidence suggests that stock and domestic bores dried up or had flows reduced in the Westbrook district because of the second range crossing cut and fill activities, proving that concerns regarding bore impacts are very real.	Nil.	Appendix U: Groundwater Technical Report Table 8.2 states that bore surveys have been undertaken for landowners impacted by the Project footprint. Where a groundwater bore is expected to be decommissioned or have access to groundwater, measures will be agreed in consultation with the impacted landholder. The make-good process is presented in Appendix U: Groundwater Technical Report Figure 8.1. If the landowner does not accept the 'make-good' assessment, ARTC will: <ul style="list-style-type: none"> Advise the landowner that they are entitled to obtain an assessment from a suitably qualified person Advise the landowner that ARTC will pay their reasonable costs Provide ARTC's bore assessment to the landowner for review by the landowner's suitably qualified person Advise landowners of their expectations as to the reasonable costs of obtaining a bore assessment An operational groundwater management and monitoring program will be developed for the initial operation years of the Project depending on groundwater observations and data collected during pre-construction activities and early works stage of the Project (Appendix U: Groundwater Technical Report Section 8.3).	Appendix U: Groundwater Technical Report Section 8.3 Table 8.2 Figure 8.1
001f	001f.0003	Private	Groundwater		Dissecting water Table for construction - Dissecting the water Table affects all bores accessing that water. Dissecting the water Table results in the water Table draining. This results in any bore holes in the area becoming dry or the water Table lowering. Lowering of the water Table will mean that the existing pumps no longer sit in water, and therefore will not pump water to the surface. To then access water these pumps, need to lowered at great expense. If the bore hole is completely dry moving the pump will not result in any water being pumped. Limiting the impacts of the inland rail to the Border to Gowrie Alignment, is nave and deceptive with respect to ground water. Dissecting the water Table results in many bores outside the alignment▪ being affected.	ARTC must undertake a proper assessment of groundwater disturbance and include all bores relying on the water streams dissected. ARTC must be conditioned to make good to any bore which exhibits any more than a 5 m drawn down and must provide new bores with the same water capacity for any bores that dry up. If new water supplies in the form of bores are not able to be provided by ARTC, ARTC must be conditioned to provide water of the same or better quality from alternative water sources to the rural properties affected.	The location of the alignment was selected in part as it is located within the existing Southern Freight Rail Corridor, gazetted as a future rail corridor in 2010. However, some excavations (cuts) will be required to achieve suitable landform within the Border to Gowrie section. Land use change (rail footprint) is not likely to influence recharge based on the size area of the Project footprint related to the aquifer. Ongoing monitoring will confirm and assess natural groundwater fluctuation (recharge to the aquifer). As part of the revised draft EIS, predictive groundwater models were developed to assess potential groundwater drawdown (worst case) due to interception of groundwater and resulting drainage within the deep cuts. Modelling results in the revised draft EIS indicate only localised drawdown around the vicinity of deep cuts that intercept groundwater, with a predicted maximum horizontal extent of drawdown extending up to 43 m from the rail centreline. Modelling indicates impact to be wholly contained within the Project footprint, with no regional groundwater drawdown/ wider impact on the aquifer as a result of the Project. For more information, see revised draft EIS Chapter 15: Groundwater, Section 15.6.2. Whilst no drawdown impacts are anticipated for groundwater bores outside the Project footprint, as stated in revised draft EIS Chapter 15: Groundwater, Section 15.7.4, where bores are expected to be decommissioned or have access/ usage impaired as result of the Project, 'make good' measures will be agreed in consultation with the affected landowners during detailed design. ARTC has developed the Groundwater make-good process referenced in EIS Chapter 15: Groundwater to provide guidance as how this process will be carried out between ARTC and landholders.	Chapter 15: Groundwater Section 15.6.2 Section 15.7.4
001f	001f.0004	Private	Groundwater	Modelling	ARTC providing inaccurate information on bores affected - ARTC say there will only be 30 bores affected by the inland rail. ARTC claim they will decommission these 30 bores. The snapshot of ARTC's own map with the yellow dots being registered bores itself shows that the 30 bores ARTC has claimed are incorrect.	ARTC need to redo the Section on groundwater and incorporate all bores in the footprint. ARTC need to provide mitigation solutions for all bores both registered and unregistered. ARTC need to be conditioned to make good for any ground water impacts inland rail causes. ARTC need to engage with bore holders on the effects of the inland rail on bores. Land holders found out their bores will be decommissioned from the EIS ARTC had not provided them with this information. In the case of irrigation bores, being told your bore is being decommissioned results in losing your income.	The Project footprint (temporary footprint required to enable the Project and permanent footprint that remains after construction) is wholly contained within the groundwater impact assessment area (1-km radius from rail centreline). Section 15.5.4 details the breakdown for registered and unregistered bores within the impact assessment area, and how that information was utilised to develop the revised draft EIS. The predictive modelling does not indicate impact to any bore (registered or not) from predicted Project groundwater impacts. Project-specific monitoring bores were installed, as detailed in Section 15.4.3. A total of 48 Project bores comprise the revised groundwater monitoring network and can form the basis of the groundwater management and monitoring plan (GMMP) (Table 15-21). ARTC has undertaken a bore survey of potential groundwater users (landowners) impacted by the Project footprint to confirm the location of registered bores and to establish the presence of any unregistered bores. Real properties (lot/ plan) to be intersected by the Project footprint or within 80 m deep cuts (>10 m deep) were targeted and landholders were provided an opportunity to identify groundwater bores (registered and unregistered) as part of this survey. See revised draft EIS Appendix U: Groundwater Technical Report, Section 4.7.5 with the results from the landholder bore survey. As stated in revised draft EIS Chapter 15: Groundwater, Section 15.7.2, where a groundwater bore is expected to be decommissioned or have access to it impaired as result of the Project, ARTC will provide 'make good' measures will be agreed in consultation with the affected landowner during detailed design. ARTC has developed the Groundwater make-good process referenced in EIS Chapter 15: Groundwater to provide guidance as how this process will be carried out between ARTC and landholders.	Chapter 15: Groundwater Section 15.4.3 Section 15.7.2 Table 15-21 Appendix U: Groundwater Technical Report Section 4.7.5
001f	001f.0005	Private	Groundwater		ARTC has provided a list of proposed 58 actions on mitigation and management actions in response to dissection water tables. Of the 58 actions, none have been undertaken prior to release of the EIS. ARTC says it will develop strategies or plans, but in the EIS none have been provided. Of the 58 points to be actions only one relates to registered bores. There is no recognition that blasting activity may also fracture the water tables beneath the proposed cuttings.	The EIS be re-released once all plans are developed so the public can comment.	The mitigation measures described in Section 15.7 of the revised draft EIS Chapter 15: Groundwater are intended for implementation in future stages of Project delivery, being construction works and operations stages, and are not applicable to the current Project stage. The proposed mitigation measures specific to the current reference design stage are described in Section 15.7.1 of Chapter 15: Groundwater and all of which have been considered and/or been undertaken during reference design stage. Localised, controlled blasting is anticipated to be used to excavate material along some sections of the Project. Controlled blasting is only likely to occur in hard rock. Where blasting is to be undertaken within the Border to Gowrie Section of the Inland Rail alignment, the depth of groundwater is expected to be sufficient to prevent impact to the underlying aquifer. Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project Chapter 15: Groundwater, Section 15.4.2 to 15.4.4). The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of groundwater changes. The proposed mitigation measures have been reviewed as part of the revised draft EIS (Chapter 15: Groundwater, Section 15.7.2). The revised draft EIS will be publicly notified with a notification period prior to acceptance of the final EIS. The Impact Assessment and Consultation Process is presented in Chapter 3: Legislation and Project Approvals Process, Section 3.2.1, Figure 3.2.	Chapter 3: Legislation and Project Approvals Process Section 3.2.1 Figure 3.2 Chapter 15: Groundwater Section 15.4.2 Section 15.4.3 Section 15.4.4 Section 15.7 Section 15.7.1 Section 15.7.2
001g	001g.0001	Private	Flooding	Cumulative impacts	Chapter 21 states that there may be a brief overlap in 2021 between the conclusion of construction for the Asterion Medicinal Cannabis Facility and the commencement of early works activities for the Project; however, it is anticipated that by this point the footprint for the Asterion Medicinal Cannabis Facility will have been established, so new impacts to land use and tenure from this development will no longer be occurring. The submitter states that the combination of flood impacts for these two Projects may result in catastrophic upstream and downstream effects, including loss of life, and not providing this data is misleading. Restricting water flow has major consequences, particularly on height of water and speed of water rise. Rapidly raising water puts at risk any downstream houses, but in the case of the Westbrook Creek, it meets Oakley Creek downstream and could cause major damage to the town of Oakley if the water is now concentrated into an inland tsunami.	The cumulative impacts be re-assessed with real data such as the flood mapping provided for the Asterion Project to be approved. This flood mapping should be combined with ARTC flood mapping to provide a proper assessment of cumulative impacts.	Development applications are considered by the relevant planning authority, in the case of the Asterion Medicinal Cannabis Facility, Toowoomba Regional Council (TRC) is the relevant determining authority. As part of any development application located in a flood-affected area, and in accordance with TRC's Flood Hazard Overlay Code, developers are required to carry out a flood risk assessment for the new development to demonstrate that no adverse flood impacts will be caused elsewhere as a result of the development; or that impacts would be suitably mitigated. ARTC does not have control over the timing of new developments as determined by TRC, and it is therefore considered unreasonable for ARTC to include proposed developments in their flood modelling to support a reference design and revised draft EIS process. As part of the detailed design of Inland Rail, significant new developments, with development approval, that are likely to affect the local hydrology and floodplain behaviour, and that is likely to be constructed prior to the construction of Inland Rail, will be included in the flood modelling. Developments for inclusion will be discussed and agreed upon with the applicable approval authority. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2
001h	001h.0001	Private	Flora and Fauna	Koala	The EIS should provide all details on crossings including locations, structures to be provided, maintenance schedules for the fauna crossings. ARTC's commitment to treating injured animals (the cost of feeding a Koala is very large as they only eat trees from where they were rescued and tree branches need to be wild harvested (i.e. climbing trees and chain sawing branches) each week to give them fresh vegetation to eat).	The EIS states -Fauna crossing opportunities for species such as Koala, Condamine earless dragon and Greater glider have been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. Where possible, these align with regional, state and locally significant fauna movement corridors or areas of important fauna habitat. " The submitter points out that the site of these crossing are not nominated in the EIS nor are the specifications of the construction of these detailed. There are no details provided for the care of injured animals.	Since the submission of the draft Border to Gowrie EIS, ARTC has developed the following key documents to support the revised draft Border to Gowrie EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. The Fauna Connectivity Strategy identifies the process for the identification and design criteria for fauna crossing opportunities for species such as Koala to provide for habitat connectivity across the landscape. The finalisation of the crossing structures, fencing and other mitigation measures is subject to detailed design and feasibility assessment to further consider constraints such as land access and hydrology mitigations. Appendix N: Draft Fauna Management Plan outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.	Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
001h	001h.0002	Private	Flora and Fauna		The fauna crossing section needs to be revised to include scientific evidence to support the locations and types of crossing. Once this new EIS is written to needs to be released for public comment.	The EIS states that fauna crossing opportunities have been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The submitter outlines that Appendix M does not provide any details of where or what type of crossings will be provided. The submitter also notes that culverts can be extremely dangerous for fauna. ARTC do not provide any evidence that the proposed crossing meet any standards and they do not have any consultants' reports supporting the colocation of crossing with waterways.	Since the submission of the draft Border to Gowrie EIS, ARTC has developed the following key documents to support the revised draft EIS: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. The Fauna Connectivity Strategy identifies the design goals and performance criteria of proposed fauna crossing opportunities for species such as Koala to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. The documents have been developed based on best practice industry standards and guidelines to maintain habitat connectivity through the landscape. Key reference documents include the Koala-sensitive Design Guidelines (DES, 2022) and DTMR's Fauna Sensitive Road Design: Volume 1 and 2 (DTMR 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage due to the consideration of alternative discipline constraints such as land access and flooding and hydrology mitigations.	Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
001h	001h.0003	Private	Flora and Fauna	Mitigation measures	It is recommended that the EIS be released for public comment once all the plans and strategies are developed to enable comment on what is actually being proposed.	The EIS is supposed to provide enough detail for the public to comment on the proposed mitigation strategies. An EIS which says these details will only be refined in the detailed design process does not meet the TORs. The specific details of the fauna fencing strategies needs to be made available to the public.	Noted. The public notification requirements of the Border to Gowrie revised draft EIS are managed by the Office of Coordinator-General in accordance with the requirements of the State Development and Public Organisation Act 1971.	N/A
001h	001h.0004	Private	Flora and Fauna	Koala	Any clearing of vegetation stresses Koalas. The trees the Koalas inhabit in the inner downs are poplar box trees which are mainly over 100 years old. Koalas need 400 trees each to survive. ARTC destroying just one tree puts the Koala in jeopardy.	Nil.	ARTC acknowledges the importance of Koala habitat and aim to avoid and reduce clearing where possible. Since the submission of the draft EIS, ARTC has undertaken field surveys to verify the presence of threatened species and ecological communities within the impact assessment area. The basis on this survey was used to avoid and reduce Project impacts to ecological values through design refinement as shown in Appendix B3: Changes to Reference Design since draft EIS. The results of field survey has also informed the revised reference design and construction zone spatial impacts, to avoid impacts of high ecological value (as verified by field surveys) where possible such as laydown areas and corridor width reductions. Where avoidance of habitat clearing was not possible to enable the Project, mitigation measures and controls have been identified to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works stage. The following key documents replace in full any preliminary versions contained in the draft EIS Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. As outlined in Chapter 11: Flora and Fauna, these mitigation measures have been selected based on the best available information including government guidelines and similar Projects. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Ecology Technical Report. Appendix Q: Environmental Offset Delivery Strategy outlines the properties that make up the Project's offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES. A summary of how the proposed offset portfolio will acquit the anticipated offset requirements for the Koala to achieve no net loss is included in Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie.	Appendix B3: Changes to Reference Design since draft EIS Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
001h	001h.0005	Private	Flora and Fauna	Koala	Translocating Koalas causes their death. Koalas have highly specified gut enzymes which allows them to digest the trees in their local area. They cannot be relocated and survive. ARTC do not provide the details of the pre-identified appropriate habitat, but if it is suitable for Koala, it is highly likely that Koalas already live in the area. This will mean potentially introducing disease to other Koala populations. Koalas are also territorial and communicate by marking their trees with their scent. Moving Koalas to other areas will hasten their demise.	Translocation cannot be used as a strategy.	<p>The plans and strategies prepared to support the revised draft EIS have been prepared in accordance with best practice and industry standards including the Koala-sensitive Design Guidelines (DES, 2022) and DTMR's Fauna Sensitive Road Design: Volume 1 and 2 (DTMR 2000 and 2010, respectively). Plans and strategies detailed in the EIS propose specific management and mitigation measures to minimise impacts to Koalas associated with construction activities.</p> <p>Appendix M: Draft Koala Management Plan and the Chapter 24: Draft Outline Environmental Management Plan Section provides management, mitigations and approaches to how ARTC propose to deal with Koalas that are located within the Project clearing footprint. Translocation of Koalas to new areas will not be used as a preferred strategy. The fauna management plan outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix M: Draft Koala Management Plan</p>
001h	001h.0006	Private	Flora and Fauna	Koala	Wildlife carers have a very tough job in sourcing fresh gum leaf each week for Koalas. They must travel considerable distance, must cut branches from trees sometimes at height and transport this leaf back to feed the Koalas. This comes at considerable expense and danger. Koala carers have said that if they could get access to plantations of trees where every 5 row was hedge rowed at a height of 12 m they could substantively cut leaf for the Koalas in their care.	<p>ARTC should let them undertake this work on the properties they have purchased. This would provide them with offsets but also provide ongoing leaf resources for the carers. ARTC could start this now by purchasing 10 year plus poplar box trees and planting them at their Southbrook properties. They would need to set up a watering system, but there is bore water available on the properties they have purchased that they could use. If the various levels of government come to the realization that the inland rail should go on a less impactful route on existing corridors, ARTC will be able to use this property as an offsets for other Projects.</p>	<p>ARTC will continue to consult and work with community and conservation groups regarding community initiatives which directly contribute to the protection and conservation of local wildlife and their habitat.</p> <p>In addition, ARTC will be delivering the Border to Gowrie Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie that will investigate opportunities to restore and create habitat for impacted threatened plants and animals which may also facilitate programs to support wildlife care and protection initiatives.</p>	<p>Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p>
001h	001h.0007	Private	Flora and Fauna	Koala	Koalas in the inner downs eat Eucalyptus populnea, of which there are not large areas. In fact, every tree counts. ARTC has understated Koala numbers by hundreds. A consultant employed by Landcare has stated that the Inner Downs Koalas may be a separate gene pool making them unique and an imperative to save.	Nil.	<p>Post the release of the draft Border to Gowrie EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. Field verified ecological assessments as well as expert input from a range of consultant, industry and academia sources have supported the ecological assessment and reporting within the revised draft EIS.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction stage. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial Ecology Technical Report. The Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements.</p> <p>ARTC has commenced a key research initiative relating to the Koala to better understand populations, potential impacts and to develop targeted mitigation and management measures. ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study Koala genetics that focusses on population genetics and dietary analysis for Koalas across eight of the Inland Rail Projects. The purpose of this study to:</p> <ul style="list-style-type: none"> ➤ Increase baseline data on Koala population resilience and restoration requirements. ➤ Inform Koala conservation controls as required in conditions of approval. ➤ Inform fauna connectivity plans. ➤ Inform Koala offset management decisions. 	<p>Appendix M: Draft Koala Management Plan</p> <p>Appendix O: Matters of National Environmental Significance</p>
001h	001h.0008	Private	Flora and Fauna	Koala	The 'high' category risk to Koalas is correct but it is not mitigated once construction is halted. The rail line fragments the food trees and the ongoing risk of death from vehicles including trains is very real. This cannot be mitigated.	To save the Koalas a new route on existing corridors needs to be selected.	<p>Mitigation measures and controls have been factored into the Project to in order to reduce the impact of habitat fragmentation and vehicle collision on fauna populations, including Koalas, after the construction stage. Fauna crossing structures and fencing will be installed to maintain habitat connectivity and restrict access to the rail corridor. As outlined in Chapter 11: Flora and Fauna, these mitigation measures have been selected based on the best available information including government guidelines and similar Projects.</p> <p>The Appendix M: Draft Koala Management Plan, Appendix N: Fauna Management Plan and Appendix P: Fauna Connectivity Strategy are new documents developed since the submission of the draft Border to Gowrie EIS. These documents detail information on risk and mitigations that specifically addresses impacts to Koalas during railway operations including roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
001h	001h.0009	Private	Flora and Fauna	Koala	ARTC need to undertake a full on-ground assessment of Koala numbers. Local evidence supports there being many viable breeding colonies along the corridor. The existing rail line was constructed over one hundred years ago, so the poplar box trees have re populated in this corridor and are the source of food for there Koala colonies. ARTC may be attempting to mislead the Coordinator-General on the numbers of Koalas to understate the impacts that will occur on the population. With the devastation to Koala population in the bush fries, every surviving Koala needs to be protected.	ARTC should be required to undertake DNA testing of the Koala population to determine if this gene pool is unique.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents based on field verified ecological survey: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed in conjunction with consultation with Commonwealth and State agencies, academic groups</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan. A Koala genetic study has been undertaken to understand the Koala population genetics along the Narromine to Acacia Ridge/Bromelton sections of the Inland Rail Project. As per results of this study (ERM, 2024) Koalas within the Project footprint belong to a single population that extends throughout south-east Queensland. Ecological monitoring which will be conducted during operation of the Project will include ongoing collection and analysis of Koala DNA samples from adjacent and broader areas from the Project and an analysis of gene flow at five-yearly intervals for 20 years.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Sections 11.5, 11.6 and 11.7</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Section 2.3</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
001h	001h.0010	Private	Flora and Fauna	Koala	The EIS was supposed to contain all information relating to conservation and management. It contains no information on this and therefore does not meet the TORs. ARTC has provided a list of things that will be done, but no things that have been done	EIS needs to be rejected and rewritten with all the things ARTC say they will do including for public comment.	<p>Post the release of the draft EIS for public notification, ARTC has completed additional detailed field surveys across the Border to Gowrie Project alignment to identify ground-truthed vegetation communities and associated habitats for threatened species. The most recent field data from the technical ecological assessments from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC), have been used to support the development of key species management plans.</p> <p>Chapter 11: Flora and Fauna within the revised draft EIS, assesses the ecological values within the Project footprint, and identifies the sensitive ecological receptors and conservation significant species. Potential impacts on these receptors have been assessed and appropriate mitigation measures have also been identified to manage these impacts. In addition, mitigation and management measures have been proposed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy.</p> <p>The Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design stage and in the Wildlife Connectivity Plan that will be prepared. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised Appendix P: Fauna Connectivity Strategy proposes a range of different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Sections 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
001i	001i.0001	Private	Social Impact Assessment		It seems to be difficult to evaluate an EIS if the proponents cannot provide data on the number of properties impacted. ARTC do not provide any actual details on the numbers of homes or sheds destroyed.	ARTC needs to reassess the route and determine how many properties are impacted. ARTC needs to disclose how many houses will be lost. The OCG needs to determine how many people losing their homes is too many for a Project which has a number of very real less impactful route alternatives.	<p>The revised draft EIS Terms of Reference require that the selected alignment is assessed.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.2 notes the number of residential dwellings requiring affected households to relocate based on the proposed revised reference design and consultation with landowners to date.</p> <p>Revised draft EIS Appendix F: Impacted Properties, provides a detailed breakdown of the Project's land acquisition requirements including the number and nature of properties affected, and the extent to which they are affected.</p>	<p>Appendix F: Impacted Properties</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.2</p>
001j	001j.0001	Private	General Project opinion - negative		The Commonwealth Government is currently undertaking an inquiry into the inland rail and into ARTC's ability to conduct this Project. ARTC has no experience in building rail lines especially greenfield lines. ARTC also has issues in the three states that inland rail is being constructed.	Many of the deficits in the EIS are covered in the submissions to the "Inquiry into the management of the Inland Rail Project by the Australian Rail Track Corporation and the Commonwealth Government." The submitter wants these submissions included in the OCGs consideration of the Project.	<p>ARTC acknowledges the feedback received from the Senate Inquiry and continues to address the recommendations of the Report. The Australian Rail Track Corporation takes very seriously its commitment to improving the understanding and addressing of community concerns, and will continue to strive to meet and also exceed expectations in engagement with landowners, communities and stakeholders as Inland Rail progresses.</p> <p>This revised draft EIS addresses the Terms of Reference (ToR) as seen in Appendix A2: Terms of Reference Cross Reference Table and the additional information requested for the Project by the Office of the Coordinator-General.</p>	<p>Appendix A2: Terms of Reference Cross Reference Table</p>
059a	059a.0001	Private - Brookstead	Landscape and Visual Amenity	Modelling	<p>Concern raised with respect to viewpoint 17 at Pittsworth; and the high level of effect due to impacts of bridges and embankments on the northern edge of Pittsworth. The submitter states that the criteria used for assessing visual amenity are based on judgemental views that do not respect the key objective of identifying those who experience and value views of the landscape.</p> <p>An example is referenced from Section 4.7 - Landscape methodology overview; Plate 1 on page 25; that mountains and hills are preferred over flat land and that these subjective views are based on broad landscape objectives, that do not respect the uniqueness of each community impacted by the rail corridor.</p> <p>The submitter states that aesthetic values in rural communities are different to those experienced by the majority of Australians on the coastal fringe.</p>	<p>The current reference design for viewpoint 17 at Pittsworth must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pittsworth. The submitter states that currently the high impact is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.</p>	<p>The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 16) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla.</p> <p>Regarding the submission comment on Viewpoint 17, moderate sensitivity of Viewpoint 17 (now 22) in the revised draft EIS is considered appropriate, due to the proximity of nearby residential viewers with a specific interest in this view, including those staying at Pittsworth Motor Inn - but also noting that the existing Gore Hwy is visible within this view and that this viewpoint is located on the outskirts of the settlement. The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High. This is further discussed in Section 8.2.22 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>The viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and the relevant Regional Council.</p> <p>With respect to the example cited in the submission, it is noted in Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, that the general principles identified in the Guidance Note for Landscape and Visual Assessment (GNLYA) (AILA, 2018) are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values.</p> <p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts, where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 8.2.22</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
059a	059a.0002	Private - Brookstead	Landscape and Visual Amenity		The submitter disputes that the change in visual amenity at viewpoint 17 near Pittsworth is acceptable; as it does not meet the principles of the guidance note in Section 4 - Objectives. The submitter states that it is a permanent, irreversible, adverse change to the landscape during construction and operational phases of the Project and these changes are listed as high impact both before and after mitigation. The submitter states the changes due to the current rail design is not a better outcome for the community.	The current reference design for viewpoint 17 at Pittsworth must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pittsworth. The submitter states that currently the high impact is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values related to the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. The Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Regarding the submission comment on Viewpoint 17, moderate sensitivity of Viewpoint 17 (now 22) in the revised draft EIS is considered appropriate, due to the proximity of nearby residential viewers with a specific interest in this view, including those staying at Pittsworth Motor Inn - but also noting that the existing Gore Highway is visible within this view and that this viewpoint is located on the outskirts of the settlement. The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High. This is further discussed in Section 8.2.22 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>The existing viewpoint assessments and visualisations provided for Viewpoint 17 (now 22) have been updated in the revised draft EIS to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and the relevant Regional Council.</p> <p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.9.3 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.9.3 Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 6 Section 8.2.22 Section 11.2 Table 95
059a	059a.0003	Private - Brookstead	Landscape and Visual Amenity		The submitter claims that viewpoint 17, is a highly sensitive visual viewpoint, as many small rural landholders have chosen this location for the Importance of the view, and its existing scenic qualities. The submitter highlights that the sensitivity of the landscape is based on the proposed design being a new greenfield Section of rail line crossing a previously quiet, rural location, and hence is a highly sensitive landscape.	The current reference design for viewpoint 17 at Pittsworth must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pittsworth. The submitter states that currently the high impact is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values related to the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. The Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Regarding the submission comment on Viewpoint 17, moderate sensitivity of Viewpoint 17 (now 22) in the revised draft EIS is considered appropriate, due to the proximity of nearby residential viewers with a specific interest in this view, including those staying at Pittsworth Motor Inn - but also noting that the existing Gore Highway is visible within this view and that this viewpoint is located on the outskirts of the settlement. The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High. This is further discussed in Section 8.2.22 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>The existing viewpoint assessments and visualisations provided for Viewpoint 17 (now 22) have been updated in the revised draft EIS to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and the relevant Regional Council.</p> <p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.9.3 Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 6 Section 8.2.22 Section 11.2 Table 95
059a	059a.0004	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	The submitter claims that the statement in Section 11.1, is misleading and incorrect in relation to viewpoint 17 at Pittsworth, that the Project is not aligned with existing rail infrastructure, and the new rail line is deliberately located to be close to the town of Pittworth; directly impacting homes and dissecting small landholdings near the town.	The current reference design for viewpoint 17 at Pittsworth must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pittsworth. The submitter states that currently the high impact is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values related to the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. The Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Regarding the submission comment on Viewpoint 17, moderate sensitivity of Viewpoint 17 (now 22) in the revised draft EIS is considered appropriate, due to the proximity of nearby residential viewers with a specific interest in this view, including those staying at Pittsworth Motor Inn - but also noting that the existing Gore Highway is visible within this view and that this viewpoint is located on the outskirts of the settlement. The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High. This is further discussed in Section 8.2.22 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>The existing viewpoint assessments and visualisations provided for Viewpoint 17 (now 22) have been updated in the revised draft EIS to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and the relevant Regional Council.</p> <p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.9.3 Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 6 Section 8.2.22 Section 11.2 Table 95
059a	059a.0005	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	The submitter states that with respect to the proposed mitigation measures in Section 11.2: 'a. Embankments', the photo montage does not minimise the extent to which embankments restrict views or affect views from nearby residences. The submitter additionally highlights that the draft EIS is incomplete and non-committal as it states it will consider treatment opportunities; but only for the northern edge of the embankment at Pittsworth and there is no detail around what the mitigation will be, nor any commitment that mitigation will actually take place. The submitter requests further detail be provided in the draft EIS, regarding the visual amenity at viewpoint 17.	The current reference design for viewpoint 17 at Pittsworth must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pittsworth. The submitter states that currently the high impact is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values related to the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. The Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Regarding the submission comment on Viewpoint 17, moderate sensitivity of Viewpoint 17 (now 22) in the revised draft EIS is considered appropriate, due to the proximity of nearby residential viewers with a specific interest in this view, including those staying at Pittsworth Motor Inn - but also noting that the existing Gore Highway is visible within this view and that this viewpoint is located on the outskirts of the settlement. The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High. This is further discussed in Section 8.2.22 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>The existing viewpoint assessments and visualisations provided for Viewpoint 17 (now 22) have been updated in the revised draft EIS to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and the relevant Regional Council.</p> <p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.9.3 Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 6 Section 8.2.22 Section 11.2 Table 95
059a	059a.0006	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	The submitter states that the mitigation measures with respect to Section 11.2, Rural and Natural landscapes, do not include the rural aspect of the southern side of viewpoint 17, as the paragraph does not refer to Pittsworth. The submitter strongly refutes that the structure proposed in the area will enhance the rural landscape, as proposed in the draft EIS claim.	The current reference design for viewpoint 17 at Pittsworth must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pittsworth. The submitter states that currently the high impact is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values related to the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. The Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Regarding the submission comment on Viewpoint 17, moderate sensitivity of Viewpoint 17 (now 22) in the revised draft EIS is considered appropriate, due to the proximity of nearby residential viewers with a specific interest in this view, including those staying at Pittsworth Motor Inn - but also noting that the existing Gore Highway is visible within this view and that this viewpoint is located on the outskirts of the settlement. The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High. This is further discussed in Section 8.2.22 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>The existing viewpoint assessments and visualisations provided for Viewpoint 17 (now 22) have been updated in the revised draft EIS to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
060a	060a.0001	Private - Brookstead	Project alignment	Modelling	Submitter raises concern with respect to the route selection process in Figure 2.15, as it is lacking information or justification for the red, amber, green, grey classifications in the route comparison. Submitter highlights the discrepancy between a 3.8 km difference between C2 (Wellcamp) and C3 (Karara) routes, yet results in a 10 minute time increase. Submitter states, there is a lacking in transparency as to why a 10 minute time difference results in an amber light for C2 and green light for C3. Submitter highlights the 4 routes are not fairly compared, because 2 routes (C3 and C4), pass through the Macintyre floodplain and the town of Inglewood, resulting in a larger area of flood impact and also resulting in more residential properties impacted, due to passing through the town of Inglewood. Submitter highlights that if the four routes were compared fairly, they would all follow the same route bypassing Inglewood, and then the C3 route would be impact less residential properties (Figure 2.15 changes), less agricultural properties (EIS Figure 2.15), and be located in an area of lower agricultural impact, hence protecting prime agricultural land (Figure 1).	Submitter requests that the Coordinator-General to reject the EIS and request fair, open and transparent route comparison information to be presented. Submitter requests that the Coordinator-General to apply the Regional Planning Interests Act to the current Inland Rail Project. Submitter requests that Inland Rail must obtain a Regional Interests Development Approval for the current route with widespread impacts on prime agricultural land, or ARTC should find an alternative route that avoids widespread damage to the cropping land.	<p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie. The corridor assessment process was conducted by independent consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and 2.9, the design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria adopted by the MCA tool comprised:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability 12.5 per cent operations: 16.5 per cent. <p>Variance in route transit times can be attributed to a number of factors including track length as well as track vertical and horizontal geometry.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the multi-criteria analysis. <p>As outlined in Section 8.5.1 (Tables 8-31 and 8-32, respectively) of Chapter 8: Land Use and Tenure, the permanent footprint will traverse less than 0.02 per cent of Class A land and Class B land, and less than 0.01% of land within an IAA within the Goondiwindi LGA. Additionally the permanent footprint traverses less than 2 per cent of Class A agricultural land, 0.22 per cent of Class B agricultural land and less than 0.2 per cent of land within an IAA within the Toowoomba LGA. The permanent footprint. Chapter 17: Social Section 17.6 and Chapter 8: Land Use and Tenure, Section 8.6 summarises the proposed management and mitigation measures for agricultural impacts. ARTC will continue to consult with farmers, graziers and owners of agricultural businesses that are directly affected or adjacent to the Project footprint during detailed design to develop measures to mitigate impacts.</p> <p>As stated in Chapter 3: Legislation and Project Approvals Process, Section 3.4.26, the Project is not a resource activity nor a regulated activity under the Regional Planning Interests Act 2014 (Qld) (RPI Act) and therefore the Act does not apply. Whilst the RPI Act is not relevant to the Project, an assessment of the Project's impact on areas of regional interest has been undertaken in Chapter 8: Land Use and Tenure to satisfy additional information requested by the Coordinator-General.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Figure 2.14 Figure 2.15 Chapter 3: Legislation and Project Approvals Process Section 3.4.26 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6 Table 8-31 Table 8-32 Chapter 17: Social Section 17.6 Appendix E: Consultation Report
060a	060a.0002	Private - Brookstead	Land Resources		Submitter raises concern with respect to Project impacts on important agricultural land and route comparisons. Submitter highlights a significant decrease in the number of agricultural properties affected on the C3 route as compared to the C2 route and questions the weightings placed on the value of agricultural land in the multi-criteria assessment process; proposing that the weightings are subjective and not provided in the draft EIS. Submitter states the EIS is lacking in transparency of the facts required to justify the route comparison. Submitter states that when they compare the numbers of impacted agricultural properties and then transpose this route onto Figure 1, showing the class of agricultural land, affected on each route, there less affected properties on C3, and that the C3 route also passes through land of a lower classification (being unshaded grey/ brown or light yellow on Figure 1).	Submitter requests that the Coordinator-General to reject the EIS and request fair, open and transparent route comparison information to be presented. Submitter requests that the Coordinator-General to apply the Regional Planning Interests Act to the current Inland Rail Project. Submitter requests that Inland Rail must obtain a Regional Interests Development Approval for the current route with widespread impacts on prime agricultural land, or ARTC should find an alternative route that avoids widespread damage to the cropping land.	<p>The Project has been aligned to be co-located with existing rail and road infrastructure, where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. However due to a number of reasons, including topography and operational design parameters, a portion of the alignment has to traverse agricultural land. As described in Section 2.8-2.10 of Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>ARTC is committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of agricultural land that cannot be avoided. The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses:</p> <ul style="list-style-type: none"> 0.02 per cent of Class A land, 0.02 per cent of Class B land, and 0.01 per cent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none"> 0.17 per cent of Class A land, 0.22 per cent of Class B land, and 0.19 per cent of IAA land. <p>The Regional Planning Interests Act 2014 (Qld) regulates areas of regional interest and requires a resource activity or regulated activity proposed to be located in an area of regional interest to obtain a regional interests development approval. As the Project is not a resource activity nor a regulated activity under the Regional Planning Interests Act 2014 (Qld), the Act does not apply (Chapter 8: Land Use and Tenure, Section 8.1). As such, the Regional Planning Interests Act 2014 (Qld), and the alignment's impact on the matters protected under Regional Planning Interests Act 2014 (Qld), do not have a bearing on the EIS process, nor is the approval of the EIS contingent on the assessment of the Project's impact on areas of regional interest. Notwithstanding this, the Project's impact on areas of regional interest protected under the Regional Planning Interests Act 2014 (Qld) has been assessed to provide a comprehensive assessment of the Project's impact on agricultural, environmental and societal values present within both the temporary and permanent disturbance footprints of the alignment.</p> <p>To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9 Area of regional planning interests traversed by the Project, which provides a total of areas of regional interest in relation to the Project footprint. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible (Chapter 8: Land Use and Tenure, Section 8.5.4).</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Chapter 8: Land use and Tenure Section 8.1 Section 8.5.4 Section 8.6.2
060a	060a.0003	Private - Brookstead	Flooding	Modelling	Submitter highlights flood impacts and irreversible damage concerns with respect to route comparisons. Route C3 is known to "follow hard, well-drained ridge terrain until it crosses the Condamine floodplain; comparatively the C2 route traverses a wider Section of floodplain and covers cracking clay soils, providing no foundation for building a railway line or bridges. The floodplain is approximately 5 km wide on the C3 corridor; the AEP 1% of 23 km is inaccurate and it can be seen that the floodplain consists of a network of broken streams on the C3 route. The C2 route transverses 19 km of floodplain at its widest point of crossing the Condamine floodplain and therefore, the route comparison should weigh up an 18 km crossing versus a 4.5 km crossing of the Condamine floodplain. Submitter states this wider crossing on C2 occurs primarily because the Condamine river catchment is joined by at least 7 creeks and many other, unnamed waterways and is located 35 km further downstream, below where these tributaries join. Submitter highlights that a larger volume of additional water, therefore is present at C2, and the hydrology modelling identifies the difficulty of modelling at this point, below Tummaville where the water breaks out of the banks and is no longer contained within the main branch of the Condamine River (Chapter 12).	Submitter requests that the Coordinator-General to reject the EIS and request fair, open and transparent route comparison information to be presented. Submitter requests that the Coordinator-General to apply the Regional Planning Interests Act to the current Inland Rail Project. Submitter requests that Inland Rail must obtain a Regional Interests Development Approval for the current route with widespread impacts on prime agricultural land, or ARTC should find an alternative route that avoids widespread damage to the cropping land.	<p>The EIS is focused on the chosen alignment selected by the Australian Government.</p> <p>The chosen alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale.</p> <p>Section 2.8 and 2.9 detail the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: infrastructure.gov.au/infrastructure-transport-vehicles/rail/inland-rail.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9
065a	065a.0001	Private - Brookstead	Landscape and Visual Amenity	Modelling	<p>Concern raised with respect to viewpoint 15 at Brookstead; and the high level of effect due to impacts of bridges and new rail corridor in and around Brookstead at Viewpoint 15. The submitter states that the criteria used for assessing visual amenity are based on judgemental views that do not respect the key objective of identifying those who experience and value views of the landscape.</p> <p>An example is referenced from Section 4.7 - Landscape methodology overview; Plate 1 on page 25; that mountains and hills are preferred over flat land and that these subjective views are based on broad landscape objectives, that do not respect the uniqueness of each community impacted by the rail corridor. The submitter states that aesthetic values in rural communities are different to those experienced by the majority of Australians on the coastal fringe.</p>	<p>The current reference design for viewpoint 15 at Brookstead must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Brookstead, specifically for local students at the School and community members using the park facilities. Currently the high impact on visual amenity specified in the draft EIS is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.</p>	<p>The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts at the high level of effect due to the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 15 (now 20) which discusses impacts on the community of Brookstead and is considered representative of possible views obtained from the school and nearby residential properties.</p> <p>With respect to the example cited in the submission, it is noted in Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, that the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values.</p> <p>It is also noted that impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Regarding the submission comment on Viewpoint 15, moderate sensitivity of Viewpoint 15 (now 20) in the revised draft EIS is considered appropriate due to the relatively low number of nearby residential viewers with a specific interest in this view and the proximity of this viewpoint to the alignment. The LVIA assessment notes that the potential effect of the Project on Viewpoint 15 (now 20) during operation is High. This is further discussed in Section 8.2.20 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Brookstead that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and the relevant Regional Council.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 4.7 Section 7.1 Section 8.2.20 Section 11.2 Table 95

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
065a	065a.0002	Private - Brookstead	Landscape and Visual Amenity		The submitter disputes that the change in visual amenity at viewpoint 15 near Brookstead is acceptable; as it does not meet the principles of the guidance note in Section 4 - Objectives. The submitter states that it is a permanent, irreversible, adverse change to the landscape during construction and operational phases of the Project and these changes are listed as high impact both before and after mitigation. The submitter states the changes due to the current rail design is not a better outcome for the community.	The current reference design for viewpoint 15 at Brookstead must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Brookstead, specifically for local students at the School and community members using the park facilities. Currently the high impact on visual amenity specified in the draft EIS is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 15 (now 20) which discusses impacts on the community of Brookstead and is considered representative of possible views obtained from the school and nearby residential properties.</p> <p>With respect to the example cited in the submission, it is noted in Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, that the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. It is also noted that impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Regarding the submission comment on Viewpoint 15, moderate sensitivity of Viewpoint 15 (now 20) in the revised draft EIS is considered appropriate due to the relatively low number of nearby residential viewers with a specific interest in this view and the proximity of this viewpoint to the alignment. The LVIA assessment notes that the potential effect of the Project on Viewpoint 15 (now 20) during operation is High. This is further discussed in Section 8.2.20 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>Current mitigation measures, outlined in Section 11, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Brookstead that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and managers.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 7.1</p> <p>Section 8.2.20</p> <p>Section 11</p> <p>Table 95</p>
065a	065a.0003	Private - Brookstead	Landscape and Visual Amenity		The submitter claims that viewpoint 15, is a highly sensitive visual viewpoint, as it impacts on the local school children and families who have chosen schooling and recreation in this small country school. The submitter states this choice is partly influenced by the importance of the rural outlook and its existing peaceful qualities. The submitter highlights that the sensitivity of the landscape is based on the proposed design being a new greenfield Section of rail line crossing a previously quiet, rural location, and hence is a highly sensitive landscape.	The current reference design for viewpoint 15 at Brookstead must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Brookstead, specifically for local students at the School and community members using the park facilities. Currently the high impact on visual amenity specified in the draft EIS is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 15 (now 20) which discusses impacts on the community of Brookstead and is considered representative of possible views obtained from the school and nearby residential properties.</p> <p>With respect to the example cited in the submission, it is noted in the Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, that the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. It is also noted that impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Regarding the submission comment on Viewpoint 15, moderate sensitivity of Viewpoint 15 (now 20) in the revised draft EIS is considered appropriate due to the relatively low number of nearby residential viewers with a specific interest in this view and the proximity of this viewpoint to the alignment. The LVIA assessment notes that the potential effect of the Project on Viewpoint 15 (now 20) during operation is High. This is further discussed in Section 8.2.20 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Brookstead that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and managers.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 7.1</p> <p>Section 8.2.20</p> <p>Section 11.2</p> <p>Table 95</p>
065a	065a.0004	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	The submitter highlights that the statement in Section 11.1, indicates the significance of impact at viewpoint 15 at Brookstead, that the Project is aligned with existing rail infrastructure, but the existing rail is not used regularly. The submitter states that the alignment is deliberately located to be close to the town at Brookstead and it directly impacts homes and infringes on landholdings in this greenfield area near the town.	The current reference design for viewpoint 15 at Brookstead must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Brookstead, specifically for local students at the School and community members using the park facilities. Currently the high impact on visual amenity specified in the draft EIS is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. Development of the revised reference design for the Project has progressed in parallel with the impact assessment process and the revised reference design has been slightly amended for the revised EIS, to reflect outcomes of ongoing engagement with the community and key stakeholders. As a consequence, design solutions for avoiding, minimising or mitigating impacts have been incorporated into the reference design and revised EIS design as appropriate and where possible. The reference design has been developed in consideration of improving environmental outcomes, contributing to community wellbeing, contributing to social, economic and environmental sustainability, and mitigating impacts to the natural landscape and visual amenity. Among the mitigation measures and controls that have been factored into the design, or otherwise implemented during the revised reference design stage for the Project are as follows:</p> <ul style="list-style-type: none"> ▶ The alignment has avoided significant settlements to the greatest extent possible to assist in minimising visual impacts (e.g. Inglewood, Millmerran, Pittsworth) except where the alignment is within or adjacent to existing rail corridor (i.e. through Yelarbon, Pampas and Brookstead) ▶ The Project has avoided, where possible, direct impacts on areas noted as being of regional landscape significance defined using the regional scenic amenity methodology (ShapingSEQ) ▶ The Project has been aligned to be co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes ▶ The alignment has been positioned to reduce the number of crossings and extent of impact on watercourses. <p>The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 15 (now 20) which discusses impacts on the community of Brookstead and is considered representative of possible views obtained from the school and nearby residential properties.</p> <p>With respect to the example cited in the submission, it is noted in Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, that the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) which are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. It is also noted that impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Regarding the submission comment on Viewpoint 15, moderate sensitivity of Viewpoint 15 (now 20) in the revised draft EIS is considered appropriate due to the relatively low number of nearby residential viewers with a specific interest in this view and the proximity of this viewpoint to the alignment. The LVIA assessment notes that the potential effect of the Project on Viewpoint 15 (now 20) during operation is High. This is further discussed in Section 8.2.20 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment.</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Brookstead that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and relevant Regional Council.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 7.1</p> <p>Section 8.2.20</p> <p>Section 11</p> <p>Section 11.2</p> <p>Table 95</p>
065a	065a.0005	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	The submitter states that with respect to Section 11.2, the photo montage shown, does not respect the rural landscape, that existing tree lines have been cleared in the montage and there is nothing indicated to minimize the extent to which the line affects views from nearby residences. The submitter states that the draft EIS document is incomplete and non-committal as it states planting strips could (not will), be introduced to assist in integrating the landform into the existing landscape. The submitter requests that further detail be documented in the draft EIS and a firm commitment to the specific form of mitigation at viewpoint 15 and near the road-rail alignment at Brookstead.	The current reference design for viewpoint 15 at Brookstead must be modified to improve the high impact on visual amenity to preserve the landscapes and views around Brookstead, specifically for local students at the School and community members using the park facilities. Currently the high impact on visual amenity specified in the draft EIS is resulting in a permanent, irreversible adverse change during both construction and operation of the inland rail Project and this is unacceptable to the local community.	<p>The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 15 (now 20) which discusses impacts on the community of Brookstead and is considered representative of possible views obtained from the school and nearby residential properties.</p> <p>With respect to the example cited in the submission, it is noted in the Section 4.9.5 of Appendix K: Landscape and Visual Impact Assessment, that the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. It is also noted that impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Current mitigation measures, outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Brookstead that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and relevant Regional Council.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.9.5</p> <p>Section 7.1</p> <p>Section 11.2</p> <p>Table 95</p>
082a	082a.0002	State Agency	Stakeholder Engagement		The State Development and Assessment Agency (SARA) would be pleased to provide detailed pre-lodgement advice on the state interests relevant to its assessment of the Inland Rail B2G Project once the final alignment is known.	To facilitate this, SARA kindly requests the Office of the Coordinator-General provide the land descriptions of all affected land parcels. All development proposals can then be assessed by SARA against the criteria in the State Development Assessment Provisions.	<p>ARTC notes the advice provided in the submission, and will consult with SARA once a final alignment is realised, in detailed design.</p> <p>The revised draft EIS has been updated with further detail presented in Chapter 8, Land Use and Tenure, Section 8.5.4 Compliance impact assessment, which considers the consistency of the Project with the land use and planning instruments relevant to the Project footprint and Project activities, being the:</p> <ul style="list-style-type: none"> ▶ State Planning Policy (July 2017) ▶ Darling Downs Regional Plan (October 2013) ▶ ShapingSEQ 2023 (August 2017). ▶ Goondiwindi Regional Planning Scheme 2018 ▶ Toowoomba Regional Planning Scheme 2012. <p>As the Project has been declared a coordinated Project, the provisions of local government planning schemes do not apply and therefore assessment of the Project's consistency with the planning schemes is not required.</p> <p>The Project's permanent footprint traverses 495 lots and 33 easements. The temporary footprint traverses a total of 573 lots and 42 easements including those within the permanent footprint (Chapter 8: Land Use and Tenure, Section 8.5.1). The potential area of impact of the Project footprint based on the current reference design, existing land use and tenure of these properties, are detailed in Appendix F: Impacted Properties. Further discussion is presented in Chapter 8.</p>	<p>Chapter 8: Land use and Tenure</p> <p>Section 8.5.4</p> <p>Appendix F: Impacted Properties</p>
082a	082a.0003	State Agency	General Project opinion - positive		The Planning Group of the Department of State Development, Infrastructure, Local Government and Planning has conducted a review of the EIS and supports the declaration of the coordinated Project and proposed EIS.	Nil.	ARTC acknowledges the Department of State Development, Infrastructure, Local Government and Planning's support of the Project's assessment pathway.	N/A
100	100.0007	Private	Noise and Vibration	Modelling	ARTC advised that the acceptable noise limit at the submitter's home is 52 decibels, despite not doing any noise testing at the property's facade. Criteria are extremely high and do not reflect what would be considered 'acceptable noise levels' under any other circumstances. Background noise monitored by ARTC at Pittsworth at night is 25-27 decibels. Their criteria suggest an increase of about 25 decibels at night during operations. ARTC has been unable to confirm how noise levels will be managed.	It should be a condition of the EIS that ARTC be required to offer to purchase any land where they cannot mitigate the nuisance noise.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
100	100.0008	Private	Noise and Vibration	Modelling	The World Health Organisation (WHO) released guidance for rail noise at night in 2018, specifying a maximum night time average noise limit from rail of 44 dB - well below the ARTC trigger levels. Submitter suggests their family and others along the rail corridor deserve 10 dB noise mitigation.	The precautionary principle should apply and if ARTC cannot refute the WHO guidelines, they should need to abide by them.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government’s Department of Health publication, The Health Effects of Environmental Noise, 2018 (‘enHEALTH 2018’). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44 dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC’s expense .</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17</p>
101	101.0001	Private	Noise and Vibration		Noise and vibration impacts on the house 'Jasches' very close to the proposed railway.	Build a new house within the flood protected area at 'Culverthorpes' main shed area. This would be cheaper than any other noise abatement.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The modelling results are discussed in Sections 7, 8, and 9 of Appendix W: Noise and Vibration Assessment Railway operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment- Railway operations Section 7 Section 8 Section 9 Section 17</p>
102	102.0004	Private	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <p>a. Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water.</p> <p>b. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service.</p> <p>c. Opportunities for the workforce to participate in sporting activities and access to recreational facilities.</p> <p>d. Benefits to the town and wider community as there is potential for increase in economic activity.</p> <p>e. Showground site could make use of infrastructure install for the camp, once the camp was removed.</p> <p>f. Emergency service would be more readily available if required.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Border to Gowrie alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the Project revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none">➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes➤ Land tenure and ownership of each site➤ Available land area➤ Proximity to supporting infrastructure and services➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation➤ To avoid areas that are within the 1% AEP floodplains where possible➤ Constraints such as significant vegetation communities, threatened species or heritage sites➤ Road access➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the detailed design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 6.1</p>
103	103.0002	Private	Noise and Vibration	Baseline/ background sampling	The EIS does not address TOR 11.117 or 11.119 as ARTC has not taken any background noise measurements along the entire Inglewood Millmerran Road.	Complete background noise measurements along the entire Inglewood Millmerran Road. Plan construction noise levels appropriately in this quiet rural area.	<p>Background noise monitoring was undertaken at representative locations along the Project alignment (Section 16.5 of Chapter 16: Noise and Vibration). The noise surveys quantified and characterised the local sources of noise to define the baseline environment prior to the construction and operation of the Project. The survey locations provide a representative measure of existing noise for the various sensitive receptors located along the Project alignment.</p> <p>The survey area included the more rural regions of the alignment where the noise environment is peaceful and not adversely influenced by suburban communities or road traffic. The background monitoring data was applied to determine stringent construction noise criteria that account for the sensitivity of the existing noise environment.</p> <p>The measured noise levels are however considered to be representative of rural noise environments that are dominated by environmental sources such as birds and insects rather than road traffic noise (refer to Chapter 16: Noise and Vibration, Section, 16.4; Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5.4; Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 5).</p>	<p>Chapter 16: Noise and Vibration Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5</p> <p>Appendix W: Noise and Vibration Assessment- Railway operations Section 5.4</p>
103	103.0003	Private	Noise and Vibration	Modelling	Submitter highlights that the Transport and Main Roads construction noise guidelines and Interim Guidelines on operational rail noise do not take background noise levels into consideration, asserting that the guidelines are inappropriate for rural spaces.	Consider other relevant guidelines including the WHO Guidelines for environmental noise, European Union guidelines, Public Health Association of Australia guidelines, World Bank guidelines, and from the USA. See submission for guideline reference details.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019) (Refer to Appendix W: Noise and Vibration Assessment Railway Operations, Section 3; Chapter 16: Noise and Vibration, Section, 16.2)</p> <p>This Guideline does not require ARTC to provide noise mitigation to comply with the WHO guideline or other foreign guidelines. The WHO guideline, for instance, is specifically written for Europe with the findings primarily based on research into noise exposure within populations surrounding airports. However, potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government’s Department of Health publication, The Health Effects of Environmental Noise, 2018 (‘enHEALTH 2018’), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration (CoP Vol 2) is gazetted under s318E of the Environmental Protection Act 1994 (EP Act), and is named as an applicable guideline under the Project Terms of Reference. Compliance with the CoP Vol 2 is a means of demonstrating compliance with the General Environmental Duty of the EP Act. The construction airborne noise criteria are based on background noise measurements. The minimum (most stringent) allowable construction noise criteria have been adopted across the Project as a result of the background noise measurement results.</p> <p>The Transport Noise Management Code of Practice Volume 1: Road Traffic Noise (CoP Vol 1) is implemented as a legislative requirement under the Transport Infrastructure Act 1994.</p>	<p>Chapter 16: Noise and Vibration Section 16.2</p> <p>Appendix W: Noise and Vibration Assessment- Railway operations Section 3 Section 11</p>
103	103.0005	Private	Noise and Vibration		Submitter outlines the possible cost of the burden of disease due to noise pollution from the Project.	Quantify, describe and avoid the risk of disease due to noise pollution from the Project.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational railway noise and vibration to sensitive receptors along the Project alignment. The updated assessments refer to established noise guidelines and criteria that are in place to protect amenity, health, and wellbeing.</p> <p>construction noise impacts, including from blasting, are presented in the revised draft EIS are predicted unmitigated worst-case 15-minute noise impacts. The EIS construction noise and vibration modelling methodology is conservative and is based on a preliminary construction methodology and worst-case vibration transmission. During detailed design, the construction noise and vibration assessment is to be refined based on a detailed construction methodology, and specific reasonable and practicable construction noise and vibration mitigation measures will be nominated. As per TMR's Transport Noise Management Code of Practice Volume 2, reasonable and practicable measures will be taken to minimise noise and vibration impacts on the community.</p> <p>The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government’s Department of Health publication, The Health Effects of Environmental Noise, 2018 (‘enHEALTH 2018’). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44 dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>The revised draft EIS Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 7 and Section 8 Section 7, Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17, and Chapter 16: Noise and Vibration, Section 16.10, provide specific noise mitigation measures proposed to control noise at residences. These measures include physical mitigation (noise fences/noise barriers) and property upgrades to existing residences. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>The concept of burden of disease is specific to organisations such as the World Health Organisation and is not a requirement for the noise and vibration assessment for the EIS. On the basis that the Project has committed to managing noise in compliance with relevant guidelines and standards that have been specifically developed to set criteria and objectives to manage the noise and vibration impacts to amenity and health and wellbeing, and in compliance with the EIS conditions of approval, a study on noise pollution and risk of disease was not pursued.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Section 8</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
103	103.0006	Private	Noise and Vibration	Mitigation measures	The EIS does not consider noise mitigation measures or the precautionary principle of the EP Act, which is required for compliance with TOR 7.2.	Address TOR 7.2 and consider noise mitigation measures.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (Section 17 of Appendix: W Noise and Vibration Assessment - Railway Operations).</p> <p>Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration (CoP Vol 2) is gazetted under s318E of the Environmental Protection Act 1994 (EP Act), and is named as an applicable guideline under the Project Terms of Reference. Compliance with the CoP Vol 2 is a means of demonstrating compliance with the General Environmental Duty of the EP Act. The construction airborne noise criteria are based on background noise measurements. The minimum (most stringent) allowable construction noise criteria have been adopted across the Project as a result of the background noise measurement results. The Transport Noise Management Code of Practice Volume 1: Road Traffic Noise (CoP Vol 1) is implemented as a legislative requirement under the Transport Infrastructure Act 1994. The assessment as detailed in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic has been developed in accordance with these Codes.</p> <p>Section 16.10 of Chapter 16: Noise and Vibration provides details of the noise and vibration mitigation measures that have been identified based on the findings of the noise and vibration assessment.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Appendix W: Noise and Vibration Assessment - Railway operations Section 17</p>
103	103.0007	Private	Noise and Vibration		If ARTC meets the requirements of TMR's Interim guidelines on operational rail noise, it does not exonerate them from their obligations under the EP Act, the TOR for the EIS, or the provision of right-to-health assured under the International Covenant of Economic, Social and Cultural Rights that Australia is a signatory to.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (Section 17 of Appendix: W Noise and Vibration Assessment - Railway Operations). The noise and vibration mitigation measures that have been identified based on the findings of the assessment are also discussed in Section 16.10 of Chapter 16: Noise and Vibration.</p> <p>Nonetheless, achieving the criteria does not preclude the potential for noise and vibration during train passbys to be perceptible at sensitive receptors in the context of the quiet rural areas along the Project alignment. ARTC shall continue to engage with the communities and stakeholders to discuss the predicted railway noise and vibration levels and measures to ameliorate potential impacts. All noise mitigation will be in place prior to commencement of Inland Rail operations and operational railway noise and vibration levels will be verified through noise and vibration monitoring once the Project is operational.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway operations Section 17</p>
106	106.0003	Private	Noise and Vibration		Sensitive receptors referred to in the EIS refers to people who are most likely to be impacted. What about animal husbandry and native fauna. Noise and vibration could drive these animals away from their native habitat or reduce the production of farmed animals - especially poultry.	Install noise walls where noise and vibration impacts will affect these other sensitive receptors, not only people. Noise walls could be installed in areas where the rail line traverses close to poultry sheds, through known colonies of native fauna and in other areas close to feedlots, and areas where a significant number of animals gather to eat, drink or sleep.	<p>The revised draft EIS has been updated to assess the potential impacts to native fauna and livestock from noise and vibration generated during both construction and operational stages.</p> <p>Noise and vibration impacts to intensive livestock operations have been assessed in Chapter 16: Noise and Vibration. ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. An assessment of potential impacts to intensive animal operations has been conducted based on a criterion of 90 dBA Lmax. The findings and recommendations of the assessment are reported in Section 16.8 of Chapter 16: Noise and Vibration.</p> <p>Chapter 16: Noise and Vibration, Section 16.8 states, the relevant noise and vibration codes of practice, standards and guidelines that apply to Inland Rail do not provide criteria, limits, or procedures to assess noise and vibration impacts to native fauna during the construction and operation of the Project. To provide a detailed assessment of noise and vibration impacts to fauna, an assessment which identified levels of expected noise and vibration, hearing range for multiple species and a review of behavioural responses available from published literature was carried out and presented in Section 11.5.2 of Chapter 11: Flora and Fauna and Section 16.8 of Chapter 16: Noise and Vibration.</p>	<p>Chapter 16: Noise and Vibration Section 16.8</p> <p>Chapter 11: Flora and Fauna Section 11.5</p>
108	108.0004	Private	Noise and Vibration	Directly impacted landowner	Submitter's residence is 230 m from proposed rail line. A rail bridge is proposed to allow private property access for neighbours. Elevating the train will cause significant noise and vibration impacts on residence during construction and operation.	Nil.	<p>While elevating the alignment may increase unmitigated noise impacts to receptors, the application of a bridge to provide a crossing over local roads avoids the need for a level crossing. Level crossings can be a source of railway noise, such as train horns and audible alarm signals. The Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration excludes level crossings (safety warning devices) from the assessment and mitigation of noise. As such, implementing bridge design can act to reduce noise impacts from alternative design outcomes, and does not discount potential future mitigation which will be further developed throughout detailed design.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration. The methodology and assessment results are presented in Chapter 16: Noise and Vibration and Appendix W: Noise and Vibration Assessment – Railway operations. As detailed design and construction works stages progress, further acoustic assessment (including noise modelling) will be undertaken to identify feasible and practicable mitigation and eligible receptors. Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment – Railway Operations, Section 17, discuss ARTC's mitigation approach and potential mitigation measures which may be used when the alignment is operational (noting these measures will be refined during detailed design and construction works stage).</p> <p>As per the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 – Construction Noise and Vibration, reasonable and practicable measures will be taken to minimise impacts on the community throughout construction. Chapter 16: Noise and Vibration, Section 16.10 and Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 6.2, discuss ARTC's mitigation approach and potential mitigation measures which may be used while construction is taking place (noting these measures will be refined during detailed design). The Management of construction noise and vibration will be administered as part of the Project's Construction Environmental Management Plan (CEMP) and is discussed in further detail in of Chapter 24: Draft Outline Environmental Management Plan. Under the CEMP, a construction Noise and Vibration Management Plan will be produced to outline all reasonable and practicable mitigation measures to be used while various construction activities are occurring and ensure compliance with relevant approvals and/or legislation.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 6.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway operations Section 17</p>
109	109.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A</p>
109	109.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Chapter 17: Social Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
110	110.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
110	110.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none">Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks.Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways.Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning.Confirm all relevant school bus services to enable consultation with the operators.Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none">Commence implementation of management measures relating to schools as agreed during the detailed design stage.Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks.Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Section 17.6 Table 17-41 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
112	112.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	Chapter 16: Noise and Vibration Section 16.5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2 Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A
112	112.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
115	115.0004	Private - Brookstead	Noise and Vibration		<p>The submitter highlights that the location of the Pampas Rural Fire Brigade shed is situated approximately 70 m from the proposed rail line and given it is the hub of the volunteer fire service amenities, the rail will detrimentally impact on these activities.</p> <ul style="list-style-type: none"> Access to the shed will be restricted at certain times and noise and vibration will adversely impact, electronic training equipment as well as regular training and maintenance activities. Pampas Rural Fire Brigade volunteers will be subjected to excessive noise and vibration as residences are in close proximity to the rail corridor, and the volunteer firefighters will be impacted in a detrimental way due to proximity to the rail line and adjacent level crossing. 	<ul style="list-style-type: none"> The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Pampas region needs to revisit decisions around rail and bridge design in the village of Pampas, road access changes and the impact on residences, local businesses and local support groups, specifically the Pampas Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form, and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form, and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landholders on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation. 	<p>ARTC acknowledges the concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during both construction and railway operations. During the community engagement process, noise, vibration, and visual amenity have been identified as potential negative impacts to the community along the Project alignment (Refer to the revised draft EIS Appendix E: Consultation Report). The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessments have identified the Pampas Rural Fire Brigade as a sensitive receptor for noise and vibration and applied noise criteria to assess potential impacts.</p> <p>The revised draft EIS Appendix E: Consultation Report, Section 5.6, states that engagement with all sensitive receptors will be undertaken as ongoing and transparent engagement will be critical to determining mitigation measures during the detailed design stage. The results of the revised draft EIS (Section 10 of Appendix W: Noise and Vibration Assessment - Railway Operations and Section 6 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic) indicate where the predicted noise levels would exceed the noise assessment criteria requiring mitigation measures to be investigated. ARTC will engage with sensitive receptors based on the modelling results. Where modelling indicates a potential for construction and/or operational railway noise to affect the amenity of the community halls and churches, ARTC will continue to consult with the management committees/ trustees of churches and community halls, including the Pampas Rural Fire Brigade (Appendix E: Consultation Report, Section 5.6).</p> <p>The railway noise assessment has been conducted in accordance with DTMR's Interim Guideline (2019), to provide a revised impact assessment, including examples of at-property noise treatments and noise barrier mitigation. The noise and vibration assessment information, including discussion on noise mitigation, can be found in Appendix W: Noise and Vibration Assessment - Railway Operations and Chapter 16: Noise and Vibration of the revised draft EIS.</p> <p>The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 10</p>
115a	115a.0005	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the Project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values Appendix X: Social Impact Assessment, Section 6.2.2.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
115a	115a.0006	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
115a	115a.0007	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
115	115a.0008	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
115a	115a.0009	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Old) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
115a	115a.0010	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD, 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
116	116.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
116	116.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures, e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Old) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
116a	116a.0007	Private - Brookstead	Landscape and Visual Amenity	Modelling	Concern raised around lack of consideration with respect to the changed visual amenity at the location where the rail corridor intersects Millmerran-Leyburn Road. Criteria used to assess visual amenity is based on judgemental values, that do not reflect those of residents in the local communities. Criteria does not respect the key objective of identifying those who experience and value views of the landscape and an example of judgemental views is cited from Section 4.7, Landscape methodology overview, Plate 1 on page 25; stating that Mountains and hills are preferred over flat land. Aesthetic values in rural communities are different to those experienced by the majority of Australians on the coastal fringe. As evidence of misguided objectives of low impact in flat and remotely settled rural communities; the submitter demonstrates some of the alternative uses of the wide brown land in the Yandilla community with four clear examples.	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location (refer Section 8.2.17 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns. Whilst Millmerran-Leyburn Road provides access to Yarramalong Weir, it is not anticipated that views from the Weir itself will be impacted.</p> <p>As noted in the Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, these are the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) which are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values.</p> <p>Impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on the Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 7.1</p> <p>Section 8.2.16</p> <p>Section 8.2.17</p> <p>Section 11.2</p> <p>Table 95</p>
116a	116a.0008	Private - Brookstead	Landscape and Visual Amenity		Submitter highlights a lack of detail provided in the EIS. Appendix I, fails to produce montage of the alignments, at this point along the Condamine floodplain. The small rural locality of Yandilla has been ignored in the EIS and there is a lacking in clear accurate detail around changes to road-rail design at the location. The lack of detail is in addition to adverse impacts due to increased flooding, lack of acknowledgement of local affected community groups and ineffective stakeholder engagement in an area highly impacted (see additional submissions from the Pampas and Yandilla communities on the Condamine floodplain). It is noted in the design diagram that the proposed rail height adjacent to the road is a 3.0 m high embankment and bridging structure, and this is the only design information that can be commented on for visual amenity in the draft EIS.	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location (refer Section 8.2.17 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns.</p> <p>As noted in the Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, these are the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) which are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. Impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 7.1</p> <p>Section 8.2.16</p> <p>Section 8.2.17</p> <p>Section 11.2</p> <p>Table 95</p>
116a	116a.0009	Private - Brookstead	Landscape and Visual Amenity		<p>Submitter states that the impact of visual amenity in the community is high impact due to a 3.0 m embankment and bridging extending from Millmerran-Leyburn Road to the Condamine River. Submitter further states that the design does not meet the principles of the Guidance Note for Landscape and Visual Assessment (GNLVA). Conversely, it results in a permanent, irreversible, adverse change to the landscape during both construction and operational phases of the Project. Submitter states that it is expected to look similar to the embankment near Pittsworth (viewpoint 17). Submitter provides key reasons for the high impact classification including:</p> <ul style="list-style-type: none"> The Millmerran Brand Line has not been used for over 10 years, the infrastructure is low, grassed over and the current line passes in from the silos in the figure, providing little visual obstruction. Therefore the 3.0 m high embankment and bridging along a length of 5 km proposed for the rail design at this specific location will destroy the visual amenity. The Gore Highway is 1 km from this location and is part of the Open Plains Country Drive tourist route. This Section of the Millmerran-Leyburn Road provides access to Yarramalong Weir, a popular local tourist attraction 7.5 km from the Gore Highway. Therefore, a wide cross Section of the tourist travellers who wish to experience this rural locality will be impacted. Submitter further highlights that whilst workers and travellers may experience transient views at speed along this road, even if only a small proportion of the travellers each day are tourists enjoying the view, this is still a significant impact on those adversely impacted by the decreased visual amenity. The Toowoomba Regional Council Plan addresses the increasing importance of the region for tourism noting increasing growth with visitors coming to experience scenic, natural, cultural and heritage attractions. 	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location (refer Section 8.2.17 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns.</p> <p>As noted in the Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, these are the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) which are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
116a	116a.0010	Private - Brookstead	Landscape and Visual Amenity		<p>Submitter disputes claim of low sensitivity in any rural area. The Condamine floodplain was originally open grassland with naturally very sparse occurrence of trees. While the grass has been cultivated to form agricultural cropping lands, there has been limited change to the long-distant views and strong skylines over the past 100 years.</p> <p>Submitter disputes that the vegetation in low lying areas has been extensively cleared, as it was not dense in the natural environment to begin with. Submitter highlights that facts need to be checked for accuracy and justified in EIS, as claims they do not provide a basis for a low sensitivity classification.</p> <p>Submitter claims that the viewpoint along Millmerran-Leyburn Road is a highly sensitive visual viewpoint (Section 4.9.2) as many rural landholders and rural rental residents have chosen this location for the importance of the view and its existing scenic qualities. The submitter further highlights that the road is frequented by tourists travelling to the camp ground at Yarralong Weir on the Condamine River.</p> <p>Submitter highlights that the sensitivity of the landscape in the area is based on a section of rail line that has not been used for over ten years and it is adding impact to a rural location, hence is a highly sensitive landscape.</p>	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location (refer Section 8.2.17 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns.</p> <p>As noted in the Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, these are the general principles identified in the <i>Guidance Note for Landscape and Visual Assessment</i> (GNLVA) (AILA, 2018) which are based on typical community responses to scenic preference studies. However, each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values. Impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 4.7 Section 7.1 Section 8.2.16 Section 8.2.17 Section 11.2 Table 95
116a	116a.0011	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	<p>Submitter highlights that the statement in Section 11.1 indicates the significance of impact at the viewpoint, that the Project is aligned with existing rail infrastructure, but the existing rail has not been used for over 10 years.</p>	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location (refer Section 8.2.17 of Appendix K: Landscape and Visual Impact Assessment).</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns.</p> <p>Impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment). Agricultural landscapes associated with Landscape Character Type (LCT C) are considered to have a low sensitivity to change due to their highly modified state (with the exception of areas containing remnant vegetation associated with waterways which is addressed in LCT A). In addition, it is noted that existing rail infrastructure (whilst not currently operational) associated with the Millmerran Branch railway is still evident in this location.</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 7.1 Section 8.2.16 Section 8.2.17 Section 11.2 Table 96
116a	116a.0012	Private - Brookstead	Landscape and Visual Amenity	Mitigation measures	<p>Submitter highlights that with respect to Section 11.2, proposed mitigation measures regarding embankments that the proposed rail design on the Millmerran-Leyburn Road is up to 3.0 m high on embankments and around bridges which will restrict views from the road and from nearby residences.</p> <p>Submitter requests that further detail be provided in the draft EIS regarding the visual amenity at this viewpoint and possible mitigation measures.</p>	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project.</p> <p>The rationale for the selection of viewpoints to provide visualisations for has been provided in Section 4.9 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment. Visualisations have been selected on the basis of those illustrating key infrastructure elements likely to be of interest to the community and/or the most sensitive viewpoints, such as from regionally-significant scenic lookouts.</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns.</p> <p>Whilst embankments of up to around 3 m are proposed in this location, it is not considered that the scale will be equivalent to that provided in Viewpoint 17 (now 22), which are up to around 13 m above existing levels. Potential impacts of rail bridges in this location are considered to be represented by Viewpoint 12 (now 17).</p> <p>The visual impact assessment, informed by the select visualisations, provide guidance on the type of mitigation likely to be appropriate across the Project as detailed in the mitigation proposals. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment, discuss potential mitigation measures for embankments and bridges.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 4.9 Section 8.2.16 Section 11.2 Table 95
117	117.0003	Private - Brookstead	Noise and Vibration	Modelling	<p>Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.</p>	<p>The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.</p>	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	Chapter 16: Noise and Vibration Section 16.5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2 Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A
117	117.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	<p>No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.</p>	<p>The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.</p>	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none">Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks.Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways.Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning.Confirm all relevant school bus services to enable consultation with the operators.Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none">Commence implementation of management measures relating to schools as agreed during the detailed design stage.Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks.Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Section 17.6 Table 17-41 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operation7 Section 16

120a	120a.0001	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
120a	120a.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase.</p> <p>The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
120a	120a.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.</p>	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
120	120a.0004	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>
120a	120a.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.</p>	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
120a	120a.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/ occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
121	121.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
121	121.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. 122	122.0005	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Pampas cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
122	122.0006	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Pampas cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. 125	125.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Pampas cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.6 Section 16.8 Section 16.10 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 4.3 Section 6 Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 5 Section 6 Section 10 Section 12.3 Section 17 Appendix G
125	125.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Pampas cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.6 Section 16.7 Section 16.8 Section 16.10 Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Section 6 Section 7 Appendix W: Noise and Vibration Assessment – Railway operations Section 4 Section 6 Section 7 Section 8 Section 9 Section 10 Section 17

126	126.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
126	126.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
127	127.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. 128	128.0005	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Pampas cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted to for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 17: Social</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
128	128.0006	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Pampas cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
129	129.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
129	129.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	<ul style="list-style-type: none"> No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR. 	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix V: Noise and Vibration Assessment - constructions and Road Traffic, Section 7. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial construction works.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School, Chapter 16: Noise and Vibration, Section 16.7 and Section 16.8. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Old) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway operations</p> <p>Section 17</p>

133	133.0004	Private	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	Submitter offers the Millmerran Showgrounds for consideration as prime location.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the Project revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the detailed design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>
134	134.0003	Private	Noise and Vibration	Directly impacted landowner	Will experience increased noise through size of trains and length as well as two railway lines converging which increases current noise levels. Will also experience noise impacts from the tower that extracts fumes from the tunnel. The tower is proposed to be located approximately 900 m in front of submitter's property.	Nil.	<p>The revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (Section 17 of Appendix: W Noise and Vibration Assessment - Railway operations and Section 16.10 of Chapter 16: Noise and Vibration).</p> <p>The updated Project description is presented in the revised draft EIS Chapter 5: Project Description. Section 5.2 and Section 5.4 describes the key components of the revised reference design for the Project. Relevant design components of the Project have been considered in the noise and vibration modelling. However the design components that were raised by the submission i.e., tunnel and towers that extract fumes do not form part of the Project design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise community disruption in the construction works stage and through to operations. All operational noise mitigation measures will be in place prior to commencement of Inland Rail operations.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.2</p> <p>Section 5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

141	141.0005	Private	Noise and Vibration		draft EIS is missing the following details: details of sound mitigation options at the source, plus specifications of noise barriers in the rail corridor and a commitment to actually construct them; details of proposed property treatments against noise pollution, as well as treatment of residual noise impacts; specific details of noise mitigation options at Brookstead and Yelarbon Schools as both are expected to have noise exceedances even if the conceptual noise barriers are built.	Provide missing information.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment, including schools. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The revised draft EIS discusses a range of reasonable and practicable mitigation measures to reduce and control operational noise (Chapter 16: Noise and Vibration, Section 16.10, and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17, and Appendix V: Noise and Vibration Assessment: construction and Road Traffic, Section 7). This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties.</p> <p>The railway noise levels were predicted at buildings and properties identified as being non-residential noise sensitive receptors, for example, places of worship, offices, schools and passive recreational facilities (such as public parks). This assessment included Brookstead and Yelarbon State Schools, including outdoor areas at these schools. This is discussed in Section 9 of Appendix W: Noise and Vibration Assessment. Free-field noise contours for outdoor receptors are also presented in Appendix I of Appendix W: Noise and Vibration Assessment. The predicted noise levels for Design Year 2040 does not indicate L_{Aeq} and SEM noise levels exceedance at Yelarbon State School. However, results indicated two buildings within Brookstead State School (ID 261749 and 261795) exceedance to the L_{Aeq} and SEM criteria.</p> <p>The attenuation measures at Brookstead and Yelarbon include the potential for railway noise barriers to screen the noise from future railway operations (Section 16 of Appendix W: Noise and Vibration Assessment Railway operations). The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School.</p> <p>The Brookstead and Yelarbon State Schools are located within 200 m of the Project footprint and the Southbrook Central State School is located 900 m from the alignment. These schools may be impacted by construction and/or operational noise and construction activities. Consultation with potentially affected schools and the Department of Education (DoE) commenced in 2017. Engagement with DoE and the school principals in 2018, 2021 and 2022 has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. Details of these meetings are outlined in Appendix E: Consultation Report, Section 4.2, Queensland Government engagement.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Appendix V: Noise and Vibration Assessment: construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 9</p> <p>Section 17</p> <p>Appendix I</p>
141	141.0012	Private	Noise and Vibration	Baseline/ background sampling	Draft EIS does not meet TOR 6.1 - no background noise modelling was completed at any location along the proposed greenfield track adjacent to Millmerran Inglewood Road.	Meet the TOR requirement.	<p>Noise monitoring locations were selected as representative of clusters of sensitive receptors, particularly those most at risk of being impacted by construction noise. The measured background noise levels are however considered to be representative of rural noise environments that are dominated by environmental sources such as birds and insects rather than road traffic noise.</p> <p>Background noise monitoring was undertaken at 29 representative locations along the Project alignment to establish the construction noise and vibration criteria (Section 5.4 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic; Section 16.5 of Chapter 16: Noise and Vibration). Based on the background noise measurement results, the Rating Background Levels (RBLs) were determined in accordance with the CoP Vol 2. The RBLs were used to derive the noise limits applicable to the construction noise assessment are summarised in Table 3.3, Section 3.3 of Appendix V: Noise and Vibration Assessment- construction and Road Traffic. For consistency across the Project, the lowest RBLs have been applied to define the construction noise criteria. By adopting the lowest RBLs, the most stringent criteria have been applied which is a conservative assessment approach. The low background noise environment resulted in the most stringent applicable construction noise criteria being adopted across the entire Project (including between Millmerran and Inglewood). Therefore, any additional noise measurements would not change the outcomes of the assessment.</p> <p>It should also be noted that background noise levels are only considered in the construction noise assessment and have no bearing on operational noise impacts.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.4</p>
141	141.0014	Private	Noise and Vibration		Draft EIS does not meet TOR 6.4 - serious consideration has not been given to avoidance of noise impacts.	Meet the TOR requirement.	<p>The draft revised EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>construction noise mitigation measures have been recommended in the revised draft EIS (Section 16.10 of Chapter 16: Noise and Vibration). In accordance with the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration, specific reasonable and practicable measures to minimise construction noise impacts will be nominated and implemented based on a detailed assessment of construction noise (Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). The noise mitigation hierarchy detailed in the Department of Transport and Main Roads' Transport Noise Management Code of Practice Volume 1: Road Traffic Noise has been recommended for the management and mitigation of operational road traffic noise impacts. Specific operational road traffic noise mitigation measures will be determined on a receptor-by-receptor basis following a detailed operational road traffic noise assessment during detailed design (Section 8 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The draft revised EIS further discusses a range of reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Section 8</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
141	141.0029	Private	Noise and Vibration		ARTC has not sought to protect or avoid impacts to the values identified in the EPP (Noise). Note that the DES application requirements for ERAs with noise impacts and TMR's policy on construction noise recognise that the impact of noise pollution depends upon the existing background noise. Whereas ARTC's proposed guidelines do not consider background noise. Submitter's property is identified as a sensitive receptor.	Noise associated with active crossings on main roads is not 'the ordinary functioning of rail infrastructure' and therefore should need to comply with the EPP (Noise). Consider a grade separated crossing with road over rail.	<p>Background noise monitoring was undertaken at 29 representative locations along the Project alignment. In accordance with the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration, the most stringent applicable construction noise criteria were adopted across the Project as a result of the low existing background noise levels measured at all 29 locations. Refer to Section 3.3 and Section 5.4 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Existing Noise Environment.</p> <p>The assessment of noise from railway operations has been conducted in accordance with the Department of Transport and Main Roads (DTMR) Interim Guideline – Operational Rail Noise and Vibration (2019) in the revised draft EIS. This state government guideline does not require consideration of background noise levels in operational rail noise assessments.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the draft revised EIS. The draft revised EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Section 16.8 and Section 16.10 within Chapter 16: Noise and Vibration, Railway Noise Assessment.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations, Mitigation and Management. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. All noise mitigation will be in place prior to commencement of operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 3.3</p> <p>Section 5.4</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
141	141.003	Private	Noise and Vibration	Modelling	The average sound intensity for a noise that will be occurring only 11 minutes each hour is inappropriate as a way to quantify the impact on sleep or liveability. The maximum intensity is a more appropriate measure. The noise impact assessment does not accurately identify the impact on the submitter's residence.	Undertake the noise assessment using appropriate methodology to accurately portray the potential impacts.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The operational railway noise assessment considers both the overall noise exposure during a day and the highest individual single event maximum noise levels (which are not averaged over time). These noise metrics specifically address aspects such as long term noise amenity and annoyance/disturbance from individual noise events. The assessment methodology for noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p>
141	141.0031	Private	Noise and Vibration	Modelling	The sound model has not been verified at sites adjacent to level crossings. ARTC argues that L_{Amax} levels correlate better with their sound model verification that the Single Event Maximum levels required by the TMR Interim Rail Noise Guidelines because they are less sensitive to outliers. This may be appropriate for train passby where noise is due to wheel/ rail interaction, but not when a passby event is accompanied by a train horn blowing for 2 seconds. draft EIS has not met TOR 11.121(d).	ARTC should be required to report both levels, as the statistical model is not validated at sensitive receptors close to active level crossings. Alternatively, replace all proposed active level crossings with grade separated crossings.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The noise emissions for level crossings have been verified from noise levels measured at existing level crossings on freight networks in Australia. This includes wheel-rail noise, level crossing alarm signals and noise from train horns. The assessment has considered the Single Event Maximum levels from the TMR Interim Rail Noise Guidelines.</p> <p>At level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.3</p>
141	141.0032	Private	Noise and Vibration	Modelling	Noise Projections rely on unjustified assumptions.	Justify assumptions used in noise modelling.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). All assumptions are described in detail and are specific to the operation of the Project. Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p>	<p>Chapter 16: Noise and Vibration,</p> <p>Section 16.8</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 10</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141	141.0033	Private	Noise and Vibration	Modelling	ARTC has chosen to use an old version of the WHO Noise guidelines. The updated WHO Environmental Noise Policy 2018 is more appropriate and is or will be reflected in noise guidelines from different states in Australia and other countries.	The draft EIS should reflect the new science behind environmental noise impacts on human health. Refer to submission for proposed appropriate noise criteria for the property. Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC’s expense.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government’s Department of Health publication, The Health Effects of Environmental Noise, 2018 (‘enHEALTH 2018’). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC’s expense. 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC’s expense .</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
141	141.0034	Private	Noise and Vibration		Noise from the train may interfere with complete sentence intelligibility (ability to hear another person speak), which is significant for the submitter whose husband works from home and is often on the phone and in teleconference meetings.	Address noise impacts at the submitter's residence.	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
141	141.0035	Private	Noise and Vibration		The WHO Guidelines on Night Noise have been peer-reviewed and discussed to reach a consensus among experts and stakeholders. There is a substantial body of evidence supporting the negative health outcomes arising from sleep disruption (including associated with noise nuisance).	A worst case scenario should be assumed until more conclusive results are forthcoming. Suitable mitigation/ management measures should be provided for every site, including townships of Yelarbon, Brookstead and Pittsworth.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government’s Department of Health publication, The Health Effects of Environmental Noise, 2018 (‘enHEALTH 2018’). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC’s expense.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
141	141.0036	Private	Noise and Vibration	Mitigation measures	Residences, offices and schools are listed as sensitive receptors for noise in the EIS. Submitter home schools one of their children. The effects of noise on learning and concentration are well researched, affecting performance of both auditory and non-auditory tasks and short term memory. Effects of extraneous noise are more pronounced in children than adults. The Projected noise of 48 dB during the day is well above the recommended noise for unaffected learning.	Submitter's home should be a candidate for noise mitigation or avoidance. Refer to the submission for further details on proposed management measures.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads' guidelines (i.e. Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration (CoP Vol 2) and Interim Guideline – Operational Railway Noise and Vibration).</p> <p>For the construction assessment, the subject property is primarily used as a residence and therefore the receiver is categorised as a residential receiver and not as an educational receiver. The construction internal noise criterion for critical educational facilities (i.e. 45 dBA $L_{Aeq,15min}$, 15 minutes) is not applicable to residential dwellings.</p> <p>The applicable DTMR operational rail noise criteria for both residential and educational receivers are the same: Single Event Maximum ≤ 82 dB(A), $L_{Aeq,24hour} \leq 60$ dB(A). Where these criteria are exceeded, feasible and practicable noise mitigation measures (e.g. noise barriers and at-property treatments) will be further investigated during the detailed design stage and installed prior to Inland Rail operations commencing (see Section 16.10 Chapter 16: Noise and Vibration).</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p>
141	141.0037	Private	Noise and Vibration	Mitigation measures	It is unclear whether the recommendation to adopt wayside horns at active crossings and soft tone alarm bells is to be taken up, either for the modelled scenario to determine noise levels at the submitter's residence or in the actual plans for the active level crossings.	This as a bare minimum needs to be clarified in the final EIS and the particular design of the active crossing specified.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>At level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.8). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise.</p> <p>The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources. The wayside horns and soft tone alarm bells were not included in the modelling and this recommendation was provided to further mitigate noise impacts at the sensitive receivers located closer to level crossings. Potential mitigation measures will be reviewed and finalised during detailed design.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.3.8</p>
141	141.0038	Private	Noise and Vibration	Mitigation measures	EIS mentions rail dampers but does not commit to using them and says they are only suitable for straight sections of track.	See submission for further details about proposed solutions, including provide information about property treatments, SEM noise levels for sensitive receptors, at-source noise mitigation, noise abatement at schools and around townships, adopting recommendations of noise measurement services at Woodspring Farm.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.2, presents a review of operational railway noise mitigation measure. Rail dampers may provide localised benefit for the control of rolling noise where the contribution from the rail is a primary factor. International experience suggests a reduction in rolling noise of 3 dBA could be achieved and there is limited evidence that suggests rail dampers can provide some benefit in controlling curving noise. The effectiveness of rail dampers may be limited by the stiffness of the ballasted track and concrete sleepers, the forces exerted by the heavy rail freight and the long-term durability and maintenance of such measures. Sections of generally straight track that are not highly susceptible to prominent or regular wear and would be most suited for the consideration of rail dampers.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>Regarding noise abatement at schools, ARTC has engaged with Department of Education (QLD) and the agreed approach is to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Consultation with potentially affected schools and the Department of Education (DoE) commenced in 2017. Engagement with DoE and the school principals in 2018, 2021 and 2022 has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. Details of these meetings are outlined in Appendix E: Consultation Report, Section 4.2, Queensland Government engagement.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p> <p>Section 17.2</p>
141a	141a.0050	Private	Noise and Vibration		Identified sensitive receptor would be impacted by noise at the proposed active level crossing. Road traffic including heavy trucks would also contribute noise nuisance - especially at night. EIS does not present noise contour maps or specific mitigation plans for sensitive receptors.	EIS to provide sufficient information to address the TOR.	<p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS (Section 12.2, Appendix W: Noise and Vibration Assessment- Railway Operations). The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns, refer to Section 16.10, Chapter 16: Noise and Vibration, Railway Noise Assessment and Mitigation and Management Measures. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>The noise mitigation hierarchy detailed in the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 1: Road Traffic Noise has been recommended for the management and mitigation of operational road traffic noise impacts. Specific operational road traffic noise mitigation measures will be determined on a receptor-by-receptor basis following a detailed operational road traffic noise assessment during detailed design. The potential noise mitigation strategies for road traffic noise are discussed in Section 8 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Noise contour mapping has been provided in the draft revised EIS. Refer to Appendix D and Appendix J, within Appendix V: Noise and Vibration Assessment - Construction and Road Traffic for construction and road traffic noise and Appendix D and Appendix E within Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 8</p> <p>Appendix D</p> <p>Appendix J</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 12.2</p> <p>Appendix D</p> <p>Appendix E</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
141b	141b.0051	Private	Land Use and Tenure		Draft EIS shows the proponent believes it has no obligation to avoid or limit its impacts on strategic cropping land (SCL). Draft EIS does not mention that the Project could be classified as a regulated activity under the RPI Act.	Move the line to forest land to protect the large area of strategic cropping land including the floodplain.	<p>The Regional Planning Interests Act 2014 (Qld) regulates areas of regional interest and requires a resource activity or regulated activity proposed to be located in an area of regional interest to obtain a regional interests development approval. As the Project is not a resource activity nor a regulated activity under the Regional Planning Interests Act 2014, the Act does not apply (Chapter 8: Land Use and Tenure, Section 8.2). As such, the Regional Planning Interests Act 2014, and the alignment's impact on the matters protected under Regional Planning Interests Act 2014, do not have a bearing on the EIS process, nor is the approval of the EIS contingent on the assessment of the Project's impact on areas of regional interest. Notwithstanding this, the Project's impact on areas of regional interest protected under the Regional Planning Interests Act 2014 has been assessed to provide a comprehensive assessment of the Project's impact on agricultural, environmental and societal values present within both the temporary and permanent disturbance footprints of the alignment.</p> <p>As described in Chapter 2: Project Rationale, Section 2.8-2.10 of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rails program of works. Traversing State Forest is also to be minimised in balance with other environmental impacts.</p> <p>To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9 by the Project, which provides a total of areas of regional interest in relation to the Project footprint. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations.</p> <p>Chapter 8: Land Use and Tenure, Section 8.5.4 (Table 8-46), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Section 8.6.2 and Table 8-51 of Chapter 8: Land Use and Tenure).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.2</p> <p>Section 8.5.4</p> <p>Section 8.6.2</p> <p>Table 8.9</p> <p>Table 8-46</p> <p>Table 8-51</p>
141b	141b.0052	Private	Land Use and Tenure		Draft EIS does not discuss the compatibility of the Project with existing and proposed land uses in regional plans and local government planning schemes and has not proposed any avoidance or mitigation measures.	Move the line to forest land to protect the large area of strategic cropping land including the floodplain.	<p>The EIS addresses the regional plan and zoning of land within the relevant planning schemes. The revised draft EIS has been updated with further detail presented in Chapter 8: Land Use and Tenure, Section 8.5.4 Compliance impact assessment, which considers the consistency of the Project with the land use and planning instruments relevant to the Project footprint and Project activities, being the:</p> <ul style="list-style-type: none"> State Planning Policy (July 2017) Darling Downs Regional Plan (October 2013) ShapingSEQ (August 2017). Goondwindi Regional Planning Scheme 2018 Toowoomba Regional Planning Scheme 2012 <p>As the Project has been declared a coordinated Project, the provisions of local government planning schemes do not apply and therefore assessment of the Project's consistency with the planning schemes is not required.</p> <p>As described in Section 2.8-2.10 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across the Inland Rail program of works. Traversing State forest is also to be minimised in balance with other environmental impacts.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.4</p>
141b	141b.0053	Private	Noise and Vibration	Mitigation measures	Draft EIS fails to demonstrate that noise mitigation measures can protect the submitter's family or their residence, their B&B cabin or their three campsites from noise impacts, especially sleep deprivation. See attached noise report for further information.	Apply noise criteria suggested in attached noise report. ARTC provide and maintain noise mitigation (see submission for suggestions).	<p>The revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments. The revised assessment is included in Sections 7 to 12 within Appendix: W Noise and Vibration Assessment - Railway Operations and Section 16.8 of Chapter 16: Noise and Vibration.</p> <p>The operational railway noise assessment considers both the overall noise exposure during a day (24 hour) and the highest individual single event maximum noise levels (which are not averaged over time). These noise metrics specifically address aspects such as long term noise amenity and annoyance/ disturbance from individual noise events during the day and night time. The assessment methodology for noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>The report provided with the submission 'Rail Noise Impacts on Woodspring' (Noise Measurement Services Pty Ltd, 2021) discusses the World Health Organisation (WHO) guidelines and the Environment Protection (Noise) Policy 2019 as criteria with which Inland Rail operations should comply. Neither of these documents are applicable to Inland Rail.</p> <p>The WHO guideline is specifically written for Europe with the findings primarily based on research into noise exposure within populations surrounding airports and does not form part of contemporary noise policy in Australia. The Environment Protection (Noise) Policy is subordinate legislation to the Environment Protection Act, 1994 which excludes the 'ordinary use of rail transport infrastructure' (Schedule 1, Part 1) from assessment under the Policy.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise community disruption in the construction works stage and through to operations. All operational noise mitigation measures will be in place prior to commencement of Inland Rail operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 11</p> <p>Section 12</p> <p>Section 17</p> <p>Section 17.4</p>
141b	141b.0054	Private	Traffic and Transport	Level crossing	There are 20 active level crossings proposed, which fails to give weight to the 'no new level crossings' policy of the Office of the National Rail Safety Regulator.	Refer to attached traffic engineering advice which identifies an alternative location for the level crossing 2 km north from the proposed location.	<p>The submitter has provided a report reviewing the location of the Millmerran - Inglewood Road level crossing - and provides an alternative level crossing location. The report has been reviewed and the analysis is found to be very limited as it does not take into account the rail alignment requirements nor does it align with the level crossing policies noted below. The alternative level crossing position cannot be supported on this basis.</p> <p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach includes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides Coordinator-General, DTMR and the Community with further transparency on the design process undertaken to date and to understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation in accordance with the detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 Office of the National Rail Safety Regulator (ONRSR) undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p>
141b	141b.0055	Private	Economics	Level crossing	Draft EIS fails to give a balanced assessment of the time loss and economic cost impacts on road vehicle owners and the community arising from wait times at active level crossings.	Suggests more accurate description of the overall delay and cost of a road vehicle being held to allow a train to cross.	<p>The revised draft EIS describes the anticipated queue lengths, journey times and level of service for each level crossing across two future year scenarios (2026 and 2040). The EIS traffic analysis indicates that delays at level crossings will, in most instances, be 5 seconds or less. The EIS describes initial mitigation measures adopted for level crossings. These include:</p> <ul style="list-style-type: none"> Grade-separation crossings of existing roads have been adopted instead of level crossings where feasible Where grade separation is not feasible, the design has been developed in accordance with ARTC Engineering Code of Practice - Level Crossings (available on the ARTC extranet) Additional physical controls at level crossings such as boom gates and warning lights are provided Safety audits will be undertaken for all public level crossings included in the detailed design. Railway safety messages will be provided to the community through awareness activities, community engagement activities and campaigns to increase public awareness, including messaging for safety around level crossings. <p>The economic costs of traffic wait times or other costs have not been captured in the economic assessment (Appendix Y: Economic Impact Assessment). Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Qld Government costs have not been included in the Appendix Y: Economic Impact Assessment.</p> <p>Refer to above information and the potential impacts and mitigations discussed in Sections 20.5.2 in Chapter 20: Traffic, Transport and Access.</p>	<p>Chapter 18: Economics</p> <p>Section 18.3</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.5.2</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 5.1</p> <p>Section 5.5</p>
141b	141b.0056	Private	Traffic and Transport	Road safety	Draft EIS fails to attribute sufficient importance to the crash risk associated with public level crossings. Proponent has designed the Project on the basis of standards which might be permissible at a mediocre level now, rather than what is appropriate for the future.	Nil.	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> The Office of the National Rail Safety Regulators (ONRSR) Level Crossing policy (ONRSR, 2019) Queensland Level Crossing Safety Strategy 2012-2021. <p>In response to the above, ARTC has updated the revised draft EIS with an additional appendix, Public level crossing treatment methodology. This is intended to provide Agencies and the Community with further transparency on the design process undertaken. Noting all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations across the Project.</p> <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>In January 2023 the ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>ARTC has updated the revised draft EIS with details regarding Public level crossing treatment methodology outlined in sub-appendix BT Inland Rail Road Rail Interface Methodology. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet/.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.6</p> <p>Section 3.7</p> <p>Appendix BT</p>

141c	141c.0057	Private	Noise and Vibration		Noise impact report prepared for the submitter by Noise Measurement Services and wind rose Figure 11.4	Nil.	<p>ARTC acknowledges that the community has raised concerns that current lifestyle and amenity may be impacted by noise impacts during future railway operations. During the community engagement process, noise and vibration has been identified as potential negative impacts to the community along the Project alignment. Refer to Appendix E: Consultation Report.</p> <p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The modelling results are discussed in Sections 7, 8, 9, and 10 of Appendix W: Noise and Vibration Assessment - Railway Operations. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019) (refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations)</p> <p>The noise assessment criteria, adopted from the Interim Guideline are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures. The summary of railway noise assessment is detailed in Section 10 of Appendix W and the recommended mitigation measures are discussed in Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations and Section 16.10 of Chapter 16: Noise and Vibration.</p> <p>The Noise Impact Report - Rail Noise Impacts on Woodspring (Noise Measurement Services Pty Ltd, 2021) is acknowledged by Inland Rail however, the criteria proposed by the consultant for Woodspring dwellings and camp grounds, and the methodology to derive the criteria do not align with the state government's requirements documented in Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
141c	141c.0058	Private	Land Use and Tenure		Aerial photographs of submitter's property and proposed alignment	Nil.	It is acknowledged that the submitter has submitted aerial photographs of their property and proposed alignment.	N/A
141c	141c.0059	Private	Traffic and Transport		Traffic engineering advice prepared for the submitter by PTT Traffic and Transport Engineering	Nil.	This item is the same as item 141b.0054 as this is the supporting document referred to within 141b.0054.	N/A
142	142.0014	Private	Noise and Vibration		EIS also uses outdated WHO night noise guidelines and dismisses the effects of noise and sleep disruption as tentative science, even though WHO has released updated guidelines with more stringent criteria based on nearly a decade of further research. The precautionary principle should be applied.	ARTC should assume that sleep will be disrupted and the effects on health will be significant. The burden of proof falls on ARTC to prove this is not the case, which they have made no attempt to do.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 (enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
142	142.0015	Private	Noise and Vibration		The noise and vibration assessments are flawed for both construction and operation. They fail to take into account the high level of acoustic amenity currently enjoyed by the greenfield sites, do not take into account impacts on sleep and associated health impacts (or the burden of disease this will create), and fail to commit to any methods or levels of noise mitigation. Trigger noise levels used to identify properties requiring mitigation do not reflect current standards.	Require sound mitigation be required to the WHO 2018 environmental noise guidelines.	<p>ARTC acknowledges that the community has raised concerns that current lifestyle and amenity may be impacted by noise impacts during the construction works stage. During the community engagement process, noise and vibration and land use have been identified as potential negative impacts to the community along the Project alignment. Refer to Appendix E: Consultation Report.</p> <p>In accordance with TMR's Transport Noise Management Code of Practice Volume 2 - Construction Noise and Vibration (CoP Vol 2), construction noise impacts are assessed against criteria which are based on measurements of the existing noise environment. As a result of the low existing background noise levels measured, the most stringent allowable construction noise criteria have been adopted for all noise sensitive receptors.</p> <p>The predicted construction noise impacts are conservative and are based on a preliminary construction methodology. During detailed design, a detailed noise assessment will be undertaken based on a detailed construction methodology, and will be used to nominate specific reasonable and practicable measures to mitigate construction noise impacts. The EIS has recommended mitigation measures based on the predicted construction noise impacts, including limiting works during the night wherever possible (Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p> <p>The management of construction noise and vibration will be administered as part of the Project's Construction Environmental Management Plan (CEMP) and is discussed in further detail in Chapter 24: Draft Outline Environmental Management Plan. Under the CEMP, a Construction Noise and Vibration Management Plan will be produced to outline all reasonable and practicable mitigation measures to be used while various construction activities are occurring and ensure compliance with relevant approvals and/or legislation.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during the detailed design stage.</p> <p>The noise assessment criteria, adopted from the Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance.</p> <p>To minimise potential impacts to the community, in particular community health and wellbeing, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance and support if Inland Rail impacts are having adverse effects on local community members (for specific details, refer to the Social Impact Management Plan within Chapter 17: Social).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
142	142.0017	Private	Noise and Vibration	Mitigation measures	ARTC's suggested noise mitigation is limited to rail dampers, which are expensive and high maintenance. Europe uses multiple other mitigation options.	If ARTC refuses to avoid the impact by realigning the route through uninhabited areas, then should be required to mitigate noise at the source where it will mitigate the effect for all sensitive receptors. Require ARTC to comply with the development code with respect to property treatments for residential buildings constructed in rail corridors.	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix C of the draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 17.4 of Chapter 16: Noise and Vibration and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 16 of Appendix W: Noise and Vibration Assessment – Railway operations. Reasonable and practicable measures will be investigated on a "case by case" basis. Mitigation measures may include the construction of noise barriers where there are a large number of properties potentially impacted or "at-property" treatments for isolated properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. ARTC's Stakeholder Team will continue to liaise with landowners during detailed design and construction works stages of Inland Rail in relation to proposed noise mitigation that may be required. Mitigation and management measures have been proposed in of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Section 16.10</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Section 17</p>
143	143.0004	Private - Turrillin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the detailed design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>

145	145.0056	State Agency	Noise and Vibration	Mitigation measures	Noise barriers provide opportunities for local communities and artist's to do murals and artwork. Are there intentions to do murals/ artwork on noise barriers at Pittsworth, Yelarbon, Brookstead?	<p>Update the EIS to confirm if murals/ artwork on noise barriers will be included as part of the community engagement process.</p>	<p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment includes a review of noise mitigation, including noise barriers. The development and implementation of the conceptual noise barriers will be subject to further detailed studies.</p> <p>Appendix X: Social Impact Assessment Section 8.2.4 includes "ARTC or the Contractor will engage with community members in Yelarbon, Brookstead and Pittsworth, and with GRC and TRC, regarding design treatments that will lessen the impacts of noise barriers on town character".</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 16</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8.2.4</p>
145	145.0057	State Agency	Noise and Vibration		<p>The impact of railway noise on new residential dwellings is managed through the declaration of Transport Noise Corridors which requires building work to adhere to the Queensland Development Code MP4.4. TNCs are available SARA and local government mapping systems and are updated as a requirement of a gazette of Transport Noise Corridors.</p> <p>The land designated as a Transport Noise Corridor comprises land within a corridor up to 250 m on both sides of the railway which is significantly affected by noise. This includes railways that carry at least 15 trains per day. The corridor is measured from the boundary of the railway with adjacent land, and then continuing the distance of up to 250 m, depending on the noise contours mapped as a result of rail traffic noise.</p>	<p>Amend the EIS to indicate that ARTC commit to working with TMR to update and gazette the railway corridor as a Transport Noise Corridor so that future development within the TNC can adequately manage and mitigate noise associated with railway operations relevant to MP4.4 under the Building Act 1974.</p>	<p>ARTC commit to discussing the process to update and gazette the railway corridor as a Transport Noise Corridor with TMR. This commitment will be included in the revised draft EIS. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment – Railway operations, Section 17.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
145	145.0058	State	Noise and Vibration	operational rail noise	<p>The scope of the Noise and Vibration Assessment has not adequately considered TMR's Interim Guideline - operational Railway Noise and Vibration (March 2019). This document is a published standard under the Transport Infrastructure Act 1994.</p> <p>A clear assessment has not been made and mitigation requirements for this mandatory part of the Interim Guideline have not been adequately presented/determined.</p>	<p>Update the EIS to provide a noise and vibration assessment in accordance with the mandatory portions of TMR's Interim Guideline - Operational Railway Noise and Vibration (March 2019).</p>	<p>The revised draft EIS has been updated to provide an assessment of railway noise and vibration in accordance with the Department of Transport and Main Road (DTMR) Interim Guideline operational Railway Noise and Vibration (2019).</p> <p>A review of the applicable assessment criteria is provided in Section 3 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 3</p>
145	145.0059	State Agency	Noise and Vibration		Section 14.4.2 does not mention, and therefore it is assumed that it does not include, approved developments within the study methodology area. These developments could be sensitive receivers and likely could be affected by the proposed rail Project.	<p>Update the EIS (including Appendix (Appendix S & T)) to acknowledge and include any approved developments as sensitive receivers within the study area and revise the assessment.</p>	<p>A review of Material Change of Use (MCU) and operational works applications for the local government areas of Goondiwindi and Toowoomba was undertaken to identify potential sensitive land uses, such as residential sub-divisions. The search was based on a six-year period up to 1 July 2022 to be consistent with the typical six-year currency period for an MCU and to align with the timeframes for the preparation of the revised draft EIS.</p> <p>The revised draft EIS noise and vibration assessments have been updated to acknowledge and include any approved, but not yet built, developments as sensitive receivers (see Section 5.1 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic and Section 8.3 of Appendix W: Noise and Vibration Assessment – Railway Operations). ARTC interrogated both the Toowoomba and Goondiwindi councils Development Approval data bases. Approved, but yet to be built developments that are sensitive land uses, have been identified at the time of the revised draft EIS preparation and included in the noise and vibration assessments.</p> <p>Further assessment of approved unbuilt development may be required should any additional applicable developments been approved prior to the notification of the Project approval.</p>	<p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Appendix W: Noise and Vibration Assessment – Railway operations</p> <p>Section 8.3</p>
145	145.006	State Agency	Noise and Vibration	operational rail noise	<p>The methodology of the Noise and Vibration Assessment has not been specifically assessed against TMR's Interim Guideline - operational Railway Noise and Vibration (March 2019).</p> <p>This document is a published standard under the Transport Infrastructure Act 1994.</p> <p>TMR drew ARTC's attention to the document during the initial adequacy review of the EIS in September 2019.</p>	<p>Where the assessment does not strictly assess against the requirements of the Interim Guideline, the EIS should clearly document how the selected method may also be used to determine compliance with TMR's Interim Guideline - Operational Railway Noise and Vibration (March 2019). An adequate review should be provided within the assessment to show how the selected method compares with the requirements of the Interim Guideline. The review should provide sufficient detail on the following aspects:</p> <ul style="list-style-type: none"> Source data (i.e. 95th percentile vs Single Event Maximum) Modelling method (algorithm, inputs and assumptions, with differences noted for various distances from the source) Criteria (for all mandatory components of the Interim Guideline) <p>Comparison - A sample area modelled and assessed under the selected Project method verses the requirements of the Interim Guideline should be provided. The sample area should have sufficient variation to allow for the differences noted to be presented.</p> <p>For non-residential receivers this may not be possible, and the assessment should clearly identify these locations and assess them in accordance with TMR's Interim Guideline - operational Railway Noise and Vibration (March 2019).</p>	<p>The revised draft EIS has been updated to provide an assessment of railway noise and vibration in accordance with the Department of Transport and Main Road (DTMR) Interim Guideline operational Railway Noise and Vibration (2019). A review of the applicable assessment criteria is provided in Section 3 of Appendix W: Noise and Vibration Assessment - Railway Operations and Section 16.8 of Chapter 16: Noise and Vibration.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 3</p>
145	145.0062	State Agency	Noise and Vibration		The EIS should assess new and upgraded roads in accordance with the Transport Noise Management Code of Practice Volume 1. The current level of detail and assessment is not consistent with this code.	<p>Update the EIS including Appendix (Appendix S) to assess as per the requirements of the Transport Noise Management Code of Practice Volume 1. Including the design of noise mitigation where required.</p>	<p>The road traffic noise impact assessment has been updated to meet the requirements of the Department of Transport and Main Roads' Transport Noise Management Code of Practice Volume 1 (CoP V1). This included pre-construction noise measurements, verification of a 3D model against the measurement results, and 3D model predictions of future road traffic noise levels. Refer to Section 8 within Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p>	<p>Appendix V: Noise and Vibration Assessment - construction and Road</p> <p>Section 8</p>
145	145.0063	State	Noise and Vibration	construction airborne noise	The noise assessment of the borrow pit has been made against the construction noise criteria. Please confirm if this activity is an environmentally relevant activity (ERA).	<p>Confirm if the borrow pit is an ERA. Update the EIS including Appendix (Appendix S) to assess against the ERA requirements including updated noise criteria (if required).</p>	<p>The viability and feasibility of accessing material from the potential borrow pit sites will be confirmed during the detailed design stage of the Project (post-EIS approval). Assessments of each borrow pit location will be undertaken during detailed design to determine material usability, volumes, environmental and social impacts and potential secondary approval triggers.</p> <p>The revised draft EIS has been updated to include noise modelling at six Project borrow pit sites as detailed in Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p>	<p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>

145	145.0069	State Agency	Noise and Vibration	Cumulative impacts	Cumulative impacts require further assessment and do not include the cumulative impacts from road/ rail operations with the multi-modal L_{Aeq} criteria from TMRs environmental emissions policy.	The EIS should be updated to determine if additional mitigation is required to address cumulative impacts. The cumulative noise impacts from road and rail operations combined should also be assessed with multi-modal L_{Aeq} criteria within the environmental emissions policy. Update the EIS accordingly.	<p>Cumulative impacts of road and rail noise</p> <p>Cumulative impacts of road traffic and railway noise are discussed in Section 16.12 of Chapter 16: Noise and Vibration in the revised draft EIS. The rail alignment of the Project will, in places, intersect and be alongside the existing road network and the future new and upgraded roads proposed within the Project.</p> <p>A table of 24-hour L_{eq} noise levels from road and railway noise has also been provided in Appendix J of Appendix W: Noise and Vibration Assessment Railway operations. The Table provides results for receptors where cumulative road and rail transport noise would be relevant on the alignment, with further discussion also provided in Section 15.1 of Appendix W.</p> <p>While the policies and guidelines referenced in this assessment do not specify criteria or management objectives for combined road and railway transport noise, an overview assessment of potential cumulative transport noise has been undertaken to inform the revised draft EIS. The assessment addresses concerns raised regarding the potential for road traffic and railway operations to result in cumulative transport noise impacts. DTMR's Development Affected by Environmental Emissions from Transport Policy, Version 4 (October 2017), assess cumulative impacts from road and rail for new developments using criteria which can be considered to assist in quantifying and assessing cumulative impacts from the Project.</p> <p>DTMR's Development Affected by Environmental Emissions from Transport Policy, Version 4 (October 2017) provides the following guidance in Section 1. Introduction:</p> <p>The Development Affected by Environmental Emissions from Transport Policy (the policy) outlines the Department of Transport and Main Roads (TMR) policy position in relation to the development of land affected by environmental emissions from linear state transport corridors and infrastructure. This includes busway, railway, light rail and state-controlled road corridors and infrastructure.</p> <p>and provides the following statement regarding application of the policy Section 3. Application of the policy:</p> <p>The policy applies throughout Queensland to development proposals for new sensitive development on land affected by environmental emissions generated from State transport corridors and government supported transport infrastructure including:</p> <ul style="list-style-type: none"> Busway corridors and busway transport infrastructure Railway corridors, rail transport infrastructure and other rail infrastructure light rail corridors and light rail transport infrastructure State-controlled roads and road transport infrastructure. <p>Hence the policy is not applicable to the development of transport infrastructure. Notwithstanding the above, a review of cumulative impacts from the Project has been undertaken by comparing the predicted new rail and new/ upgraded road noise levels predicted for operational rail and road noise.</p> <p>The policy provides three sets of criteria depending on the type of state transport corridor. These are:</p> <ol style="list-style-type: none"> Railway OR Multimodal corridor which includes a railway Busway or Light Railway State Controlled Road or Multimodal corridor which does not include a railway or includes <15 single railway events. <p>As Inland Rail will be a railway with over 15 trains per day the Railway OR Multimodal corridor criteria are considered most comparable. The criteria is detailed in Table 3: Primary (external) noise criteria for new sensitive development, DTMR's Development Affected by Environmental Emissions from Transport Policy, Version 4 (October 2017). This is also presented and discussed in Section 16.12 of Chapter 16: Noise and Vibration.</p> <p>Comparing the DTMR Development Affected by Environmental Emissions from Transport Policy with the Interim Guideline noise criteria for new railways which has been adopted for the Project, the Interim Guideline criteria are 5dB more stringent for L_{Aeq} (24hr) and SEM. At the majority of sensitive receptors close enough to both the road network and railway alignment to potentially experience cumulative transport noise, railway noise levels are expected to be the dominant noise contribution (during train passby). Hence at sensitive receivers that exceed the rail noise criteria (which is more stringent than the cumulative criteria) they will be provided with mitigation for rail noise, which also assists in controlling cumulative road and rail noise. Applying the DTMR's Development Affected by Environmental Emissions from Transport Policy does not result in any additional triggers.</p>	Chapter 16: Noise and Vibration Section 16.2 Appendix W: Noise and Vibration Assessment - Railway Operations Section 15.1
145	145.007	State Agency	Noise and Vibration	Mitigation measures	The Section 11.125 of the ToR states: Describe any expected exceedances of noise and vibration goals or criteria following the provision or application of mitigation measures and how any residual impacts would be addressed. However, operational rail and road mitigation measures have not been adequately designed and therefore it is unknown what level of mitigation is considered reasonable and practicable. The EIS should clearly demonstrate mitigation requirements and residual exceedances. The noise barrier heights reviewed should not be limited in height to 4 m above ground. Each receiver (or group of receivers) which is predicted to exceed the criteria shall be specifically addressed in the report and mitigation options discussed. Where the Project changes the road structure the noise barrier option should clearly present and address this issue and ensure that it does not obstruct crossings.	Update the EIS and revise the assessment to determine the level of noise barrier and other mitigation requirements for sensitive receivers consistent with the requirements of the ToR. The assessment should clearly state if TMRs Interim Guideline - operational Railway Noise and Vibration (March 2019) requirements have been met. The residual exceedances of criteria shall be clearly stated and why noise mitigation on rail corridor land, commercial corridor land or future railway land is not reasonable or practicable. It is expected that the EIS provides a clear review and recommend reasonable and practicable mitigation for each receiver (or group of receivers).	<p>The road traffic noise impact assessment has been updated to meet the requirements of the Department of Transport and Main Roads' Transport Noise Management Code of Practice Volume 1 (CoP V1). This included pre-construction noise measurements, verification of a 3D model against the measurement results, 3D model predictions of future road traffic noise levels and recommended the CoP's road traffic noise mitigation hierarchy. Refer to Section 7 within Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>The draft revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers greater than 4 m in height, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations and Section 16.10 of Chapter 16: Noise and Vibration).</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - construction and Road Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
145	145.0071	State Agency	Noise and Vibration		Table 14.39 states that no noise mitigation will be installed until after the Project is operating and additional noise monitoring has been completed. This requirement is not standard practice (i.e. delay the installation of treatment). The noise (and other) mitigation shall be determined as part of the EIS and installed before operations commence. Noise monitoring is typically conducted after the Project is operational to confirm that noise treatments (i.e. noise barriers) are performing as predicted.	Update the EIS (including Chapter 22) and revise the assessment to determine the level of noise barrier and other mitigation requirements for sensitive receivers consistent with the requirements of the ToR. Mitigation must be determined as part of the EIS and installed before operations commence. Update the EIS (inc Chapter 22 Outline Environmental Management Plan and Appendix Z Proponent Commitments) accordingly.	<p>Noise mitigation measures (e.g. noise barriers, at-property treatments) will be further investigated during the detailed design stage and installed prior to Inland Rail operations commencing (Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations). Compliance noise and vibration monitoring will be undertaken within 6 months of Project opening to ensure that mitigation measures are adequate. If the results of monitoring indicate additional exceedances of the operational noise and vibration criteria, then additional reasonable and practicable mitigation will be implemented in consultation with affected property owners.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - Railway Operations Section 17
145	145.0072	State	Noise and Vibration	operational rail noise	Chapter 14 has not considered the potential noise impacts of the future operational railway on future sensitive land uses. Table 14.39 notes potential noise walls or barriers or earth mounds at the rail corridor boundary to mitigate operational rail noise to a group of sensitive receptors.	<p>The proposed railway is likely to generate environmental emissions that may impact upon existing and future residential uses. It is recommended that the development be designed, constructed and implements mitigation measures to meet the relevant environmental emission criteria for noise set out in the Department of Transport and Main Roads' Development Affected by Environmental Emissions from Transport Policy, Version 4 (October 2017), Table 3 Rail Noise External Criteria, referenced in the ToR, which is available at: tmr.qld.gov.au/business-industry/technical-standards-publications/development-on-land-affected-by-environmental-emissions</p> <p>Potential noise barriers and earth mounds in the existing railway corridor will need approval/ licences from the railway manger (QR) under Section 255 of the Transport Infrastructure Act 1994. The design and construction of noise barriers will need to comply with Queensland Rail's Civil Engineering Technical Requirement CIVIL-SR-014 and Transport and Main Roads' Specifications MRTS04 General Earthworks.</p>	<p>The revised draft EIS noise and vibration assessments have been updated to acknowledge and include any approved, but not yet built, developments as sensitive receivers. ARTC interrogated both the Toowoomba and Goondwindi Regional Council's Development Approval databases. Approved, but yet to be built developments that are sensitive land uses, have been identified at the time of the revised draft EIS preparation and included in the noise and vibration assessments (Section 8.3 of Appendix V: Noise and Vibration Assessment - Railway Operations). Further assessment of approved unbuilt development may be required should any additional applicable developments be approved prior to the notification of the Project approval.</p> <p>As per the Department of Transport and Main Roads' Interim Guideline - operational Railway Noise and Vibration, a sensitive land use is a location which may be affected by transport noise and/or vibration where there is an existing land use listed in Section 2.1 or an approved development application for land uses listed in Section 2.1.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments. The revised assessment is presented in Appendix: W Noise and Vibration Assessment - Railway operations.</p> <p>ARTC is not responsible for mitigating railway noise for new, currently unapproved developments establishing next to Inland Rail. These developments must comply with the Department of Transport and Main Roads' Development Affected by Environmental Emissions from Transport Policy, Section 3 of the Policy states that the Policy applies 'to development proposals for new sensitive development on land affected by environmental emissions generated from state transport corridors and government supported transport infrastructure'. The Policy and the external noise criteria therefore do not apply to ARTC, but to the developer establishing next to the railway.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - Railway Operations Section 4 Section 17
145	145.0195	State	Noise and Vibration	Baseline/ background sampling	It is unclear in the EIS if the baseline noise at the 12 potential borrow sites has been established so that if the sites become operational a comparison of noise levels can be accurately made. If this baseline assessment is not undertaken until detailed design, it is likely there may not be sufficient time to collect an adequate baseline level.	Update the EIS to confirm if baseline noise monitoring was undertaken for the borrow pit locations.	<p>Baseline noise monitoring was undertaken across the Project to determine appropriate construction noise criteria, as per the Department of Transport and Main Roads' Transport Noise Management Code of Practice Volume 2 - construction Noise and Vibration. At each monitoring location, background noise levels were measured which were consistent with the application of the minimum (most stringent) allowable noise criteria. As a result, construction noise impacts, including those from borrow pits, were assessed against these minimum noise criteria. Additional noise monitoring would be unlikely to yield different noise criteria, and if it did, those criteria would be less stringent than those currently nominated.</p> <p>Section 4.2 and Section 5.4 of the Appendix V: Noise and Vibration Assessment - Construction and Road Traffic provides further discussion on the baseline environmental noise and vibration surveys that were undertaken in 2018, 2022 and 2023. In consideration of the current reference design, additional baseline noise monitoring surveys were completed for the Project including a monitoring activity at the site of the proposed Heckendorf Road borrow pit site (i.e. Lot 111 on DY182, Millmerran-Inglewood Road, Clontarf).</p> <p>The revised draft EIS has been updated to include additional noise modelling of the six Project borrow pit sites (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic; Section 16.6.2 of Chapter 16: Noise and Vibration).</p>	Chapter 16: Noise and Vibration Section 16.6.2 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 4.2 Section 5.4 Section 6.1
145	145.0196	State	Noise and Vibration	Modelling	It is unclear in the EIS if the increased height of the Cunningham and the Gore Highways was modelled due to them being placed on grade separation crossings. This will be particularly relevant for vehicles (especially road-trains) accelerating up onto the bridges when travelling away from the receptors.	Update the EIS to confirm that the height increases were included in the assessment.	<p>ARTC can confirm that road height increases due to road separations have been accounted for by the noise modelling assessment. The results of the operational road traffic noise assessment are discussed in Section 8.1 and Section 8.2 of Appendix V: Noise and Vibration Assessment construction and Road Traffic, and Section 16.7 of Chapter 16: Noise and Vibration. Noise mitigation measures are also discussed in Section 8.3 of Appendix V: Noise and Vibration Assessment construction and Road Traffic, which considers various solutions such as noise barriers, at-property treatments and quieter road pavement surfaces to address impacts to receptors along the alignment.</p>	Chapter 16: Noise and Vibration Section 16.7 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 8.1 Section 8.2 Section 8.3
145	145.0197	State Agency	Noise and Vibration		The new Gore Highway at Brookstead is not listed in the table.	Update the EIS to include the new Gore Highway at Brookstead.	<p>ARTC can confirm that changes to the Gore Highway near Brookstead are considered road upgrades and have been included under upgraded roads report sections.</p> <p>The operational road traffic noise assessment has included the Gore Highway at Brookstead. The operational road traffic assessment is discussed in Section 8 and Appendix G of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p>	Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 8 Appendix G
145	145.0272	State Agency	Noise and Vibration	Proponent commitments	Noise and vibration mitigation measures are to be installed during construction activities prior to operation of any rolling stock. Noise and vibration mitigation measure will be installed to ensure rolling stock does not exceed criteria as specified in Table 2.2.1, 2.2.2 and 2.2.3 as specified in TMR's Interim Guideline operational Railway Noise and Vibration.	Noise and vibration mitigation measures must be installed during construction activities prior to operation of any rolling stock in accordance to rail operational criteria as specified in TMR's Interim Guideline operational Railway Noise and Vibration. Amend the Proponent Commitments and Outline Environmental Management Plan accordingly.	<p>Noise mitigation measures (e.g. noise barriers, at-property treatments) will be further investigated during the detailed design stage and installed prior to Inland Rail operations commencing, where it is deemed reasonable and practicable. Compliance noise and vibration monitoring will be undertaken within 6 months of Project opening to ensure that mitigation measures are adequate. If the results of monitoring indicate additional exceedances of the operational noise and vibration criteria, then additional reasonable and practicable mitigation will be implemented in consultation with affected property owners. The proposed mitigation measures are further discussed in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration. Assessment - Railway Operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - Railway Operations Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
146	146.0004	Private - Turallin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the detailed design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>
146a	146a.0001	Private - Brookstead	Social Impact Assessment	Modelling	<p>The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.</p> <p>The SIA survey does not represent views of the community members who may be impacted by the Project.</p>	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
146a	146a.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase.</p> <p>The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
146a	146a.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
146	146a.0004	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 17</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
146a	146a.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. ARTC is committed to working directly	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Old) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
146a	146a.0006	Private - Brookstead	Stakeholder Engagement		ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.	Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD, 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
147	147.0002	Private	Noise and Vibration		Submitter's farm homestead is located 100 m from construction site and 150 m from proposed rail line. ARTC contacted submitter to inform of noise impacts and outlined next step is to discuss mitigation measures. ARTC did not follow up on mitigation measures. Style and design of homestead is not practical to modify with sound insulation and double glazing. It also cannot be moved. Question whether ARTC has considered prevailing wind speed and direction in their sound/ noise level modelling.	Only compensation practical is to build a new house 350-450 m from the rail corridor.	<p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances sound propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
147a	147a.0004	Private	Project scope		Clarity sought around the meaning of the 'study area' identified over the submitter's property. See submission for maps. What is ARTC studying? How long will the area stay a 'study area'? Will the area preclude development and/or farming activities? How will ARTC study this area if they do not have access?	There should be a time limit that the 'study area' can remain. If not, results of future legal actions may result increased costs to tax payers. Simple questions that someone negatively impacted by the Project would like straight answers to.	<p>A Corridor Options Report for the Borer to Gowrie Rail Project was completed in 2017, overseen by a Project Reference Group appointed by the Australian Government and chaired by Mr Bruce Wilson AM. The report was made publicly available by the Australian Government on 21 September 2017 (Chapter 2: Project Rationale, Section 2.9.3).</p> <p>The report considered several options and recommended the alignment from the New South Wales border via Wellcamp Charlton. The Australian government supported this alignment and proposed a two-kilometre-wide study area to be progressed through ARTCs phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. Chapter 2: Project Rationale, Section 2.8 and 2.9 of the revised draft EIS describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website (Chapter 2: Project Rationale, Section 2.9.3).</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.9.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
148	148.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
148	148.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
149	149.041	State Agency	Noise and Vibration	construction vibration	Section 7.9 contains very little information on blasting, a contributor to Potential construction Impacts, Airborne Noise and Ground Borne Vibration. A separate section on blasting has been added which does not address the first two impacts (Airborne Noise and Ground Borne Vibration). The criteria described in Table 26 Recommended Minimum Working Distances for Vibration Intensive Equipment, only mentions controls for ground vibration, effectively ignoring blast overpressure and flyrock resulting from poor blast design and execution. This is considered a deficiency that needs to be corrected and the previously suggested amendments should be incorporated into the EIS. This includes: In accordance with Explosives Regulation 2017, Section 152(a) Use of Blasting Explosives. A prescribed shotfirer must use blasting explosives as required under Australian Standard 2187 Part 2: 2006, use of explosives. This standard includes environmental controls for overpressure, vibration and flyrock. Sub-standard performance outcomes from blasting resulting in referrals to the Explosives Inspectorate would be measured against the criteria in the legislation and its reliance on AS2187.2:2006. It is suggested that the maximum permissible charge weight to meet the sensitive structure vibration criteria in Transport and Main Roads (TMR) document CoP Vol 2 is shown in Table 27 Charge Mass Ranges for Set Distances. However, when referring to TMR CoP Vol 2 it does not include Table 27. It is unknown where the information in the Table 27 and Table 28 originates? Both tables are unreferenced and do not come from AS2187.2:2006, although it is possible that they may be derived from the calculations listed in the Standard.	This Section of the EIS is wholly unsatisfactory and should be re-written to incorporate blasting impacts. Amend to include the following information under Blasting (page 63): In accordance with Explosives Regulation 2017, Section 152(a) Use of Blasting Explosives A prescribed shotfirer must use blasting explosives as required under Australian Standard 2187 Part 2: 2006, use of explosives. This standard includes environmental controls for overpressure, vibration and flyrock.	<p>The construction blasting assessment within the draft revised EIS, has assessed blasting and has been assessed separately to construction airborne noise and ground borne vibration. This is because airblast overpressure and blasting ground borne vibration are assessed against specific blasting criteria. Blasting impacts have been assessed in accordance with DTMR's CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2 (see Section 3.3, Appendix V: Noise and Vibration Assessment – Construction and Road Traffic).</p> <p>The blasting assessment includes:</p> <ul style="list-style-type: none"> The nominated criteria Airblast and ground vibration propagation formulae from AS 2187.2, including worst-case assumptions of propagation constants in the absence of detailed geotechnical information Minimum distances between potential blasting locations and sensitive receptors Predicted maximum blasting charge masses for various distances from blasting. <p>There are no ToR or legislative requirements to assess flyrock impacts, including under CoP Vol 2, and flyrock impacts have not been assessed. ARTC's specialist blasting contractors will design and implement all blasts to prevent impacts from flyrock at sensitive receptors near to the blast locations. The design of individual blasts occurs as part of the construction stage and is informed from localised trial blasts to optimise the blast parameters for the control of air blast over pressure, blast induced vibration, and flyrock.</p> <p>Mitigation measures in relation to blasting are discussed in Section 16.10, Chapter 16: Noise and Vibration. ARTC has incorporated text consistent with the requirements of the CoP Vol 2 regarding the use of AS 2187.2 for measurement and blasting and this has been included in Section 16.10. The following mitigation measure has also been included: "In accordance with Explosives Regulation 2017, Section 152(a) Use of Blasting Explosives, the construction contractor will engage a suitably qualified and prescribed shotfirer to use blasting explosives in accordance with Australian Standard 2187 Part 2: 2006, use of explosives. This standard includes environmental controls for overpressure, vibration and flyrock.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 3.3</p>
149	149.042	State Agency	Noise and Vibration	construction vibration	Within Section 3.5.11 there is reference to blast caps and detonators. It is unsure what the term blast caps refers to? Blasting caps is an obsolete term and are now referred to as detonators.	The use of the term blast caps within this Section and elsewhere in the EIS should be removed and substituted with detonators.	The term 'blast caps' has been removed from the revised draft EIS.	N/A
149	149.043	State Agency	Noise and Vibration	construction vibration	Section 5.4.0, Table 5.30 - For noting: <ul style="list-style-type: none"> A Blasting Contractor engaged to perform blasting activities will also have to consider security of the explosives for the entire duration of the task. Blasting Contractors will need to maintain a Security Management System. Segregation of incompatible products will also have to be considered. 	Nil.	<p>Chapter 5: Project Description Section 5.6.14 states "Where explosives are used during construction, the works will be undertaken by the appointed licenced blasting contractor in accordance with the Explosive Act 1999 (Qld) and AS 2187.2:2006—Explosives—Storage and Use: Part 2: Use of Explosives (Standards Australia, 2006).</p> <p>The blasting contractor will need to maintain a Security Management System and prepare a Blast Management Plan for the task to ensure that potential impacts are properly assessed and managed. The blasting contractor will be responsible for the security of the explosives for the duration of the task, including the segregation of incompatible products".</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.14</p>
149	149.044	State Agency	Noise and Vibration	construction vibration	Table 5.26 - For noting: For any construction blasting relating to earthworks, tunnelling or drainage, the licenced shotfirer and blasting contractor will have to determine the blast design and quantity of explosives to complete the task.	Nil.	<p>The air-blast and vibration management criteria used throughout Chapter 16: Noise and Vibration have been developed have been developed in line with recommendations from the CoP Vol 2. Guidance was referenced from Australian Standard (2006) AS 2187.2 (Explosives – Storage and use Part 2: Use of explosives) to calculate potential air-blast and ground vibration levels from blast events. Section 16.6 of Chapter 16: Noise and Vibration states that "In practice each blast will be carefully planned by a specialist blasting contractor to control the air-blast and vibration levels. "</p> <p>As part of the assessment for the revised draft EIS, the blasting assessment includes calculations to determine the blast parameters that are expected to control the emissions to meet the air-blast and blast vibration criteria.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p>
151	151.0001	Community Group	Noise and Vibration		Yelarbon silos - sound barriers not to obstruct the view of the silos and be constructed in front of them	Use other sound reduction measures other than barriers in front of silos	<p>The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers.</p> <p>Mitigation measures provided as part of the revised draft EIS (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations and Section 16.10 of Chapter 16: Noise and Vibration), proposed a concept noise barrier in Yelarbon to mitigate railway noise impacts on homes and businesses. The noise wall design in Yelarbon will be progressed during detailed design with consideration of the silo art, hydrology and pedestrian connectivity. Depending on its location, height, materials and length, a noise wall could affect views to the Yelarbon silo art from the viewing platform on the other side of the rail line.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 3: Yelarbon rest area has been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>An additional site visit was undertaken in October 2021 to assess the potential impact of views from the GrainCorp silo artwork viewing area. As a result, an additional viewpoint assessment (Viewpoint 4) has been included within Appendix K: Landscape and Visual Impact Assessment, Section 8.2.4 and Section 9.1.4. This viewpoint assessment includes a visualisation showing the potential impact of noise walls and other Project infrastructure in this location. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and managers.</p> <p>ARTC is investigating the design for the noise walls to determine whether satisfactory noise mitigation can be achieved without obscuring views to the silos. If views to the Yelarbon silos are affected by noise walls, ARTC would facilitate provision of mitigation measures, e.g. a complementary mural on the noise wall and/or roadside landscaping, in consultation with the Yelarbon community and Goondiwindi Shire Council.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2.4</p> <p>Section 9.1.4</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
151	151.0003	Community Group	Noise and Vibration		Permanent sound monitors installed prior to commencement of trains	Collection of noise monitoring data	<p>A programme of noise and vibration monitoring is recommended to be undertaken within 12 months of the commencement of railway operations on the Project. The purpose of the monitoring is to quantify the rail noise and vibration levels from the daily rail operations and assess the Project's compliance with any relevant conditions of approval relating to noise and vibration emissions.</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 16.8, provides further detail on the recommended programme of noise and vibration monitoring for the Project.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 16.8</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
152	152.0004	Private - Turalin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the detailed design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>
153a	153.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that:</p> <ul style="list-style-type: none"> Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
153	153.0004	Private - Turalin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. 153	153a.0001	Private - Brookstead	Noise and Vibration	operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or Project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
153a	153a.0002	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Border to Gowrie alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
153	153a.0003	Private - Turrallin Workers	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
153a	153a.0005	Private - Brookstead	Stakeholder Engagement		ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landholders. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.	<p>Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'detailed design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS.</p>	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners' occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.3</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
153a	153a.0006	Private - Brookstead	Social Impact Assessment	Modelling	The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very small participation of residents for the local community in Brookstead as it was poorly advertised and promoted by ARTC within the Brookstead region. Thus the statistical nature of the activity has limited validity and does not represent views of the community members who may be impacted by the Project.	The Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
153a	153a.0007	Private - Brookstead	Social Impact Assessment	Mitigation measures	<ul style="list-style-type: none"> Insufficient feasible alternative solutions with less social impacts on the community and day-to-day activities at the school have been discussed with the Brookstead community in relation to the impacts of the noise and vibration of the rail during both construction and operation. Insufficient detail is provided about how the social impacts to the community (impact on community values, anxiety and business disadvantage due to decreasing property values, construction noise or dust affects, distress in relation to changes to lifestyles, operational noise etc) will be minimised or mitigated and as such the draft EIS is incomplete according to TOR condition 11.140. 	Nil.	<p>As described in revised draft EIS Appendix X: Social Impact Assessment, environmental impacts that could affect social and mental wellbeing include noise, changes to visual amenity, changes to traffic networks, changes to water access, impacts on the use of properties affected by partial acquisition or changes to connectivity across the rail corridor.</p> <p>Design measures such as avoidance of town centres, avoidance of major farm infrastructure, the design of road-rail interfaces and provision for private crossings have sought to reduce impacts.</p> <p>Beyond this, mitigation strategies addressing environmental impacts such as noise, dust and emissions, impacts on groundwater bores and impacts on the traffic network are addressed in detail in relevant technical reports and Chapter 24: Draft Outline Environmental Management Plan. These measures aim to avoid environmental impacts and/or reduce potential impacts to levels which are considered acceptable under the relevant legislation and environmental guidelines.</p> <p>Strategies implemented by ARTC to date to address impacts on wellbeing include community information and engagement strategies, provision of funding for mental health support services, and provision of donations and sponsorships for Projects that improve community resilience and the amenity of local facilities.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. Specific initiatives that will contribute to local community wellbeing have been identified in Appendix X: Social Impact Assessment, Section 8.5.6 for evaluation in consultation with key stakeholders.</p> <p>Appendix X: Social Impact Assessment also details how ARTC will engage with stakeholders to optimise local involvement in Project employment and Project supply, avoid impacts on housing access and mitigate impacts on community facilities, all of which are linked to support for community wellbeing.</p> <p>Regarding proposed solution:</p> <ol style="list-style-type: none"> The draft Social Impact Assessment (Appendix X: Social Impact Assessment) has been deemed to meet the TOR by the Coordinator-General. The timing for development of the Community Wellbeing Plan (during the detailed design stage) acknowledges that: <ul style="list-style-type: none"> Stakeholders need the opportunity to understand specific impacts before they can confirm priorities for implementation, (e.g. the type and location of community facility improvements, parks or streetscape upgrades) The Project's detailed design may change the location or nature of impacts requiring mitigation Councils have a range of priorities in terms of their responses to the Project and the EIS, of which specific community wellbeing initiatives are one, with timed needed to consider local priorities and the location and nature of specific impacts A process of deliberation with key stakeholders is required to develop the plan, including the respective and responsibilities of stakeholders for delivery of specific initiatives ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement ARTC acknowledges the uncertainty that Project development creates; however, design is an iterative process and landowners have been provided with information as it becomes available. Appendix X: Social Impact Assessment, Section 7.1) details the strategies that ARTC has implemented to support affected residents. As noted in Chapter 24: Draft Outline Environmental Management Plan. <p>ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners' occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required (Appendix X: Social Impact Assessment, Section 8.6.1).</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.1</p> <p>Section 8.5.6</p> <p>Section 8.6.1</p>
156a	156a.0006	Private	Project alignment		See submission 156 for further details.	Use forestry route and send the rail line to Gladstone with Dalby as the hub.	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering construction and operating costs Multi-criteria analysis (MCA). <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The vast majority of freight carried on Inland Rail (on a NTK basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout SEQ. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail Alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> Reduce demand to use IR by 50 per cent Reduce IR revenue by 60 per cent Reduce the Inland Rail Benefit Cost Ratio by 80 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006 - 2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to the Border to Gowrie Project.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p>
158	158.0004	Private - Turallin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. Existing sites are within walking distance of the Millmerran town centre, access to facilities and local bus service. Opportunities for the workforce to participate in sporting activities and access to recreational facilities. Benefits to the town and wider community as there is potential for increase in economic activity. Showground site could make use of infrastructure install for the camp, once the camp was removed. Emergency service would be more readily available if required. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration.</p> <p>The revised draft EIS construction noise assessment has assessed the typical worst case 15-minute noise impacts (Section 6.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). Environmental noise impacts of any potential power generators used for non-resident workforce accommodation sites are not expected to exceed the construction noise impacts already assessed. In addition, the facility locations are suitably sized to enable generators to be located with a sufficient buffer distance away from accommodation and communal facilities to minimise potential noise impacts to the construction workforce and to surrounding sensitive receptors.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>As described in Section 5.6.4 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised during the detailed design stage of the Project. As mentioned in Section 3.4.5 and 3.4.38 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation facilities secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approval Process</p> <p>Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p>
162	162.0004	Private - Turallin Workers	Noise and Vibration		Proposed location lacks services. Should generators be required to supply power, this would create noise.	<p>A non-resident workforce accommodation located within the Millmerran town perimeter due to the supporting reasons:</p> <ol style="list-style-type: none"> Sites which already exist (such as a construction camp prior to the Millmerran Power Station, the Millmerran Sportsman's club site or the Millmerran Showgrounds which is close to an all-weather airstrip) containing services available such as power, sewerage and water. 163	163.0005	Private	Noise and Vibration	Directly impacted landowner	I am concerned about with vehicles creating noise with reverse beepers going on and of all hours of the day and night during construction and then the sounds of the trains once there up and running	Suggest that any vehicles working on the property fitted with reverse beepers must be able to turn them off if night work is done. So hopefully all these will be considered especially a different corridor would be much appreciated	<p>ARTC acknowledges that reversing beepers can be a source of annoyance, however they are required to be used for workplace safety purposes in accordance with Queensland workplace health and safety legislation. To minimise intrusive noise, vehicles will be fitted with a non-tonal reversing beacon which operate over a wide range of frequencies and produce a 'pshh-pshh' sound as opposed to the typical tonal 'beep-beep'. Most construction activities will take place during the daytime and the use of reversing beepers will be carefully managed in proximity to sensitive receivers.</p> <p>Mitigation measures for noise and vibration impacts, both for construction activities and railway operations are discussed in Section 16.10 of Chapter 16: Noise and Vibration.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p>
163	163a.0006	Private	General Project opinion - negative	Directly impacted landowner	Submission is identical to 163.	Nil.	ARTC acknowledges the submitter's concerns. Please refer to the responses to submission number 163.0001 to 163.0005 for how these concerns have been addressed.	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
164a	164a.0002	Private	Noise and Vibration	operational rail noise	In relation to our property Lot no 1501 Y56917 4 Bengalla St Yelarbon 4388. The increased noise from an estimated twenty trains per day travelling at high speed these trains being 1.8 km long with containers stacked two high will considerably affect our lifestyle destroying the reason why we chose to live in Yelarbon	The possibility of the trains travelling at reduced speed through our town would help in noise reduction. In relation to our house added insulation in the form of double glazing windows or another suitable product be considered	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 also discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction works of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>The assessment of noise levels with conceptual noise barriers has identified that, depending on the final extent and the height of the noise barriers, the noise criteria may not be fully achieved at all receptors. At-property treatments could then be applied to sensitive receptors that do not achieve the noise criteria, this would be determined by ARTC on a case-by-case basis. All noise mitigation will be in place prior to commencement of Inland Rail operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p> <p>Section 17.4</p>
164a	164a.0003	Private	Traffic and Transport	operational road traffic noise	In relation to our property Lot no 1501 Y56917 4 Bengalla St Yelarbon 4388. Roadworks in relation to the inland rail Project. The opening of the closed Section of Bengalla St will result in increased traffic passing our property at our front door.	In relation to the opening of Bengalla St this will add to traffic passing close to our front door. If possible Bengalla St in its current form could service traffic both in and out of Yelarbon. I feel that the added noise created by these trains and the heavy traffic on the overpass will affect all Yelarbon residents and as for myself I am willing to negotiate for a suitable result.	<p>ARTC has engaged with both Goondiwindi Regional Council and Yelarbon township community in the development of road layouts. It was concluded that opening and extending Bengalla street to connect to Yelarbon-Keeta road, via an existing road reserve, is fundamental to the scheme and provides greater connectivity and mobility for the township.</p> <p>Appendix AA: Traffic Impact Assessment, Section 3.7.2 discusses the reference design reviews and updates for the Yelarbon road rail interfaces and the proposed pedestrian crossing facilities.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.7.2</p>
165	165.0004	Private	Noise and Vibration		Proposed blasting 1 km from our residence Damage to house foundations from nearby blasting ARTC has proposed an unacceptable noise level for our residence. Noise monitoring during construction and operational stage Disruption and noise created by operational maintenance crews, e.g. maintenance line in back yard ground borne noise/ vibrations and effects on individuals	<ol style="list-style-type: none"> 1. House inspected pre and post Project to receive compensation if the house is affected by any of the above 2. Consulted personally in regard to acceptable noise levels 3. NO noise above 50 decibels 4. Noise monitoring during construction and operational stages. 5. ARTC must be conditioned to maintain acceptable noise levels. 6. Sound barriers and sound proofing measure to existing home 7. Compensation for the above should we be unable to reside in our home in the future due to rail impacts. 8. Rail Loop and maintenance loop to be relocated to the industrial area near Wellcamp airport. 9. ARTC to pay for relocation costs and rental costs to another residence during construction. 	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and amenity during both construction works and operations stages. The revised draft EIS has been updated to undertake both construction (including blasting) and operational noise and vibration modelling in accordance with Department of Transport and Main Road's (DTMR) Codes of Practice and Interim Guideline (2019).</p> <p>If blasting is deemed necessary for construction, appropriately trained and licenced shot firers will be engaged to undertake the blasting activities in accordance with QLD's regulatory requirements and the limits (for airblast over-pressure and ground vibration) provided in DTMR's CoP Volume 2 (Chapter 16: Noise and Vibration, Section 16.6). ARTC will provide regular updates to the local community to ensure that residents are kept informed of when blasting activities will be carried out. In relation to blasting activities, the following measures to mitigate blasting impacts are included in the assessment:</p> <ul style="list-style-type: none"> ➤ Reducing the charge size by use of delays and reduced charge masses where possible ➤ Ensuring adequate blast confinement to minimise the amount of overpressure ➤ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. ➤ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ➤ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. ➤ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. ➤ Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys to assess the structural integrity of buildings along the alignment in accordance with the considerations outlined in Section 16.10 of Chapter 16: Noise and Vibration. <p>Construction noise and/or vibration monitoring may be undertaken in response to noise or vibration complaints and to assess compliance of construction activities against adopted criteria. Following commencement of operations, ARTC will undertake noise and vibration monitoring to confirm that operational rail noise predictions were correct and that mitigation is working as intended.</p> <p>ARTC will also operate a complaints handling system during construction and operations to ensure stakeholder feedback and complaints are responded to appropriately.</p> <p>Noise and vibration mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration, Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. All operational noise mitigation measures will be in place prior to commencement of Inland Rail operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
167	167.0001	Private	Noise and Vibration		Noise and vibration pollution	Sufficient funding to double glaze all windows and ducted air conditioning in our future house	<p>The revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments. The revised assessment is presented in Appendix: W Noise and Vibration Assessment - Railway operations. The proposed mitigation measures are further discussed in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise community disruption in the construction works stage and through to operations. All operational noise mitigation measures will be in place prior to commencement of Inland Rail operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
168	168.0004	Private	Noise and Vibration	Directly impacted landowner	Residential noise pollution of engine and carriages including horn noise at level crossings.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations states that in level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.3</p> <p>Section 17</p>
168a	168a.0006	Private	Surface Water	Flood immunity	The submitter is concerned about the Section 137 to 143 km between the Condamine River and Yandilla. He highlights that a 1.8 km long rail bridge foundation across Hall Road (138 km to 142 km) and 46 group of culverts at almost 3 km long in the Section 139.37 km to 142.58 km can cause changes in peak water levels, direction and velocity of flood waters, changes in duration of inundation, flood flow distribution, block water flow as a result of debris accumulation and intensify soil erosion. Th submitter is concerned that in this scenario plenty of debris and weeds run into our land Lot 1 DY492, Lot 2 DY492 and Lot 38 DY853 comparing to existing hydrologic history. The situation will become worst if heavy rainfall occurs. Additionally, gravels used in rail lines will flow into the surrounding paddocks in an event of flooding, damaging agricultural machinery and creating other operational issues. He also feels that existing design on number of culverts may be far away from enough to handle flood water break out at Condamine and Grass Tree Creek.	Install screens on culverts to filter debris and weeds. Culverts clean up management and execution plan should be built, but the submitter doubts its efficiency during flooding. Possibly Rail Bridge will be the best option all the way across Condamine Flood Plain. The submitter also wants an opportunity to comment on the finalised report of the international flood expert panel, Senate Inquiry and other drafts to the EIS.	<p>Bridge and culvert numbers and openings have been designed to pass a 1% AEP flood, in line with Australian industry guidelines and best practise.</p> <p>With respect to ongoing maintenance of culverts, ARTC as the operator of Inland Rail, will implement an Inspection and Maintenance program in accordance with ARTC's Civil Technical Maintenance Plan (extranet.artc.com.au/docs/eng/track-civil/procedures/track-civil/ETE-00-03.pdf), Flooding Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/Section10.pdf) and ETG-10-01 General Appendix to ARTC Track & Civil Code of Practice (extranet.artc.com.au/docs/eng/track-civil/procedures/flooding/ETG-10-01.pdf) to ensure that culverts are free flowing and clear of excess vegetation growth and/or blockages. ETG-10-01 (Flooding) considers that blockage or partial blockage of waterway > 20% loss of area due to debris, rubbish or siltation is a defect. The required response time is within 28 days to repair/restore.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as detailed in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p>
168a	168a.0007	Private	Groundwater	Directly impacted landowner	The submitter talks about the Section between 137 to 143 km between the Condamine River and Pampas. The submitter is concerned about the drilling impacts of foundation structures intercepting the shallow aquifers supplying water to Millmerran, Pittsworth, Brookstead & Southbrook townships and their surrounds, various localities including Pampas and surrounding areas, and on agricultural irrigation, stock water and domestic use.	Nil.	<p>The drilling of foundation pilings associated with bridges is unlikely to cause any permanent impacts to groundwater other than temporary impacts during the construction works stage. Pilings will be of a sufficient spacing to prevent permanent impact to groundwater flow and will be constructed using cured in place (CIP) technique in which concrete slurry is pumped through a hollow stem auger concurrently as soil/ rock is brought to the surface (Chapter 15: Groundwater, Section 15.6.3). Only minor volumes of groundwater are anticipated to be brought to surface using the CIP method (e.g. 5 to 10 litres per 20 m deep auger hole). No active dewatering is anticipated. The spacing of the pilings is such that impediment of groundwater flow is unlikely and not expected.</p> <p>Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 to 15.4.4). Site-based groundwater monitoring events are on hold until the detailed design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset. The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting from aspects of the Project (see the proposed groundwater management and monitoring program (GMMP) in the revised draft EIS, Chapter 15: Groundwater, Section 15.7.3 for a detailed approach to monitoring for impacts during construction).</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.4.2</p> <p>Section 15.4.4</p> <p>Section 15.6.3</p> <p>Section 15.7.3</p>
168a	168a.0008	Private	Noise and Vibration	Directly impacted landowner	Residential noise pollution of engine and carriages including horn noise at level crossings.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations states that in level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3). Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
168a	168a.0009	Private	Flooding	Directly impacted landowner	Change in flood flow distribution, velocity of flood water and intensify soil erosion result in decrease of our cropping production and significant devaluation of our properties.	Nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC has undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>In order to support this, additional mapping has been generated by ARTC to provide further information and justification to the Expert Flood Panel. This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 2</p> <p>Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
168a	168a.0010	Private	Traffic and Transport	Directly impacted landowner	The interference to farming operations due to increased traffic frequency and deteriorating condition of Hall Road during the construction phase of the Project.	Nil.	<p>ARTC acknowledges this issue, which will continue to be addressed as the design and construction planning progresses. Consultation with landholders will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/ properties. However, during the property acquisition process, ARTC will seek to secure agreements with affected landholders, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties, as described in Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.2.</p> <p>The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p>
169	169.0001	Private	Noise and Vibration		Existing noise to proposed inland rail. Noise levels construction and operation.	To complete noise treatments at homes prior to construction commencing.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property and lifestyle during both construction works and operations stages. The revised draft EIS has been updated to undertake both construction and operational noise and vibrating modelling in accordance with DTMR's Codes of Practice and Interim Guideline (2019).</p> <p>Noise and vibration mitigation measures are recommended in Chapter 16: Noise and Vibration (Section 16.10), Appendix V: Noise and Vibration Assessment - Construction and Road Traffic (Section 7) and Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17). Reasonable and practicable measures will be investigated on a "case by case" basis. Mitigation measures may include the construction of noise barriers where there are a large number of properties potentially impacted or 'at-property' treatments for isolated properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>ARTC will ensure required mitigation is in place at the start of operations. The at-property treatments shall be considered as soon as possible once the assessment of the final design is complete to support the mitigation of construction impacts and minimise the risk of not having mitigation in place prior to the commencement of operations. The determination of eligibility of treatments, and the specific treatment provided, is also likely include the measurement of noise levels from the operation of the Project. Particularly, where the modelled (predicted) noise levels are within a relatively small margin of compliance.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
169	169.0003	Private	Noise and Vibration		House movements and vibration impacts	Complete a pre-construction inspection of each impacted house which is to be agreed to by contractor as a baseline condition of home.	<p>The construction vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction vibration impacts during the detailed design stage of the Project will be undertaken. Mitigation has been included in the revised draft EIS (Section 16.10, Chapter 16: Noise and Vibration). Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys prior to assess the structural integrity of buildings along the alignment in accordance with the assessment considerations outlined in Section 16.10 within Chapter 16: Noise and Vibration.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p>
171	171.0003	Community Group	Noise and Vibration		Over 900 local Pittsworth residents signed a petition to the Qld Government about potential noise impact of the proposed route, which is less than 200 m from Pittsworth town and would cause considerable impact to local residents if the proposed route was maintained. ARTC has ignored community feedback and concern. ARTC has refused to provide any detail about noise abatement measures that will be taken (if any) to mitigate the noise which will likely be in excess of acceptable levels. Of particular concern to residents is that if they live outside the 200-m exclusion zone, you are not eligible to compensation of any kind and the ARTC has no obligation to minimise sound disturbance.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with the Department of Transport and Main Roads Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes appropriate noise level criteria for residential activities that have been applied to evaluate potential impacts and define where noise mitigation may be required. The revised assessment is included in Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
171a	171a.0008	Private	Project alignment		The proper study of a viable alternate route needs to be included. One that has less impact on environment and community.	Use an independent engineering firm to look at the viable options.	<p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie. The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment as the preferred concept alignment for the Border to Gowrie Project. The Corridor Options Report, the preparation of which was overseen by a Project Reference Group appointed by the Australian Government and chaired by Mr Bruce Wilson AM, was made publicly available by the Australian Government on 21 September 2017. The estimate of quantities used in cost estimates contained in the report was subject to an independent review by RPS in August 2017, with no shortcomings identified.</p> <p>The base case via Wellcamp Charlton alignment formed the centreline of a two-kilometre-wide study area to be progressed through ARTCs phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. Chapter 2: Project Rationale of the draft EIS describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> Environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) Community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) Approvals and stakeholder engagement: 12.5 per cent Technical viability: 17 per cent Safety: 16.5 per cent Constructability: 12.5 per cent Operations: 16.5 per cent. 	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
171b	171b.0009	Private	Traffic and Transport	Aquatic fauna	Road closure impacts are not assessed adequately.	Survey the local residents on these proposed road closures.	<p>Further consultation with DTMR, local authorities, impacted stakeholders and local residents affected by proposed closures will be undertaken in the detailed design stage once the alignment, associated road closures and crossings have been confirmed and a construction contractor is appointed. These consultations and resulting mitigation measures will be discussed and agreed with the road controlling authorities.</p> <p>Appendix AA: Traffic Impact Assessment, Section 5.9 discusses the road diversion assessment for the following diversions:</p> <ul style="list-style-type: none"> Athol School Road, Athol Biddeston Southbrook Road, Southbrook Lochaber Road, Pittsworth Oakey Pittsworth Road, Pittsworth Tip Road, Pittsworth Ware Street, Brookstead Fysh Road, Pampas. <p>At each of these diversion locations, an assessment has been undertaken to summarise the following:</p> <ul style="list-style-type: none"> Existing situation, including the road network and active and public transport provisions Required site distance length Traffic information and rerouting assumptions Capacity (SIDRA) and turn warrants assessment without and with Project Recommendations for mitigation measures. <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the detailed design and construction works stages to ensure that safety concerns and issues are addressed.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.9</p>

171c	171c.0009	Private	Noise and Vibration		Specific noise mitigation measure need to be provided.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments. The revised assessment is included in Appendix: W Noise and Vibration Assessment - Railway Operations. Mitigation measures are also discussed in Section 16.10 of Chapter 16: Noise and Vibration Section 17 of Appendix W.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise community disruption in the construction works stage and through to operations. All operational noise mitigation measures will be in place prior to commencement of Inland Rail operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix: W Noise and Vibration Assessment - Railway operations</p> <p>Section 10</p> <p>Section 11</p> <p>Section 17</p>
172a	172a.0001	State Agency	Surface Water		Water requirements from the Macintyre River	the proponent will need to address Queensland Gov water requirements from the Macintyre River north by liaising with DRDMW.	<p>ARTC has continued to consult with DRDMW regarding the sourcing of construction water since publication of the draft EIS.</p> <p>Discussion regarding construction water in Section 5.6.24 of Chapter 5: Project Description has been revised substantially since release of the draft EIS. Section 5.6.24 now states ARTC recognises that water sourcing and availability is critical to supporting the construction of the Project. Sources of construction water will be finalised as the construction approach is refined during the detailed design. Through this process, refined water demand planning will be undertaken, including detailed contingency options, if protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>ARTC has consulted with each of the potential water suppliers. Details of consultation are provided in Appendix E: Consultation Report.</p> <p>Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements Report.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.24</p> <p>Appendix B5: Construction Water Requirements Report</p> <p>Appendix E: Consultation Report</p>
172a	172a.0002	State Agency	Surface Water		Infrastructure within the Macintyre River	the proponent should confirm no infrastructure will be placed within the Macintyre River or within mapped or unmapped features on the DRDMW watercourse identification map.	The Project commences at the NSW/QLD border, which is the median point of the Macintyre River. Inland Rail will cross the Macintyre River on a viaduct, with abutments and piers located within the bankfull width of the river. 535 m of this viaduct structure is situated within Queensland and will be subject to approval through the EIS. This detail is provided in Section 5.4.6 of Chapter 5: Project Description.	<p>Chapter 5: Project Description</p> <p>Section 5.4.6</p>
172a	172a.0003	State Agency	Flora and Fauna		if excavation of material, placement of fill or destruction of vegetation is proposed within a feature mapped as a watercourse on the DRDMW watercourse identification map, a riverine protection permit will be required if the works cannot be carried out in accordance with the riverine protection permit exemption requirements.	Destruction of vegetation in a watercourse	The detailed design for riparian vegetation, aquatic fauna and habitats Section of Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report, outlines Project impact mitigation measures. Impacts to waterways, riparian vegetation and in-stream flora and habitats are sought to be minimised during the design stage. Where the Project is unable to comply with the exemption requirement, a Riverine Protection Permit will be sought for works within a watercourse.	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.6</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p>
172a	172a.0004	State Agency	Surface Water		Overland flow drainage feature	there is an overland flow drainage feature on lot 37 on MH878 that is immediately downstream of an authorised overland flow storage that bywashes into this feature. A bank on this feature that captures (takes) overland flow cannot be permitted under the Border Rivers and Moonie Water Plan area. A bank across this feature would also impact on the taking of overland flow by users downstream as well as flows into the Macintyre River.	The revised reference design includes culverts under the proposed rail embankment to maintain existing flow paths. At 37MH878 runoff generated from catchments bisected by the proposed Inland Rail embankment allows for four culvert locations to maintain cross drainage flows, namely C34.64 (NS2B) (consisting of 9 x 3.0 m x 1.2 m reinforced concrete box culverts), C34.70 (NS2B) (consisting of 19 x 3.0 m x 1.5 m reinforced concrete box culverts), C34.75 (NS2B) (consisting of 10 x 3.0 m x 1.2 m reinforced concrete box culverts) and C34.79 (NS2B) (consisting of 7 x 3.0 m x 1.2 m reinforced concrete box culverts). Further assessment and design development will continue through the design process into detailed design to maintain existing flow paths and cross drainage.	<p>Appendix B1: Design Drawings - 2-0001-310-ELE-10-SK-4-102 - Border to Gowrie Revised draft EIS General Arrangement Sheet 2.</p>
172a	172a.0005	State Agency	Surface Water		Impact on irrigation infrastructure and pumping infrastructure	the proponent should describe/ mitigate potential impacts on irrigation infrastructure and privately owned pumping infrastructure on the QLD side of the border.	<p>Chapter 8: Land Use & Tenure of the revised draft EIS acknowledges that private services and utilities may be impacted by the Project and that resolution to the impact will be determined on an individual case-by-case basis in consultation with landowners during detailed design. The detailed design will be developed to ensure that affected landowners retain access to existing natural resources, including water (Chapter 8: Land Use and Tenure, Section 8.6).</p> <p>If, following consultation, relocation and/or protection of water utilities is determined to be the preferred solution, the works will be designed and constructed in accordance with the following outlined in Table 8-51 of Chapter 8: Land Use and Tenure:</p> <ul style="list-style-type: none"> Water Supply Code of Australia (Water Services Association of Australia, 2011) AS/ NZS 2566 Buried flexible pipeline: Structural design (Standards Australia, 1998). <p>Alternatively, if impacts to water utilities cannot reasonably be avoided or mitigated through design, appropriate compensation arrangements will be discussed and agreed with the affected landowner.</p>	<p>Chapter 8: Land Use & Tenure</p> <p>Section 8.6</p> <p>Table 8-51</p>
172a	172a.0006	State Agency	Surface Water		Water harvesting	the proponent should describe/ mitigate potential impacts on water harvesting caused by proposed infrastructure on the Macintyre River floodplain.	<p>The flooding and hydrology study presented in Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS has assessed impacts to existing overland flow as a consequence of the Project. Whilst change to hydraulic regimes may occur (due to new infrastructure) at 1% AEP conditions, hydrological modelling indicates that no significant changes are expected to base-flow and low-flow conditions (refer Appendix T1 and T2: Hydrology and Flooding Technical Report Volume 1 and 2) and that access to surface water resources will not be affected.</p> <p>As stated in Table 13-16 of Chapter 13: Surface Water, the detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).</p>	<p>Chapter 13: Surface Water</p> <p>Table 13-16</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
172a	172a.0007	State Agency	General Project opinion - positive		Consultation with the proponent	DRDMW seeks ongoing consultation with ARTC with regard to water requirements for NS2B.	<p>As outlined in the revised draft EIS, Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report, ARTC recognise DRDMW as a key stakeholder of the Project.</p> <p>Additional consultation with this stakeholder has been undertaken during the development of the rEIS in 2022 and ARTC is committed to ongoing consultation with DRDMW as the Project progresses through the detailed design stage.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Appendix E: Consultation Report</p>
173	173.0004	State Agency	Noise and Vibration		Visual amenity and acoustic treatments for schools	Dept Education to be a stakeholder in the design process for visual amenity and acoustic treatments proposed in vicinity of schools	<p>Brookstead and Yelarbon State Schools are located within 200 m of the Project footprint and the Southbrook Central State School is located 900 m from the alignment. These schools may be impacted by construction and/or operational noise and construction activities. Consultation with these schools and the Department of Education (DoE) commenced in 2017. Engagement with DoE and the school principals in 2018, 2021 and 2022 has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. Details of these meetings are outlined in Appendix E: Consultation Report, Section 4.2. Queensland Government engagement. The agreed approach is to work with the schools and DoE during detailed design to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. The noise and vibration mitigation measures in the revised draft EIS are discussed in Section 16.10 of Chapter 16: Noise and Vibration.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. 	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p>
176	176.0001	Private	Noise and Vibration		The Project extends along the entire northern boundary of Pittsworth and will severely impacts on residents during construction and operation resulting in daytime disruptions and sleep disturbance. The proportion of retirees on the north side is significant. Their lifestyle and wellbeing will be totally disrupted. Families with young children living on the northern side of town will also be impacted. ARTC has failed to engage with residents and inform them of noise and vibration impacts.	<ol style="list-style-type: none"> EIS does not comply with the TOR EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design. True noise and vibration impact on Pittsworth cannot be determined until detailed design. Review alignment - the route is unsuitable. 	<p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p> <p>To provide an illustration of how noise walls could look like, concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2.22, has been updated to include an artist's impression showing the potential for mitigation measures in this location, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2.22</p> <p>Section 11.2</p> <p>Table 95</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
176	176.0003	Private	Noise and Vibration	Blasting	Residents would be unaware of the impact of noise and vibration they will experience from blasting especially from the Broxburn site. The excavation site to the north of Pittsworth will also result in considerable noise over a sustained period. Vibration and noise from pile driving will also affect the entire town.	<ol style="list-style-type: none"> 1. EIS does not comply with the TOR 2. EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design. 3. True noise and vibration impact on Pittsworth cannot be determined until detailed design. 4. Review alignment - the route is unsuitable. 	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact property, lifestyle and amenity during the construction works and operations stages. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community (refer to Section 5.6, Appendix E: Consultation Report).</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>If blasting is deemed necessary for construction, appropriately trained and licenced shot firers will be engaged to undertake the blasting activities in accordance with State regulatory requirements and the limits (for airstblast over-pressure and ground vibration) provided in DTMR's CoP Volume 2 (see Chapter 16: Noise and Vibration, Section 16.6). ARTC will provide regular updates to the local community to ensure that residents are kept informed of when blasting activities will be carried out. In relation to blasting activities, the following measures to mitigate blasting impacts are included in the assessment:</p> <ul style="list-style-type: none"> ➤ Reducing the charge size by use of delays and reduced charge masses where possible ➤ Ensuring adequate blast confinement to minimise the amount of overpressure ➤ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative ➤ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ➤ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors ➤ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>Prior to construction, ARTC will undertake building condition or dilapidation surveys to assess the structural integrity of buildings along the alignment in accordance with the considerations outlined in Section 16.10, Chapter 16: Noise and Vibration.</p> <p>In addition, the following measures have been recommended to mitigate the noise and vibration impacts of piling:</p> <ul style="list-style-type: none"> ➤ When piling, avoiding dynamic compaction using large tamping weights near sensitive and critical receptors where possible ➤ Reducing energy per blow when piling (consider first whether this may result in prolonged exposure with no realised reduction in community disturbance) ➤ When piling, acoustic damping will be provided to sheet steel piles to reduce vibration and resonance ➤ When piling, resilient pads will be used between pile and hammerhead. Care will be taken when selecting a resilient pad as energy is transferred to the pad in the form of heat ➤ Construction progress and upcoming activities will be communicated to local residents and stakeholders, particularly when noisy or vibration generating activities are planned, such as vibratory compaction and piling. <p>The draft revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (refer to Section 17 Appendix W: Noise and Vibration Assessment – Railway operations). Specific measures for Pittsworth are detailed in Section 17.4. All operational noise mitigation will be in place prior to commencement of operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise community disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Sections 16.5</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17.4</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p>
176	176.0005	Private	Noise and Vibration		Is the vibration of a train of this length and tonnage unquantifiable?	<ol style="list-style-type: none"> 1. EIS does not comply with the TOR 2. EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design. 3. True noise and vibration impact on Pittsworth cannot be determined until detailed design. 4. Review alignment - the route is unsuitable. 	<p>Ground borne vibration is assessed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 13. The assessment identified that an estimated off-set distance of 12 m from the outer rail would be required to achieve ground-borne vibration criteria for residential buildings. Section 13 of Appendix W: Noise and Vibration Assessment - Railway Operations further discusses that a review of the Project alignment identified that all sensitive receptors, excluding those expected to be acquired by the Project, would be outside of the 12 m off-set distance from the outer rail of the Inland Rail track. On this basis, the railway operations on the Project rail tracks would achieve the ground-borne vibration assessment criteria at all sensitive receptors.</p> <p>Ground vibration impacts have also been assessed and a review of identified sites of potential heritage significance has been undertaken. Peak particle velocity (PPV) levels are predicted to comply with applicable heritage vibration criteria at distances greater than 15 m from the nearest rail. The review has not identified any potential vibration impacts to heritage sites from railway induced ground-borne vibration.</p> <p>Further assessment of impact is recommended during the detailed design stage to verify the screening assessment outcomes.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 13</p>
177	177.0002	Private - Brookstead	Noise and Vibration	construction airborne noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents during the construction stage, resulting in daytime disruptions and night-time sleep disturbance. Significant proportion of retirees on the north side of the town, their lifestyle and well-being will be totally disrupted, particularly during the construction stage. Families with young children living on the norther side of the town will also be impacted by the changed living conditions. Reference is made to construction Noise 14.4.3. Residents would be unaware of the noise and vibration they will experience from blasting especially from the Broxburn site.	<p>Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.</p>	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area (Chapter 16: Noise and Vibration, Section 16.6 and 16.9).</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Blasting impacts have been assessed in accordance with CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2. These criteria are listed in Section 16.6 of Chapter 16: Noise and Vibration, Blasting Criteria.</p> <p>The following measures to mitigate blasting impacts are suggested where practicable as part of Section 16.10, Chapter 16: Noise and Vibration:</p> <ul style="list-style-type: none"> ➤ Reducing the charge size by use of delays and reduced charge masses ➤ Ensuring adequate blast confinement to minimise the amount of overpressure ➤ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. ➤ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ➤ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. ➤ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC acknowledges that during the EIS stage may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and wellbeing, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
177	177.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Noise barriers illustrated, lack detail and the maps used are old, detail is lacking in terms of the dimensions of the indicated barriers. The location of noise barriers shown on the two maps are open to question as far as possible effectiveness is concerned. Barriers illustrated in Option 2 would be totally inadequate.	<p>Draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design stage.</p>	<p>ARTC acknowledges the concerns from the community that noise and vibration has the potential to impact lifestyle and amenity during railway operations. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the community along the Project alignment. Refer to Section 5.6 and 5.10 of Appendix E: Consultation Report. The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers (Section 16.10, Chapter 16: Noise and Vibration).</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>In addition, ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie LVIA Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2. The existing Viewpoint 2 (VP02) and associated visualisation in Yelarbon have now been updated to show and describe the potential impact of conceptual noise walls in this location. In addition, a new viewpoint (VP04) and visualisation has been prepared to discuss and represent potential impacts as viewed from the Yelarbon Silo Art viewing area (VP03 and VP04). It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. frangible vegetation zone requirements and sightlines) that cannot be resolved at this stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Section 5.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17.4</p>
180	180.0001	Private	Noise and Vibration		Dispute the numbers given in Figure 2.14 of Chapter 2 in the EIS. These numbers on affected residents only include those with property within the rail corridor and therefore do not include the population of Pittsworth (3296 as of 2016 census), who would be affected by noise and disruption of rail construction and operation.	<p>Seeking a night-time curfew be placed on trains passing through Pampas, Brookstead and Pittsworth. Community consultation process needs to be undertaken again. We ask that an independent facilitator oversees the consultation process to ensure a fair process where community concerns are heard, acknowledged, considered• and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication.</p>	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The DTMR Interim Guideline only requires an impact area of up to 150 metres from the railway.</p> <p>As noted in Section 2.8 of the Chapter 2: Project Rationale in the revised draft EIS, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4.22, has been updated to include an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p> <p>Regarding proposed solution, it is not feasible to place a night-time curfew on trains travelling through the towns of Pampas, Brookstead and Pittsworth, as one of the remits of Inland Rail is to move freight between Melbourne and Brisbane within 24 hours. However, ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
180a	180a.0006	Private	Flooding	Blockage of drainage structures	There will be lives lost if the Inland Rail is built across the Condamine floodplain near Pampas. The rail design includes an embankment 1.095 m higher than current bank heights. There is also insufficient bridging and culverts to allow free-flowing water under this new embankment height. Culverts and bridges will also cause debris to build up and the flow of water won't be able to pass and then recede.	Nil.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
180a	180a.0007	Private	Stakeholder Engagement		Dispute that ARTC has undertaken the consultation process described in Appendix C Figure 2.1, where they claimed they would "inform, consult, involve, collaborate, empower" affected landholders. When ARTC came to visit the submitter's property at Fysh Road, Pampas, ARTC said that the flood could not have been that deep and they accused us of painting a flood line on the shed. We feel that ARTC has not treated local community members with respect and believed or used the information on flood heights presented by local landholders. These interactions clearly indicated that ARTC has failed to build trust and credibility in stakeholder engagement, and have dismissed local knowledge and records of flood heights, and treated affected landholders with contempt.	The community consultation process needs to be undertaken again. We request that an independent facilitator oversees the consultation process to ensure a fair process where community concerns are "heard, acknowledged, considered" and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Appendix C, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses, particularly with reference to the flood model and likely impacts on future flood events.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD, 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first Living in Place survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners' occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
180a	180a.0008	Private	Project alignment		Do not believe that the cost comparisons between the route have been made on accurate numbers. The like for like costings did not include the additional bridging and construction costs to cross the flood plain, as ARTC has only become aware of construction difficulties on black soil foundations, and the real width and volume of water flowing across the floodplain between Millmerran and Brookstead in recent years. So these numbers in Figure 2.15 of Chapter 2 of the EIS are misleading to make the Base case route look better, and they were formed in 2016 before the flood modelling had been undertaken and before the flood plain crossing had been designed. The costs for the rail design have blown out substantially since then, as the enormity and reality of crossing the floodplain has become apparent.	The costings of the route comparisons in Figure 2.15 in Chapter 2 of the EIS must be undertaken on realistic figures around the current flood plain design to allow for affair route comparison. The detail of the flood model by the panel of experts and the likely impacts and increased flood risk and impact due to increased embankment heights with obstructed free flow across the flood plain are not yet available, so the EIS hydrology should be rejected until we have accurate information on hydrology.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 meters (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>Consultation with landholders will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>
181	181.0001	Private	Noise and Vibration	Aquatic Fauna	Dispute the numbers given in Figure 2.14 of Chapter 2 in the EIS. These numbers on affected residents only include those with property within the rail corridor and therefore do not include the population of Pittsworth (3296 as of 2016 census), who would be affected by noise and disruption of rail construction and operation.	<p>Seeking a night-time curfew be placed on trains passing through Pampas, Brookstead and Pittsworth. Community consultation process needs to be undertaken again. We ask that an independent facilitator oversees the consultation process to ensure a fair process where community concerns are heard, acknowledged, considered and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication.</p>	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, has been updated to include an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p> <p>Regarding proposed solution, it is not feasible to place a night-time curfew on trains travelling through the towns of Pampas, Brookstead and Pittsworth, as one of the remits of Inland Rail is to move freight between Melbourne and Brisbane within 24 hours. However, ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5</p> <p>Section 10.5.4.22</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 10</p> <p>Section 17</p>
181a	181a.0006	Private	Flooding	Blockage of drainage structures	There will be lives lost if the Inland Rail is built across the Condamine floodplain near Pampas. The rail design includes an embankment 1.095 m higher than current bank heights. There is also insufficient bridging and culverts to allow free-flowing water under this new embankment height. Culverts and bridges will also cause debris to build up and the flow of water won't be able to pass and then recede.	The community consultation process needs to be undertaken again. We request that an independent facilitator oversees the consultation process to ensure a fair process where community concerns are heard, acknowledged, considered and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Appendix C, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses, particularly with reference to the flood model and likely impacts on future flood events.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
181a	181a.0007	Private	Stakeholder Engagement		Dispute that ARTC has undertaken the consultation process described in Appendix C Figure 2.1, where they claimed they would "inform, consult, involve, collaborate, empower" affected landholders. When ARTC came to visit the submitter's property at Fysh Road, Pampas, ARTC said that the flood could not have been that deep and they accused us of painting a flood line on the shed. We feel that ARTC has not treated local community members with respect and believed or used the information on flood heights presented by local landholders. These interactions clearly indicated that ARTC has failed to build trust and credibility in stakeholder engagement, and have dismissed local knowledge and records of flood heights, and treated affected landholders with contempt.	Nil.	<p>ARTC empathises with the landowner and the distress that this incident may have caused. ARTC employees operate under a Code of Conduct, which requires them to be respectful and courteous at all times. Complaints regarding an ARTC employee should be made directly and would be taken seriously by the Company. Complaint grievance procedure is clearly outlined on the Inland Rail website.</p> <p>Chapter 6: Stakeholder Engagement, Section 6.6.4 and Appendix E: Consultation Report, Section 5.3 detail the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the revised reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>ARTC notes that it does not have a record of having visited the submitter's property in Fysh Road, Pampas, and is unable to confirm if submitter currently or previously owned a property in Fysh Road, Pampas.</p> <p>Community engagement has influenced the development of the revised reference design, and this will be presented in the revised draft EIS. Landowners with the highest level of exceedances have been offered one-on-one meetings to discuss mitigation measures specific to their property. The revised reference design includes updates to the Condamine floodplain crossing design, which incorporates all community feedback collected during consultation. Key changes include:</p> <ul style="list-style-type: none"> ▶ Extending the proposed bridge over the North Branch by approximately 250 m north ▶ Moving the proposed Yandilla rail bridge further south and combining with the proposed Grasree Creek bridge ▶ Increasing the number of proposed culverts near Yandilla grain silos to ensure the drainage channel to the south of the silos has sufficient culverts to convey flood water. 	Chapter 6: Stakeholder Engagement Section 6.6.4 Appendix E: Consultation Report Section 5.4
181a	181a.0008	Private	Project alignment		Do not believe that the cost comparisons between the route have been made on accurate numbers. The like-for-like costings did not include the additional bridging and construction costs to cross the flood plain, as ARTC has only become aware of construction difficulties on black soil foundations, and the real width and volume of water flowing across the floodplain between Millmerran and Brookstead in recent years. So these numbers in Figure 2.15 of Chapter 2 of the EIS are misleading to make the Base case route look better, and they were formed in 2016 before the flood modelling had been undertaken and before the flood plain crossing had been designed. The costs for the rail design have blown out substantially since then, as the enormity and reality of crossing the floodplain has become apparent.	The costings of the route comparisons in Figure 2.15 in Chapter 2 of the EIS must be undertaken on realistic figures around the current flood plain design to allow for affair route comparison. The detail of the flood model by the panel of experts and the likely impacts and increased flood risk and impact due to increased embankment heights with obstructed free flow across the flood plain are not yet available, so the EIS hydrology should be rejected until we have accurate information on hydrology.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and State guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted Flood Impact Objectives (FIOs) to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC has undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b) an independent process executed by consultants Future Freight Joint Venture and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rail's program of works.</p> <p>The method of like-for-like design comparison options undertaken as part of the Corridor Options Report is appropriate for design development because it allows designers to evaluate different design options based on a consistent set of criteria. When considering design alternatives, it is crucial to have a fair and objective basis for comparison at a set point in time to ensure that the best design choice is made with the information available at that time. By using like-for-like design comparisons, designers can assess the strengths and weaknesses of each option in relation to specific parameters such as functionality, cost, environmental impact, and feasibility. This approach ensures that all design options are evaluated on an equal footing, providing a fair and unbiased assessment. A chosen design undergoes refinement and adaptation to incorporate inputs such as updated flood modelling, site surveys, geotechnical studies, environmental assessments, and other relevant information. Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to Reference Design since draft EIS to reflect the alignment maturity.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. 184	184.0001	Private	Noise and Vibration	construction airborne noise	The submitter has significant concern about the noise and vibration in the construction and operation stage of the rail. His house is approximately 120 m from the proposed railway. The submitter wants the proponent to mitigate and eliminate any impacts of noise and vibration.	Nil.	<p>ARTC acknowledges the concerns from the community that noise and vibration has the potential to impact lifestyle and amenity during both construction and railway operations. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Border to Gowrie alignment.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area (Chapter 16: Noise and Vibration, Sections 16.5 and 16.10).</p> <p>Operational road traffic noise impacts have been predicted based on a preliminary road traffic noise assessment and conservative assumptions. operational road traffic noise mitigation measures will be determined on a receptor-by-receptor basis following a detailed operational road traffic noise assessment during detailed design. The noise mitigation hierarchy detailed in the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 1: Road Traffic Noise has been recommended for the management and mitigation of operational road traffic noise impacts.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 16: Noise and Vibration Section 16.6 Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
189	189.0005	Private	Noise and Vibration		The submitter is worried about noise, dust, vibration and the effects it will have on their health (husband is an asthmatic) and that of the livestock.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>A qualitative assessment of construction dust impacts assessment was also undertaken for the Project, as presented in Section 12.5.1 of Chapter 12: Air Quality. The construction dust assessment did not consider impacts to animal welfare as there are no air quality goals for dust prescribed by Commonwealth, State or Local Governments which are set for the protection of animal welfare. However, the construction dust assessment considered impacts to human health and aesthetic amenity, which have stricter legislated air quality goals than the concentration and deposition levels which are indicated to impact animal welfare (Andrews & Shriskandarajah, 1992, Donham, 1991, and Donham et al, 1995).</p> <p>Recommended mitigation measures to minimise dust emissions from the construction of the Project are presented in Section 12.6 in Chapter 12: Air Quality. These recommended mitigation measures will reduce the risk of significant air quality impacts at sensitive receptors, including animals. The recommended mitigation and management strategies are included in Chapter 24: Draft Outline Environmental Management Plan for the Project.</p> <p>The revised draft EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments.</p> <p>Noise and vibration impacts to livestock are not assessable under the revised draft EIS terms of reference and relevant legislation. However, ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. The findings and recommendations of the assessment are discussed in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.</p>	Chapter 12: Air Quality Section 12.5.1 Section 12.6 Chapter 16: Noise and Vibration Section 16.9 Section 16.10 Chapter 24: Draft Outline Environmental Management Plan Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
191a	191a.0001	Private - Brookstead	Stakeholder Engagement		The submitter feels that the community consultation process has not been credible and trustworthy as claimed in the Aims and Methodology of Appendix C of the draft EIS. There is a lack of transparency and lack of willingness to consult and engage with impacted landholders in a collaborative manner evidenced by lack of detail in minute taking by ARTC at CCC meetings and multiple corrections required to minutes from most meetings.	<p>The draft EIS should be rejected because:</p> <ol style="list-style-type: none"> 1. It does not comply with the TOR set by the Coordinator General. 2. Stakeholder engagement through the Community Consultative Committees has failed. Consultation must be redone. 3. The EIS process around flood modelling, flood impacts and consequent rail design needs to be redone and include the response and recommendations of the independent panel and the community. 4. Given the failure of past stakeholder engagement and the subsequent damage to affected communities caused by ARTC's approach, the CG should remove the responsibility from ARTC for ongoing stakeholder engagement. 	<p>The Southern Darling Downs CCC operated in line with its agreed Charter (available online). This specifies that the scope of the committee is to:</p> <ul style="list-style-type: none"> ▶ Receive briefings and updates on the Project ▶ Discuss and provide comment or feedback on negotiable aspects of the Project ▶ Represent community views regarding local issues, impacts and benefits ▶ Act as a conduit to provide information about the Project to the broader community. <p>ARTC has complied with the EIS ToR.</p> <p>Minutes of all past meetings are available on the CCC webpage. These demonstrate that the scope of the committee has been met. Minutes are distributed to members for review prior to publication. Committee members, through the chair, are given the opportunity prior to any meeting to provide topics to be included in the agenda of upcoming meetings.</p> <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 5.1
191a	191a.0002	Private - Brookstead	Stakeholder Engagement		Lack of input of local knowledge - In the SDCCC meeting on 13 June 2019, committee members presented landholder feedback providing photographic evidence of additional flood water not included in the flood model. Affected landholders on the Condamine floodplain have been repeatedly told by ARTC and their representatives that the flood heights on properties from previous flood events are inaccurate. The community still feels that the issue hasn't been adequately resolved by ARTC.	Nil.	<p>Appendix E: Consultation Report, Section 5.3 details the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design. This included one-on-one and small group meetings with landowners to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design, and surveying historic flood markers on private property.</p> <p>The community consultative committees (CCCs) were only one part of the community engagement program. Detailed minutes of each of the community consultative committee meetings are available on the Inland Rail website.</p> <p>The Condamine floodplain crossing design has been updated to incorporate community feedback. Key changes include:</p> <ul style="list-style-type: none"> ▶ Extending the proposed bridge over the North Branch by approximately 250 m north ▶ Moving the proposed Yandilla rail bridge further south and combining with the proposed Grasree Creek bridge ▶ Increasing the number of proposed culverts near Yandilla grain silos to ensure the drainage channel to the south of the silos has sufficient culverts to convey flood water. <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC is continuing to consult with impacted landowners in regard to the results of local catchment modelling through finalisation of the EIS and development of the detailed design. The purpose of this consultation will be to ensure that impacts to property-scale water balance features, such as irrigation channels and dams, are appropriately considered in the EIS and revised reference design. Feedback from this consultation will be used to update flood modelling for the Project, if appropriate to do so. Outcomes of this consultation and revised local catchment modelling will be incorporated into the Final EIS.</p> <p>Consultation with impacted stakeholders will continue through detailed design of the Project to ensure that alterations to the design and its impacts are communicated back to landowners. Impacts are to be determined at all drainage structures and waterways affected by construction works. The change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event.</p> <p>The Condamine River flood model has been subject to review by an independent panel of experts. ARTC and its consultants are working to update the flood model in accordance with the flood panel's recommendations.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 5.1
191a	191a.0003	Private - Brookstead	Stakeholder Engagement		ARTC representative unable to answer queries - an ARTC representative who spoke on noise and vibration issues spent 30-40 minutes merely talking and not engaging with the community. This speaker was then unable to clearly answer any specific questions, leaving community members more confused and concerned about the noise and vibration issues of 500-tonne freight trains.	Nil.	<p>ARTC notes the feedback on the presentation skills of the noise and vibration subject matter expert who presented to the CCC meeting on 18 September 2019. ARTC notes that the meeting minutes include the technical information presented, which provides an alternative way for members to receive the information. ARTC further notes that the meeting minutes were accepted by the committee as an accurate record of the meeting and do not indicate that there were any questions unable to be answered.</p> <p>ARTC also notes it also presented to the community consultative committees (CCCs) on noise and vibration again on the 1 December 2020 meeting as a follow on to ongoing questions from the committee. These meeting minutes are also available online.</p>	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
191a	191a.0004	Private - Brookstead	Stakeholder Engagement		ARTC has not undertaken a Stakeholder satisfaction survey (Appendix C, Section 2.5 p10), and this is a vital missing link in the consultation process, as it would provide clear evidence of the success of this process.	Nil.	ARTC has now implemented quarterly community surveys to obtain feedback on communications and interactions with the community. Details of the survey are found in Appendix E: Consultation Report, Section 4.6.8.	Appendix E: Consultation Report Section 4.6.8
191a	191a.0005	Private - Brookstead	Stakeholder Engagement		The EIS response column in Table 5.20 lists a broad Chapter or Appendix that deals with the general topics raised, however in no way indicates any specific resolution or action around the questions and feedback raised in the CCC process.	Nil.	Minutes of all CCC meetings are available on the CCC webpage: <ul style="list-style-type: none"> ▶ inlandrail.artc.com.au/building-inland-rail/working-with-communities/community-consultative-committees/sdd-ccc/ ▶ inlandrail.artc.com.au/building-inland-rail/working-with-communities/community-consultative-committees/idd-ccc/ These demonstrate that scope of the committee has been met.	N/A
191a	191a.0006	Private - Brookstead	Flooding - Condamine River		Ongoing issues around the Condamine floodplain crossing that have not been adequately resolved, and these include the flood model, flood impacts and bridging to mitigate risk and soil erosion due to culvert design.	Nil.	Construction and operations flood impacts on land in the Condamine River floodplain have been described in Section 14.8.1 of the EIS (Chapter 14: Flood and Geomorphology) and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 7.5.3. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC has undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
191a	191a.0007	Private - Brookstead	Stakeholder Engagement		According to the SDCCC charter, the committee will be chaired by an independent person referred to as the Chair. However, Chair has acted outside of his designated "independent" role, in order to influence the decisions and actions of CCC members, discourage committee member input and interactions in a threatening manner. The Chair has also 'shut-down' and limited question time for community observers to 10 minutes at the end of each meeting, and when meetings have not run to time, this question time has been further limited or closed off.	Nil.	The Southern Darling Downs CCC operated in line with its agreed Charter (available online). This specifies that the scope of the committee is to: <ul style="list-style-type: none"> ▶ Receive briefings and updates on the Project ▶ Discuss and provide comment or feedback on negotiable aspects of the Project ▶ Represent community views regarding local issues, impacts and benefits ▶ Act as a conduit to provide information about the Project to the broader community. Minutes of all past meetings are available on the CCC webpage: <ul style="list-style-type: none"> ▶ inlandrail.artc.com.au/building-inland-rail/working-with-communities/community-consultative-committees/sdd-ccc/ ▶ inlandrail.artc.com.au/building-inland-rail/working-with-communities/community-consultative-committees/idd-ccc/ These demonstrate that scope of the committee has been met. Question time for observers is at the discretion of the Chair. The committee charter specifies "On conclusion of the business of the Committee, and time permitting, the Chair will provide the opportunity for observers to ask questions of ARTC. "ARTC notes that it advertises all CCC meetings online, through newsletters and regional newspapers and this advertising gives community to direct any questions or concerns they would like asked at a CCC meeting to the committee. ARTC also notes that it provides multiple other opportunities for community members to ask questions including online, via phone, email, one-on-one meetings, and community information sessions."	
191b	191b.0001		Economics		The Project rational with regard to the economic benefits of the Project has not been substantiated by facts in the draft EIS. The submitter has provided alternative evidence as follows: 1. The Millmerran Branch Line was severely damaged by flood waters in 2010-2011, and in the last 10 years no grain has been transported from Millmerran to Brisbane. Hence, the Inland Rail freight for grain transport from this region cannot compete with road transport rate. 2. The submitter also questions how the IR is expected to carry out increased agricultural freight given the current IR design does not go to Brisbane port but terminates in Acacia Ridge which will add to the cost of agricultural produce. The cost will also increase given multiple merchant and suppliers are replacing the single desk structure of GrainCrop who is the sole marketing agent. 3. They also highlight that GrainCorp takes 3 hours to deliver freight from farm gate to Brisbane Port which will triple with the IR facility. Similarly, the submitter outlines that with the nearest receival depot in Acacia Ridge in Brisbane any produce transferred to Melbourne, for instance, would take 2 hours at each end more (totalling 28 hours). There will additional costs associated with this, as well as in having 3 different modes of transport.	The draft EIS should outline the current reality of road versus rail options for agriculture produce transfer on the South West and Millmerran Branch line. The business claim should be substantiated with examples/ scenarios.	The vast majority of freight carried on Inland Rail will be bulk container freight destined for domestic intermodal terminals and further distributed throughout South East Queensland (SEQ) (Inland Rail Programme Business Case, 2015). Inland Rail will have a connection direct to the Port of Brisbane from day one of full operations via connection in the vicinity of the Acacia Ridge terminal to the existing dual-gauge freight line operated by QR connecting to the Port. Further, trains going through to the Port of Brisbane (including obviously grain trains) do not need to be double-handled after the grain is loaded on to the train. Grain producers will seek to make use of the most efficient and cost effective method of transporting grain to the Port, and within a certain distance from the Port that may well be via road transport rather than rail. It is noted that in the revised draft EIS only 2 of 19 trains using Inland Rail in year 2028 will be Queensland grain trains travelling from Yelarbon to Fisherman's Island at the Port of Brisbane and only 3 of 24 in 2040 will be such trains.	Chapter 18: Economics Section 18.4
191c	191c.0001	Private - Brookstead	Landscape and Visual Amenity		The impact of visual amenity in community is high (and not moderate as stated) due to a 2.5 m embankment and then bridging extending out from Pampas. The submitter disputes the claim that powerlines and power poles only cause moderate obstructions to the sunset view.	The design should then be modified to improve the high impact on visual amenity to preserve the landscapes and views around Pampas to meet the visual amenity needs of local residents and a high proportion of tourists heading to the Yarramalong Weir camp ground.	The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. The Landscape and Visual Impact Assessment (LVIA) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of potential alternative options that may have been considered. The landscape and visual impact assessment has been updated in Section 8.2.18 - Viewpoint 13 (now 18) of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment to reflect changes to the alignment and road works within the vicinity of Pampas due to consultation with the Department of Transport and Main Roads. Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location (refer Section 8.2.17 of Appendix K: Landscape and Visual Impact Assessment). An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns. It is also noted that there are a relatively low number of nearby permanent residential receptors and a low number of transient sensitive receptors anticipated to be experiencing views along Millmerran-Leyburn Road (2019 AADT 190 vehicles, 24% of which are heavy vehicles). Whilst Millmerran-Leyburn Road provides access to Yarramalong Weir, it is not anticipated that views from the Weir itself will be impacted. Whilst embankments of up to around 3 m are proposed in this location, it is not considered that the scale will be equivalent to that provided in Viewpoint 17 (now 22), which are up to around 13 m above existing levels. Potential impacts of rail bridges in this location are considered to be represented by Viewpoint 12 (now 17). ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 8.2.16 Section 8.2.17 Section 8.2.18
191c	191c.0002	Private - Brookstead	Landscape and Visual Amenity		The Gore Highway is on the Open Plains Country Drive tourist route (as noted in the draft EIS) and provides access to Yarramalong Weir, a popular local tourist attraction 7.5 km from the Gore Highway. The submitter states that this will impact a wide cross-Section of the tourist travellers who wish to experience this rural locality. It will result in permanent, irreversible, adverse change to the landscape during both construction and operational phases of the Project.	Nil.	The landscape and visual impact assessment has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla and provides a visualisation of proposed infrastructure in this location. The Landscape and Visual Impact Assessment (LVIA) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of potential alternative options that may have been considered. An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns. It is also noted that there are a relatively low number of nearby permanent residential receptors and a low number of transient sensitive receptors anticipated to be experiencing views along Millmerran-Leyburn Road (2019 AADT 190 vehicles, 24% of which are heavy vehicles). Whilst Millmerran-Leyburn Road provides access to Yarramalong Weir, it is not anticipated that views from the Weir itself will be impacted. Whilst embankments of up to around 3 m are proposed in this location, it is not considered that the scale will be equivalent to that provided in Viewpoint 17 (now 22), which are up to around 13 m above existing levels. Potential impacts of rail bridges in this location are considered to be represented by Viewpoint 12 (now 17). ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.	Appendix K: Landscape and Visual Impact Assessment Section 4.0 Section 8.2.16

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
191c	191c.0003	Private - Brookstead	Landscape and Visual Amenity		The submitter disputes the claim made in the draft EIS that the Condamine floodplain has low sensitivity in terms of adverse impacts on existing landscape character and values. The submitter states that the Condamine floodplain was originally open grassland with naturally very sparse occurrence of trees. While the grass has been cultivated to form agricultural cropping lands, there has been limited change to the long-distant views and strong skylines over the past 100 years. The submitter also disputes the claim that the vegetation in low-lying areas has been extensively cleared, as it was not dense in the natural environment to begin with.	Facts need to be checked and justified in the EIS as these claims are not accurate.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment Technical Report and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts, including Viewpoint 12 (now 17) which discusses impacts on the Condamine River floodplain and riparian corridor between Pampas and Yandilla.</p> <p>As noted in the Section 4.7 of Appendix K: Landscape and Visual Impact Assessment, these are the general principles identified in the Guidance Note for Landscape and Visual Assessment (GNLVA) (AILA, 2018). Each landscape and viewpoint assessment within the LVIA has been independently assessed on their associated values.</p> <p>It is also noted that "Wide brown land" is not a term used in the landscape assessment as it relates to a poem (not a recognised landscape assessment technique), however impacts on the Condamine River, its floodplain and the rural landscape are discussed in the assessment of impacts on Landscape Character Type (LCT) A, LCT C and LCT D (Section 7.1 of Appendix K: Landscape and Visual Impact Assessment). Regarding the sensitivity of the rural landscape, no change is proposed as agricultural landscapes associated with LCT C have a low sensitivity to change due to their highly modified state (with the exception of remnant vegetation associated with waterways which is addressed in LCT A). In addition we note that existing rail infrastructure (whilst not currently operational) associated with the Millmerran Branch railway is still evident in this location.</p> <p>The submitter claims that no visualisations are provided for the Condamine floodplain which is incorrect, as a visualisation is provided for Viewpoint 12 (now 17) near Pampas. The assessment of Viewpoint 17 as having a low sensitivity is considered appropriate due to the relatively low number of permanent receptors in this location and transient nature of views experienced along the Gore Highway.</p> <p>Regarding Viewpoint 13 (now 18), the sensitivity is considered to be Moderate as there are only a relatively small number of residents within Pampas and the existing condition is affected by the presence of the Gore Highway, disused railway and existing powerlines and power poles.</p> <p>An additional viewpoint (Viewpoint 16) and visualisation has been provided to assess potential impacts on Millmerran-Leyburn Road (Section 8.2.16 of Appendix K: Landscape and Visual Impact Assessment) in response to community concerns.</p> <p>It is also noted that there are a relatively low number of nearby permanent residential receptors and a low number of transient sensitive receptors anticipated to be experiencing views along Millmerran-Leyburn Road (2019 AADT 190 vehicles, 24% of which are heavy vehicles). Whilst Millmerran-Leyburn Road provides access to Yarramalong Weir, it is not anticipated that views from the Weir itself will be impacted.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.7</p> <p>Section 7.1</p> <p>Section 8.2.16</p>
191d	191d.0001	Private - Brookstead	Social Impact Assessment		<p>The submitter is an affected landowner. He raises concerns about his mental health and wellbeing due to the tensions as a result of this IR Project. As of 2021 he has been involved in the Project as a PRG member and has been on the SDOCC since its inception. He failed to sleep adequately through the night given the unpredictability of the Project and because no one would listen to the issues that the submitter region is facing. He also raises similar conditions for several people in Brookstead which is in the Project alignment. The draft EIS should be rejected because:</p> <ul style="list-style-type: none"> the draft EIS is incomplete due to the omissions of a community wellbeing plan that will not be ready till the detailed design phase. In event of this omission the true extent of social impact on the Brookstead community cannot be determined. 	Nil.	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 7.4.2 acknowledges that the Project has resulted in stress and anxiety for some landowners and residents. In addition to the ongoing community engagement process which aims to provide information and enable consideration of landholders' concerns, ARTC has invested in a mental health partnership to enable people affected by the proposed Project to access local and independent mental health support services. This includes the New Access Program delivered by Richmond Fellowship Qld or Lives Lived Well, which helps people experiencing stress and anxiety through face-to-face or telephone support available at no cost, and without the need for a referral.</p> <p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Appendix X: Social Impact Assessment, Section 8 provides a comprehensive Social Impact Management Plan addressing identified impacts, including community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during the detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective and responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.4.2</p> <p>Section 8</p> <p>Section 8.5.6</p>
191d	191d.0002	Private - Brookstead	Noise and Vibration		The small town of Brookstead lies in close proximity to the proposed rail and will be impacted by noise and vibration in the construction and operation stages. No alternative solutions have been discussed with the community for a feasible alternative with less social impact. The Brookstead Hall should be identified in Section 5.42 as an affected community building. The draft EIS provides no details about how the social impacts arising from noise and vibration will be minimised or mitigated.	Nil.	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment.</p> <p>ARTC has used the latest building data to identify sensitive receptors within the EIS study area in accordance with the Department of Transport and Main Road (Qld) guidelines. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. The Brookstead Community Hall has now been included as a sensitive receptor for modelling purposes and for impact assessment. ARTC is now confident that all sensitive have now be identified for use in the draft revised EIS.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
191d	191d.0003	Private - Brookstead	Stakeholder Engagement		Very few residents from the local community in Brookstead has participated in the survey as it was poorly advertised and promoted by ARTC. The resident were unaware of any involvement of Elliot Whitting as a SIA proponent until the EIS was realised. In this way, the draft EIS has failed to represent the views of the community members who may be impacted by the Project. He also raises the issue that a total of 121 surveys responses were received of which 114 respondents identified as residential location. Appropriate 83% of surveys were from Toowoomba LGA and 7% from Goondiwindi. The remaining from other LGAs. The submitter states that with a population of approximately 160,779 surveys response from Toowoomba LGA sample has very limited statistical validity.	Nil.	<p>Appendix E: Consultation Report, details the engagement carried out by ARTC to inform the Social Impact Assessment (SIA). It also details the distribution and promotion of the community survey, which included a newsletter delivered to the study area and adjacent communities in October 2018, email to 1,464 registered stakeholders, the November and December e-newsletters, at the November 2018 community information sessions and at the November 2018 IDD CCC meeting.</p> <p>In addition, a hard copy of the survey and a postage-paid return envelope was mailed to 212 landowners in the focused area of investigation in December 2018. ARTC notes that the community survey was only one element of the community engagement carried out to inform the SIA. The revised draft SIA has considered the results of consultation conducted between March 2021 and June 2022. Other elements are described in Appendix E: Consultation Report.</p>	Appendix E: Consultation Report
191e	191e.0001	Private - Brookstead	Nil Response		Duplicate submission of 191d.	Nil.	ARTC acknowledges the submitters concerns. Please refer to the responses to submission number 191d.0001 to 191d.0003 for how these concerns have been addressed.	N/A
191f	191f.0001	Private - Brookstead	Nil Response		Duplicate submission of 191d.	Nil.	ARTC acknowledges the submitters concerns. Please refer to the responses to submission number 191d.0001 to 191d.0003 for how these concerns have been addressed.	N/A
192a	192a.0059	Community Group	Project scope		Appendix 1 Correspondence covers a large volume of supporting material, including a flood report from WRM water, minutes of meetings, letters, media releases, reports, submissions to the senate inquiry, meeting agendas, media releases, briefing notes, brochures, maps, media articles, Hansard records, meeting presentations.	Nil.	<p>As stated in Chapter 6: Stakeholder Engagement, Table 6-8 all submissions received from stakeholders were reviewed by the Coordinator-General. This includes the items included in Appendix 1 - documents and correspondence supporting, of Submission 192 received from Millmerran Rail Group.</p> <p>Chapter 6: Stakeholder Engagement, Section 6.4.2 states that in December 2021, following consideration of the draft EIS and stakeholder submissions, the Coordinator-General notified ARTC that additional information was required. A formal request for additional information was issued to ARTC on 4 January 2022. ARTC has completed additional investigations, assessments and stakeholder engagement to inform the revised draft EIS and address issues raised in the submissions. This engagement process also included incorporating design refinements and additional mitigation measures into the reference design in response to feedback received from directly and indirectly impacted stakeholders, resulting in several reference design changes and mitigation measures.</p> <p>Responses to the items raised in the body of the submission 192 will be inclusive of the consideration given to the items included in Appendix 1 of submission 192.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.4.2</p> <p>Table 6-8</p>
192a	192a.0059	Community Group	Project scope	Baseline/ background sampling	In addition to the main submission an appendix 1 is provided which provides supporting material across all areas. Document includes letters, briefing material, media releases, meeting minutes, presentations, maps, Hansard records. Transcripts and an independent review of flood modelling prepared by WRM Water and Environment (Condamine River). Several videos also provided of local flood events.	Nil.	<p>As stated in Chapter 6: Stakeholder Engagement, Table 6-7 all submissions received from stakeholders were reviewed by the Coordinator-General. This includes the items included in Appendix 1 - documents and correspondence supporting, of Submission 192 received from Millmerran Rail Group.</p> <p>Chapter 6: Stakeholder Engagement, Section 6.4 states that in December 2021, following consideration of the draft EIS and stakeholder submissions, the Coordinator-General notified ARTC that additional information was required. A formal request for additional information was issued to ARTC on 4 January 2022. ARTC has completed additional investigations, assessments and stakeholder engagement to inform the revised draft EIS and address issues raised in the submissions. This engagement process also included incorporating design refinements and additional mitigation measures into the reference design in response to feedback received from directly and indirectly impacted stakeholders, resulting in several reference design changes and mitigation measures.</p> <p>Responses to the items raised in the body of the submission 192 will be inclusive of the consideration given to the items included in Appendix 1 of submission 192.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.4</p> <p>Table 6-7</p>
192a	192a.0060	Community Group	Flooding		<p>Report prepared by WRM Water and environment - Independent review of flood modelling undertaken for the Condamine river. Recommendations made:</p> <ul style="list-style-type: none"> update flood modelling for existing conditions and the Reference Design be updated prior to approval the draft EIS. investigate and report on more frequent flood events than 20% AEP modelled events. include quantitative limits for flood impact objectives. Flood impact objectives provide more guidance with respect to acceptable flood impacts. EIS to adequately identify and justify the acceptability of changes in flood impacts. mapping to be provided for all flood events and as well as more frequent events such as 50% AEP. flood impacts presented so that a landholder can determine impacts to their property. consistent best practice approach that considers losses for piers and superstructure as well as some debris blockage/ - sensitivity testing for bridge/ waterway structures. document miscellaneous infrastructure that could impact flood behaviour and their impact on the FIO detailed. additional discussion on potential addition mitigation. a discussion on future/ planned road upgrades and the mitigation of additional impact. FIO to be assessed for road upgrades. 	Nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC has undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0087	Community Group	Noise and Vibration	Modelling	TOR item 11.121 not adequately addressed due to multiple route alignment options crossing DA Hall properties not considered in assessment. The multiple Inland Rail alignment options for DA Hall properties will have varying degrees of impact relating to noise and vibration. The close proximity of some of these route alignments to current poultry operations is not reflected in the reference designs of the draft EIS.	Nil.	<p>Regarding the Project route, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community Chapter 2: Project Rationale Section 2.8 and 2.9). The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ ability to enhance the Inland Rail service offering ▶ construction and operating costs ▶ multi-criteria analysis (MCA). <p>The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders, and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts). The final reference design in the revised draft EIS minimise to the greatest extent practicable, impacts to intensive livestock operations by creating buffer distances between the rail alignment and current operations.</p> <p>In addition, the Project alignment has been revised since submission of the draft EIS. The Millmerran Alternative Alignment (MAA) alignment has been based upon ongoing consultation with local business and community (refer to Chapter 2: Project Rationale, Section 2.9.3). The proposed updated reference design for the revised draft EIS is expected to reduce potential impacts or risks associated with Inland Rail operational noise, vibration, light emissions, and biosecurity risks on DA Hall's business by creating greater separation of the main business infrastructure and the alignment.</p> <p>ARTC is committed to working directly with impacted landowners to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and landowners will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p> <p>The revised "Millmerran Alternative Alignment" has been selected with the following criteria:</p> <ul style="list-style-type: none"> ▶ completely avoids severing high intensive animal and agricultural industries (including Class and Class B Agricultural Areas) ▶ increase of safety and travel benefits for the community ▶ rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ▶ the new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ▶ reduces adverse economic and social impacts. 	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3
193	193.0088	Community Group	Noise and Vibration	Baseline/ background sampling	TOR item 11.117 not adequately addressed - the draft EIS doesn't describe the existing noise and vibration environment relating to the area of DA Hall affected by the Project.	Nil.	<p>Environmental noise levels were surveyed outdoors at 29 locations within the noise and vibration study area (Section 16.5 of Chapter 16: Noise and Vibration and Section 5.4 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. Noise measurement locations were selected to represent the geographic range of the sensitive receptors along the Project alignment.</p> <p>The most stringent applicable construction noise criteria were adopted across the Project as a result of the low existing background noise levels measured at the surveyed locations. Additional noise measurements would not have lowered the adopted noise criteria in that area.</p>	Chapter 16: Noise and Vibration Section 16.5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.4
193	193.0089	Community Group	Noise and Vibration	Directly impacted landowner	TOR item 11.118 not adequately addressed - the draft EIS has not described an illustrated on maps the location of all sensitive noise and vibration receptors adjacent to all Project components. Dwelling receptor ID 256813 is located at the poultry operation, however there are no sensitive receptors for the poultry operation or piggery operation that fall within the Project footprint, influenced by the Inland Rail alignment options.	Include DA Hall & Co poultry operation as a sensitive receptor (other) in the draft EIS.	<p>Livestock facilities are not considered 'sensitive land uses' in the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019) and do not require assessment. However, ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. The findings and recommendations of the assessment are discussed in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.</p> <p>The alignment through Millmerran has now been optimised via the alignment option 'Millmerran Alternative Alignment' (see Chapter 2: Project Rationale Section 2.10.9). The revised alignment is a result of ongoing consultation with local businesses and community as well as public submissions and provides the following benefits:</p> <ul style="list-style-type: none"> ▶ completely avoids severing high intensive animal and agricultural industries (including Class and Class B Agricultural Areas) ▶ increase of safety and travel benefits for the community ▶ rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ▶ the new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ▶ reduces adverse economic and social impacts no longer identify any impacts imposed on the poultry farm or piggery. Consultation with agricultural industries and other potentially impacted landowners will continue throughout the stages of the Project. 	Chapter 2: Project Rationale Section 2.10.9 Chapter 16: Noise and Vibration Section 16.9
193	193.009	Community Group	Noise and Vibration	Directly impacted landowner	TOR item 11.119 not adequately addressed - impacts of noise and vibration at DA Hall operations has not been considered including in baseline monitoring. Chapter 14 fails to acknowledge in any way the potential for and the type of impact specific to poultry and piggery operations. Applying standard criteria, and therefore mitigation measures, have failed to meet the intent of consultation and address Project-specific issues. Reference to Taylor Byrne report Appendix in 193a.	Describe the existing noise and vibration environment and describe the adverse impact from Inland Rail operation on the noise and vibration environment at DA Hall & Co poultry.	<p>The background noise level is used to establish the construction noise criteria. Background noise monitoring was undertaken at 29 representative locations along the Project alignment (Section 16.5 of Chapter 16: Noise and Vibration and Section 5.4 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The most stringent applicable construction noise criteria were adopted across the Project as a result of the low existing background noise levels measured at these locations. Additional noise measurements at Doug Hall & Co Poultry would not have lowered the adopted noise criteria.</p> <p>Noise and vibration impacts to livestock are not assessable under the revised draft EIS terms of reference and relevant legislation. However, ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. The findings and recommendations of the assessment are discussed in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.</p> <p>The alignment through Millmerran has now been optimised via the alignment option 'Millmerran Alternative Alignment' (see Chapter 2: Project Rationale, Section 2.10.9). The revised alignment is a result of ongoing consultation with local businesses and community as well as public submissions and provides the following benefits:</p> <ul style="list-style-type: none"> ▶ completely avoids severing high intensive animal and agricultural industries (including Class and Class B Agricultural Areas) ▶ increase of safety and travel benefits for the community ▶ rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ▶ the new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ▶ reduces adverse economic and social impacts no longer identify any impacts imposed on the poultry farm or piggery. Consultation with agricultural industries and other potentially impacted landowners will continue throughout the stages of the Project. 	Chapter 2: Project Rationale Section 2.10.9 Chapter 16: Noise and Vibration Section 16.5 Section 16.9 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.4
193	193.0092	Community Group	Noise and Vibration	Modelling	TOR item 11.125 not adequately addressed - identification of relevant criteria parameters for impacts to poultry from noise and vibration would further inform appropriate mitigation measures.	Condition ARTC Project footprint to avoid the impact area for poultry operations as determined by criteria and impact assessment prepared by industry experts.	<p>Noise and vibration impacts to livestock are not assessable under the revised draft EIS terms of reference and relevant legislation. However, ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on livestock. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. The findings and recommendations of the assessment are discussed in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.</p> <p>The alignment through Millmerran has now been optimised via the alignment option 'Millmerran Alternative Alignment' (see Chapter 2: Project Rationale, Section 2.10.9). The revised alignment is a result of ongoing consultation with local businesses and community as well as public submissions and provides the following benefits:</p> <ul style="list-style-type: none"> ▶ completely avoids severing high intensive animal and agricultural industries (including Class and Class B Agricultural Areas) ▶ increase of safety and travel benefits for the community ▶ rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ▶ the new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ▶ reduces adverse economic and social impacts no longer identify any impacts imposed on the poultry farm or piggery. Consultation with agricultural industries and other potentially impacted landowners will continue throughout the stages of the Project. 	Chapter 2: Project Rationale Section 2.10.9 Chapter 16: Noise and Vibration Section 16.9
193	193.0093	Community Group	Noise and Vibration	Directly impacted landowner	Submitter references report undertaken by Taylor Byrne Impact assessment report (by Dr Scott) noting the impacts from rail noise and vibration on animal welfare and loss of production causing loss of business (including estimated economic costs).	Nil.	<p>Poultry operations are considered a construction vibration receptor in Appendix C21 Sensitive receptors of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Noise and vibration impacts to intensive livestock operations have been assessed in Chapter 16: Noise and Vibration. ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. An assessment of potential impacts to intensive animal operations has been conducted based on a criterion of 90 dBA Lmax. The findings and recommendations of the assessment are reported in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.</p> <p>The alignment through Millmerran has now been optimised via the alignment option 'Millmerran Alternative Alignment' (see Chapter 2: Project Rationale, Section 2.10.9). The revised alignment is a result of ongoing consultation with local businesses and community as well as public submissions and provides the following benefits:</p> <ul style="list-style-type: none"> ▶ Completely avoids severing high intensive animal and agricultural industries (including Class and Class B Agricultural Areas) ▶ Increase of safety and travel benefits for the community ▶ Rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ▶ The new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ▶ Reduces adverse economic and social impacts no longer identify any impacts imposed on the poultry farm or piggery. Consultation with agricultural industries and other potentially impacted landowners will continue throughout the stages of the Project. 	Chapter 2: Project Rationale Section 2.10.9 Chapter 16: Noise and Vibration Section 16.9
193a	193a.0001	Community Group	Flooding		Note report: WRM (Dr Marker) Independent Review of Flood Modelling undertaken for the Condamine River Floodplain (commissioned by the Millmerran Rail Group - report number 1283-01-J 29 April 2021). Report attached to submission and referred to throughout to support issues raised.	Nil.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Further design refinement, mitigation, and consultation will continue through the detailed design stage of the Project.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.6 Section 8.6
193a	193a.0002	Community Group	Social Impact Assessment	Directly impacted landowner	Note report: produced by Taylor Byrne - Impact assessment of proposed Inland rail route through DA Hall operations. Impact assessment focused on animal welfare, future business expansion option and impact to business operations.	Nil.	<p>The reference design was refined during preparation of the revised draft EIS including re-alignment of the rail corridor to avoid impacts on Doug Hall and Co's poultry and piggery operations which would have affected their employment numbers, and design refinements to avoid impacts on feedlot infrastructure. Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts.</p>	Appendix X: Social Impact Assessment Section 8.6.1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
194	194.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Section 3 Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
194	194.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
194	194.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
195	195.0006	Private	Noise and Vibration		Majority of residences in Brookstead and Pampas are marked as sensitive receptors, triggering a review of mitigation. However, several other residences are not marked as sensitive receptors, and these residences are much closer in distance to the rail corridor than many others marked as sensitive. There are apparent discrepancies in the classification of "sensitive receptors" that are not clearly explained in the draft EIS. The draft EIS must justify the criteria for classification of sensitive receptors and why some residences are considered not to be impacted by noise, as this is not clear in the current draft.	Nil.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>The land use and receptor categories that are potentially sensitive to noise and vibration are defined in various regulatory guidelines for Queensland. The following categories have been adopted from CoP Vol 1 (road traffic), CoP Vol 2 (construction) and the Interim Guideline (rollingstock operations) (Section 16.5 of Chapter 16: Noise and Vibration)</p> <p>The description of the various sensitive receptors referenced from the Interim Guideline are discussed in Section 5.1 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>With respect to the assessments done for construction and road traffic noise, the receptors were identified in accordance with the requirements of codes of practice (Section 5.1, Section 5.2, Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5.1</p> <p>Appendix A</p>

197	197.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
197	197.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
2	2.0001	Private	Noise and Vibration	Mitigation measures	Property owners have trees growing on the current rail boundary fence as 'noise mitigation measure'. Have requested additional tree plantings on the new boundary fence.	Inland Rail to provide tree plantings on the new boundary fence to help stop the noise.	<p>The planting of trees on a property boundary is not a noise mitigation measure and will not reduce railway noise. For vegetation to reduce noise by any perceptible level, the vegetation has to be dense and cover large areas. It is therefore not considered a reasonable or practicable noise mitigation measure for this Project. However if residents feel that vegetation would assist with minimising visual impacts this can be considered by ARTC.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
201	201.0011	Private - Brookstead	Noise and Vibration	Mitigation measures	<p>Submitter states that three of their residences listed as sensitive receptors (260213, 260150, 260165) on the noise and vibration maps (maps 24 and 25 of 53 in Figure 17, Appendix T), however there has been scant detail verbally communicated with them and at no stage has there been mention of mitigation for noise impacts raised or addressed. Submitter highlights that these details are also not presented in full in the draft EIS and form part of the missing information in Table 23.5 of the document.</p>	Nil.	<p>The draft revised EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. During the community engagement process, noise, vibration have been identified as potential negative impacts to the community along the Project alignment. Refer to Appendix E: Consultation Report. The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>The railway noise assessment has been conducted in accordance with DTMR's Interim Guideline (2019), to provide a revised impact assessment, including examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The noise and vibration assessment information, including discussion on noise mitigation, can be found in Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations and Section 16.10 of Chapter 16: Noise and Vibration of the draft EIS. The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and residential properties. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The draft revised EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced. During detailed design, further detailed engineering, and acoustic assessments, including noise modelling, will be undertaken and will consider sensitive receptors in the vicinity of the Project. Specific and reasonable mitigation measures will be developed and implemented following this detailed assessment and prior to construction commencing and further verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
201	201.0012	Private - Brookstead	Noise and Vibration	Modelling	Two key business buildings in close proximity to the residences (260213, 260150, 260165) have not been listed on the noise and vibration plan as sensitive receptors. This is another omission within the draft EIS. One business shed houses a workshop, service and maintenance facilities, chemical, fuel and oil storage facilities, office and meeting room and toilet block on 2RP87457. Farming and maintenance operations occur in these buildings from 5am to 7pm on a regular basis, on approximately 80% of days in the year. The business office is within 90 m of the rail corridor and will be impacted by noise and vibration (Map 25 of 53, Figure 17). The second building houses a workshop containing engineering tools and we expect that operation of these large but precise machines will be impacted by vibration. ARTC has not listed this engineering workshop as a sensitive receptor (Map 24 of 53 in Figure 17, Appendix T).	Nil.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery, and land use information to identify sensitive receptors within the EIS study area.</p> <p>ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the construction and Operational noise and vibration modelling. ARTC is now confident that all sensitive have now be identified for use in the draft revised EIS modelling.</p> <p>In accordance with the Terms of Reference and the requirements of the Office of the Coordinator General, the noise assessments for construction, road traffic, and railway operations are based on Codes and guidelines from the Department of Transport and Main Roads. The Codes and guidelines classify receptors sensitive to noise and vibration and there is some variation in the classifications between the guidelines based on the sensitivity to different sources and characteristics of noise. As such, there will be some differences in the way individual buildings are assessed with respect to noise from construction, road traffic, and railway operations.</p> <p>The Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section.</p> <p>Sensitive receptors have also been identified in accordance with Department of Transport and Main Roads document Transport Noise Management Code of Practice: Volume 2 – construction Noise and Vibration (CoP V2). These are further detailed in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 5.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5</p>
204	204.0002	Private - Brookstead	Noise and Vibration	construction airborne noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents during the construction stage, resulting in daytime disruptions and night-time sleep disturbance. Significant proportion of retirees on the north side of the town, their lifestyle and well-being will be totally disrupted, particularly during the construction stage. Families with young children living on the norther side of the town will also be impacted by the changed living conditions Reference is made to construction Noise 14.4.3. Residents would be unaware of the noise and vibration they will experience from blasting especially from the Broxburn site.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.9.3 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Blasting impacts have been assessed in accordance with CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2. These criteria are listed in Section 16.6 of Chapter 16: Noise and Vibration, Blasting Criteria.</p> <p>The following measures to mitigate blasting impacts are suggested where practicable as part of Section 16.10, Chapter 16: Noise and Vibration:</p> <ul style="list-style-type: none"> Reducing the charge size by use of delays and reduced charge masses Ensuring adequate blast confinement to minimise the amount of overpressure Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC acknowledges that during the EIS stage may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and wellbeing, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Section 17.6 of Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
204	204.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Noise Barriers illustrated, lack detail and the maps used are old, detail is lacking in terms of the dimensions of the indicated barriers. The location of noise barriers shown on the two maps are open to question as far as possible effectiveness is concerned. Barriers illustrated in Option 2 would be totally inadequate.	draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design stage.	<p>ARTC acknowledges the concerns from the community that noise and vibration has the potential to impact lifestyle and amenity during railway operations. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the community along the Project alignment. Refer to Section 5.6 and 5.10 of Appendix E: Consultation Report. The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers (Section 16.10, Chapter 16: Noise and Vibration).</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>In addition, ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie LVIA Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2. The existing Viewpoint 2 (VP02) and associated visualisation in Yelarbon have now been updated to show and describe the potential impact of conceptual noise walls in this location. In addition, a new viewpoint (VP034) and visualisation has been prepared to discuss and represent potential impacts as viewed from the Yelarbon Silo Art viewing area (VP034/ B and VP04). It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. fragile vegetation zone requirements and sightlines) that cannot be resolved at this stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Section 5.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17.4</p>
205	205.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	The small town of Brookstead lies in close proximity to the proposed rail corridor. Most residences have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation (Chapter 14), and the Brookstead State School also lies within 90 to 100 m from the proposed rail corridor. The submitter states that all residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors due to construction and operation of the rail. However, no alternative solutions have been discussed with the Brookstead community for a feasible alternative with less social impacts on day-to-day activities at the school or in the community, and this falls short of the requirements of Section 6.7 in the TOR.	The draft EIS does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Potential mitigation measures have been included in the revised draft EIS Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic and Section 16.10 of Chapter 16: Noise and Vibration. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC has engaged with Department of Education (QLD) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
205	205.0004	Private - Brookstead	Noise and Vibration	Modelling	The Brookstead Community Hall has not been identified in Section 5.42 as an affected community building.	Nil.	<p>The comment regarding the Brookstead Community Hall is acknowledged. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment (Appendix A of Appendix V: Noise and Vibration Assessment construction and Road Traffic and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations). ARTC has used the latest building data to identify sensitive receptors within the EIS study area in accordance with the Department of Transport and Main Road guidelines.</p> <p>The revised draft EIS has now included the Brookstead Community Hall as a sensitive receptor for the revised noise and vibration modelling. The revised draft EIS Chapter 16: Noise and Vibration and Appendix W: Noise and Vibration Assessment - Railway Operations and Appendix V: Noise and Vibration Assessment construction and Road Traffic has been updated accordingly to show potential noise and vibration impacts from both construction and operations at the Brookstead Community Hall.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Appendix A</p> <p>Appendix V: Noise and Vibration Assessment construction and Road Traffic</p> <p>Appendix A</p>
205	205.0007	Private - Brookstead	Noise and Vibration	Modelling	Noise impacts are not clearly and consistently defined and variability due to predominant wind direction is not considered. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
206	206.0002	Private - Brookstead	Noise and Vibration	construction airborne noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents during the construction stage, resulting in daytime disruptions and night-time sleep disturbance. Significant proportion of retirees on the north side of the town, their lifestyle and well-being will be totally disrupted, particularly during the construction stage. Families with young children living on the norther side of the town will also be impacted by the changed living conditions Reference is made to construction Noise 14.4.3. Residents would be unaware of the noise and vibration they will experience from blasting especially from the Broxburn site.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.9.3 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Blasting impacts have been assessed in accordance with CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2. These criteria are listed in Section 16.6 of Chapter 16: Noise and Vibration, Blasting Criteria.</p> <p>The following measures to mitigate blasting impacts are suggested where practicable as part of Section 16.10, Chapter 16: Noise and Vibration:</p> <ul style="list-style-type: none"> ➤ Reducing the charge size by use of delays and reduced charge masses ➤ Ensuring adequate blast confinement to minimise the amount of overpressure ➤ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. ➤ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ➤ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. ➤ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC acknowledges that during the EIS stage may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well-being, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
206	206.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Noise Barriers illustrated, lack detail and the maps used are old, detail is lacking in terms of the dimensions of the indicated barriers. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation (Chapter 16: Noise and Vibration, Section 16.6 and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6). Construction noise impacts predicted for each sensitive receptor are modelled in accordance with the requirements of CoP Vol 2 that factors in a set of meteorological conditions including a slight downwind setting which enhances propagation from the source to receptor. The construction noise modelling methodology is discussed further in Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 4.3. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment.</p> <p>The revised rail noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The methodology Section further discusses that the Interim Guideline requires the prediction of railway noise to be undertaken using the Kilde 130 modelling methodology. This algorithm does not allow for assessment of varying weather conditions in the prediction of train noise. However, Kilde 130 provides a conservative prediction which is typically greater than more advanced modelling methodologies which allow for modelling of weather effects. Appendix W: Noise and Vibration Assessment - Railway Operations provides a discussion on the consideration of local weather on railway noise (Section 12.3) and the meteorological effects on modelling (Appendix G).</p> <p>Whilst there may be periods when the weather conditions influence the propagation of noise from train passby events, the railway operation are forecast to be 1 to 2 train movements per hour with audible passby events likely to be 2 to 5 minutes in duration. The combination of the duration and intermittency of the train passbys would diminish the influence of weather conditions on the railway noise levels assessed over the 24-hour period.</p> <p>The daily noise levels from the steady state noise emissions from idling trains at the crossing loops can be more readily influenced by local weather conditions than noise from the transient train passbys. The calculation of noise levels from the trains idling at the crossing loops and level crossing alarms included an allowance for downwind noise enhancing weather conditions and/or moderate temperature inversions. The assessment of various sources of noise from railway operations is appropriate for the assessment of worst-case noise levels.</p> <p>With regards to sensitive receptors, the Interim Guideline identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial stage of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.6</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 4.3</p> <p>Section 6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p> <p>Section 12.3</p> <p>Section 17</p> <p>Appendix G</p>
208	208.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that: Non compliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions are provided in the revised draft EIS, Chapter 16: Noise and Vibration (Sections 16.6, 16.7, 16.8) and the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic (Sections 6 and 7), and Appendix W: Noise and Vibration Assessment – Railway operations (Sections 7, 8, 9, 10).</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 17 of Appendix W Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.6</p> <p>Section 16.7</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Section 6</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway operations Section 4</p> <p>Section 6</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p> <p>Section 17</p>
21	21.0002	Private	Noise and Vibration	Directly impacted landowner	Concerned about noise on the lives of my children. The house I live in is sound receptor 319012, and the maximum allowable noise is touching the house. No noise mitigation is required is cruel. We have 11 children and 4 of which have special needs. 79 decibels 20 times a day is going to impact sleep.	Construct a noise mitigation barrier at location.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Border to Gowrie alignment. Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>Noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>Specific and reasonable mitigation measures will be developed and implemented following the detailed assessment and prior to operation commencement and further verification of noise levels during initial operations. Particularly, where the modelled noise levels are within a relatively small margin of compliance, the determination of eligibility of treatments, is also likely include the measurement of noise levels from the operation of the Project.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
21	21.0004	Private	Noise and Vibration	Mitigation measures	The submitter is worried about cardiovascular and other health effects of noise from the Project. There are a cluster of residences near the north-west side of the proposed alignment near Purcell Road Umbriam. There should be noise mitigation at this location to protect health of residents.	Noise mitigation barrier here to protect the residents	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration. The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Noise mitigation shall be provided by ARTC where the Department of Transport and Main Roads criteria are not met, including the potential for at-property treatments.</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17, and Chapter 16: Noise and Vibration, Section 16.10 of the revised draft EIS provide noise mitigation measures proposed to control noise at residences. These measures include noise barriers and at-property upgrades to existing residences. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
210	210.0003	Private	Noise and Vibration		The proposed alignment at Yelarbon is only metres from the town's main street. What effect will this have noise and vibrations have on the town's residents, homes and businesses and also the farm homesteads that the line goes close to?	The landowners and resident who have land resumed to enable the line to be constructed must be fairly compensated for the loss of their asset and also for the social disruption they suffer.	<p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
212	212.0006	Private	Noise and Vibration	Local business and industry procurement	The noise of the Inland Rail trains will directly disruption the staff working at the Vary Agricultural Services Office on Ware Street Brookstead. The Line is within 100 m of the premises. The horns blowing will add to the disruption creating frustration for staff. The close proximity of the Inland Rail to the weighbridge of 100 m, between Goondiwindi and Toowoomba, will likely cause direct issues with the calibration of the weighbridge. Vary Agricultural Service cart 19,700 tonne in one year of fertiliser. Every truck must be weighed, checked and recorded for every load. Incorrect weights are a cost to the business and the customer. For trucks taking product to market, if a truck is weighed and not correct the truck and driver is banned for two weeks. If there is no guarantee that the weighbridge is correctly calibrated with a high level of confidence, the entire trucking industry locally using the public weighbridge will be compromised. Without the weighbridge in operation, Vary Agricultural Services cannot maintain a viable business.	The weighbridge is externally audited and every 12 months. A failure will put the weighbridge out of commission until it is corrected. If the calibration cannot be corrected, the weighbridge will need to be decommissioned.	The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. Ground-borne vibration from ground-level train passbys has been assessed and are discussed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 13. The assessment has considered the submission regarding the potential vibration impacts on a weighbridge located approximately 100 m from the rail line between Goondiwindi and Toowoomba. A heavy vehicle weighbridge is designed to operate with heavy vehicles manoeuvring adjacent to it and to withstand the dynamic loads of heavy vehicles driving onto the weighbridge. The operation of weighbridges is also not adversely impacted by running diesel engines. In comparison, vibration levels from railway operations 100 m distant from the weighbridge would be significantly less than those associated with truck movement and running diesel engines and is therefore not expected to adversely impact operation of the weighbridge. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 13 Section 17
213	213.0001	Private	Noise and Vibration		The submitter is concerned about the train noise affecting their home and wellbeing, including affecting her activities such as reading books.	1. Put sound walls/ barriers 2. Redirect route through forest	The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations. The preferred location for the proposed rail corridor (as presented in the draft revised EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).	Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
215a	215a.0001	Private - Brookstead	Flooding	Modelling	Issues raised with respect to flood modelling and hydrology which have not been fully resolved and validated. Submitter highlights that the EIS is incomplete as it does not consider: The ongoing investigation by the Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail Project by ARTC and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021. The ongoing assessment of the Independent Panel of Experts for Flood Studies, which states it expected to complete their work by the end of 2021	Nil.	The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7.6 Section 8.6
215a	215a.0002	Private - Brookstead	Flooding - Condamine River	Modelling	Concerns raised with respect to the complexity and limitations of modelling the Condamine floodplain with sparse data: The flood model is calibrated on only two flood events (1991 and 2010) and it is to be questioned whether this is sufficient data to build a model for the complex nature of the Condamine floodplain. Both flood events of 1991 and 2010 fall below a 1 in 100 event, equal to an annual exceedance probability (AEP) of 1%. The 2010 flood event is shown as being a 1 in 20 year flood (5% AEP) at the Warwick gauge station, between a 1 in 20 year and a 1 in 50 year flood at the Tummaville gauge station (2-5% AEP) and between a 1-2% AEP at the Cecil Plain Weir. Therefore, predictions for the 2010 flood and allowances for these water heights do not meet the 1 in 100 event requirements for rail design. The model is limited, as the accuracy has not been assessed against a known even of this magnitude.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Sections 7.2 and 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. It should also be noted that as per Australian guidelines (Australian Rainfall and Runoff, 2019) minor, moderate, large, and extreme flood events have been modelled. This includes the 1% AEP event, the 1 in 2,000 AEP event, the 1 in 10,000 AEP event and the Probable Maximum Flood (PMF). These events, which are greater in magnitude than calibration events, ensure the design is tested against a full range of flood magnitudes to assess its performance.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.2 Section 7.2.3 Section 7.3
215a	215a.0003	Private - Brookstead	Flooding - Condamine River	Modelling	Issues raised with modelling the complexity of modelling the Condamine system Concerns raised with respect to the data inputs for model calibration are not being used from Tummaville station. Submitter highlights understanding of the unreliability of this gauge station, but also understand the changes in the system between Warwick and Tummaville, and the associated tributaries that enter the system between these two gauging stations. Submitter questions, the importance of the discrepancy in the results in Table 9.15 and Table 9.16 (Appendix Q1), showing the differences between the flood frequency analysis and URBS model flows. Submitter states that surely the URBS model flows in Table 9.16 are a gross under-prediction of the flood frequency analysis peak discharges and requests that these results be more clearly explained and presented in the EIS document.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	URBS results were reconciled against Flood Frequency Analysis at an upstream pivot (Warwick) and a downstream pivot (Cecil Weir + Lone Pine, i.e. 'Outlet'). The match between URBS and FFA flows is not as strong at the 'outlet' compared to that at Warwick and is a result of the URBS model being insufficient for capturing the full floodplain behaviours (e.g. braided channels and large storage) downstream of Warwick, which must be resolved hydraulically. To clarify these uncertainties, in consultation with the Expert Flood Panel, the Condamine River hydraulic model has been extended past the Cecil Weir gauge to enable a joint calibration/ validation with the URBS model for four well-recorded historical events (1991, 2010, 2013, 2021) (Section 7 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). The joint calibration/validation found that the differences between modelled and recorded flood levels at Cecil Weir were between +60 mm (+0.6% difference in depth) and +250 mm (3.4% difference in depth) respectively. The current design hydrology and flood modelling approach are considered suitably robust and conservative for the purposes of the revised draft EIS. The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7
215a	215a.0004	Private - Brookstead	Flooding	Modelling	Concerns raised with respect to the validation of the flood model Submitter highlights that with respect to the floodmarks, summarized in Table 9.28, that the validation exercise has eroded trust and credibility in the flood model, rather than increased confidence in the model as claimed in the draft to page 13-14 for further technical detail.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	2010 floodmark validation has been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Updated floodmark validation results can be found in Table 7.31 of Section 7.3.7 in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7.3.7 Section 7.6 Section 8.6 Table 7.31
215a	215a.0005	Private - Brookstead	Stakeholder Engagement		Submitter raises concerns with respect to community consultation around the flood model. Submitter highlights that until this point in time; ARTC, FFJV as well as Dr Macintosh had been brushing aside documented photographic evidence for certain flood events that show clear justification for the community's flood height records	Nil.	Appendix E: Consultation Report, Section 5 of the revised draft EIS detail the community engagement undertaken by ARTC to inform the Condamine River flood model and the floodplain crossing design. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed. In October 2018, the SDDCCC appointed independent advisor, Dr John Macintosh from Water Solutions Pty Ltd to carry out an independent review of the Condamine River floodplain hydrology model. ARTC financially supported this work, and provided technical information to Dr Macintosh for his independent review but was otherwise not involved in this process.	Appendix E: Consultation Report Section 5
215a	215a.0006	Private - Brookstead	Flooding	Modelling	Submitter highlights that ARTC representatives supplied misinformation to the Senate committee, demonstrating a lack of consultation within ARTC from the ground up as well as its dismissal of documentary flood evidence and concerns about the flood model convey to them by affected landholders.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7.6 Section 8.6
215a	215a.0007	Private - Brookstead	Flooding	Modelling	Local floodplain residents have been attempting to work with ARTC for over three years around the accuracy of the flood model and the height and extent of water in the 2010 flood event. Additionally, request for further detail around the flood model has not been forthcoming to address concerns. The local floodplain residents have been continually assured that the flood model is 'fit for purpose however the residents are still very uncertain about its accuracy, validity and ability to predict future events. There has been little communication about modelled results on properties and increased flood impacts due to the IR rail design.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	Operational flood impacts in the Condamine River floodplain have been described in Section 14.8.1 of the revised draft EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Section 14.5 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.5 Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
215a	215a.0009	Private - Brookstead	Stakeholder Engagement		<ul style="list-style-type: none"> Submitter highlights that as stakeholder engagement by ARTC has failed in the past, there is extreme concern that the EIS document states that there will be further model refinements and consultation with landholders outside of the EIS process. Submitter highlights that their past experience with ARTC having concerns ignored, records and local knowledge discounted. Submitter highlights that ARTC has no credibility or trust within the community of the Condamine floodplain as they have not engaged with stakeholders in a consultative and collaborative manner in the past. 	<ul style="list-style-type: none"> The draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJV, as the engineers for ARTC. 	<p>ARTC will continue to consult with impacted landowners in regard to the results of local catchment modelling through finalisation of the EIS and development of the detailed design. The purpose of this consultation will be to ensure that impacts to property-scale water balance features, such as irrigation channels and dams, are appropriately considered in the EIS and Project design. Feedback from this consultation will be used to update flood modelling for the Project, if appropriate to do so. Outcomes of this consultation and revised local catchment modelling will be incorporated into the final EIS.</p> <p>The flood modelling conducted for the Project was reviewed by the Independent International Expert Panel for Flood Studies, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Expert Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment. As part of additional assessment and studies conducted for the revised draft EIS, ARTC assessed all local catchments against the new Flood Impact Objectives (FIOs), which determine the acceptable parameters within which the Project can change or increase the existing flood conditions, including afflux, time of inundation, velocity, hazard and flow directions. In October 2022, ARTC undertook consultation with all landowners that were shown to have the highest exceedances to the FIOs, in order to discuss these potential impacts and allow ARTC to develop mitigations specific to each area or property.</p> <p>As per ARTC's flood model engagement framework, ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures. Property specific impacts were identified during the consultation sessions in 2022, with the potentially impacted landholders (e.g. access, property specific observations and constraints) and the results recorded for incorporation when mitigations are applied in detailed design along with FIO application.</p> <p>ARTC provided technical information to Dr Macintosh for his independent review but was otherwise not involved in this process and is thus unable to comment. ARTC notes that it also cooperated and shared technical information with the Independent Flood Panel and a flooding expert appointed by local landowners.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Appendix E: Consultation Report Section 5
215a	215a.0010	Private - Brookstead	Flooding		Local landholders are extremely concerned about potential dangers to lives, homes, rural infrastructure and prime agricultural land, the unique and highly fertile black cracking clay (vertisol) soil resource and agricultural enterprises due to an unacceptable flood risk imposed by the IR design. Concerns raised with respect to the current design, that it will result in both short-term and long-term impacts that are irreversible, due to changed water flow and velocity resulting from the proposed rail design. These changes directly contravene the mandatory ToR of 6.2 as the EIS does not acknowledge that these flooding impacts are likely to be irreversible. Refer to page 18 for further details about flooding impact concerns.	The Condamine Main Branch Bridge be extended 400 m to the South to join the Condamine South Branch Bridge The Condamine South Branch Bridge be extended to Millmerran-Leyburn Road to ensure no erosion damage to concentrated water flow through culverts in this area. The submitter requests a bridge from the Millmerran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design in this area.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for water flow velocities. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the detailed design stage of the Project.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 4.2 Sections 5 - 17
215a	215a.0011	Private - Brookstead	Flooding		Submitter highlights that the inundation maps from Appendix Q2 at this location show unacceptable increased heights from minor to major flood events around the proposed rail structure. Refer to page 19 of submission for more detail. The impact of the rail design from Millmerran-Leyburn road to the Condamine River for more extreme events results in alarming increases in flood height of up to 0.5 m and, the submitter states that this flood impact is totally unacceptable The draft EIS does not address alternative rail design that may mitigate these flood impacts, and this violates ToR 11.68, 11.69, 11.142 as it ignores avoidance of the potential risks to people and property that may be associated with the Project from flooding. Submitter disagrees with the assumptions made in Chapter 12 (P 12-166) of the draft EIS that the change in peak water levels due to design are acceptable. From this statement the submitter states that it is obvious that the impacts of the rail design result in unacceptable changes that violate the flood-impact objectives, and that this failure to meet design objectives is happening at critical flood receptors, as well as across areas of agricultural land. Submitter highlights a second major concern that the series of culverts (and bridge pylons) will increase the flow volumes and water velocity when water is channelled under and around these structures, increasing the erosion risk and causing long-term and irreversible damage to the farming system and soils (see ToR 6.2). Submitter highlights that long-term and irreversible environment impacts associated with this obstruction to the natural water flow in flood events is unacceptable. The current design must be further modified to remove the obstruction and inadequate drainage resulting from the use of culverts in the design.	Nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.9 of the EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.5.1 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.21a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel (Section 22.3.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk.</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design (the updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised Reference Design.</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures will be reviewed and confirmed during detailed design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the detailed design stage, when detailed site-specific data is available.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 4.8 Table 14-4 Figure 14.20a-e Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 7.5.3 Section 22.3 Appendix B
215a	215a.0012	Private - Brookstead	Flooding	Erosion	Submitter raises concern regarding increased risk of Soil Erosion with irreparable and irreversible Impacts. Local landholders have tried to collaborate with ARTC and FFJV on numerous occasions to discuss the consequences of erosion both adjacent to and downstream from the proposed rail design, due to increased velocity by impeding water flow across an 18 km floodplain to a cross-sectional area of 7.5 km of bridging and culverts, under an elevated wall of up to 3 m high. Refer to pages 20-22 for further information.	The Condamine Main Branch Bridge be extended 400 m to the South to join the Condamine South Branch Bridge The Condamine South Branch Bridge be extended to Millmerran-Leyburn Road to ensure no erosion damage to concentrated water flow through culverts in this area. The submitter requests a bridge from the Millmerran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design in this area.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8 of the EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14-20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel (Section 22.3.1 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk.</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design (the updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised Reference Design.</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures will be reviewed and confirmed during detailed design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the detailed design stage, when detailed site-specific data is available.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 4.8 Table 14-4 Figure 14-20a-e Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 7.5.3 Section 22.3 Appendix B
215a	215a.0013	Private - Brookstead	Flooding		The submitter raises concerns with the flood impact objectives and disputes EIS claims around rail design. The Submitter questions the flood impact objectives and proposes that it is not acceptable for an increase of 200 to 400 mm over agricultural cropping land due to rail design. Refer to pages 21-22 of submission for further details.	Nil.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for land, with further FIO requirements that relate to land usage, impacted area, etc. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and State guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the detailed design stage of the Project.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 4.2 Sections 5 - 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
215a	215a.0014	Private - Brookstead	Flooding		The submitter highlights that the work of the Independent Panel of Expert for flood studies directly relates to the draft EIS, specifically the Condamine River floodplain Section of the proposed B-G route. Therefore, the submitter states the CG should invite ARTC to withdraw the draft EIS, ensuring the Panels advice and best practice for design of waterway structures in a floodplain environment is incorporated into the draft EIS for the CG and stakeholders to consider and comment. The submitter requests the CG to commit to awaiting the release of the Panels advice before making a determination on the draft EIS, and prior to doing so invite stakeholders to comment on the Panels findings. The submitter further requests that the CG insist that the flood impact objectives listed in Table 12.8 be changed as per indication in point 1, on page 23 of the submission. The submitter further requests that the CG review the flood impact objectives in Table 12.8 and insist no change as per indication in point 2, on page 23 of the submission. The submitter proposes that no change is acceptable under sound environmental management and in relation to ToR 6.2, 11.69, 11.142 (a) (ii)The submitter requests that the flood impact objectives must include a requirement to adhere to best management practices for agricultural farming systems and soil conservation on the Condamine flood plain. Refer to further detail provided on page 24 of submission. The submitter requests that the CG reject the application of flood model outputs presented in the EIS as unacceptable. Refer to further detail provide on page 24 of submission.	Nil.	The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. The Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC has undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 5 - 17
215a	215a.0015	Private - Brookstead	Flooding	Modelling	The submitter raises concerns with respect to the flood modelling and climate change impacts, stating that the rail design fails to meet flood impact objectives for seasonal variations and the likely impact of climate change into the near future, where these extreme events will be of greater intensity and occur at more frequent intervals. The submitter highlights that whilst the EIS addresses the flood immunity of the current rail design, it makes no consideration of the impacts on agricultural land, or detailed assessment of sensitive flood receptors under this climate change scenario and this is a failure to meet the mandatory requirements of ToR 6.2 and 6.3, as well as ToR 11.48 and 11.54.	Nil.	The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Climate change and the selected Representative Concentration Pathway are discussed throughout Chapter 14: Flooding and Geomorphology and Sections 5 to 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS (within the climate change assessment of each floodplain section). For the avoidance of doubt the RCP 6.5 (2090 horizon) climate change scenario has been adopted for the Project.	Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 5 - 17
215a	215a.0016	Private - Brookstead	Flooding	Modelling	Submitter states that the draft EIS fails to address uncertainty in the hydrologic and hydraulic models presented, and that results are presented in a deterministic way. Submitter states that given the complex nature of the Condamine flood plain system and the associated difficulties in flood modelling, it is imperative that a full analysis of uncertainty surrounding the predicted peak heights, flow velocities and inundation times are assessed. The submitter highlights that these omissions in the current draft of the EIS document violate the mandatory requirements of ToR 6.3.	Draft EIS submitted by ARTC should be rejected on the grounds that: It does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. The draft EIS is incomplete due to the omission of an assessment of uncertainty surrounding the flood model outputs including predictions of peak height, flow velocity and inundation time for flood events The incomplete nature of the draft EIS as indicated in Table Z3.5. The flood impact on the Condamine floodplain cannot be determined until the details of the Project footprint, level crossing design, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As with all of our prior interactions with ARTC, the detail is scant and is not yet available.	Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC has considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River and Back Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.6 Section 8.6
216	216.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines. Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2 Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A
216	216.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations. The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors. The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations). The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to: <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will: <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation 5.6 Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.	Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Section 17.6 Table 17-41 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
216a	216a.0001	Private	Flora and Fauna	Koala	Lack of appropriate ecological survey for Koala habitation. The submitter is from the Pittsworth Landcare Group who are dedicated to the protection of Koalas. The ARTC data was only sourced from desktop studies and purchased data from the like of the Australia Koala Foundation. They mention the Australian Koala Foundation as a source, but however it is not referenced in the EIS. There is no evidence of any ground proofing of habitat. The relevant fauna assessment (Appendix J) suggests that scats and Koala scratches were surveyed at selected locations but these results are not reported in the document.	The draft EIS submitted by the ARTC should be rejected on the grounds that it does not comply with the Terms of reference as set by the Coordinator general on 16 November 2018. The draft EIS is incomplete in this form.	Appendix O: Matters of National Environmental Significance of the revised draft EIS, outlines the assessment undertaken to determine the degree of significance of impacts on Koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements. Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan (DKMP). A Koala genetic study has been undertaken to understand the Koala population genetics along the Narramine to Acacia Ridge/ Bromelton sections of the Inland Rail Project. As per results of this study (ERM, 2024) Koalas within the Project footprint belong to a single population that extends throughout south-east Queensland. Ecological monitoring which will be conducted during operation of the Project will include ongoing collection and analysis of Koala DNA samples from adjacent and broader areas from the Project and an analysis of gene flow at five-yearly intervals for 20 years. Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.	Appendix E: Consultation Report Section 4.2 Section 5 Section 5.11 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix O: Matters of National Environmental Significance Appendix P: Fauna Connectivity Strategy

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
216a	216a.0002	Private	Flora and Fauna	Koala	The submitter informs that there is significant Koala habitat from Yarranlea to Athol. DNA sampling has been taken and the possibility of a new gene pool exists. Therefore this area must never be touched. The Koala activity in this location is very high which leads to the assumption of a breeding area. The linear nature of the Inland rail will be a barrier and likely to diminish Koala dispersal/genetic flow east and west of the rail line. ARTC has failed to identify the area where Koalas are likely to cross and to provide feasible structures for safe passage.		<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act 1999. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS: Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Appendix P: Fauna Connectivity Strategy identify the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingleswood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: Volume 1 and 2 (DTMR 2000 and 2010, respectively). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p> <p>In addition, ARTC has commenced two key research initiatives relating the Koala (<i>Phascolarctos cinereus</i>) to better understand populations, potential impacts and to develop targeted mitigation and management measures. Regarding the proposed solution, ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study Koala genetics that focusses on population genetics and dietary analysis for Koalas across eight of the Inland Rail Projects. The purpose of this study is to:</p> <ul style="list-style-type: none"> ➤ Increase baseline data on Koala population resilience and restoration requirements. ➤ Informs Koala conservation controls as required in conditions of approval. ➤ Informs fauna connectivity plans. ➤ Informs Koala offset management decisions. ➤ Contribute to Infrastructure Sustainability Council credits. <p>The expected completion date for these studies is June 2023.</p>	<p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5</p> <p>Section 5.11</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
218	218.0011	Local Government	Noise and Vibration		Draft EIS does not address the impact of noise and vibration	<p>Landscape, noise and vibration</p> <p>The proposed landscape, visual, noise and vibration impacts are not appropriately addressed or assessed by the draft EIS. The draft EIS therefore fails to achieve the requirements under 'Land' in the TOR and requires updating to meet the OCG's TOR.</p> <p>The potential for sleep disturbance appears to be grossly underestimated and ultimately dismissed. The draft EIS needs to demonstrate how the assessment criteria that is currently adopted can possibly protect the ability to sleep at sensitive dwellings and/or sensitive community centres (places where the community congregate for essential activity including schools).</p> <p>The draft EIS needs to be updated to use appropriate noise impact assessment criteria and the proponent should commit to being responsible for implementing meaningful noise impact mitigation measures.</p>	<p>The draft revised EIS has been updated to address potential impacts from noise and vibration at sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The construction noise impacts provided in the EIS are conservative predictions of unmitigated worst-case 15-minute construction noise levels based on a preliminary construction methodology (Chapter 16: Noise and Vibration, Section 16.6). As specific hours of construction for each construction activity is not yet known, potential noise impacts have been assessed against appropriate CoP Vol 2 noise criteria for all hours. The night and evening criteria are more stringent than the day criteria in order to consider potential sleep disturbance impacts. Reasonable and practicable measures to minimise construction noise impacts are to be nominated and implemented based on community consultation and a detailed assessment of construction noise impacts during the detailed design stage of the Project. Mitigation measures to be considered have been included in the EIS (Chapter 16: Noise and Vibration, Section 16.10). Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4.22, has been updated to include an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5</p> <p>Section 10.5.4.22</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.2</p>
218	218.0063a	Local Government	Social Impact Assessment		Social impacts: Table 4.3 does not include detail relating to social impacts from the proposed Project.	Table 4.3 of the draft EIS requires update to include criteria for assessing social impacts.	Section 9 of revised draft EIS Appendix X: Social Impact Assessment provides the criteria for assessing social impacts.	Appendix X: Social Impact Assessment Section 9
218	218.0087	Local Government	Noise and Vibration		<p>Land objectives: The Land objectives provided in the OCGs TOR states that the proposed Project should be designed and operated to:</p> <p>(a) Improve environmental outcomes; and</p> <p>(b) Contribute to community wellbeing; and</p> <p>(c) Contribute to social, economic and environmental sustainability; and</p> <p>(d) Mitigate impacts to the natural landscape and visual amenity.</p> <p>The draft EIS fails to provide detailed information around potential noise barriers. It is acknowledged in various reports that there will be significant noise amenity impact along the rail alignment, particularly at Brookstead and Pittsworth, however there is no clear indication regarding how that impact will be mitigated. It appears that the best choice is a noise barrier, which will severely impact the visual amenity of these two settlements.</p> <p>There is also concern surrounding the application of CPTED principles, which has been mentioned in the draft EIS. Parts of the construction of the alignment, final product and mitigation measures has high potential to create undesirable places and spaces in which the community wellbeing and social sustainability objectives expressed in the TOR may be negatively impacted or not achieved. Information is missing from the draft EIS around these objectives in direct relation to the mitigation measures.</p>	<p>The proposed landscape, visual, noise and vibration impacts are not appropriately addressed or assessed by the draft EIS. The draft EIS therefore fails to achieve the requirements under Land in the TOR and requires update to meet the OCGs TOR.</p> <p>TRC request that the OCG impose the following condition:</p> <p>The proponent is required to appropriately address landscape, visual, noise and vibration impacts directly including designing, constructing and operating the proposed Project in a way which:</p> <p>(a) Improves environmental outcomes; and</p> <p>(b) Contributes to community wellbeing; and</p> <p>(c) Contributes to social, economic and environmental sustainability; and</p> <p>(d) Mitigates impacts to the natural landscape and visual amenity.</p>	<p>The revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (Section 17 of Appendix: W Noise and Vibration Assessment - Railway operations).</p> <p>As part of the visual assessment, 29 representative viewpoints have been selected and assessed for both construction works and operations stages of the Project (Section 1.2, Appendix K: Landscape and Visual Impact Assessment). This assessment includes visualisations of concept noise barriers and related mitigation measures and related mitigation measures at each location. During construction, the greatest visual impact identified was up to a Moderate level of effect, relating to nine viewpoints.</p> <p>As outlined in Section 6.2.2, Table 21 of Appendix K: Landscape and Visual Impact Assessment, the potential need for noise barriers has been identified and a concept developed based on operational noise modelling at the viewpoints (Appendix W: Noise and Vibration Assessment – Railway operations). The provision of noise barriers and other potential feasible and practicable mitigation options to reduce and control noise levels and noise related impacts at sensitive land uses will be considered during the detailed design stage, in particular in the vicinity of Yelarbon, Brookstead and Pittsworth. Therefore, the potential visual impact of noise barriers in these locations has been considered in this assessment.</p> <p>Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment details mitigation measures for the impact of noise barriers on landscape and visual impact amenity include minimising the use of noise barriers to the greatest extent possible. Where these are or may be required in the future, particularly in towns and urban areas, ensure they are designed sympathetically to their surroundings and consider CPTED and graffiti issues, where appropriate considering the inclusion of community artwork and urban design and/or transparent panelling. This strategy should be applied to any noise barriers required within Yelarbon, Brookstead or Pittsworth Table 95, Appendix K: Landscape and Visual Impact Assessment.</p> <p>Design of noise barriers including confirmation of length and materials is subject to development at detailed design stage. Landscape design will enhance or complement the local context to integrate new structures, fencing and noise barriers Table 95, Appendix K: Landscape and Visual Impact Assessment.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 1.2</p> <p>Section 6.2.2</p> <p>Section 11.2</p> <p>Table 21</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway operations</p> <p>Section 17</p>
218	218.0152	Local Government	Noise and Vibration		Sensitive receptors: The draft EIS lists various sensitive receptors considered in the assessment according to applicable legislation and guidelines. Intensive animal production (identified in Section 15.6.5.2) is not noted as a sensitive receptor. There is the potential that ongoing operational noise and vibration could detrimentally alter animal behaviour and productivity, which could impact viability of significant investment in animals and infrastructure.	The draft EIS requires update to include consideration of noise and vibration on productivity of intensive animal production facilities within a determined distance from the line to allow for requirement of appropriate mitigation measures.	<p>The railway noise assessment has been conducted in accordance with DTMR's Interim Guideline (2019), to provide a revised impact assessment.</p> <p>Following the assessment of impacts and stakeholder engagement on the base options of the alignment, a design change was adopted and incorporated in the Project revised reference design involving a horizontal rail alignment at Millmerran to reduce impacts to intensive animal and agricultural operations, Class A, Class B agricultural areas and eliminate two active level crossings (refer to Chapter 2: Project Rationale, Section 2.10). The realignment also creates greater separation between the main animal operations and infrastructure, thus reducing associated impacts including noise and vibration. The Millmerran realignment was also informed by feedback provided by a DA Halls in the form of a supplied report. The relevant noise and vibration codes of practice, standards and guidelines that apply to Inland Rail do not provide criteria, limits, or procedures to assess noise and vibration impacts to intensive animal operations.</p> <p>Noise and vibration impacts to intensive livestock operations have been assessed in Chapter 16: Noise and Vibration. ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. An assessment of potential impacts to intensive animal operations has been conducted based on a criterion of 90 dBA Lmax. The findings and recommendations of the assessment are reported in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.</p>	<p>Chapter 2: Project Rationale</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.9</p>
218	218.0153	Local Government	Noise and Vibration		Noise from construction: construction noise is calculated to a receiver height of 4.6 m while operational noise is calculated to a receiver height of 1.8 m. The operational Railway Noise and Vibration Technical Report (Appendix T) then states that receiver points are at 2.4 m. The outcomes are unlikely to change significantly, or at all, between the different receiver heights, however the inconsistency was noted.	The draft EIS requires update to ensure all modelled receivers should be clear and consistent between documents and scenarios.	<p>Modelling of construction noise and operational railway noise has been undertaken using different methodologies and different, but appropriate, assumptions. Receiver heights have been modelled at 0.5 m below eave height consistent with DTMR recommendations. For a small portion of sensitive receptors (isolated rural dwellings) with no eave heights available, receptor heights have been determined to be 1.8 m above the terrain level for ground floor, and 4.6 m above terrain level for first floor (if applicable) (Section 4.3, Appendix V - Construction Noise and Vibration and operational Road Traffic Technical Report, and Section 6.1, Appendix W - Operational Railway Noise and Vibration Technical Report.</p> <p>The Operational noise and vibration modelling has been undertaken in accordance the Department of Main Roads' Interim Guideline - Operational Railway Noise and Vibration (March 2019). The updated modelling is presented in the draft revised EIS in Chapter 16 - Noise and Vibration, Appendix V - construction Noise and Vibration and operational Road Traffic Technical Report, and Appendix W - Operational Railway Noise and Vibration Technical Report. The updated modelling has operational noise modelling has incorporated the most up to data building height data along the alignment.</p>	<p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 4.3</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0154	Local Government	Noise and Vibration		<p>Noise at residential dwellings: Section 14.6.1 states the lower limits are generally considered to be just perceptible while referring to a noise limit of 45 dBA Leq,15 min in areas with night-time background levels below 30 dBA. The DES noise measurement manual (2020) suggests that changes in noise levels above 3 dBA are perceptible and that a change of 10 dBA is perceived as twice as loud. A change of 15 dBA will be perceptible and certainly have potential to cause nuisance at sensitive receptors in quiet rural areas.</p> <p>The statement that lower limits will be just perceptible is misleading and incorrect, and it dismisses the likelihood that residents in very quiet areas will be disturbed by levels of noise that may be considered low in other settings.</p>	<p>Although the criteria appear to be correct, the report should not make a baseless and misleading claim regarding the sensitivity of a community. A truthful sentence, for example, may be the lower limit of 45dBA Leq,15 min during non-standard hours does not ensure that construction noise will be inaudible at all sensitive receptors, and some disturbance from noise at the lower limit remains possible, especially in very quiet locales.</p>	<p>The commentary regarding construction noise criteria in Chapter 16: Noise and Vibration of the revised draft EIS and report will have since been revised to align with the CoP Vol 2. This has been reflected in the updated EIS Chapter: 16 Noise and Vibration, Section 16.6, which discusses the findings of the revised construction noise and vibration assessment. Further details of the assessment are also presented in Sections 3 to 6 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p>	<p>Chapter 16: Noise and Vibration Section 16.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 3 Section 4 Section 5 Section 6</p>
218	218.0155	Local Government	Noise and Vibration		<p>Noise and vibration: The requirement of TOR 11.120 is to describe the characteristics of the noise and vibration sources that would be emitted when carrying out the activity describe noise and vibration emissions (including fugitive sources) that may occur during construction, commissioning and operation.</p> <p>Given the geology of the area, it is surprising that an assessment of the vibration from hydraulic hammers has not been included in the assessment of impacts. Should the proponent wish to use hydraulic hammers during construction activities, an assessment would be required in order to meet TOR 11.120.</p> <p>TOR 11.124 requires the draft EIS to describe how the proposed Project would be managed to be consistent with best practice environmental management for the activity The following information provided in the draft EIS is not considered to be consistent with best practice for environmental management:</p> <ul style="list-style-type: none"> Vibration criteria provided in Table 14.30 are expressed as Limits rather than Guideline Targets. Many large-scale Projects adopt the latter, which potentially allows the opportunity for the construction contractor to motivate for alternative, possibly elevated, criteria, in order to develop the proposed Project at a reduced cost and/or a quicker schedule. Guideline targets may sometimes be considered advantageous for construction contractors as they allow opportunities for alternative construction techniques. However, Guideline Targets are less rigid in terms of clearly identifying permissible values and therefore offer less certainty for affected property owners. Additionally, the Limits approach offers increased assurance of potential Project impacts for TRC and affected property owners. <p>The proposed vibration limits for blasting are taken largely from the ANZECC Guidelines rather than AS AS2187.2, which is less restrictive where blasting in a particular area requires fewer blasts. While the draft EIS indicates that for the purposes of the proposed Project, the AS2187.2 criteria have been adopted, the conditions do not include reference to the type of blasting operations and therefore reflect the ANZECC Guidelines, and not AS2187.2. Compliance with the more stringent ANZECC conditions might restrict the scale of blasting and necessitate that the construction contractor adopt hammering to remove rock (considered more intrusive to sensitive receptors) in areas where blasting might have been preferred.</p> <ul style="list-style-type: none"> The calculation of the explosive weights for complying with overpressure criteria for blasting of the cuttings provided in Table 14.31 is incorrect and may unnecessarily eliminate drilling and blasting as a feasible excavation method. The calculations provided in Table 14.31 that are based upon generic relationships provide reasonable estimates for vibration compliance however conclude that blasting with 200 m of a receptor will require specialised blast design to comply with the overpressure criteria. The Table further concludes that blasting at a separation distance of 200 - 800 m from a property will necessitate explosive weights varying between < 1 and < 5 kilograms (respectively). These calculations are erroneous and inconsistent with normal construction blast practices. Best practice would include a controlled trial blast prior to the larger scale production blasts. Although this is not a specific performance criterion that a small trial blast is undertaken in each cutting to confirm the vibration predictions, it is expected that the contractor would require a trial blast as part of their procedures. 	<p>The draft EIS should be updated to:</p> <ul style="list-style-type: none"> Update the vibration assessment to include vibration from hydraulic hammers. Update Table 14.30 to reflect Guideline Targets rather than Limits. Correct the data in Table 14.31 to ensure that blasting as a method of excavation is not eliminated based on incorrect calculations. Improve the overall assessment of impacts from vibration by estimating the number of affected days at various locations along the proposed Project alignment, rather than for only the number of properties potentially affected. Dividing the proposed Project into areas and highlighting the impacts in each cutting would also have allowed for a more considered assessment and provide for easy understanding by the reader. Include an indication of the duration of vibration impacts from the proposed Project. This information would be considered useful for persons potentially affected by the proposed Project when determining how they may be affected by vibration. Given that the construction contractor may vary from the methods identified, the size of the equipment, or scale and timing of the works, it is accepted that determining the duration of any impact could be difficult. It would however be information that the contractor could include in their construction Environmental Management Plan, and an indication of what may be expected should be provided in the draft EIS. The predicted vibration levels from the mechanical methods are limited to vibratory rollers without mention of different size hydraulic hammers (which are fully expected to be used at different areas of the proposed Project). The Vibration Assessment of the draft EIS should include consideration of all activities which produce vibration. Best practice would include a controlled trial blast prior to the larger scale production blasts. 	<p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project will be undertaken. Mitigation have been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area. The worst-case construction vibration activities modelled as part of the EIS assessment are vibratory compaction and piling (percussive and vibratory).</p> <p>The revised draft EIS construction vibration assessment now includes an assessment of hydraulic hammers and is discussed under Section 6.1.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The assessment of airblast overpressures and ground vibration related to blasting is discussed in Section 4.3.3 and Section 6.1.3 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Vibration criteria are described in the document from which they have been adopted - the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration (CoP Vol 2)- as 'limits' (Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). This terminology is therefore considered appropriate. The construction contractor is to implement the construction Noise and Vibration Management Plan, to be developed during detailed design and informed by a detailed construction noise and vibration assessment, rather than the revised draft EIS report.</p> <p>The EIS assessment has adopted human comfort blasting criteria from the CoP Vol 2, and building damage blasting criteria from DIN4150-3 and BS 7385, on the recommendation of the CoP Vol 2.</p> <p>With regards to the comment regarding incorrect calculations on Table 14.31, the construction blasting assessment has been updated and is presented in Section 16.6.3 of Chapter 16: Noise and Vibration. It is unclear from the comment in what way the calculations may be incorrect, however the revised assessment presents the details of the blasting assessment for the control of airblast and ground vibration impacts. These calculations in the assessment have been based on preliminary geotechnical assumptions, preliminary construction methodology, and conservative, worst-case modelling assumptions. Further details of the assessment can be found in Section 6.1.3 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic of the revised draft EIS.</p>	<p>Chapter 16: Noise and Vibration Section 16.6.3 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 3.3.1 Section 4.3.3 Section 6.1.2 Section 6.1.3</p>
218	218.0157	Local Government	Noise and Vibration		<p>Assessment of sleep disturbance 5: Section 14.7.4.1 references the WHO Night Noise Guidelines for Europe (2009) and accepts that an external level of L_{Amax} 49 dB(A) is the trigger for sleep disturbance, assuming opened windows. The Section goes on to say that 'based on noise modelling, the noise levels from rollingstock could be above L_{Amax} 49 dB(A) within approximately 1 km of the rail corridor.'</p> <p>Noise modelling in the draft EIS demonstrates that levels much higher than 49 dBA L_{max} are predicted to be experienced at distances greater than 1 km. For example, receiver 255402 appears to be approximately 1.6 km from the track and is predicted to experience 73 dBA L_{max}.</p> <p>The potential for sleep disturbance appears to be grossly underestimated and ultimately dismissed. As such the potential acoustic impacts of the Project have not been adequately assessed or mitigated.</p>	<p>Nil.</p>	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0158	Local Government	Noise and Vibration		<p>Assessment of sleep disturbance 5: Section 14.7.4.1 of the draft EIS states that 'further advice from the WHO acknowledges the establishment of relationships between single event noise indicators, such as L_{max}, and long-term health outcomes remains tentative. Consequently, the WHO guidance has not been applied as criteria or numerical limits on the Project.' The WHO released new guidelines in 2018 which strongly recommend a night time outdoor noise limit of 44 dBA Leq,night. The draft EIS does not reference this newer document, rather the document has adopted trigger levels of 55 dBA Leq,night and 80 dBA L_{max}, both of which appear to have no connection to any credible guidance on the mitigation of sleep disturbance.</p> <p>As it stands, there appear to be several hundred sensitive receptors that fall between predicted night time noise levels of 44 and 55 dB(A) Leq,night. These several hundred dwellings have not triggered mitigation but are above the WHO guidelines for sleep disturbance. The result is that the financial and personal cost of the rail noise impacts are borne by those residents without any form compensation. See the example Figure below, which is Figure 15 from the draft EIS Appendix T, the red box encloses the dwellings that exceed WHO noise guidelines but do not trigger the proponent's mitigation process.</p> <p>The potential for sleep disturbance appears to be grossly underestimated and ultimately dismissed. As such the potential acoustic impacts of the Project have not been adequately assessed or mitigated.</p>	Nil.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. 218	218.016	Local Government	Noise and Vibration		<p>Assessment of sleep disturbance 5: Section 14.7.4.1 continues with where sensitive residential land uses are proposed to be developed within 1 km of rail freight corridors, it would be expected that residential property, complying to Australian building codes and standards, would achieve facade noise reductions greater than the conservative 7 dBA assumption applied in this assessment.</p> <p>However:</p> <ul style="list-style-type: none"> By relying on the construction of a dwelling to protect the internal noise amenity, the proponent is assuming these dwellings will keep windows closed year-round, and potentially require air-conditioning or mechanical ventilation. In Queensland, new residential developments only have specific design requirements for rail noise when they fall within a Gazetted transport noise corridor, which generally extend no more than 250 m from freight rail corridors. It is estimated that noise levels in excess of the WHO guidelines will be experienced for over 2 km, leaving the balance without any relevant codes or standards to ensure their protection. <p>The potential for sleep disturbance appears to be grossly underestimated and ultimately dismissed. As such the potential acoustic impacts of the Project have not been adequately assessed or mitigated.</p>	Nil.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). 218	218.0161	Local Government	Noise and Vibration		<p>construction, design, level of attenuation Impact on amenity:</p> <p>The Land objectives provided in the OCG's TOR states that the proposed Project should be designed and operated to:</p> <ol style="list-style-type: none"> Improve environmental outcomes; and Contribute to community wellbeing; and Contribute to social, economic and environmental sustainability; and Mitigate impacts to the natural landscape and visual amenity. <p>The draft EIS discusses a number of mitigation measures to minimise noise impacts on the surrounding environment. However, specific details have not been provided for impact on visual amenity, particularly from key locations, including but not limited to noise walls or barriers to be potentially located at Brookstead and Pittsworth.</p> <p>Appendix T identifies the following conceptual noise barrier mitigation:</p> <ul style="list-style-type: none"> Brookstead: 720 m long, 4 m high (in two locations). It was acknowledged in the appendix that the noise barrier would not be sufficient on its own to reduce noise emissions. Pittsworth: 570 m long, up to 4 m high (alongside track) or 3 m barriers directly along Pittsworth Motor Inn and Stanley Street sites. <p>It was identified in Appendix T that none of the proposed noise barriers were successful in reducing noise for all sensitive receptors. The potential for negative impact on the visual amenity of these locations is high, particularly given that the draft EIS identifies a minimum height of 4 m required to achieve noise attenuation.</p> <p>SPP Liveable Communities (3)(a) and (b) require development to be designed to value and nurture local landscape character and the natural environment and maintain or enhance important cultural landscapes and areas of high scenic amenity. These impacts have not been considered in Appendix T.</p> <p>The lasting impacts on visual amenity and landscape have not been considered by the draft EIS in relation to the noise barriers that will most likely be required at Brookstead and Pittsworth.</p>	<p>The proponent has not adequately demonstrated how the impacts to the natural landscape and visual amenity will be mitigated as no clear information has been provided around the noise barriers. This information is crucial to achieving the TOR and ensuring the protection of visual amenity, community wellbeing and the natural landscape.</p>	<p>The revised EIS has been updated to address potential impacts from the operational rail noise and vibration in accordance with Department of Transport and Main Roads - Interim Guideline operational Railway Noise and Vibration (2019). The assessment includes a review of noise mitigation, including noise barriers, and clearly identifies all residual exceedances and requirements for additional measures such as at-property acoustic treatments (Section 17 of Appendix: W Noise and Vibration Assessment - Railway operations.</p> <p>As part of the visual assessment, 29 representative viewpoints have been selected and assessed for both construction works and operations stages of the Project (Section 1.2, Appendix K: Landscape and Visual Impact Assessment). This assessment includes visualisations of concept noise barriers and related mitigation measures and related mitigation measures at each location. During construction, the greatest visual impact identified was up to a Moderate level of effect, relating to nine viewpoints.</p> <p>As outlined in Section 6.2.2, Table 21 of Appendix K: Landscape and Visual Impact Assessment, the potential need for noise barriers has been identified and a concept developed based on operational noise modelling at the viewpoints (Appendix W: Noise and Vibration Assessment – Railway Operations). The provision of noise barriers and other potential feasible and practicable mitigation options to reduce and control noise levels and noise related impacts at sensitive land uses will be considered during the detailed design stage, in particular in the vicinity of Yelarbon, Brookstead and Pittsworth. Therefore, the potential visual impact of noise barriers in these locations has been considered in this assessment.</p> <p>Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment details mitigation measures for the impact of noise barriers on landscape and visual impact amenity include minimising the use of noise barriers to the greatest extent possible. Where these are or may be required in the future, particularly in towns and urban areas, ensure they are designed sympathetically to their surroundings and consider CPTED and graffiti issues, where appropriate considering the inclusion of community artwork and urban design and/or transparent panelling. This strategy should be applied to any noise barriers required within Yelarbon, Brookstead or Pittsworth Table 95, Appendix K: Landscape and Visual Impact Assessment.</p> <p>Design of noise barriers including confirmation of length and materials is subject to development at detailed design stage. Landscape design will enhance or complement the local context to integrate new structures, fencing and noise barriers Table 95, Appendix K: Landscape and Visual Impact Assessment.</p>	<p>Appendix K: Landscape and Visual Impact Assessment Section 1.2 Section 6.2 Section 11.2 Table 21 Table 95 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.017	Local Government	Noise and Vibration		Health and wellbeing, social infrastructure: The draft EIS does not appropriately assess the impact of rail noise on the learning environment at Brookstead Primary School, which is located in close proximity to the proposed alignment (directly across the road).	The draft EIS should be amended to include a commitment to consulting with DESE and the Brookstead school to identify how the proponent will mitigate the significant noise and vibration impacts which will be experienced at the school.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment, including schools.</p> <p>At Brookstead, an assessment of noise has been undertaken for the proposed construction works and future railway operations. The assessment includes detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise and vibration from the construction and operation of the Project and achieve the assessment criteria.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School.</p> <p>The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Chapter 16: Noise and Vibration, Section 16.10, and the associated technical reports Appendix V: Noise and Vibration Assessment: construction and Road Traffic, Section 7, and Appendix W: Noise and Vibration - Railway Operations, Section 17).</p> <p>ARTC has engaged with Department of Education (QLD) and the agreed approach is to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Consultation with potentially affected schools and the Department of Education (DoE) commenced in 2017. Engagement with DoE and the school principals in 2018, 2021 and 2022 has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. Details of these meetings are outlined in Appendix E: Consultation Report, Section 4.2.3, Queensland Government engagement.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Section 4.2.3 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
219a	219a.0001	Private	Land Resources		Concern about the need to keep the alignment weed free to protect agricultural practises in the region. Note this is a brief summary of a detailed description of concerns and weed dispersion impacts on agricultural practices.	N/A	<p>ARTC acknowledges the concerns from landowners about the potential spread of weeds during the construction stage of the Project. The revised draft EIS has been updated to provide additional information on the management and mitigation measures that will be implemented to avoid and minimise the spread of weeds during construction.</p> <p>The results and mitigation measures sections of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report outline the weeds identified in the Project footprint during surveying efforts, and how the dispersal of weeds will be manages and mitigated during each stage of the Project, including the development of a Biosecurity Management Plan as part of the Construction Environmental Management Plan that will be implemented prior to construction taking place.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Report</p>
219a	219a.0002	Private	Land Resources		Concern that cuttings and excavation will create an environment for the natural germination and dispersal of weeds. 219a	219a.0003	Private	Land Resources		Rehabilitation and landscape management measures should be included in the EIS	Nil.	A Rehabilitation and Landscaping Management Plan will be developed for the Project. It will establish location-specific objectives, timeframes and responsibilities for rehabilitation, reinstatement and/or stabilisation works. ARTC has also included additional rehabilitation and landscape management and mitigation measures in revised draft EIS Chapter 24: Draft Outline Environmental Management Plan, Section 24.2 and 24.9.	Chapter 24: Draft Outline Environmental Management Plan.
219a	219a.0004	Private	Land Resources		<p>ARTC has not recognised rogue grasses as weeds of concern and have not mentioned how these weeds will be controlled and what the contingent plans will be in the result of initial failure to control them.</p> <ul style="list-style-type: none"> Rogue grasses spread by wind-borne seeds are a serious threat to grazing and cultivation. It is difficult to control rogue grasses because there are no selective grass herbicides that will destroy rogue grasses without also destroying desirable grasses which need to be preserved for stock feed or erosion control. The EIS does not specifically identify who will do what in the Biosecurity Management sub-plan. 	ARTC needs to have definite programmes in place before construction and these specific plans must be detailed - not vague indications of what they intend to do. The EIS should not be considered complete until commitments are defined accurately and include contingency action as well.	<p>ARTC acknowledges the concerns from landowners about the potential spread of weeds during the construction stage of the Project. The revised draft EIS has been updated to provide additional information on the management and mitigation measures that will be implemented to avoid and minimise the spread of weeds during construction.</p> <p>The results and mitigation measures sections of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report outline the weeds identified in the Project footprint during surveying efforts, and how the dispersal of weeds will be manages and mitigated during each stage of the Project including the development of a Biosecurity Management Plan as part of the Construction Environmental Management Plan that will be implemented prior to construction taking place.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Report</p>
219b	219b.0001	Private	General Project opinion - negative		<p>The building and operation of this high speed, interstate railway</p> <ul style="list-style-type: none"> with daily train movements predicted to be 19 daily in 2026 and 24 daily by 2040 will have an unprecedented and profound impact on the residents of this town! 	Nil.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.8 of the Project Rationale (Chapter 2), the alignment around the Pittsworth area was selected for a number of reasons including after extensive investigations. These reasons include that investigations show the location as having both improved technical viability and construction feasibility as well as there being fewer impacts to community, stakeholder, and properties. This resulted in the Pittsworth area being selected for the alignment. Through the environmental impact process, impacts have been avoided wherever possible, reduced, mitigated and managed to the greatest extent possible. ARTC remain committed to continuing to work with the directly impacted landowners as well as the local Pittsworth community to develop solutions that minimises or mitigates impacts of the Project wherever possible.</p>	Chapter 2: Project Rationale Section 2.8
219b	219b.0002	Private	Noise and Vibration	construction groundborne noise	The submitter raised concerns that the three laydown areas within 2 km of Pittsworth will have impacts on social receptors, about the need for additional fill to be trucked in and that people of Pittsworth are 'just going to have to put up with the noise'.	The only mitigation measure that is possible during construction is restriction of working hours.	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during the construction works stage of the Project. The revised draft EIS has been updated to address potential impacts from construction noise and vibration to sensitive receptors along the Project alignment. Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration (Chapter 16: Noise and Vibration, Section 16.6, and Appendix V: Noise and Vibration Assessment - constructions and Road Traffic, Section 6.1). Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10, and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Section 6.2. The development and implementation of such measures will be subject to further review and assessment by the construction contractor. The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area. The majority of the construction works for the Project will be undertaken during the day as defined in the Project's primary hours of construction and depending on the nature of the works, some activities may need to be undertaken outside of the primary construction hours (refer to Chapter 5: Project Description, Section 5.8.2). Where works are required outside of primary construction hours, for example night works and delivery of materials, these works shall be subject to careful planning and appropriate controls shall be in place, particularly to mitigate impacts associated with noise and vibration. The planning process would include consultation with the local community and stakeholders to inform of the proposed works, any anticipated impacts and the measures implemented to control possible impacts.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 5: Project Description Section 5.6.2 Chapter 16: Noise and Vibration Section 16.6 Section 16.10 Appendix V: Noise and Vibration Assessment - constructions and Road Traffic Section 6 Section 7</p>
219b	219b.0003	Private	Noise and Vibration	operational rail noise	The submitter raised concern that the elevation of the rail will expose the town to increasing levels of noise and that the route selection has not met the design criteria of co-locating the route with transport corridors or avoiding steep terrain and topographical constraints and has not resulted in tangible measures for noise reduction other than noise barriers.	Nil.	<p>The preferred location for the proposed rail corridor (as presented in the draft revised EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project.</p> <p>The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration. The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
219b	219b.0004	Private	Noise and Vibration	operational rail noise	The submitter raised concern that the gradient exceeds the maximum grade standards of 1:100 west of Pittsworth and that this will increase noise levels as trains will need to run at full throttle past Pittsworth to get up the slope.	Nil.	<p>Since the reference design was developed, the rail vertical alignment has been reviewed to utilise more 1:80 grades as part of a value engineering exercise to improve Project outcomes such as road/ rail interfaces and earthworks volumes. Although 1:50 grades for mountainous terrain was referenced in EIS documentation, these are not preferred by Inland Rail and may only be considered under extraordinary circumstances and subject to ARTC engineering review and approval. Chapter 5: Project Description, Section 5.3.3 provides a summary of changes to the reference design since the draft EIS and the basis of design.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project.</p> <p>The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration. The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 5: Project Description Section 5.3.3 Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
219b	219b.0005	Private	Noise and Vibration	operational rail noise	The submitter raised concerns that not all receptors are mapped and that five dwellings near the Gore Highway haven't been considered for noise barriers even though they meet the criteria. (See submission 219b, p3 for more information)	Nil.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial phase of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>The revised draft EIS Chapter 16: Noise and Vibration, Section 16.10, and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17, discuss that the Interim Guideline advises that mitigation measures to control railway noise and vibration should be considered on rail corridor land, commercial corridor land, or future railway land. Consistent with this approach, ARTC shall primarily seek to control noise and vibration at source and through measures implemented within railway lands, for example railway noise barriers.</p> <p>Noise barriers are generally only considered where groups of triggered receptors are apparent. A review of noise barrier options for the Project is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. For isolated receptors, such as single dwellings in rural areas, noise barriers would generally not be considered as the required extent of noise barrier structures would not be reasonable or practicable for single receptors. For three or more receptors on the same side of the track, noise barriers will be considered as a primary noise mitigation option. ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17 Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
219b	219b.0006	Private	Noise and Vibration	operational rail noise	The submitter raised concerns that proposed noise barriers may be ineffective and that investigations into the provision and erection of noise barriers is yet to be undertaken.	The EIS should contain design drawings for noise barriers and ARTC should be instructed to properly research this overwhelming aspect of social discomfort and distress' before construction commences.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. These measures include noise barriers and at-property upgrades to existing residences. A review of noise barrier options for the Project is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4.22, has been updated to include an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4.22</p> <p>Appendix K: Landscape and Visual Impact Assessment Section 11.2</p> <p>Table 95</p> <p>Chapter 16: Noise and Vibration Section 16.8 Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 10 Section 17 Section 17.4</p>
219b	219b.0007	Private	Landscape and Visual Amenity		The EIS doesn't contain a viewpoint for the north/ northeast of the town and doesn't capture the vegetation and profile of McEwan National Park.	Nil.	<p>Viewpoints 17 (now Viewpoint 22) were selected on the basis of field work investigations and community feedback received regarding potential impacts on Pittsworth.</p> <p>The McEwan Area is a State Forest (i.e. it is not National Park) and does not appear to be promoted for recreation.</p> <p>During initial field work investigations, no views were obtained from the Assembly of God as it is a private landowner. Nearby views from public locations were not included due to the comparatively low number of receptors compared to other parts of Pittsworth. To address community concerns, an additional site visit was undertaken in October 2021 to assess the potential impact of views from the northern and northern eastern parts of Pittsworth and a view was obtained near the Assembly of God church to address the submitter's concern. As a result, an additional viewpoint assessment (Viewpoint 24) has been included within Appendix K: Landscape and Visual Impact Assessment Section 8.2.24 and Section 9.1.24. Another new view and visualisation in the Pittsworth area (Viewpoint 23) has also been included to assess impacts.</p>	<p>Appendix K: Landscape and Visual Impact Assessment Section 8.2.24 Section 9.1.24</p>
219b	219b.0008	Private	Landscape and Visual Amenity		<p>The submitter raised concerns that the EIS doesn't meet the objectives of the land Section of the TOR: Development should be designed and operated to:</p> <p>(a) improve environmental outcomes (b) contribute to community wellbeing (c) contribute to social, economic and environmental sustainability (d) mitigate impacts to the natural landscape and visual amenity.</p>	Nil.	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts.</p> <p>How the ToR have been addressed is outlined in Appendix A2: Terms of Reference Cross Reference Table.</p> <p>The revised draft EIS Appendix X: Social Impact Assessment includes a description of the Project's community benefits, and revised draft EIS Appendix Y: Economic impact assessment describes the economic benefits.</p> <p>Appendix X: Social Impact Assessment Technical Report (Section 7.4.9, 8.4.5 and 8.5.3) also describes potential Project legacies which will leave lasting benefits for local communities. In addition ARTC has committed to the development of a Community Wellbeing Plan that will facilitate community Projects supporting community wellbeing.</p>	<p>Appendix A2: Terms of Reference Cross Reference Table</p> <p>Appendix K: Landscape and Visual Impact Assessment Section 4.0</p> <p>Appendix X: Social Impact Assessment Section 7.4.9 Section 8.4.5 Section 8.5.3</p>
219b	219b.0009	Private	Landscape and Visual Amenity		The submitter raised concerns that the future views don't consider the noise barriers.	Nil.	<p>An additional site visit was undertaken in October 2021 to assess the potential impact of views from the GrainCorp silo artwork viewing area. As a result, an additional viewpoint assessment (Viewpoint 4) has been included within Appendix K: Landscape and Visual Impact Assessment Section 8.2.4 and Section 9.1.4. This viewpoint assessment includes a visualisation showing the potential impact of noise walls and other Project infrastructure in this location.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 3, Viewpoint 15 (now 20) and Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>In addition, artist's impressions showing the potential for mitigation measures in these locations to reduce the visual impact/ improve visual amenity have been prepared, noting that these are indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and relevant Regional Council.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Appendix K: Landscape and Visual Impact Assessment Section 8.2.4 Section 9.1.4</p>
219b	219b.0010	Private	Stakeholder Engagement		<p>People living in Pittsworth had no say in the decision for Inland Rail to be routed past their town and have no support from their elected representatives in Federal, State or local government. Appeals last year at a CCC meeting at Biddeston for the Toowoomba Regional Council to convene a community meeting at Pittsworth, were vehemently refused. The reason given was that it wasn't a local council issue. This attitude of indifference by elected representatives and the failing of ARTC to properly communicate - not just engage - with local residents has left an abiding feeling of hopelessness, abandonment and anxiety among them.</p>	<p>This route is entirely unsuitable and the alignment should be honestly and professionally reviewed.</p>	<p>During preparation of the Project reference design and EIS, it was not within ARTC's scope to investigate alternative routes outside the study area that was set by the Australian Government following its review of the four alternative routes in the Yelarbon to Gowrie Corridor Options Report (DIRD, 2016). Appendix E: Consultation Report, Section 3 outlines the early engagement undertaken to determine the railway corridor. This can be found in the Yelarbon to Gowrie Corridor Options Report, available on the ARTC website.</p> <p>At the request of the Deputy Prime Minister, in 2020, ARTC prepared the Inland Rail Information Paper, which considered alternative Project alignments via Whetstone State Forest and Cecil Plains. It was concluded that the alternative alignment would result in a longer distance and transit time, increased costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The methodologies employed in the Information Paper were reviewed by GTA Consultants and were found to be suitable. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details.</p>	<p>Appendix E: Consultation Report Section 3</p>
219b	219b.0011	Private	Social Impact Assessment		The submitter raised concerns about impacts of the Project on amenity, property values, the social fabric of the town and liveability: "Many of the potentially impacted residents are retirees who have chosen the tranquility and friendliness of Pittsworth to live in harmony, dignity and happiness. Many more are families with young children seeking a healthy, safe and pleasant town to live, work and play. The building of this railway will mean that the value and saleability of their homes will suffer - as well as their lifestyle and health. "	<p>This route is entirely unsuitable and the alignment should be honestly and professionally reviewed.</p>	<p>The Terms of Reference for the EIS requires the selected alignment be assessed.</p> <p>In locating the rail line to the north of Pittsworth rather than following the existing rail line, the Project sought to minimise impacts on Pittsworth and its residents. The Project alignment diverts from the existing rail line to avoid the township of Southbrook.</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 7.1.9 notes that property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. Current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres.</p> <p>The Project has committed to a wide range of environmental mitigation and management measures to minimise noise impacts, impacts on scenic amenity and changes to connectivity which could otherwise affect property values.</p>	<p>Appendix X: Social Impact Assessment Section 7.1.9</p>
219b	219b.0012	Private	General Project opinion - negative		The submitter raised concerns that the noise and visual amenity impacts of the railway will be unmitigable and that there is nothing that the people of Pittsworth can do about it, noting that "This situation is really not a fair go!"	<p>This route is entirely unsuitable and the alignment should be honestly and professionally reviewed.</p>	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.8 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected for a number of reasons including after extensive investigations. These reasons include that investigations show the location as having both improved technical viability and construction feasibility as well as there being fewer impacts to community, stakeholder, and properties. This resulted in the Pittsworth area being selected for the alignment. Through the environmental impact process, impacts have been avoided wherever possible, reduced, mitigated and managed to the greatest extent possible.</p> <p>ARTC remain committed to continuing to work with the directly impacted landowners as well as the local Pittsworth community to develop solutions that minimises or mitigates impacts of the Project wherever possible.</p>	<p>Chapter 2: Project Rationale Section 2.8</p>
219c	219c.0001	Private	MNES	Koala	The submitter raised concerns that Koalas are listed as having a vulnerable classification despite conservation groups calling fro the species to be listed as endangered.	Nil.	<p>On the 12 February 2022, the Department of Agriculture, Water and the Environment (now the Department of Climate Change, the Environment, Energy and Water), changed the listing status for Koala (combined population of QLD, NSW and ACT) under the <i>Environment Protection and Biodiversity Conservation Act 1999</i> (EPBC Act) from 'vulnerable' to 'endangered'. The Border to Gowrie Project was determined to be a controlled action prior to 12 February 2022. In accordance with Section 158A of the EPBC Act 1999, the Koala will continue to be assessed under its previous vulnerable listing status in the revised draft EIS.</p> <p>The revised draft EIS has been updated to note in Chapter 11: Flora and Fauna that the Koala has moved from Vulnerable to Endangered on 12 February 2022 advice.</p>	<p>Chapter 11: Flora and Fauna</p>
219c	219c.0002	Private	MNES	Koala	The submitter raised concerns that the EIS only identifies Koalas at Pittsworth and Southbrook, however studies and scat collection over the last decade by Pittsworth Landcare and by concerned conservationists have observed Koalas/ Koala scats along the whole of alignment from Millmerran to Gowrie. Data has been downloaded onto Wildnet with GPS authentication. See submission for maps sourced from Landcare	Nil.	<p>Appendix O: Matters of National Environmental Significance Report of the revised draft EIS, outlines the assessment undertaken to determine the degree of significance of impacts on Koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. Surveys were informed by observations and other site-specific information provided in submissions and from consultation undertaken with community groups. The results of field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed in consultation with various agencies, community groups and academic groups, and with reference to written submissions received on the draft EIS as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p>	<p>Appendix E: Consultation Report Section 4.2 Section 5 Section 5.11</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix O: Matters of National Environmental Significance</p> <p>Appendix P: Fauna Connectivity Strategy</p>
219c	219c.0003	Private	MNES	Koala	The submitter raised concerns that the undulating timbered upland Downs country that Inland Rail will be constructed through has been proven to support a vibrant population of inner Downs Koalas and there is still sufficient and connected remnant vegetation to support them and that 'construction of this line will create an unprecedented, formidable obstruction which will prevent the free movement of Koalas from one side of the rail line to the other and the necessary clearing of natural vegetation from Yarranlea eastwards will permanently destroy significant remnant habitat, some of which is zoned.	Nil.	<p>The Project footprint has been subject to historical disturbance and clearing, with one third of the alignment length located within brownfield (areas already subject to previous transport infrastructure development). The remaining greenfield portions of the Project area extend largely through areas subject to agricultural land uses.</p> <p>As outlined in Chapter 11: Flora and Fauna, the impact assessment considered the maximum potential area of disturbance and implemented a conservative approach to guide mitigation strategies. Mitigation measures have been developed and outlined in Chapter 11: Flora and Fauna. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as Koala. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design stage and in the Wildlife Connectivity Plan that will be prepared. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7</p> <p>Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
219c	219c.0004	Private	MNES	Koala	The submitter raised concerns about noise impacts on Koalas and identified sections of the EIS where ARTC has noted both potential noise impacts and difficulties for Koalas to relocate. Submitter is concerned that ARTC has recognised the impact of construction noise on Koalas but has no policy to address the issue.	Nil.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan (DKMP), Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. These plans and strategy propose specific management and mitigation measures to minimise impacts to Koalas associated with construction activities, including noise impacts.</p> <p>Noise impacts to listed threatened species that are associated with both construction and railway operations have been assessed in the revised draft EIS. Refer to EIS Chapter 11: Flora and Fauna. Specific management and mitigation measures for Koalas during both construction and railway operations have been proposed for Koalas in the DKMP and in Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
219c	219c.0005	Private	MNES	Koala	The submitter raised concerns about impacts of blasting on Koalas, noting that blasting locations included areas of igh-density Koala population and concernthat loud noises from blasting would startle Koalas and cause them to panic and flee	The EIS should include detailed noise and vibration sub-plans as a component of the construction Environmental Management Plan including specific measures undertaken to mitigation noise and shock waves of blasting activities on Koalas	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix M: Draft Koala Management Plan (DKMP) to support the revised draft EIS. The DKMP will be standalone appendix for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. This plan, as well as Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report, proposes specific management and mitigation measures to minimise impacts to Koalas associated with construction activities, including noise impacts.</p> <p>As part of the revised draft EIS, ARTC has undertaken extensive noise and vibration modelling for the construction works stage of the Project, including blasting activities. The modelling was done in accordance with the relevant Department of Transport and Main Roads Code of Practice. The modelled outputs, proposed management and mitigation measures has been presented in Chapter 16: Noise and Vibration and In Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Noise impacts to listed threatened species that are associated with both construction and railway operations have been assessed in the revised draft EIS. Refer to EIS Chapter 11: Flora and Fauna. Specific management and mitigation measures for Koalas during both construction and railway operations have been proposed for Koalas in the DKMP and in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>As part of the detailed design stage, and in order to obtain secondary approvals, detailed environmental management plans and species management plans will be prepared by ARTC. These plans will stipulate management measures/ requirements/ procedures that will reduce the risk of injury to native species, including the Koala.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix O: Matters of National Environmental Significance Report</p>
219c	219c.0006	Private	MNES	Terrestrial fauna	Submitter raised concerns about potential entrapment of the Koala and Plains Earless Dragon in trenches and open pits.	The EIS should include plans for preventing mortality or injury from entrapment or accidents and contingency plans/ procedures for the rescue and treatment of injured Koalas	<p>Risk of entrapment of wildlife in trenches and open pits is minimised using standard construction techniques.</p> <p>Chapter 24: Draft Outline Environmental Management Plan contains all the fauna management and mitigations measures which as part of the detailed design stage, and in order to obtain secondary approvals, will be used to develop a detailed construction environmental management plans and species management plans. These plans will stipulate management measures/ requirements/ procedures that will reduce the risk of injury to native species, including the Koala and Condamine earless dragon.</p>	Chapter 24: Draft Outline Environmental Management Plan
219c	219c.0007	Private	MNES	Koala	Submitter raised concerns about the lack of information regarding the impacts of the construction of sediment basins on Koala habitat.	Submitter would like the EIS to include design specifications of sediment basins, the amount of clearing required, the reduction in Koala habitat, whether the sediment basins will be retained after construction or, if not, the rehabilitation plan for them and whether it would include planting of eucalypts for Koalas and contingency plans for any breaches	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of habitat critical to the survival of the species, as defined under the EPBC Act 1999. The most recent field data from the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and the University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works stage. Fauna crossing structures and fencing will be installed to maintain habitat connectivity and restrict access to the rail corridor. As outlined in Chapter 11: Flora and Fauna, these mitigation measures have been selected based on the best available information including government guidelines and similar Projects. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report.</p> <p>Detail on proposed sediment basin locations and sizing is included within Chapter 5: Project Description, Section 5.6.18, Table 5-33. Temporary site drainage and water-management controls will be installed in order to minimise the impacts of runoff and sedimentation from construction activities on adjacent receptors. Temporary site drainage and water runoff management will be in accordance with the International Erosion Control Association's Best Practice Erosion and Sediment Control document (International Erosion Control Association, 2008) and will:</p> <ul style="list-style-type: none"> Minimise runoff and sedimentation from Project activities to existing watercourses and drainage features Minimise disturbance to the water quality of existing watercourses and drainage features along the Project alignment. <p>The revised reference design includes 20 sediment basins, as identified in Appendix B1: Design Drawings. All of the proposed sediment basins are passive, which allows surface runoff from a catchment to flow into the sediment basin without the need for pumping. The placement and sizing of sediment basins for the Project have been established based on the landform, earthworks and 80th percentile 5-day storm event required to construct the revised reference design. Therefore, the placement and sizing of sediment basins will need to be reassessed and revised, as required, as part of the detailed design process. Sufficient allowance has been included in the Project footprint for sediment basins to be relocated and/or resized, as required, to support the detailed design.</p> <p>Sediment basins that are not required post construction works stage, will be rehabilitated. Rehabilitation and restoration works of temporary disturbance areas are outlined throughout Chapter 24: Draft Outline Environmental Management Plan. Revegetation within the gazetted rail corridor will consist of non-woody vegetation due to rail safety requirements for an operational rail line.</p>	<p>Chapter 5: Project Description Section 5.6.18</p> <p>Table 5-33</p> <p>Chapter 11: Flora and Fauna</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Section 24.9</p> <p>Appendix B1: Design Drawings</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix O: Matters of National Environmental Significance Report</p>
219c	219c.0008	Private	MNES	Koala	Submitter raised concerns about safety impacts of vehicle activity accessing five laydown areas in proximity to Koala habitat.	The EIS should include measures to manage potential impacts of vehicle activity near laydown areas	<p>Since the submission of the draft EIS, ARTC has developed Appendix M: Draft Koala Management Plan (DKMP) to support the revised draft EIS. The DKMP will be standalone appendix for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. This plan proposes specific management and mitigation measures to minimise impacts to Koalas associated with construction activities, including measures to minimise potential vehicle strikes to Koalas.</p> <p>Traffic Management Plans will also be implemented during construction, and will include mitigation measures such as driving to conditions, speed limits and dust management.</p> <p>As part of the detailed design stage, and in order to obtain secondary approvals, detailed environmental management plans and species management plans will be prepared. These plans will stipulate management measures/ requirements/ procedures that will reduce the risk of injury to native species, including the Koala. construction contractors will be trained in these plans, which will include a Traffic Management Plan. Should an incident occur with native wildlife, this is to be reported in line with reporting requirements and involve local wildlife carers as required.</p>	<p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5</p> <p>Section 5.1</p> <p>Appendix M: Draft Koala Management Plan</p>
219c	219c.0009	Private	MNES	Koala	<p>Submitter raised concerns that:</p> <ul style="list-style-type: none"> Inland Rail will dissect 8 and run adjacent to 5 areas of recognised importance for wildlife preservation between Yarranlea to south-west of Wellcamp airport. although Section 10.9.5 indicates that Inland Rail will intersect patchy, fragmented vegetation north of Pittsworth, the EIS fails to acknowledge the existence of continuous tracts of Koala habitat on both sides of the proposed route with the exception of short sections directly adjacent to Pittsworth and north of Southbrook building the Project through this area will create an unprecedented barrier to unrestricted movement of Koalas through their habitat and result in existing areas of habitat being isolated from one another and becoming unsuitable for future Koala colonisation the existing QR line has 25 slow moving trains annually and is built at ground level so presents no barrier for Koalas, however the Inland Rail design includes embankments and cuttings which will be impassable for Koalas and include 19 trains per day, including 8 night trains 	The EIS should include details of mitigation measures that will be implemented, as opposed to vague statements about what may be considered during detailed design.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used for the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report.</p> <p>Appendix P: Fauna Connectivity Strategy identify the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g. revegetation). These scenarios will be used to inform design workshops and community consultation at the detailed design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and TMR's Fauna Sensitive Transport Infrastructure Delivery manual (TMR, 2024). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the detailed design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised draft Appendix P: Fauna Connectivity Strategy.</p>	<p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5</p> <p>Section 5.11</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix O: Matters of National Environmental Significance Report</p> <p>Appendix P: Fauna Connectivity Strategy</p>
219c	219c.0010	Private	MNES	Koala	Submitter raised concerns about proposed mitigation measures including risks of Koalas climbing fauna fencing, not using fauna passages or attracting predators or high mortality rates from relocation.	The EIS should be altered to clearly demonstrate commitment to avoiding impacts to vulnerable species such as the Koala and protecting their habitat.	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used for the <i>Technical Ecological Assessment from Ausecology</i> (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
219c	219c.0011	Private	MNES	Koala	The range and numbers of Koalas in this region have been grossly underestimated by ARTC and their ecologists. Koala habitat exists but is under threat from Inland Rail. Koalas are a species of concern for groups such as Pittsworth Landcare who have been working with landholders to plant Koala friendly eucalypts and this environmental effort to support the future viability should not have been in vain.	The route of Inland Rail should be reconsidered.	<p>Appendix O: Matters of National Environmental Significance of the revised draft EIS, outlines the assessment undertaken to determine the degree of significance of impacts on Koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the <i>Significant Impact Guidelines 1.1 - Matters of National Environmental Significance</i>. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with Commonwealth legislative requirements.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify Koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the <i>Technical Ecological Assessment</i> from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>The preferred location for the proposed Border to Gowrie rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9 of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to Reference Design since draft EIS to reflect the alignment maturity.</p>	<p>Chapter 2: Project Rationale Section 2.8 Appendix B3: Changes to Reference Design since draft EIS Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix O: Matters of National Environmental Significance Appendix P: Fauna Connectivity Strategy</p>
220	220.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	People living in Pittsworth had no say in the decision for Inland Rail to be routed past their town and have no support from their elected representatives in Federal, State or local government. Appeals last year at a CCC meeting at Biddeston for the Toowoomba Regional Council to convene a community meeting at Pittsworth, were vehemently refused. The reason given was that it wasn't a local council issue. This attitude of indifference by elected representatives and the failing of ARTC to properly communicate - not just engage - with local residents has left an abiding feeling of hopelessness, abandonment and anxiety amongst them.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2 Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A</p>
220	220.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Section 17.6 Table 17-41 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
221	221.0001	Private	Noise and Vibration		The submitter is concerned about the noise from construction and operational use and maintenance which will create long-term hearing loss that cannot be reversed.	Relocate proposed track to another area where train bells horns and maintenance and possible disasters will effect less people and animals.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property and lifestyle during both construction works and operations stages. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment.</p> <p>The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration. The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Noise mitigation shall be provided by ARTC where the Department of Transport and Main Roads criteria are not met, including the potential for at-property treatments. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS (Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic and Section 16.10 of Chapter 16: Noise and Vibration). Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft revised EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
225	225.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.5 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2 Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
225	225.0006	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Old) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatment. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
225	225.0015	Private - Brookstead	Noise and Vibration	Mitigation measures	The submitter states that the proponent has not mentioned the impacts on the operation that noise and vibration will have on individual properties and the intensive animals (feedlots) that are located close to the proposed line. The submitter states that animals will become agitated with excessive noise and vibration and the health of the animals are being put at risk.	The submitter states that the proposed rail line should be moved further away from these intensive animal feedlots/piggeries.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019) (refer to Appendix W: Noise and Vibration Assessment - Railway Operations, Sections 7 to 10).</p> <p>Noise and vibration impacts to livestock are not assessable under the revised draft EIS terms of reference and relevant legislation. However, ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. The findings and recommendations of the assessment are discussed in Section 16.9 of Chapter 16: Noise and Vibration of the draft revised EIS.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.9</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 7</p> <p>Section 8</p> <p>Section 9</p> <p>Section 10</p>
225	225.0016	Private - Brookstead	Noise and Vibration	Mitigation measures	The submitter states that the assessment of sleep disturbance, will leave landholders with mental health issues.	The submitter states that the draft EIS needs to demonstrate the number of dwellings that will be affected and what mitigation is in place to address the issue	<p>ARTC acknowledges the concerns from the local community that noise and vibration has the potential to impact lifestyle and amenity during both construction and railway operations. During the community engagement process, noise, vibration, and visual amenity have been identified as potential negative impacts to the community along the Project alignment. Refer to Section 5.6 of Appendix E: Consultation Report.</p> <p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Section 16.8 of Chapter 16: Noise and Vibration). The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Noise mitigation shall be provided by ARTC where the Department of Transport and Main Roads criteria are not met, including the potential for at-property treatments (refer to Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>Sleep disturbance has been assessed based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>ARTC acknowledges that during the EIS stage may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well being, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
226	226.0002	Private	Noise and Vibration	Modelling	Section 7.3.1: Figure 8 does not clearly indicate the assumed notch setting values. Please add a second Y-axis for notch values to Figure 8.2. Section 7.3.1: Figure 8 does not appear to show any dynamic braking areas. Please confirm. 3. Section 7.3.1: The locomotive notch settings have been estimated for modelling purposes. This is of concern given the perceived impact of assumed notch settings have on predicted noise levels4. Section 7.3.4: The third dot point (pg. 50) states that no assumptions were made for freight wagon defects. As such, the modelling does not provide an indication of potential elevated noise levels from aging, poorly maintained rolling stock. 5. Section 7.3.4: The last dot point (pg. 50) states that the noise level modelling assumed a track running surface free of defects. Again, this assumption is not conservative given the likelihood of defects developing during operation.	Proposed solution for point 3 mentioned above It is suggested that possibility of verifying assumptions via simulation, or consultation with experienced train drivers be considered. Proposed solution for point 4 mentioned above It is suggested that the modelling be repeated with assumptions made for common rolling stock defects, to determine the sensitivity of predicted noise levels to rolling stock defects. Proposed solution for point 5 mentioned above It is suggested that the modelling be repeated with track surface defects applied, to determine the sensitivity of predicted noise levels to track defects.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>Details regarding the notch settings and modelling inputs are provided in the accompanying text in Chapter 16: Noise and Vibration, Section 16.4.6 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3.</p> <p>The noise source levels are based on measurements of existing locomotives undertaken at various gradients on existing sections of the ARTC network and therefore incorporate real-world notch settings into the source levels. Different drivers use different notch settings and accelerations, therefore estimating the notch setting ranges is a reasonable approach. Noise level predictions will be subjected to further detailed studies and verification of noise levels during initial operations.</p> <p>ARTC currently implements Wayside Noise Monitoring Systems across the rail network to identify individual rollingstock and the specific sources of noise for the targeted mitigation of railway noise. It is therefore expected that defective rollingstock can be readily identified and removed from service.</p> <p>Heavy haul railways like Inland Rail typically show relatively low levels of rail roughness: this is supported by the historical performance of other heavy haul railways as well as corrugation measurements taken on other sections of the ARTC network. There are also no tight radius curves on the alignment on which rail roughness may be more prone to development.</p> <p>Where rail roughness issues arise these can usually be treated with periodic maintenance procedures (e.g. rail grinding or rail milling). Where sections are particularly prone to corrugating, changes to the wheel rail interface such as changing the fastener stiffness, applying top of rail friction modifiers or adding rail dampers can also potentially address these issues.</p> <p>The track for Inland Rail will be continuously welded to eliminate noise from rail joints. It is expected other defects can be controlled with periodic maintenance.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.4.6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.3</p>
226	226.0003	Private	Noise and Vibration		Section 11.6: First dot point (pg. 123) indicates that noise due to bunching and stretching has been limited to trains decelerating into, and accelerating from crossing loops only. However, Figure 9, and Figure 10 in Section 7.3.2 (pg. 48-49), show changes in train speed near Pittsworth. It is therefore suspected that additional noise due to bunching, and stretching may also occur in the Section of track passing Pittsworth.	If this is a possibility, then the submitter thinks that the operational noise modelling should be repeated with appropriate assumptions made for bunching and stretching noise.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>Details regarding modelling inputs are provided in Appendix W: Noise and Vibration Assessment – Railway operations, Section 6.3.</p> <p>Stretching and bunching only occurs where trains reduce to, or increase from, very slow speeds. Where trains do not access crossing loops, speeds are not expected to reduce below 30 km/h. It is therefore not considered a realistic possibility that stretching and bunching would occur at locations outside of crossing loops. This is further discussed in Appendix W: Noise and Vibration Assessment – Railway operations, Section 6.3 and 12.4.</p>	<p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 6.3</p> <p>Section 12.4</p>
227	227.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. 227	227.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
229	229.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Sections 16.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5.1</p> <p>Section 5.2</p> <p>Appendix A</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p> <p>Appendix A</p>
229	229.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - constructions and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
23	23.0001	Private	Noise and Vibration	Mitigation measures	The operational rail noise for residents within 1 km of the rail alignment may have night-time noise exceeding 49 dB. Evidence from WHO says hypertension and myocardial infarction is more likely to occur at noises above 50 dB.	Residences within 1 km of the rail should have sound mitigation paid for by ARTC noise barriers, earth mounds, insulation, double glazed windows and air conditioners or any combination of these that will bring the night noise below a L_{Amax} of 49 prior to the tracks becoming operational.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 (enHEALTH 2018). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
230	230.0004	Private	Noise and Vibration		In Chapter 14, the EIS seems to focus on the short term impacts of construction noise and vibration and in the submitter's view inadequately addresses the issue of the long term noise impacts nor does it define actual mitigation measures to be adopted. This Chapter is quite technical and complex in terms of different dB(A) values, etc and makes no attempt to put the threshold or trigger noise levels into context and describe with some local context what the likely increases in noise levels actually mean in terms of residents and occupant perception of the noise increases and their peaceful enjoyment of their homes and indeed of their wellbeing.	Adopt lower trigger and threshold levels for action on noise and these should essentially be set at the existing noise levels so there is no noise impact on the community.	<p>ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project. The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
230	230.0005	Private	Noise and Vibration	Baseline/ background sampling	The trigger or threshold target levels of 60 dB(A) for 15 hours equivalent and 80 dB(A) max the submitter argues as being too high, particularly for a community that is used to much lower levels of noise and have been for some time and the quiet and tranquil nature of the region is why many of these residents have chosen to live here.	Nil.	<p>The railway noise assessment has been updated to adopt the assessment criteria from the Department of Transport and Main Roads Interim Guideline operational Railway Noise and Vibration (March 2019). The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance (Chapter 16: Noise and Vibration, Section 16.8). Noise mitigation shall be provided by ARTC where the Department of Transport and Main Roads criteria are not met, including the potential for at-property treatments.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.8</p>
230	230.0006	Private	Noise and Vibration		In terms of mitigation measures, the EIS does not define any committed actions and pushes them into the category of being worked out during detailed design and construction stage. For example, the draft EIS states that the noise walls will only be considered at Yelarbon, Brookstead and Pittsworth where mitigation can effectively control noise at groups of sensitive land uses and receptor building where noise level reductions are required at sensitive receptors. The submitter feels that if the proponent considers that noise walls are ineffective in controlling noise, then they won't be installed - leaving the community perspective out.	Nil.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive land uses and sensitive receptors along the Project alignment.</p> <p>construction noise mitigation measures have been recommended in the revised draft EIS in accordance with the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration. Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Road's Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>To illustrate how the proposed noise walls could look like, concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 20 (Near Brookstead State School) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2.20, has been updated to include an artist's impression showing the potential for mitigation measures in this location has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4 Chapter 16: Noise and Vibration Section 16.10 Appendix K: Landscape and Visual Impact Assessment Section 8.2.20 Section 11.2 Table 95 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
230	230.0007	Private	Noise and Vibration		At the Pittsworth site in particular the rail alignment is on a 14 m or so high embankment and crosses over a rail over road bridge and hence noise wall would not be effective in this situation. However, noise walls near properties will tend to block you in and diminish any outlook from the property and so the residents and community will lose amenity and part of the attraction of living in the town which is the open spaces and being able to be part of the overall landscape. So noise may be mitigated but another impact is imposed.	The provision of mitigation measures needs to be more appropriate and sensitive to the current lifestyle and social settings of the townships and individual dwellings impacted and not involve any compromise on the existing amenity enjoyed by the communities being impacted.	<p>The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline - operational Railway Noise and Vibration (March 2019), with results being presented in the revised draft EIS. Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations. The assessment of railway noise barrier mitigation has also been updated (refer to Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>In addition, ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Project LVIA Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4 and Appendix K: Landscape and Visual Impact Assessment, Section 11.2. It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and further liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. frangible vegetation zone requirements and sightlines) that cannot be resolved at this stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4 Appendix K: Landscape and Visual Impact Assessment Section 11.2 Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17 Section 17.4</p>
233	233.0012	State	Noise and Vibration	operational rail noise	<p>Inclusion of World Health Organisation (WHO), 2009, "Night Noise Guidelines for Europe" has no direct reference in the ToR or other TMR guidance/ policy, unlike the other Australian, British and German Standards that are either specifically listed in the ToR and/or cross-referenced in the TMR's Code of Practices/ Interim Guidelines.</p> <p>Inclusion of the WHO Guideline's reference also appears inconsistent with the intent of Clause 11.124 in the ToR. Only reference to the WHO 2009 guideline is in the DES Noise Measurement Manual. However, this Manual outlines noise from ordinary use/ operations of rail transport infrastructure is not within scope of the manual's application being an activity listed in Schedule 1 of EP Act.</p> <p>The inclusion of this reference is not expanded upon and creates confusion, including with expectation for mitigation.</p>	Clarify the relevance of WHO 2009 Night Noise Guidelines for Europe to the Project, and whether or not it will not be used criteria to comply with. If not, provide context to its inclusion.	<p>Whilst guidance from the World Health Organisation can, in some circumstances, provide supporting advice on aspects such as sleeping disturbance, ARTC has elected to no longer reference the World Health Organisation guideline noise levels in the revised draft EIS.</p> <p>This decision was based on the noise and vibration assessments for the revised draft EIS now adopting relevant noise and vibration criteria from DTMR's Transport Noise Management Code of Practice Volumes 1 and 2 and the Interim Guideline The submissions to the draft EIS also highlighted the application of supplemental guideline noise levels was potentially confusing to stakeholders and the community, leading at times to a misinterpretation of the assessment and its findings.</p> <p>References to the World Health Organisation guidelines have been removed from Appendix W: Noise and Vibration Assessment - Railway Operations. Refer to Section 3 Appendix W: Noise and Vibration Assessment - Railway Operations that provides guidance on the relevant application of legislation, standards and Guidelines for operational rail noise in Queensland. Section 11 provides further discussion on the assessment of sleep disturbance impacts.</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense .</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3 Section 11 Section 17.4</p>
233	233.0013	State	Noise and Vibration	operational rail noise	<p>Audible safety warning devices (both crossing alarm bells and train horns) used at active level crossings has been included in the scope of modelling predicted levels.</p> <p>This inclusion of train horns specifically is not consistent with Section 2.2.1 (operational Airborne Noise Criteria) of TMR's Interim Guideline for operational Noise and Vibration (GSTI) and therefore, not consistent with Clause 11.121 (f) of the ToR.</p>	Due to public safety obligations, exclude train horns and crossing alarm bells from the scope of modelling inputs to operational predicted noise levels.	<p>The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The revised draft EIS Appendix W- Noise and Vibration Assessment - Railway Operations states that in level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3).</p> <p>Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 6.3</p>
233	233.0014	State	Noise and Vibration	operational rail noise	<p>No clarity or mention to the WHO 2009 Night Noise Guideline's recommended level with respect to whether or not it also defines Assessment Criteria and/or "best practice environmental management" as part of ARTC's rail noise management strategy.</p> <p>This is important for ToR compliance with both "Impact Assessment" and "Mitigation Measures" (Clause 11.124) perspectives. QR has an interest noting the proposed mitigation measures at both Yelarbon and Brookstead being in the form of noise barriers that may be constructed near, beside or on the existing rail corridor (see Figures 24 and 25 of Appendix T – SLR operational Noise and Vibration Report).</p>	<p>Describe whether ARTC rail noise management strategy includes the WHO (2009) Night Noise Guidelines' Recommended Level of 42 dB(A) Internal $L_{A_{max}}$ level as either or both an Assessment Criteria and Best Practice Environmental Management for designing/ implementing mitigation measures.</p>	<p>Whilst guidance from the World Health Organisation can, in some circumstances, provide supporting advice on aspects such as sleeping disturbance, ARTC has elected to no longer reference the World Health Organisation guideline noise levels in the revised draft EIS.</p> <p>This decision was based on the noise and vibration assessments for the revised draft EIS now adopting relevant noise and vibration criteria from DTMR's Transport Noise Management Code of Practice Volumes 1 and 2 and the Interim Guideline The submissions to the draft EIS also highlighted the application of supplemental guideline noise levels was potentially confusing to stakeholders and the community, leading at times to a misinterpretation of the assessment and its findings.</p> <p>References to the World Health Organisation guidelines have been removed from Appendix W: Noise and Vibration Assessment - Railway Operations. Refer to Section 3 Appendix W: Noise and Vibration Assessment - Railway Operations that provides guidance on the relevant application of legislation, standards and Guidelines for operational rail noise in Queensland. Section 11 provides further discussion on the assessment of sleep disturbance impacts.</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. 233	233.0015	State	Noise and Vibration	operational rail noise	There is limited discussion or summary details provided relative to the comparison against the WHO (Europe) 2009 night noise criteria. Hence, it is difficult to determine the effect on such exceedances and whether the WHO night noise will drive compliance and any Project mitigation works required under Clauses 11.125 to 11.126 of the ToR.	Provide more clarity on how the Assessment Criteria status of the WHO Night Noise Guideline's Recommended Level in ARTC overall operational noise management approach.	<p>Whilst guidance from the World Health Organisation can, in some circumstances, provide supporting advice on aspects such as sleeping disturbance, ARTC has elected to no longer reference the World Health Organisation guideline noise levels in the revised draft EIS.</p> <p>This decision was based on the noise and vibration assessments for the revised draft EIS now adopting relevant noise and vibration criteria from DTMR's Transport Noise Management Code of Practice Volumes 1 and 2 and the Interim Guideline The submissions to the draft EIS also highlighted the application of supplemental guideline noise levels was potentially confusing to stakeholders and the community, leading at times to a misinterpretation of the assessment and its findings.</p> <p>References to the World Health Organisation guidelines have been removed from Appendix W: Noise and Vibration Assessment - Railway Operations. Refer to Section 3 Appendix W: Noise and Vibration Assessment - Railway Operations that provides guidance on the relevant application of legislation, standards and Guidelines for operational rail noise in Queensland. Section 11 provides further discussion on the assessment of sleep disturbance impacts.</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 (enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3 Section 11 Section 16 Section 17.4
233	233.0016	State	Noise and Vibration	operational rail noise	Table 14.37 outlines design considerations with the objectives to remove the need for trains to sound horns with the use of wayside level crossing alarms. Although this is a good acoustic design objective, this needs to be placed in context of rail safety requirements of the Railway Manager(s) consistent with the corresponding Clause 11.143 of ToR that require the Project to ensure safety of people during operation stage. Interface risks with other Railway Managers does not appear to be adequately addressed. Clause 11.143 of the ToR acknowledges the proposed Project's co-location and potential interaction between Railway Managers with the Millmerran Branch and South Western Line.	Provide additional wording to highlight that the need to sound the horn will still be determined by rail safety accreditation and the applicable Safety Management System of the responsible Railway Manager.	Additional wording to be included in Chapter 16: Noise and Vibration (Table 16.37: Proposed Noise and Vibration Mitigation Measures) to highlight that the sounding of the train horn is currently a requirement of the network rules and any changes will subject to further review in line with relevant safety requirements.	Chapter 16: Noise and Vibration Section 16.10 Table 16-37
233	233.0024	State	Noise and Vibration	operational rail noise	<p>Audible safety warning devices (both crossing alarm bells and train horns) used at active level crossings has been included in the scope of modelling predicted levels.</p> <p>This inclusion of train horns specifically is not consistent with Section 2.2.1 (operational Airborne Noise Criteria) of TMR's Interim Guideline for operational Noise and Vibration (GSTI) and therefore, not consistent with Clause 11.121 (f) of the ToR.</p>	Due to public safety obligations, exclude train horns and crossing alarm bells from the scope of modelling inputs to operational predicted noise levels.	<p>The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019).</p> <p>The revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations states that in level crossings, noise associated with train horns and warning devices are excluded from the noise assessment under the Interim Guideline due to the safety obligations associated with such noise sources (Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.3).</p> <p>Whilst these sources are not assessed under the DTMR requirements, the noise levels from train horns and level crossings have been considered separately to quantify their effects and inform design development to minimise noise. The study assumed all active level crossings included noise sources during each train passby for the crossing alarm bells and approaching train horns. The passive level crossings only included the train horns as noise sources.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 6.3
233	233.0025	State	Noise and Vibration	operational rail noise	There is limited discussion or summary details provided relative to the comparison against the WHO (Europe) 2009 night noise criteria. Hence, it is difficult to determine the effect on such exceedances and whether the WHO night noise will drive compliance and any Project mitigation works required under Clauses 11.125 to 11.126 of the ToR.	Provide more clarity on how the Assessment Criteria status of the WHO Night Noise Guideline's Recommended Level in ARTC overall operational noise management approach both in terms of number of exceedances and triggers for noise mitigation.	<p>Whilst guidance from the World Health Organisation can, in some circumstances, provide supporting advice on aspects such as sleeping disturbance, ARTC has elected to no longer reference the World Health Organisation guideline noise levels in the revised draft EIS.</p> <p>This decision was based on the noise and vibration assessments for the revised draft EIS now adopting relevant noise and vibration criteria from DTMR's Transport Noise Management Code of Practice Volumes 1 and 2 and the Interim Guideline The submissions to the draft EIS also highlighted the application of supplemental guideline noise levels was potentially confusing to stakeholders and the community, leading at times to a misinterpretation of the assessment and its findings.</p> <p>References to the World Health Organisation guidelines have been removed from Appendix W: Noise and Vibration Assessment - Railway Operations. Refer to Section 3 Appendix W: Noise and Vibration Assessment - Railway Operations that provides guidance on the relevant application of legislation, standards and Guidelines for operational rail noise in Queensland. Section 11 provides further discussion on the assessment of sleep disturbance impacts.</p> <p>The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 (enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014.</p> <p>Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland.</p> <p>Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 3 Section 11 Section 17 Section 17.4
235	235.0002	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to day activities.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none">➤ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks.➤ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways.➤ Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning.➤ Confirm all relevant school bus services to enable consultation with the operators.➤ Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none">➤ Commence implementation of management measures relating to schools as agreed during the detailed design stage.➤ Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks.➤ Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Section 17.6 Table 17-41 Appendix E: Consultation Report Section 5.6 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
235	235.0004	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 16.5 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.5</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2</p> <p>Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A</p>
235	235.0004	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. 236	236.0006	Private	Noise and Vibration	Cumulative impacts	The submitter outlines that his property is considered a sensitive receptor. With existing mine and power station in his area, he is concerned about the cumulative noise and vibration impacts of the rail Project. His home is also a business area for him which have not been considered for assessment by ARTC. In the past, the submitter has experienced blasts at mines which have been disruptive and destructive to his business.	<ol style="list-style-type: none"> 1. The impact to the submitter's business needs to be assessed as having cumulative impacts when rail noise is combined with those from the nearby mine and power station. 2. Reject EIS as it has failed to address these issues. 	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment.</p> <p>Under the DTMR Code of Practice Volume 2: construction Noise and Vibration, construction noise and vibration criteria for dwellings is the same as or more stringent than the criteria for commercial or retail areas. Considering this receptor as a residential dwelling therefore assesses construction noise and vibration impacts against the most stringent applicable criteria at the receptor. Considering this receptor as a commercial area would not result in the assessment of construction noise and vibration impacts at the receptor against more stringent criteria. Cumulative impacts from the Commodore Coal Mine, Millmerran Power Station, and the construction of the Project have been considered and such consideration is included in the revised draft EIS.</p> <p>Commercial and business areas are not considered sensitive receptors under the DTMR Noise Management Code of Practice Volume 1: Road Traffic Noise. A residential receptor type is the only appropriate type to consider this receptor for operational road traffic noise assessment. If the area was considered commercial, it would not be assessed for operational road traffic noise impacts.</p> <p>Commercial and business areas are not considered sensitive receptors under the DTMR operational Rail Interim Guideline. However, rail noise criteria for office areas are same as for residential properties.</p> <p>Cumulative noise impacts is addressed in Section 9 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic and Section 15 of Appendix W: Noise and Vibration Assessment - Railway Operations of the revised draft EIS and Section 16.12 of Chapter 16: Noise and Vibration. ARTC is not responsible for disturbance caused by other parties. Noise and vibration mitigation measures are discussed in Chapter 16: Noise and Vibration, Section 16.10</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10 Section 16.12</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 9</p> <p>Appendix W: Noise and Vibration Assessment - Railway operations Section 15</p>
237	237.0014	Private	Noise and Vibration	construction airborne noise	The EIS identifies sensitive receptors for Project operational activities (Appendix T operational Railway Noise and Vibration Technical Report) in accordance with Interim Guideline - operational Railway Noise and Vibration: Government Supported Transport Infrastructure (DTMR, 2019). The interim guideline defines 'accommodation activities' as a sensitive land use, which includes the activity of housing 'non-resident workforce accommodation'. The EIS does not identify any of the GrainCorp sites as non-resident workforce accommodation, despite the presence of night-time sleep accommodation areas and rest buildings offered by each, and none of the sites is considered for operational noise and vibration impact assessment. GrainCorp considers the process of identifying sensitive operational noise and vibration receptors to be erroneous.	GrainCorp requests the EIS undertake the operational noise and vibration impact assessment in consideration of actual land uses present at its grain handling facilities.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). ARTC has used the latest building data aerial imagery, and land use information to identify sensitive receptors within the EIS study area. The GrainCorp accommodation in Brookstead is represented by receptor 261493, as shown in Appendix W: Noise and Vibration Assessment - Railway Operations, Appendix A-Map 44A.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 16. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>With respect to construction noise, the GrainCorp accommodation in Brookstead is represented by the same receptor, 261493, as shown in Appendix C and Appendix D of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations. ARTC has undertaken engagement with businesses, including GrainCorp (Appendix E: Consultation Report)</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix E: Consultation Report Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Appendix C Appendix D Appendix W: Noise and Vibration Assessment - Railway Operations Section 16 Appendix A</p>
238	238.003	State Agency	Noise and Vibration		The department has significant concerns regarding the adequacy and results of the noise and vibration assessment, including the failure to adequately consider the impact of the development on sleep disturbance other than commit to appropriate attenuation treatments to mitigate acoustic impacts at properties along the alignment, with no specific details provided. The draft EIS states that at 130 sensitive receptors the noise prediction is exceeding the $L_{Aeq}(9\text{hour})$ night time noise criteria of 55 dBA by 1 to 12 dB (see Figure 12, Predicted night-time $L_{Aeq}(9\text{hour})$ rail noise levels (year 2026) & Figure 15, Predicted night-time $L_{Aeq}(9\text{hour})$ rail noise levels (year 2040)). For sensitive receptors requiring more than 10dB noise mitigation, the draft EIS should provide specific detailed information, rather than the high-level information provided.	The draft EIS should detail how the required noise attenuation at identified sensitive receptors identified in the draft EIS of more than 10dB above noise criteria will be, achieved, costed, and implemented. The draft EIS should clearly articulate the proposed mitigation strategy for all identified adversely impacted sensitive receptors (including for sensitive receptors identified as likely to experience night noise levels above 10dB). It should be expressed as a function of the attenuation required, given the large number of identified residences requiring noise mitigation. The plan should include details of the attenuation required at each sensitive receptor and how it will be achieved. Evidence that the proposed mitigation will work and are practical should also be provided. The strategy should describe the protocol that would be deployed for up from 5dB to 10dB and 10dB to 15dB noise mitigation at a residence. The draft EIS should identify how many sensitive receptors are predicted to have a noise exceedance from the noise criteria in these ranges. The draft EIS should report the outcomes of consultation with directly affected landowners, including the level of acceptance or otherwise by affected parties. The draft EIS should discuss any proposed plans if residents refuse to have mitigation work done on their homes. The draft EIS should discuss up to what value of noise mitigation work is consider cost-effective, rather than potential purchase of a residence. Options for dealing with the Projected excessive noise impacts, including purchasing of residences, should be fully described in the EIS. Clear commitments are needed for actions prior to and after approval (if granted) and particularly before construction and operation of the Project.	<p>The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations). Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. All permanent noise mitigation will be in place prior to the commencement of Inland Rail operations.</p> <p>Noise mitigation measures will be further investigated during the detailed design stage and installed prior to Inland Rail operations commencing, where it is deemed reasonable and practicable. Compliance noise and vibration monitoring will be undertaken within 6 months of Project opening to ensure that mitigation measures are adequate. If the results of monitoring indicate additional exceedances of the operational noise and vibration criteria, then additional reasonable and practicable mitigation will be implemented in consultation with affected property owners.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17</p>
240	240.0001	Private	Noise and Vibration	construction airborne noise	The submitter is concerned about noise from machinery and trains. Noise generated from these, will have an impact on our overall health and well-being. Noise will affect our hearing, based on your study we can expect the noise to increase substantially during construction and then continue further upon completion. Recently his area of residence has seen a rise in traffic levels, resulting in increase in noise level. Installation of a highway and double decker rail in front of our home will have a major impact on our whole household. Resulting in ongoing physical and Mental Health Issues, including insomnia.	<ol style="list-style-type: none"> 1. Double glazing of all house windows, soundproofing fence. 2. Moving existing house and outbuildings back on block 3-6 mtrs. 3. Re-establish tank and fit filter system to address dust and other airborne pollutants 4. Establishment of electric gates for easy access of front/ back entrances. 5. Establish soundproofing in the floor wall and roofing areas for effective protection to be implemented. 6. Implementation of permanent soundproof fencing/ barrier. 7. Arrange for another suitable home for us to move permanently. 	<p>The construction noise levels at this receptor are predicted to be above the standard hours upper limit, for most construction activities. Therefore mitigation measures will be adopted following community consultation prior to works commencing. It is noted that the predictions for the EIS are conservative unmitigated worst-case 15-minute construction noise levels based on a preliminary construction methodology (Section 6.1 of Appendix V: Noise and Vibration Assessment construction and Road Traffic). Reasonable and practicable measures to minimise construction noise impacts to below the standard hours lower noise limit will be nominated and implemented following a detailed assessment of construction noise impacts during the detailed design stage of the Project.</p> <p>Mitigation measures to be considered have been included in the EIS (Appendix V: Noise and Vibration - Construction and Road Traffic, Section 7 of Appendix V: Noise and Vibration Assessment- Construction and Road Traffic and Section 16.10 of Chapter 16: Noise and Vibration). This may include conducting works while the property is unoccupied, or offering periods of respite for this receptor to manage any residual impacts. It is noted that construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 6 Section 7</p>
240	240.0002	Private	Noise and Vibration	construction groundborne noise	The submitter is extremely concerned about the noise which will result from building the highway and railway outside their home. They are concerned that their house will not withstand the vibrations resulting from the construction stages of both the railway and highway. This will result in Mental Health Issues Anxiety, Insomnia.	<ol style="list-style-type: none"> 1. Move our home back on our block. 2. Establish new laundry and tank with water filtration system. 3. Implementation of permanent soundproof fencing/ barrier. 	<p>The operational road traffic noise assessment was undertaken in accordance with the Queensland Department of Transport and Main Roads (DTMR) Transport Noise Management Code of Practice Volume 1—Road Traffic Noise (CoP Vol 1) (refer to Section 8 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic). The 2038 road traffic noise levels (10 years after the Project commissioning) were predicted to exceed the 68 dB LA10(18h) noise limit at 8 Taloom Street (receptor ID 254562) by 2 dB. Road traffic noise mitigation for the Project is discussed in Section 8 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. It is noted that the property is in a non-access controlled road situation (the house only has access from Taloom Street), therefore noise treatments are not warranted according to CoP V1.</p>	<p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 8</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
240	240.0003	Private	Noise and Vibration	construction road traffic noise	The current noise and vibrations felt from heavy machinery are making it difficult for the submitter and family to hear when talking to people either in person or via phone calls in the front of home. The submitter already has hearing problems which will only be degraded further from ongoing highway noise invading their home. It is expected, based upon EIS results that this noise level will be accentuated with the construction and completion stages of the Highway and rail. With the proposed highway changes, the new highway will be immediately outside their home, considerably closer, therefore causing continual unacceptable noise. This noise is expected, to be more excessive than they are currently experiencing. This will aggravate hearing problems and mental health issue.	<ol style="list-style-type: none"> 1. Move the house back on the block. 2. Double Glazing and sound proofing the front fence as well. All recommended changes should be completed prior to works being undertaken. A suggestion was made to move the house backwards on their block to help reduce the noise. This could be an option to assist with noise reduction, along with the above suggestions. 3. Provision of suitable accommodation should be made during this house moving period. 4. Implementation of permanent soundproof fencing/ barrier. 5. Supply a new home or compensation to purchase a replacement home. 	<p>The construction vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction vibration impacts during the detailed design stage of the Project will be undertaken. Mitigation has been included in the revised draft EIS (Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p> <p>Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys to assess the structural integrity of buildings along the alignment in accordance with the assessment considerations outlined in Section 16.10 of Chapter 16: Noise and Vibration.</p> <p>Revised Operational noise and vibration modelling has been undertaken and results are presented in the revised draft EIS. Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix: W operational Railway Noise and Vibration Technical Report. The draft revised EIS further discusses a range of reasonable and practicable mitigation measures to reduce and control noise and vibration.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7</p> <p>Appendix W: Noise and Vibration Assessment - construction and Road Traffic Section 17</p>
240	240.0004	Private	Noise and Vibration		Vibration experienced during the construction stage of both the rail and road have potential to cause physical damage to the submitters' dwelling. Ground vibration may potentially undermine the load bearing walls and piers of their home. Paintings or pictures fall from walls and glass pictures have been broken. There is potential for noise to be experienced as intrusive on everyday life or disruptive to outdoor social activities.	Move and Restump their house before commencement of construction. Move associated outbuildings back on block to a reasonable sound/ noise level, re-site tank and setup with filter system to address airborne pollution from traffic and trains, establish double glazed windows to assist in reduction of noise, establish electric gates for both front and back entrance for resident safety, construct carport for back entrance.	<p>The construction vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction vibration impacts during the detailed design stage of the Project will be undertaken. Mitigation has been included in the revised draft EIS (Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p> <p>Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys to assess the structural integrity of buildings along the alignment in accordance with the assessment considerations outlined in Section 16.10 of Chapter 16: Noise and Vibration.</p> <p>Revised operational noise and vibration modelling has been undertaken and results are presented in the revised draft EIS. Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix: W operational Railway Noise and Vibration Technical Report. The draft revised EIS further discusses a range of reasonable and practicable mitigation measures to reduce and control noise and vibration.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7</p> <p>Appendix W: Noise and Vibration Assessment - construction and Road Traffic Section 17</p>
241	241.0003	Private	Noise and Vibration	construction airborne noise	The submitter is concerned about noise.	The submitter wants sound proof windows installed at his place.	<p>ARTC acknowledges the concerns from the local community that noise and vibration has the potential to impact lifestyle and amenity during both construction and railway operations. The revised draft EIS has identified the potential for sensitive receptors to be impacted from both construction and operational noise and vibration impacts in exceedance of the nominated DTMR noise criteria.</p> <p>The construction vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction vibration impacts during the detailed design stage of the Project will be undertaken. Mitigation has been included in the revised draft EIS (Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic).</p> <p>The railway noise assessment was undertaken in accordance with DTMR's Interim Guideline (2019) and has been updated to provide a revised impact assessment, including examples of at-property noise treatments and concept barrier design. The noise and vibration assessment information, including discussion on noise mitigation, can be found in Section 17 Appendix W: Noise and Vibration Assessment - Railway Operations and Section 16.10 of Chapter 16: Noise and Vibration of the revised draft EIS. The development and implementation of such measures will be subject to verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise Vibration Assessment - construction and Road Traffic Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
242	242.0002	Private - Brookstead	Noise and Vibration	construction airborne noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents during the construction stage, resulting in daytime disruptions and night-time sleep disturbance. Significant proportion of retirees on the north side of the town, their lifestyle and well-being will be totally disrupted, particularly during the construction stage. Families with young children living on the norther side of the town will also be impacted by the changed living conditions Reference is made to construction Noise 14.4.3. Residents would be unaware of the noise and vibration they will experience from blasting especially from the Broxburn site.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS as discussed in Section 16.10 of Chapter 16: Noise and Vibration. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>Blasting impacts have been assessed in accordance with CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2. These criteria are listed in Section 16.6 of Chapter 16: Noise and Vibration, Blasting Criteria.</p> <p>The following measures to mitigate blasting impacts are suggested where practicable as part of Section 16.10, Chapter 16: Noise and Vibration:</p> <ul style="list-style-type: none"> ➤ Reducing the charge size by use of delays and reduced charge masses ➤ Ensuring adequate blast confinement to minimise the amount of overpressure ➤ Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. ➤ Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors ➤ Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. ➤ Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC acknowledges that during the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and wellbeing, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Border to Gowrie Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale Section 2.8</p> <p>Chapter 16: Noise and Vibration Section 16.6 Section 16.10</p> <p>Chapter 17: Social Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
242	242.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Noise Barriers illustrated, lack detail and the maps used are old, detail is lacking in terms of the dimensions of the indicated barriers. The location of noise barriers shown on the two maps are open to question as far as possible effectiveness is concerned. Barriers illustrated in Option 2 would be totally inadequate.	draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design stage.	<p>ARTC acknowledges the concerns from the community that noise and vibration has the potential to impact lifestyle and amenity during railway operations. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the community along the Project alignment. Refer to Section 5.6 and 5.10 of Appendix E: Consultation Report. The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers (Section 16.10, Chapter 16: Noise and Vibration).</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>In addition, ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie LVIA Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2. The existing Viewpoint 2 (VP02) and associated visualisation in Yelarbon have now been updated to show and describe the potential impact of conceptual noise walls in this location. In addition, a new viewpoint (VP03) and visualisation has been prepared to discuss and represent potential impacts as viewed from the Yelarbon Silo Art viewing area (VP03 and VP04). It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. frangible vegetation zone requirements and sightlines) that cannot be resolved at this stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4</p> <p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix E: Consultation Report Section 5.6 Section 5.10</p> <p>Appendix K: Landscape and Visual Impact Assessment Section 8.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17.4</p>

248	248.0004	Private - Brookstead	Noise and Vibration		The submitter highlights that the location of the Brookstead Rural Fire Brigade shed is situated approximately 70 m from the proposed rail line and given it is the hub of the volunteer fire service amenities, the rail will detrimentally impact on these activities. Access to the shed will be restricted at certain times and noise and vibration will adversely impact, electronic training equipment as well as regular training and maintenance activities. Brookstead Rural Fire Brigade volunteers will be subjected to excessive noise and vibration as residences are in close proximity to the rail corridor, and the volunteer firefighters will be impacted in a detrimental way due to proximity to the rail line and adjacent level crossing.	The submitter states that the EIS document should be rejected by the Coordinator General until the community consultation process is completed full, with transparency and accountability, to ensure a fair process where community concerns are heard, acknowledged, considered and that the community is truly empowered in influencing the best possible outcome in their region, especially for essential Emergency Services where life-and-death responses are involved. The consultation in the Brookstead region needs to revisit decisions around rail and bridge design in the village of Brookstead, road access changes and the impact on residences, local businesses and local support groups, specifically the Brookstead Rural Fire Brigade Shed access and operation. The EIS document needs to be rejected in its current form, and completed to include all affected Emergency Services and local community groups as stakeholders in Table 2.2. The EIS document needs to be rejected in its current form, and completed to include all details around road and rail design, including level crossing, so that we can address impacts on emergency services within our local community, according to the Terms of Reference for the EIS. The submitter requests that the Coordinator-General ask ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landholders on the Condamine River floodplain. Specifically, we ask that ARTC expand the EIS and provide detail on Project footprint including areas to be acquired, final level crossing design, utilities, cross drainage configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation.	<p>ARTC acknowledges the concerns from the community that noise and vibration have the potential to impact lifestyle and amenity during both construction and railway operations. During the community engagement process, noise, vibration, and visual amenity have been identified as potential negative impacts to the community along the Project alignment (see the revised draft EIS Appendix E: Consultation Report). The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the Project alignment. The assessments have identified as the Brookstead Rural Fire Brigade as a sensitive receptor for noise and vibration, and applied noise criteria to assess potential impacts.</p> <p>The revised draft EIS Appendix E: Consultation Report, Section 5.6, states that engagement with all sensitive receptors will be undertaken as ongoing and transparent engagement will be critical to determining mitigation measures during the detailed design stage. The results of the revised draft EIS Appendix W: operational Railway Noise and Vibration Technical Report indicate where the predicted noise levels would exceed the noise assessment criteria requiring mitigation measures to be investigated. ARTC will engage with sensitive receptors based on the modelling results. Where modelling indicates a potential for construction and/or operational railway noise to affect the amenity of the community halls and churches, ARTC will continue to consult with the management committees/ trustees of churches and community halls, including the Brookstead Rural Fire Brigade (Appendix E: Consultation Report, Section 5.6).</p> <p>The railway noise assessment has been conducted in accordance with DTMR's Interim Guideline (2019), to provide a revised impact assessment, including examples of at-property noise treatments and noise barrier mitigation. The noise and vibration assessment information, including discussion on noise mitigation, can be found in Appendix W: Noise and Vibration Assessment - Railway Operations and Chapter 16: Noise and Vibration of the revised draft EIS. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 16: Noise and Vibration Appendix E: Consultation Report Section 5.6 Appendix W: Noise and Vibration Assessment - Railway Operations
251	251.0003	Private - Brookstead	Noise and Vibration	Modelling	Not all residences in the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook communities have been identified to lie within the area impacted by noise and vibration of the rail during both construction and operation, and there is a lack of clarity as to why some residences are included and others are omitted. There are apparent discrepancies in the classification of 'sensitive receptors' and notation of residences marked as sensitive receptors in Appendix T.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Project alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS Project alignment. The study area is substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in draft revised EIS in Section 17.4 in Chapter 16: Noise and Vibration and in Sections 5.1 and 5.2 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.5 of Chapter 16: Noise and Vibration and Section 5 and Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	Chapter 16: Noise and Vibration Section 17.4 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 5.1 Section 5.2 Appendix A Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Appendix A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
251	251.0005	Private - Brookstead	Noise and Vibration	Mitigation measures	No alternative solutions have been discussed with the Brookstead community for feasible alternative with less social impacts on the schools affected and their day-to-day activities. Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 and demonstrates that the detail around noise mitigation has not been developed. The lack of detail and Project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both construction works and operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the detailed design stage and verification of noise levels during initial operations.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced (Section 16 of Appendix W: Noise and Vibration Assessment - Railway Operations).</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g. façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g. off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree to the communication process between ARTC and school communities during the construction works stage. The construction contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the detailed design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g. dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Old) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the detailed design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report, Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
252	252.0006	Private - Brookstead	Noise and Vibration		The submitter states that the well-being of the native fauna common to this area will also be disturbed by the movement and noise of machinery during the construction stage of IR. The submitter states that the identified structures, will transform and possibly destroy a considerable part of the vegetation	The submitter highlights the concern of severe impact by the bank to be built by Inland Rail from Longhurst Lane to the overpass over the Yarranlea Road which is a huge structure that will split the habitat and potentially cause severe soil degradation to farms in this area. The submitter states that it will affect the movement of particularly the Koala, but also the other native species.	The noise and vibration codes of practice and standards do not provide meaningful criteria against which impacts to fauna can be assessed. A review of noise and vibration effects to native fauna has been undertaken by the terrestrial ecologists and is discussed in Section 5.2 of Appendix O: Matters of National Environmental Significance, Section 5.2 of Appendix L: Terrestrial and Aquatic Ecology Technical Report, and Section 16.8 of Chapter 16: Noise and Vibration. The review provided discussion on the characteristics of construction and operational noise and ground-borne vibration to describe how such emissions could impact native fauna. The assessment determined that, whilst noise and vibration can be a source of possible impact, the effects of any impacts were not significant.	<p>Chapter 16: Noise and Vibration</p> <p>Section</p> <p>Section 16.8</p> <p>Section 5.2 of Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix O: Matters of National Environmental Significance</p> <p>Section 5.2</p>
253	253.0002	Private - Brookstead	Noise and Vibration	construction airborne noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents during the construction stage, resulting in daytime disruptions and night-time sleep disturbance. Significant proportion of retirees on the north side of the town, their lifestyle and well-being will be totally disrupted, particularly during the construction stage. Families with young children living on the norther side of the town will also be impacted by the changed living conditions Reference is made to construction Noise 14.4.3. Residents would be unaware of the noise and vibration they will experience from blasting especially from the Broxburn site.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS as discussed in Section 16.10 of Chapter 16: Noise and Vibration. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>Blasting impacts have been assessed in accordance with CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2. These criteria are listed in Section 16.6 of Chapter 16: Noise and Vibration, Blasting Criteria.</p> <p>The following measures to mitigate blasting impacts are suggested where practicable as part of Section 16.10, Chapter 16: Noise and Vibration:</p> <ul style="list-style-type: none"> Reducing the charge size by use of delays and reduced charge masses Ensuring adequate blast confinement to minimise the amount of overpressure Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC acknowledges that the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes, including noise impacts. To minimise potential impacts to the community, in particular, community health and wellbeing, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details, see the Border to Gowrie Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.6</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
253	253.0003	Private - Brookstead	Noise and Vibration	Mitigation measures	Noise Barriers illustrated, lack detail and the maps used are old, detail is lacking in terms of the dimensions of the indicated barriers. The location of noise barriers shown on the two maps are open to question as far as possible effectiveness is concerned. Barriers illustrated in Option 2 would be totally inadequate.	Draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design stage.	<p>ARTC acknowledges the concerns from the community that noise and vibration has the potential to impact lifestyle and amenity during railway operations. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the community along the Project alignment. Refer to Section 5.6 and 5.10 of Appendix E: Consultation Report. The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers (Section 16.10, Chapter 16: Noise and Vibration).</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>In addition, ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie LVIA Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2. The existing Viewpoint 2 (VP02) and associated visualisation in Yelarbon have now been updated to show and describe the potential impact of conceptual noise walls in this location. In addition, a new viewpoint (VP03) and visualisation has been prepared to discuss and represent potential impacts as viewed from the Yelarbon Silo Art viewing area (VP03 and VP04). It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. frangible vegetation zone requirements and sightlines) that cannot be resolved at this stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix E: Consultation Report</p> <p>Section 5.10</p> <p>Section 5.6</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
255	255.0001	Private - Brookstead	Noise and Vibration	Mitigation measures	The proposed Inland Rail route is in close proximity to the submitters house and the submitter states that ARTC has not conferred with them regarding the magnitude of the noise that will be generated during the construction or operational stages. The submitter highlights that given the identified sources of noise, the stated 11 trains per day and 8 at night; they will experience considerable daytime disruption as well as sleep disturbance which will be exacerbated by the fact that the prevailing night-time winds are from the ESE. The submitter highlights as per Appendix ZZ pg. 62 that the location of the proposed Yarranlea over-pass adjacent to the Yarranlea Road, will create noise and movement during the construction stage. The submitter states that the proposed route situated to the south of the submitters home, will be up to 7.4 m in elevation and that trains will be required to ascend a considerable incline from the west of this location, for some 2 km to reach this point. Indications are that the noise levels will be in excess of acceptable levels and audible for some time. The route is uphill to a point east of the township of Pittsworth, therefore noise will be audible for some distance to the east of the submitters property.	It does not comply with the Terms of Reference set by the Coordinator-General on 16.11.18 The draft EIS is incomplete due to the omission of noise minimization and/or mitigation measures that will not be developed until the detailed design stage. Because of the incomplete nature of the draft EIS as indicated in Table 23.5, it is not feasible that the true noise and vibration impacts on isolated farmsteads and farm enterprises can be determined until all details of the Project footprint have been completed. ARTC has provided insufficient details to identify the true impact this Project will have on rural communities. A review of the entire alignment is necessary to consider a route that will cause less impact on one of the South East Queensland's most closely settled and productive rural areas.	The preferred location for the proposed rail corridor (as presented in the draft revised EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix C of the draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts). The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during both the construction works and operations stages of the Project. Construction noise impacts are assessed with respect to applicable and appropriate criteria, in accordance with relevant policies, guidelines and legislation. Construction noise impacts predicted to each sensitive receptor are based on adverse weather conditions, including the worst-case wind direction. The revised draft EIS has made preliminary but conservative predictions of potential construction noise impacts, recommended measures to mitigate construction noise impacts, and described the need for specific reasonable and practical mitigation measures to be nominated and implemented based on a detailed construction noise assessment. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration. The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17 Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 7
255	255.0002	Private - Brookstead	Noise and Vibration	Modelling	In the map of Yarranlea Receptors Appendix T. (map 32 Figure 17), the location of the submitters home is not identified. The properties sited and identified as receptors are not a true indication of those that will be impacted by noise. The ages of the maps used in this section fail to identify more recently build homes along the route.	It does not comply with the Terms of Reference set by the Coordinator-General on 16.11.8. The draft EIS is incomplete due to the omission of noise minimization and/or mitigation measures that will not be developed until the detailed design stage. Because of the incomplete nature of the draft EIS as indicated in Table 23.5, it is not feasible that the true noise and vibration impacts on isolated farmsteads and farm enterprises can be determined until all details of the Project footprint have been completed. ARTC has provided insufficient details to identify the true impact this Project will have on rural communities. A review of the entire alignment is necessary to consider a route that will cause less impact on one of the South East Queensland's most closely settled and productive rural areas.	The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. The assessment has also updated the Project's sensitive receptor set in accordance with the Interim Guideline, which identifies the receptors that can be potentially sensitive to noise and vibration from railway operations. The description of the various sensitive receptors referenced from the Interim Guideline are detailed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 5 and Appendix A. The sensitive receptors included in the assessment of railway noise and vibration are also detailed in this section. ARTC has used the latest building data, aerial imagery, and land use information to identify sensitive receptors within the EIS study area. ARTC acknowledges the concern from the community that some sensitive receptors were missed during the initial phase of the noise and vibration modelling. ARTC is now confident that all sensitive have now been identified for use in the revised draft EIS. The presence of submitter's address can be verified from the receptor set used in the report. If however, the address is outside the 2 km study area, this would not be covered by the assessment. Based on the submitter's provided address, it appears that this is outside the 2 km study area. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 16. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 5 Section 16 Appendix A
26	26.0007	Private	Noise and Vibration	Mitigation measures	ARTC has stated residences within 1 km of the Project will experience a night-time noise of above 49 dB.	Every residence within 1 km should have noise mitigation at property including noise barrier walls and earthworks. Also, ARTC should pay the decrease in property value as a result of noise, which can be calculated by an impartial valuer appointed by Toowoomba Regional Council.	The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations). The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014. Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dB Leq,night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq,night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland. Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 11 Section 17
3	3.0001	Private	Noise and Vibration	Directly impacted landowner	Concerned about the noise and ground vibration and the implications for their 120 year old Railway Station house (former Greenhill Station) which is located 75 m from Inland Rail line.	Property treatment (insulation) for noise mitigation.	The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations. Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. All permanent noise mitigation will be in place prior to the commencement of operations. The revised draft EIS Appendix W: Noise and Vibration Assessment - Railway Operations, Section 13 and Section 14 discusses that based on the proximity of the sensitive receptors to the rail corridor, the assessment has identified that the potential ground-borne vibration and ground-borne noise levels would comply with the Interim Guideline criteria at all sensitive receptors. Notwithstanding, if there are potential ground-borne noise impacts confirmed during detailed design, a range of vibration control measures, could be investigated to dampen the vibration energy at source and reduce the potential for vibration induced impacts at nearby sensitive receptors. Prior to construction commencing, the Principal Contractor, will undertake dilapidation surveys on selected properties along the Project alignment, to assess structural integrity of buildings and related infrastructure. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 13 Section 14 Section 17
32	32.0005	Private	Noise and Vibration	Local business and industry procurement	Concern about impacts to tourism at Yelarbon. Submission notes that Yelarbon have just won an award for their recently completed silo art Project and now the train will be travelling in front of it.	ARTC should need to take some financial responsibility for the loss in trade of tourism operators along the track. This could take the form of sound mitigation or grants to individual operators to diversify away from activities or to a group such as the Goondwindi Chamber of Commerce or Council. There is an opportunity to do some good and get some positive media by building a noise mitigation wall and painting it with a complimentary mural to the one on the silos.	ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie Landscape and Visual Amenity (LVIA) Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment Technical Report, Section 8.2. The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 3: Yelarbon rest area has been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design. An additional site visit was undertaken in October 2021 to assess the potential impact of views from the GrainCorp silo artwork viewing area (Viewpoint 4). As a result, an additional viewpoint assessment has been included within Appendix K: Landscape and Visual Assessment, Section 8.2.4 and Section 9.1.4. This viewpoint assessment includes a visualisation showing the potential impact of noise walls and other Project infrastructure in this location. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/ improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and Regional Councils to ensure compliance with detailed site constraints (e.g. fragile vegetation zone requirements and sightlines) that cannot be resolved at this stage. ARTC is investigating the design for the noise walls to determine whether satisfactory noise mitigation can be achieved without obscuring views to the silos. If views to the Yelarbon silos were affected by noise walls, ARTC would facilitate provision of mitigation measures, e.g. a complementary mural on the noise wall and/or roadside landscaping, in consultation with the Yelarbon community and Goondwindi Shire Council. Additional noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4 Chapter 16: Noise and Vibration Section 16.10 Appendix K: Landscape and Visual Impact Assessment Technical Report Section 8.2 Section 8.2.4 Section 9.1.4 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
34	34.0002	Private	Noise and Vibration	Mitigation measures	Concern as to why obligation under Mandatory Part 4.4 of the Queensland Development Code do not need to be met and that this is grossly inadequate and unfair given someone building a category 2 house in the vicinity of railway has to follow the same guidelines to mitigate noise. Submission notes that under the code, they would be classified as a category 2 property.	The ARTC should be held to the same standard as any developer wishing to build next to Railway Land and have to provide the upgrades necessary in the Mandatory Part (MP) 4.4 of the Queensland Development Code (QDC) to meet the required mitigation levels for the category. Submitters house fall under category 2 because of the maximum noise level of 78 and they should need to provide 30dB of mitigation in my habitable rooms or else buy the property at market value. Mitigations involve reducing the rail noise by 30 decibels in habitable rooms by a combination of sound absorbing materials on the roof (Concrete or terracotta tile or metal sheet roof with sarking, plasterboard ceiling at least 10 mm thick fixed to ceiling cavity, mineral insulation or glass wool insulation at least 50 mm thick with a density of at least 11 kg/ m3.), external walls (at least 100 mm of concrete of brick masonry), floors, entry doors (solid core with acoustically rated seals) and window glazing with 10 mm thick laminated glass with acoustically rated seals.	Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Noise mitigation shall be provided by ARTC where the Department of Transport and Main Roads criteria are not met, including the potential for at-property treatments. QDC MP4.4 does not apply to infrastructure providers such as Inland Rail. Comparison of the requirements of MP4.4 against the Project is inconsistent with the approach defined in the Interim Guideline to define potential impacts. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.	Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17
35	35.0001	Private	Noise and Vibration	Modelling	Concern about inconsistencies in noise modelling. It says in Section 1.2 that Border to Gowrie will ultimately be used to accommodate trains 3600 m long, but when modelling train noise (appendix T, Table 22), vibration (appendix T, Table 22), traffic impact (Appendix X Section 6.4.3.1) and Air Quality (Appendix O, Section 5.3.1.1 and Appendix O Table 2.4), all modelling has been conducted with trains a maximum of 1800 m long. This effectively invalidates 7 chapters and associated appendices of the draft EIS which may have underestimated social impacts by as much as 100%.	Withdraw the EIS until it is internally consistent. The Coordinator General should insist the entire draft EIS be reformulated and submitted with models based upon a 3600 m train, or else limit the track to 1800 m trains in Queensland in perpetuity.	The current design only allows for 1,800 m long trains to utilise Inland Rail, therefore the assessment only considers trains of 1,800 m length. This is further detailed in Chapter 5: Project Description, Section 5.4.1 and as it relates to the operational railway noise assessment in Appendix W: Noise and Vibration Assessment Railway operations, Section 1.	Chapter 5: Project Description Section 5.4.1 Appendix W: Noise and Vibration Assessment - Railway Operations Section 1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
45	45.0004	Private	Noise and Vibration	Baseline/background sampling	Trigger level set by ARTC for the noise is too high and not in line with local government recommendations or Queensland Development Code. Housing in this area was built for a non-urbanised level of background noise, and was not constructed with the knowledge it would be next to a railway corridor, therefore all noise is unmitigated. ARTC is only encouraged to mitigate noise if the maximum noise exceeds 85decibels. The disparity in these requirements is unjust. The Coordinator general should make approval conditional on the ARTC being held to the same standards in QLD Development Code MP4.4.	ARTC needs to take all possible measures to mitigate sound for affected dwellings, regardless of cost. Apply the criteria from the QDC for Building in Railway corridors and require ARTC to make the same upgrades to walls, roofs, windows, doors and floors as described in the code.	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. QDC MP4.4 does not apply to infrastructure providers such as Inland Rail. Comparison of the requirements of MP4.4 against the Project is inconsistent with the approach defined in the Interim Guideline to define potential impacts.</p> <p>The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6. The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Sections 7, 8 and 10.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations of the railway.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 7 Section 8 Section 6 Section 10 Section 17</p>
058a	58a.0008	Private - Brookstead	Noise and Vibration	operational rail noise	<p>The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents due to the on-going noise and vibration from the rolling stock combined with additional signals form alarm bells and train horns, resulting in daytime disruptions and nighttime sleep disturbance. The height of structures over the Oskey to Pittsworth Road and Lochabar Road will mean that operational Noise will be disturbingly audible to more residents than have been identified in the Noise Abatement Section of the EIS Appendix T 15.4.4.</p> <p>The 5 laybys of varying area to be located in close proximity to the township, will result in considerable machinery movements, another source of noise and dust and a potential impediment to the movement of local traffic.</p> <p>Vibration of a train of the length and tonnage has not been quantified.</p> <p>Vibration and noise that will affect the entire town population, during the driving of piles to the required depth.</p>	<p>Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.</p>	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Chapter 2: Project Rationale (Section 2.8), the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMR Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians; however, ARTC has assessed noise impacts from active level crossings and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns, refer to Section 16.10 within Chapter 16: Noise and Vibration, Railway Noise Assessment.</p> <p>Ground-borne vibration is assessed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 13. An assessment of ground-borne vibration was undertaken to identify where railway induced vibration and its effects may be a potential source of impact. The ground-borne vibration levels associated with train movements were assessed to achieve the relevant vibration criteria at all sensitive receptors. It is identified that any receivers within 12 m from the alignment has potential to exceed the human comfort criteria Further assessment of these impact is recommended during the detailed design stage to verify the screening assessment outcomes.</p> <p>ARTC acknowledges that during the EIS stage may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well-being, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Border to Gowrie Social Impact Management Plan within Section 17.6 of Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.8</p> <p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Chapter 17: Social Section 17.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan Section 24.9.9</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 13 Section 17</p>
058a	58a.0009	Private - Brookstead	Noise and Vibration	construction airborne noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents during the construction stage, resulting in daytime disruptions and night-time sleep disturbance. Significant proportion of retirees on the north side of the town, their lifestyle and well-being will be totally disrupted, particularly during the construction stage. Families with young children living on the northern side of the town will also be impacted by the changed living conditions Reference is made to construction Noise 14.4.3. Residents would be unaware of the noise and vibration they will experience from blasting especially from the Broxburn site.	<p>Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.</p>	<p>ARTC acknowledges the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the construction works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the detailed design stage of the Project. Mitigation has been included in the revised draft EIS as discussed in Section 16.10 of Chapter 16: Noise and Vibration. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project.</p> <p>Blasting impacts have been assessed in accordance with CoP Vol 2. Blasting criteria have been adopted from CoP Vol 2 and AS2187.2. These criteria are listed in Section 16.6 of Chapter 16: Noise and Vibration, Blasting Criteria.</p> <p>The following measures to mitigate blasting impacts are suggested where practicable as part of Section 16.10, Chapter 16: Noise and Vibration:</p> <ul style="list-style-type: none"> Reducing the charge size by use of delays and reduced charge masses Ensuring adequate blast confinement to minimise the amount of overpressure Avoiding secondary blasting where possible. The use of rock breakers or drop hammers may be an acceptable alternative. Avoiding blasting during heavy cloud cover or during strong winds blowing towards sensitive receptors Establishing a blasting timetable through community consultation, with blasts times negotiated with surrounding sensitive receptors. Residents, occupants and other stakeholders within 1 km radius of a blast location (or wider, if deemed appropriate by pre-blast assessment) will be notified a minimum of three calendar days in advance of a blast occurring. <p>ARTC acknowledges that the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes, including noise impacts. To minimise potential impacts to the community, in particular, community health and wellbeing, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details, see the Border to Gowrie Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.</p>	<p>Chapter 2: Project Rationale Section 2.8</p> <p>Chapter 16: Noise and Vibration Section 16.6 Section 16.10</p> <p>Chapter 17: Social Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
058a	58a.0010	Private - Brookstead	Noise and Vibration	Mitigation measures	Noise Barriers illustrated, lack detail and the maps used are old, detail is lacking in terms of the dimensions of the indicated barriers. The location of noise barriers shown on the two maps are open to question as far as possible effectiveness is concerned. Barriers illustrated in Option 2 would be totally inadequate.	Draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design stage.	<p>ARTC acknowledges the concerns from the community that noise and vibration has the potential to impact lifestyle and amenity during railway operations. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the community along the Project alignment. Refer to Section 5.6 and 5.10 of Appendix E: Consultation Report. The revised draft EIS has been updated to provide additional details on noise mitigation measures, including the proposed concept noise barriers (Section 16.10, Chapter 16: Noise and Vibration).</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction of the Project. This analysis will consider all design, engineering, environmental and social factors that determine the location, extent, and height of the noise barriers (or similar structures). In particular, the investigations will need to carefully consider aspects such as flooding and the management of surface water, wind loading, visual amenity and safety within and outside the railway corridor.</p> <p>In addition, ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie LVIA Study Area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2. The existing Viewpoint 2 (VP02) and associated visualisation in Yelarbon have now been updated to show and describe the potential impact of conceptual noise walls in this location. In addition, a new viewpoint (VP03) and visualisation has been prepared to discuss and represent potential impacts as viewed from the Yelarbon Silo Art viewing area (VP03 and VP04). It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. frangible vegetation zone requirements and sightlines) that cannot be resolved at this stage.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4</p> <p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix E: Consultation Report Section 5.6 Section 5.10</p> <p>Appendix K: Landscape and Visual Impact Assessment Section 8.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17.4</p>
058a	58a.0011	Private - Brookstead	Social Impact Assessment	Property Devaluation	<ul style="list-style-type: none"> Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. Families with young children living on the northern side of the town will be impacted by real estate devaluation. 	Review the entire alignment, this route is not suitable.	<p>The Terms of Reference for the revised draft EIS require that the selected alignment is assessed.</p> <p>The revised draft EIS is unable to provide advice on individual property values. Property owners' concerns about the potential for impacts on the value of their properties is acknowledged in Appendix X: Social Impact Assessment, Section 7.1.9. As noted, property values may be affected by a range of factors related or unrelated to the Project. Any Project impacts on property values would differ between properties with respect to e.g. Current land use, distance to the rail alignment, location in relation to any impacts experienced, and buyers' views on impacts such as noise, versus proximity to e.g. employment centres.</p>	<p>Appendix X: Social Impact Assessment Section 7.1.9</p>
058a	58a.0012	Private - Brookstead	Stakeholder engagement		ARTC has failed to engage with residents and inform them of the impacts of the train noise and vibration.	The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.	<p>ARTC has updated noise and vibration modelling during the development of the revised draft EIS. Details of the noise and vibration modelling can be found in Chapter 16: Noise and Vibration and Appendix V: Noise and Vibration Assessment – Construction and Road Traffic and Appendix W: Noise and Vibration Report - Railway operations.</p> <p>The updated noise and vibration assessments have been presented to the Inner Darling Downs Community Consultative Committee (IDCCCC) and Southern Darling Downs Community Consultative Committee (SDCCCC).</p> <p>ARTC has shared the results of the noise modelling and potential mitigation strategies with sensitive receivers, as outlined in Appendix E: Consultation Report, Section 5.6 and will continue to engage with these stakeholders. ARTC will consider noise walls or barriers and/or earth mounds at the rail corridor boundary at Yelarbon, Brookstead and Pittsworth, where it can be demonstrated that the mitigation can effectively control noise at groups of sensitive land uses and receptor buildings. Whether noise barriers would be a reasonable and practicable noise mitigation strategy will be determined by ARTC during detailed design.</p> <p>ARTC will continue to engage with the community about noise and vibration impact and mitigation measures throughout the detailed design, construction works and operations stages of the Project.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Appendix E: Consultation Report Section 5.6</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
005a	5a.0010	Private	Project alignment	Infrastructure crossings/ interaction	B2G summary of findings states that the Inland Rail will maximise the use of existing corridors, however it does not.	Take the line to the deep water port of Gladstone. Keep the line inland so as not to have to climb or descend too much. Miles is a good area for a hub, a days drive from the Brisbane city and 10 hours from Toowoomba. A line already exists between Toowoomba and Brisbane which will cease to be used when the Acland mine shuts, so an arterial line could be built from Miles to Toowoomba could be an option.	<p>The vast majority of freight carried on Inland Rail (on a net tonne kilometre basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout SEQ. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> ➤ Reduce demand to use IR by 50 per cent ➤ Reduce IR revenue by 60 per cent ➤ Reduce the Inland Rail Benefit Cost Ratio by 80 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to Border to Gowrie. This is also available in Sections 2.8.2.9 and 2.10 in Chapter 2: Project Rationale.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Appendix E: Consultation Report
005a	5a.0011	Private	Land Use and Tenure	Severance of agricultural land	<p>B2G summary of findings states that the Inland Rail will:</p> <ul style="list-style-type: none"> ➤ Minimise the use of private land, which the Project has not done ➤ Minimise the severance of land parcels, which the Project has not even tried. Submission notes that In one instance the land owner asked the ARTC to move the track about 100 m north so it ran down his boundary. ARTC refused, giving him two parcels of land. 	The State forest is available in the right direction.	<p>Mitigation measures that have been factored into the reference design, or otherwise implemented during the reference detailed design stage for the Project are described in Chapter 8: Land Use and Tenure, Section 8.6.1 and include:</p> <ul style="list-style-type: none"> ➤ The Project has been aligned to be co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes ➤ Where possible the Project footprint is located adjacent to property boundaries to reduce potential fragmentation and sterilisation of agricultural land ➤ Refinement of the horizontal alignment considered placement of the Project footprint such that it traverses along, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA ➤ The Project footprint has been established to provide the minimum-sized area required to safely and efficiently construct, maintain and operate the Project ➤ Where stock routes have been intersected by the Project footprint, design solutions have been proposed that allow for the continuity of stock movement. <p>In addition, as stated in Chapter 8: Land Use and Tenure, Section 8.5.4, Table 8-46, further refinement of the horizontal alignment during detailed design and alignment of the permanent footprint will occur such that it traverses along, or as close as possible to, property boundaries, to reduce potential fragmentation and sterilisation of Class A and Class B land. Impacts such as severance or loss of land that may have the potential to impact operations of agricultural businesses will be considered by the constructing authority in the terms of the acquisition agreements.</p> <p>With regards to the use of State Forests, traversing State Forest has been minimised in balance with other environmental impacts. As described in Chapter 2: Project Rationale Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Where the Project requires land to be acquired for the permanent footprint within a State forest, partial revocation of the State forests in accordance with the Forestry Act 1959 (Qld) will be required to enable the future gazetted of rail corridor over the same land.</p> <p>Notwithstanding, during detailed design stage, the Project footprint will be further refined to that which is required to safely construct, operate and maintain the Project, which will include minimising property acquisition requirements, property severance and disruption to land use and transport networks. This wording has been included in Chapter 8: Land Use and Tenure, Table 8-51, as a clarification in the revised draft EIS.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.1 Table 8-46 Table 8-51 Appendix E: Consultation Report
005a	5a.0012	Private	Land Use and Tenure		<p>B2G summary of findings states that the Inland Rail will:</p> <ul style="list-style-type: none"> ➤ Minimise the use of private land, which the Project has not ➤ Minimise impact to existing commercial and agricultural operations, which the Project has not. 	Nil.	<p>Mitigation measures that have been factored into the reference design, or otherwise implemented during the reference design stage for the Project are described in Chapter 8: Land Use and Tenure, Section 8.6.1 and include:</p> <ul style="list-style-type: none"> ➤ The Project is co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. ➤ Where possible the Project footprint is located adjacent to property boundaries to reduce potential fragmentation and sterilisation of agricultural land ➤ The Project footprint has been established to provide the minimum-sized area required to safely and efficiently construct, maintain and operate the Project. ➤ Where stock routes have been intersected by the Project footprint, design solutions have been proposed that allow for the continuity of stock movement. <p>In addition, as stated in Chapter 8: Land Use and Tenure, Section 8.5.4, Table 8-46, further refinement of the horizontal alignment during detailed design and alignment of the permanent footprint will occur such that it traverses along, or as close as possible to, property boundaries, to reduce potential fragmentation and sterilisation of Class A and Class B land. Impacts such as severance or loss of land that may have the potential to impact operations of agricultural businesses will be considered by the constructing authority in the terms of the acquisition agreements. The Project footprint will be further refined to that which is required to safely construct, operate and maintain the Project, which will include minimising property acquisition requirements, property severance and disruption to land use and transport networks (Chapter 8: Land Use and Tenure, Table 8-51).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises.</p>	Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.1 Table 8-46 Table 8-51
005a	5a.0013	Private	Flora and Fauna		B2G summary of findings states that the Project will avoid sensitive environmental and social areas, however it has not and the Project has not even looked to achieve this. The Project puts the track straight through essential habitat for Koalas and Other wildlife Turtles and lizards of different types in Southbrook.	Nil.	<p>The current alignment of the Project falls within portions of the Southern Freight Rail Corridor, a designated transport corridor. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report and revised draft EIS Appendix O: Matters of National Environmental Significance Report.</p> <p>As the Project moves into the detailed design and construction stages, more focused and comprehensive ecological surveys will be undertaken. Along with informing the design and construction, these will include specific measures to avoid, mitigate, minimise impacts on Koala, along with ongoing monitoring activities (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report and revised draft EIS Appendix O: Matters of National Environmental Significance Report). Where impacts cannot be avoided (e.g. Clearing of remnant vegetation or habitat for a threatened species), mitigation and management measures will be implemented. In instances where a significant residual impact as identified by the relevant EPBC Act significant assessment criteria, biodiversity offsets will be secured (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report and revised draft EIS Appendix O: Matters of National Environmental Significance Report).</p> <p>Appendix P: Fauna Connectivity Strategy has also been prepared for the Project, which identifies the location of proposed fauna crossing opportunities for species such as Koala. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process and in the Wildlife Connectivity Plan that will be prepared. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the detailed design process and incorporated where appropriate (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report).</p>	Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Report Appendix P: Fauna Connectivity Strategy
005a	5a.0014	Private	Flora and Fauna	Koala	B2G summary of findings states that the Project will avoid sensitive environmental and social areas, however it has not and the Project has not even looked to achieve this. The Project puts the track straight through essential habitat for Koalas and Other wildlife Turtles and lizards of different types in Southbrook.	Nil.	<p>Since the draft EIS was released for public submission ARTC has undertaken additional ecology surveys. The basis of these surveys was used to avoid and reduce Project impacts to ecological values through design refinement as shown in Appendix B3: Changes to Reference Design since draft EIS.</p> <p>Mitigation measures have been developed and outlined in the Section on vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report. In addition, a fauna connectivity strategy has been prepared for the Project (Appendix P: Fauna Connectivity Strategy), which identifies the location of proposed fauna crossing opportunities for species such as Koala.</p> <p>The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross-drainage and rail maintenance access roads. Habitat for threatened species (including the Condamine Earless Dragon) has been avoided wherever possible (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report and revised draft EIS Appendix O: Matters of National Environmental Significance Report).</p> <p>Where impacts to threatened species habitat cannot be avoided, mitigation and management measures will be implemented. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, during both the construction works and operations stages. Impact mitigation will include pre-clearance surveys prior to disturbance. Management and mitigation measures to protect vulnerable and endangered species are proposed in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>In instances where a significant residual impact as identified by the relevant EPBC Act significant assessment criteria, biodiversity offsets will be secured (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report and revised draft EIS Appendix O: Matters of National Environmental Significance Report). ARTC will provide biodiversity offsets in accordance with the relevant state or commonwealth legislation and guidelines. ARTC's approach to delivering environmental offset requirements is outlined in Appendix Q: Environmental Offset Delivery Strategy.</p>	Chapter 11: Flora and Fauna Sections 11.5., 11.6 and 11.7 Chapter 24: Draft Outline environmental Management Plan Appendix B3: Changes to reference design since draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Report Appendix P: Fauna Connectivity Strategy Appendix Q: Environmental Offset Delivery Strategy
005a	5a.0015	Private	Project alignment		The route selection as has been pointed out on numerous occasions is farcical. Just a simple study of the map shows that Toowoomba region is not enroute from Melbourne to Brisbane It is up the range and nearly as north as Brisbane and should never have been considered. The cost of fuel alone and the speed the train will have to use to take it up and down the range when speed was one of the main factors of this route.	A line already exists between Toowoomba and Brisbane which will cease to be used when the Acland mine shuts so an arterial line could be built from Miles to Toowoomba could be an option.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one from the New South Wales border to Brisbane via Toowoomba and the other via Warwick and Rathdowney (Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/ revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>In 2015, the Inland Rail Implementation Group (IRIG) endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017 (Chapter 2: Project Rationale, Section 2.9.3).</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment was to be progressed through phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d), where pages 83 to 95 relate specifically to Border to Gowrie and Appendix 4 (pp. 109-116) provides a detailed history of routes via Warwick that have been considered over time.</p>	Chapter 2: Project Rationale Section 2.8.2 Section 2.9.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
005a	5a.0016	Private	Project alignment		B2G summary of findings states that the Project will avoid challenging topography and geological conditions, which it certainly has not. The choice of the Southbrook route takes it adjacent to the highest point on the map before Toowoomba but it is too high for what the ARTC need meaning they are going to gouge a huge V in this and 17 m or more down when there is a suitable gully only a few hundred meters north of it.	Avoid topography and geological conditions. Take the line to the deep water port of Gladstone keep the line inland so as not to have to climb or descend too much. For the Southbrook route, consider using the suitable gully only a few hundred meters north of the current alignment.	<p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the multi-criteria analysis (MCA). <p>As noted in Chapter 2: Project Rationale, Section 2.9.3, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>Chapter 2: Project Rationale, Figure 2-28, shows that alignment OPT2 (blue) largely aligns with the submitter's suggested route and follows the edge of the study area outside Pittsworth and Southbrook townships.</p> <p>Based on local topographical constraints, the OPT2 alignment generated circa twice the volume of earthworks compared to the reference design alignment that parallels the Gore Highway where possible. Supported by the MCA process, ARTC note, relative to the alternative alignments investigated through this area, the reference design reduced its exposure to the challenging topography. Additionally, the reference design creates a multi-modal transport corridor that offers significant benefits in greenfield environments including co-location of major transport infrastructure, less earthworks, less farms with severance impact and less overland flow path crossings. Chapter 2: Project Rationale, Section 2.8 and 2.10 presents outcomes of the Option 1 and Option 2 assessments.</p> <p>The vast majority of freight carried on Inland Rail (on a net tonne kilometre basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout SEQ. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> Reduce demand to use IR by 50 per cent Reduce IR revenue by 60 per cent Reduce the Inland Rail Benefit Cost Ratio by 80 per cent. 	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Section 2.10 Figure 2-14 Figure 2-15 Figure 2-28 Appendix E: Consultation Report
005a	5a.0017	Private	Traffic and Transport	operational traffic	B2G summary of findings states that the Project will optimise railway operations. For the line travelling in Queensland, this is not true. Just a simple study of the map shows that Toowoomba region is not enroute from Melbourne to Brisbane It is up the range and nearly as north as Brisbane and should never have been considered. The cost of fuel alone and the speed the train will have to use to take it up and down the range when speed was one of the main factors of this route.	A line already exists between Toowoomba and Brisbane which will cease to be used when the Acland mine shuts so an arterial line could be built from Miles to Toowoomba could be an option.	Chapter 2: Project Rationale (Section 2.8-2.10) of the revised draft EIS describes the route selection process for the proposal. Furthermore, ARTC has also released a broader Inland Rail route analysis documented in Melbourne to Brisbane Inland Rail Route History 2006-2019 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie.	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10
005a	5a.0018	Private	Traffic and Transport	operational traffic	Toowoomba is too close to be a freight hub. No one will load a truck and drive it to Toowoomba and stop 2 hours from the port of Brisbane only to pay to have the goods unloaded and loaded on the rail then reloaded at Acacia Ridge and unloaded and reloaded at the Port. Even a transport company in Toowoomba will not do that they will simply drive the goods to the port. Assuming Toowoomba as a hub is illogical.	Take the line to the deep water port of Gladstone keep the line inland so as not to have to climb or descend too much Miles is a good area for a hub a days drive from the Brisbane city 10 hours from Toowoomba.	<p>The vast majority of freight carried on Inland Rail will be bulk container freight destined for domestic intermodal terminals and further distributed throughout South East Queensland as outlined in Section 2.2 of Chapter 2: Project Rationale. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently.</p> <p>At a regional level, the Project has the potential to catalyse development by stimulating business and industry development at the Toowoomba Enterprise Hub in Wellcamp. By providing efficient transport access to intrastate and interstate markets, the Project may act as a catalyst for further private sector investment in this area, particularly for freight and logistics operations. The further development of the Toowoomba Enterprise Hub has the potential to unlock greater economic activity in the region, such as through promoting greater international export opportunities via Wellcamp Airport.</p> <p>Supply chain operators, including train operators, aim for the most efficient means of transport possible and that is achieved by having trains that consist of freight for specific markets (i.e. domestic or export markets), rather than trains with a mixture of both. One intermodal reference train, with 40% of wagons double-stacked, can carry the same volume of freight as 110 heavy trucks so any apparent advantage in trucking time saving would diminish relative to the volume of product carried by a single train consist over time (Section 2.2 of Chapter 2: Project Rationale).</p>	Chapter 2: Project Rationale Section 2.2
005a	5a.0019	Private	Project alignment	operational traffic	The route should not be considered because the fuel to traverse the range with thousands of tons of freight will eat up fuel, have ongoing costs cost and result in unnecessary wear. This will be ongoing forever, costing millions extra.	Take the line to the deep water port of Gladstone keep the line inland so as not to have to climb or descend too much.	<p>ARTC acknowledges the commentary relates to the broader Inland Rail business case and alignment in Queensland, outside of scope of the Border to Gowrie EIS. For completeness, the following response has been provided. More information on Project rationale can be found in Chapter 2: Project Rationale.</p> <p>Australia's population is predicted to increase by 60 per cent over the next 40 years, with high levels of growth in South-East Queensland metropolitan Brisbane and Melbourne. Australia will need a reliable and efficient rail network to meet the increasing freight needs and take the strain off already congested road networks. Further information on future freight demand is provided in Chapter 2: Project Rationale, Section 2.2.</p> <p>Trains currently run to the Port of Brisbane and will continue to do so once Inland Rail is operational; however, trains accessing the Port of Brisbane will not be required to be double stacked as they will be transporting bulk freight such as coal or grain for export. The Australian Government and Queensland Government are undertaking a joint study of options and requirements for port/rail connections that will consider current and future demand and the relationship with the Inland Rail Project.</p> <p>Coal is currently railed along the Queensland Rail West Moreton Line to the Port of Brisbane. The 2015 Inland Rail Program Business Case forecast that coal and minerals will account for circa 25 per cent of the forecast total traffic that will be carried on Inland Rail (on a net tonne kilometre basis (NTK basis)). The majority of freight carried on Inland Rail (on a NTK basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout South East Queensland. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail Alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> Reduce demand to use IR by 50 per cent Reduce IR revenue by 60 per cent Reduce the Inland Rail Benefit Cost Ratio by 80 per cent. 	Chapter 2: Project Rationale Section 2.2
005a	5a.0020	Private	Economics		This track will not make a profit until 2062. ARTC has recently asked for 5 billion more and now we have been told they do not envisage coal being carted on the line for years to come. Coal made up a great proportion of the income for the line which basically means this track will never make a dime. Also, the costing did not allow for any track down time or rebuild, which will happen in the next 40 years or more, as well as allowance for building the hubs at either end.	Nil.	<p>All assumptions relating to demand modelling, including the connection to the Port of Brisbane and intermodal terminals, and revenue are considered in the Inland Rail Programme Business Case (2015). As such the revised draft EIS reflects the information contained in the Business Case and does not include any new assumptions.</p> <p>In regards to coal, for the purposes of the economic benefit assessments contained within the Inland Rail EIS', freight movements from coal demand have been excluded. This approach is consistent with the cost benefit analysis completed for the Inland Rail Programme Business Case (2015). With specific reference to the cost benefit analysis results for the scenarios 'No Western Line Upgrade', extracted from the Inland Rail Programme Business Case (2015) Chapter 9: Land Resources. Economic Analysis, where coal benefits are equal to zero (0).</p> <p>The reference design for the Project has an engineering design life of 100 years and it is based on industry best practice. The costs associated for any track down time or rebuild cannot form part of the economic impact assessment and are not required to be assessed as part of the final Terms of Reference for the Project.</p>	Chapter 18: Economics Section 18.7 Appendix Y: Economic Impact assessment Section 5.3
005a	5a.0021	Private	Social Impact Assessment		Putting the track near the highway disturbs all of those living in the towns. Submission notes that the track between Brookstead and Toowoomba is the only portion of the track that follows a highway for approximately 20 km. It follows the Gore highway bringing into play the Towns of Pittsworth and Southbrook. The highway was built to service the patrons of the towns.	Nil.	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 1.2, notes the alignment follows the existing rail line through Brookstead, minimising the need for additional land acquisition.</p> <p>In locating the rail line to the north of Pittsworth rather than following the existing rail line, the Project sought to minimise impacts on Pittsworth and its residents. The Project alignment diverts from the existing rail line to avoid the township of Southbrook. Other towns are avoided with the exception of Yelarbon on the existing rail line.</p> <p>The revised draft EIS Terms Of Reference require that the selected alignment is assessed. The EIS is unable to comment on an alternative alignment.</p> <p>Impacts on the road network are assessed in Section 5.0 of Appendix AA: Traffic Impact Assessment.</p>	Appendix AA: Traffic Impact Assessment Section 5.0 Appendix X: Social Impact Assessment Section 1.2
005a	5a.0022	Private	Social Impact Assessment	Local business and industry procurement	Submission notes that the patrons of Miles need extra employment. This will be encouraged if the alignment is routed through to Gladstone.	Take the line to the deep water port of Gladstone keep the line inland.	The revised draft EIS Terms of Reference require that the selected alignment is assessed. The EIS is unable to comment on an alternative alignment.	N/A
005a	5a.0023	Private	Traffic and Transport	Infrastructure crossings/ interaction	Implied impacts to existing infrastructure. Brisbane is busy enough and the only way you can build in Brisbane is by knocking down existing infrastructure.	Nil.	Trains currently run to the port and will continue to do so once Inland Rail is operational; however, trains accessing the Port of Brisbane will not be required to be double stacked as they will be transporting bulk freight such as coal or grain for export, which utilise wagons as opposed to containers (Section 2.2 of Chapter 2: Project Rationale). The Australian Government and Queensland Government are undertaking a joint study of options and requirements for port/ rail connections that will consider current and future demand and the relationship with the Inland Rail Project.	Chapter 2: Project Rationale Section 2.2
005b	5b.0024	Private	Groundwater	Private groundwater bore/ s	All bores in the region are necessary even if they are not for huge irrigation Projects and putting a rail line in the area may affect the water flow to these lesser bores which may make a property unliveable if this water flow or quality is affected. These bores may not be within close proximity to the line.	ARTC should be conditioned to list all bores in within what could be an effected area. Distance from line should be decided by an "independent body of hydrologists". All bores should be tested for quality and quantity before and after the works have been carried out. Should there be any changes to either this should be rectified financially or physically.	<p>Revised draft EIS Figures 15.27-15.29 of Chapter 15: Groundwater presents the groundwater modelling results and registered bores in proximity to the deep cuts expected to result in groundwater drawdown. Appendix U: Groundwater Technical Report of the revised draft EIS presents registered bores located within the Project footprint to be decommissioned, their reported aquifer, reported depth, and location. These figures and Table have been updated in the revised draft EIS.</p> <p>As part of the revised draft EIS, predicative groundwater models were developed to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts. The indicative cuts for modelling were selected as best representing the local geological conditions and worst-case potential impacts (cuts most likely to intersect groundwater). Modelling results in the revised draft EIS indicate only localised drawdown around the vicinity of deep cuts that intercept groundwater, with a predicted maximum extent of drawdown extending up to 43 m from the rail centreline. Modelling indicates impact to be wholly contained within the Project footprint, with no regional groundwater drawdown/ wider impact on the aquifer as a result of the Project. The models were updated to reflect the refined alignment and design as part of the revised draft EIS and the results are presented in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.5.</p> <p>Bores required to be decommissioned within the Project footprint or access restricted as a result of the Project will have 'make good' measures agreed in consultation with the landholder (see Section 8.2 (Table 8.2) of Appendix U: Groundwater Technical Report for the make-good process). As modelling has indicated drawdown will likely extend a maximum of 43 m horizontally from the deepest cut, impacts to bores outside the Project footprint is unlikely. Groundwater monitoring will continue throughout the construction works and operations stages of the Project to monitor for potential adverse impacts as a result of the Project.</p> <p>An independent technical advisor has been engaged to review the assessment of groundwater drawdown as described in the revised draft EIS.</p>	Chapter 15: Groundwater Section 15.6.2 Figure 15.27 Figure 15.28 Figure 15.29 Appendix U: Groundwater Technical Report Section 6.3.5 Section 8.2 Table 8.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
005b	5b.0025	Private	Groundwater		Concern about groundwater flow if the Project affects groundwater flow and quality.	ARTC should be conditioned to list all bores in within what could be an effected area. Distance from line should be decided by an "independent body of hydrologists". All bores should be tested for quality and quantity before and after the works have been carried out. Should there be any changes to either this should be rectified financially or physically.	<p>As part of the revised draft EIS, predicative groundwater models were developed to assess potential groundwater drawdown due to interception of groundwater and resulting drainage within the cuts (Project elements considered to potentially impact on groundwater). The indicative cuts were selected as best representing the local geological conditions and worst-case potential impacts (cuts most likely to intersect groundwater). The draft modelling results indicated that the extent of drawdown may extend up to 43 m from the centre of the Project alignment (from the deepest cuts) in that cut area. The modelling was updated to reflect the revised alignment and design as part of the revised draft EIS and the results are presented in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.5. Figures 15.27-15.29 of Chapter 15: Groundwater visually demarcate the anticipated extent of drawdown.</p> <p>As stated in the revised draft EIS Chapter 15: Groundwater, Table 15-17, minor groundwater mounding may occur below significant embankments and compressible material. However, the depth to groundwater along the Project alignment is typically > 5 m BGL, which reduces the likelihood of potential mounding. Minor risk of mounding is noted in areas of fractured MRV where the fractured rocks are hydraulically connected to flooded alluvial units. Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 and 15.4.4). The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of groundwater changes.</p>	Chapter 15: Groundwater Section 15.4.2 Section 15.4.4 Section 15.6.2 Figure 15.27 Figure 15.28 Figure 15.29 Table 15-17 Appendix U: Groundwater Technical Report Section 6.3.5
005c	5c.0026	Private	Social Impact Assessment	operational rail noise	Concern that alignment disturbs one major town and village unnecessarily. Submission notes that the map used in the Section, notably 15.16 you can quite clearly see that from Brookstead to Toowoomba the ARTC has chosen the rail line follow the road closely. At no other areas on the map does following the road happen if as you can quite clearly see the road does not go directly to its destination namely Toowoomba. The Gore highway deviates from the straight line and goes past Pittsworth and Southbrook. These are one major town and one large village that will be effected by the railway line unnecessarily. Submission further notes that this alignment will result in all the Towns folk of Pittsworth and Southbrook being disturbed x number of times a night.	The line from Brookstead to Toowoomba should be straightened out and for passing loops that are planned to be moved to a less populated area.	<p>Appendix X: Social Impact Assessment, Section 1.2 notes the alignment is located on the existing rail line on the southern border of Brookstead, minimising the need for additional land acquisition. In locating the rail line to the north of Pittsworth rather than following the existing rail line, the Project sought to minimise impacts on Pittsworth and its residents. The Project alignment diverts from the existing rail line to avoid the township of Southbrook.</p> <p>Additionally, Appendix X: Social Impact Assessment, Section 7.1 notes the potential for rail noise and changes to local scenic character for Brookstead, Pittsworth and Southbrook residents. Management measures as detailed in the Outline Environmental Management Plan are intended to address noise and scenic amenity impacts, where mitigations of noise exceedances or scenic amenity impacts are triggered.</p> <p>Appendix X: Social Impact Assessment, Section 8.5.8 (Table 8.12) notes that ARTC will engage with GRC and TRC to identify partnership opportunities to address impacts on local character and the amenity of these towns, and develop a Community Wellbeing Plan which will include measures to offset amenity impacts.</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10 found that the predicted noise levels from the crossing loops were well within the ARTC noise management criteria and would be substantially lower than the railway noise levels from the daily train pass-by events on the adjacent main line.</p>	Appendix X: Social Impact Assessment Section 1.2 Section 7.1 Section 8.5.8 Table 8.12
005c	5c.0027	Private	Flora and Fauna		Concern that the alignment from Brookstead to Toowoomba will impact the abundance of gums and trees in the area. Submission notes that this route takes the line past the highest point next to Toowoomba which is designated as essential habitat.	The line from Brookstead to Toowoomba should be straightened out. This will ensure that unnecessary earth moving is negated.	<p>Chapter 11: Flora and Fauna states that the alignment has been refined to avoid sensitive vegetation, areas with known threatened flora and fauna communities and key habitat areas, where practicable. The alignment was developed in consultation with the community (Section 2.8 of the revised draft EIS Chapter 2: Project Rationale). The Brookstead alignment was moved approximately 40 m south. The alignments from Yarranlea and Southbrook and Southbrook to Athol were revised to minimise interactions with constraints including challenging topography and geotechnical conditions and environmentally sensitive areas.</p> <p>The alignment from Athol to Gowrie Mountain reduces the amount of earthworks and drainage needed, impacts fewer private properties and will have shorter length within floodplains (Section 2.9 and 2.10.14 of Chapter 2: Project Rationale). The alignment for Warrego Highway to Gowrie Junction was revised to have a shorter length, less hydrological impact and traverses fewer properties (Section 2.9 and 2.10.15).</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10.14 Section 2.10.15 Chapter 11: Flora and Fauna
005c	5c.0028	Private	Flora and Fauna	Koala	Concern that the alignment from Brookstead to Toowoomba will impact the Koala population in the area.	The line from Brookstead to Toowoomba should be straightened out. This will ensure that unnecessary earth moving is negated.	<p>Chapter 11: Flora and Fauna, states that the alignment has been refined to avoid sensitive vegetation, areas with known threatened flora and fauna communities, and key habitat areas, where practicable. The alignment was developed in consultation with the community (Chapter 2: Project Rationale, Section 2.8). The Brookstead alignment was moved approximately 40 m south.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to reference design since draft EIS to reflect the alignment maturity.</p> <p>The alignments from Yarranlea to Southbrook and Southbrook to Athol were revised to minimise interactions with constraints including challenging topography and geotechnical conditions and environmentally sensitive areas (revised draft EIS Chapter 2: Project Rationale, Section 2.10.12 and 2.10.13, respectively). The alignment from Athol to Gowrie Mountain reduces the amount of earthworks and drainage needed, impacts fewer private properties and shorter length within floodplains. The alignment for Warrego Highway to Gowrie Junction was revised to have a shorter length, less hydrological impact and traverses fewer properties.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.10.12 Section 2.10.13 Chapter 11: Flora and Fauna Appendix B3: Changes to Reference Design since draft EIS Appendix E: Consultation Report Section 5.1
005c	5c.0029	Private	Project alignment		This Brookstead to Toowoomba route takes the line past the highest point next to Toowoomba making it such a high point that the line has to be gouged out of the landscape by 35 Meters down causing a 2 in 1 v shaped crevice of over 150 m wide. This area also has several gum trees on which the Koala population is surviving.	The line from Brookstead to Toowoomba should be straightened out. This will make the line more economical it will take the line away from Pittsworth and Southbrook. This will also mean that the alignment will not have to take in the Hill at 2980 Gore Highway ensuring that all that unnecessary earth moving is negated.	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">▶ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)▶ approvals and stakeholder engagement: 12.5 per cent▶ technical viability: 17 per cent▶ safety: 16.5 per cent▶ constructability: 12.5 per cent▶ operations: 16.5 per cent. <p>The alternative route that has been put forward in the submission would result in increased impacts to state forest, would still intercept a similar length of the Condamine floodplain and does allow the Project to maximise the use of existing brownfield corridors.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
005d	5d.0030	Private	Project alignment		Submission notes that rationale for route does not make sense. Submission notes that the alignment through Toowoomba makes no sense because of it's elevation and because it is not a straight line to the Port of Brisbane. This results in greater fuel consumption due to elevation.	If it is necessary to bring goods to Toowoomba , utilise existing lines not being used.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ ability to enhance the Inland Rail service offering ▶ construction and operating costs ▶ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ▶ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ▶ approvals and stakeholder engagement: 12.5 per cent ▶ technical viability: 17 per cent ▶ safety: 16.5 per cent ▶ constructability: 12.5 per cent ▶ operations: 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/ revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development (Section 2.8.2 of Chapter 2: Project Rationale).</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General (Section 2.9.3 of Chapter 2: Project Rationale). The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020 (Section 2.9.3 of Chapter 2: Project Rationale). Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.8.2 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
005d	5d.0030	Private	Project alignment	Directly impacted landowner	Concern about inconsistency in rationale as to why current routes were chosen, resulting in impacts to landowners. Submission notes that farms and landowners are impacted due to the straight alignment and supposed need for speed (24hr transit time), further noting that other sections of the rail do not align with this rationale. Submission notes that the alignment through to Toowoomba makes no sense because of its elevation and because it is not a straight line to the Port of Brisbane. The need for the tunnel also results in slowing down of services, further demonstrating the lack of consistency in rationale.	A thorough investigation should be carried out as to why the routes were chosen and how the reasoning they use for one portion of the line does not carry over to the next. More sensible routes would be through Gladstone Port or Warwick (for speed). Either route will negate the need to climb the range, which would otherwise result in higher fuel consumption.	<p>ARTC acknowledges the commentary relates to the broader Inland Rail business case and alignment in Queensland, outside of scope of the Border to Gowrie EIS. For completeness, the following response has been provided. More information on Project Rationale can be found in Chapter 2: Project Rationale.</p> <p>Australia's population is predicted to increase by 60 per cent over the next 40 years with high levels of growth in South-East Queensland, metropolitan Brisbane and Melbourne. Australia will need a reliable and efficient rail network to meet the increasing freight needs and take the strain off the already congested road network. Future freight demand is discussed in Chapter 2: Project Rationale, Section 2.2.</p> <p>Trains currently run to the port and will continue to do so once Inland Rail is operational; however, trains accessing the Port of Brisbane will not be required to be double stacked as they will be transporting bulk freight such as coal or grain for export. The Australian Government and Queensland Government are undertaking a joint study of options and requirements for port/ rail connections that will consider current and future demand and the relationship with the Inland Rail Project.</p> <p>Coal is currently railed along the Queensland Rail West Moreton Line to the Port of Brisbane. The 2015 Inland rail Programme Business Case forecast that coal and minerals accounts for circa 25% of the forecast total traffic that will be carried on Inland Rail (on a net tonne kilometre basis (NTK basis)). The vast majority of freight carried on Inland Rail (on a NTK basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout SEQ. Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> ▶ Reduce demand to use IR by 50 per cent ▶ Reduce IR revenue by 60 per cent ▶ Reduce the Inland Rail Benefit Cost Ratio by 80 per cent 	Chapter 2: Project Rationale Section 2.2 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
005d	5d.0031	Private	Social Impact Assessment		Concern about impacts to communities, particularly Pittsworth and Southbrook due to Project alignment. Submission notes that this alignment was only chosen in order to service the nearby airport.	Submission notes that original route from Goondiwindi to Toowoomba was a more sensible route, possible implication to revert to this alignment.	<p>The revised draft EIS Terms Of Reference require that the selected alignment is assessed.</p> <p>Appendix X: Social Impact Assessment, Section 1.2 notes in locating the rail line to the north of Pittsworth rather than following the existing rail line, the Project sought to minimise impacts on Pittsworth and its residents. The Project alignment diverts from the existing rail line to avoid the township of Southbrook. Appendix X: Social Impact Assessment includes assessment of impacts on Pittsworth and Southbrook.</p>	
005d	5d.0032	Private	Flora and Fauna	Koala	Concern about impacts to Koala habitat due to alignment being routed through the Millmerran flood plain.	Submission notes that original route from Goondiwindi to Toowoomba was a more sensible route, possible implication to revert to this alignment.	<p>Chapter 2: Project Rationale, Section 2.9 and 2.10.10 describes that the alignment through Millmerran follows an existing QR corridor, which is found to be an appropriate option as it utilises an existing corridor rather than greenfield alternatives. The benefits of this alignment include:</p> <ul style="list-style-type: none"> ▶ Shortest route to traverse the Condamine floodplain ▶ Eliminates need for two railway corridors in the area ▶ Minimises loss of highly productive farmland. <p>Chapter 11: Flora and Fauna states that the alignment has been refined to avoid sensitive vegetation, areas with known threatened flora and fauna communities, and key habitat areas, where practicable.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report, Consultation Outcomes. Refer to Appendix B3: Changes to Reference Design since draft EIS to reflect the alignment maturity.</p>	Chapter 2: Project Rationale Section 2.9 Section 2.10.10 Chapter 11: Flora and Fauna Appendix B3: Changes to Reference Design since draft EIS

005d	5d.0033	Private	General Project opinion - negative		Submission posits that the alignment was routed close to the airport because of the influence of a wealthy individual who managed to change all zoning regulations in the area. Submission posits that there are many dishonest people with their own agendas influencing the route.	Nil.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/ revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route (Section 2.8 of Chapter 2: Project Rationale).</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <p>Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson</p> <p>Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton</p> <p>Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton</p> <p>Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick</p> <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General (Section 2.8 of Chapter 2: Project Rationale). The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. 	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
005d	5d.0034	Private	Stakeholder Engagement	Aquatic fauna	Submission raises concern that information was inaccurate and withheld from an independent review body, which resulted in the ceasing of further investigations about the forestry route. Submission notes that most landholders wanted this investigation.	A thorough investigation should be carried out as to why the routes were chosen and how the reasoning they use for one portion of the line does not carry over to the next.	<p>An assessment by ARTC on the potential merits of a forestry alignment along the powerline easement west of Inglewood indicated that this corridor was not viable for the Inland Rail. Consequently, this option was not considered as part of the corridor review undertaken by Department of Infrastructure and Regional Development (DIRD) in 2015-16.</p> <p>As detailed in Chapter 2: Project Rationale, in July 2018, ARTC received a request from Goondiwindi Regional Council to consider an alternative alignment through the state forest. It was concluded that the alternative alignment performed less favourably in achieving the Inland Rail Service Offering (Section 2.10.5 of Chapter 2: Project Rationale).</p> <p>In 2020, at the request of the Deputy Prime Minister, ARTC prepared the Inland Rail Information Paper, which considered alternative Project alignments via Whetstone State Forest and Cecil Plains (Section 2.9.3 of Chapter 2: Project Rationale). It was concluded that the alternative alignment would result in a longer distance and transit time, increased costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The methodologies employed in the Information Paper were reviewed by GTA Consultants and were found to be suitable. Further information on the stakeholder engagement supporting route selection and alignment planning is detailed in: Route history of Inland Rail 2006-2021 - Inland Rail (accessible from artc.com.au)</p>	Chapter 2: Project Rationale Section 2.9.3 Section 2.10.5 Appendix E: Consultation Report Section 3
005e	5e.0035	Private	Social Impact Assessment	Local business and industry procurement	Concern about permanent impacts to communities and business including financial losses. Submission attributes this to the noise and filth of the railway line, and animal fatalities from trains running through properties. The gradient and design of this tunnel ensures no livestock can be transported on the line.	The number of families affected by taking the route through green field sites, unnecessarily close to towns (particularly Pittsworth and Southbrook) should be considered, with the use of an independent assessor.	<p>The Project alignment has been designed with consideration to minimising property acquisition which would result in impacts on residents and communities. The Project's alignment avoids town centres with the exception of Yelarbon where the existing rail line is located through the town.</p> <p>Appendix X: Social Impact Assessment, Section 7.1.2 notes the number of residential dwellings requiring affected households to relocate based on the proposed revised reference design and consultation with landowners to date.</p> <p>The rail line would be fenced to avoid interaction with livestock Chapter 5: Project Description, Section 5.4.12. Wildlife crossings are provided as part of the Project to minimise impacts on wildlife refer Section 5.4.12 Fauna fencing and crossings and Table 5-19 in Chapter 5: Project Description.</p>	Chapter 5: Project Description Section 5.4.12 Table 5-19 Appendix X: Social Impact Assessment Section 7.1.2
005e	5e.0036	Private	Social Impact Assessment	Directly impacted landowner	Concern about permanent impacts to communities including quality of life and the home environment. Submission attributes this to noise and filth of the railway line.	The number of families affected by taking the route through green field sites, unnecessarily close to towns (particularly Pittsworth and Southbrook) should be considered, with the use of an independent assessor.	<p>The Project alignment diverts from the existing rail line to avoid the township of Southbrook. Where noise exceedances are predicted, noise mitigation measures will be implemented as noted in revised draft EIS Chapter 16: Noise and Vibration, Section 16.10.</p> <p>The results of the air quality assessment of Project operations, Appendix R: Air Quality Technical Report, Section 5.4, indicate that cumulative background plus Project air quality pollutants would below guideline levels at all sensitive receptors.</p> <p>The Project alignment has been designed with consideration to minimising property acquisition which would result in impacts on residents and communities. Appendix X: Social Impact Assessment, Section 7.1.2 notes the number of residential dwellings requiring affected households to relocate based on the proposed revised reference design and consultation with landowners to date.</p>	Chapter 16: Noise and Vibration Section 16.10 Appendix R: Air Quality Technical Report Section 5.4 Appendix X: Social Impact Assessment Section 7.1.2
005e	5e.0037	Private	Social Impact Assessment	Land acquisition/ compensation	Concern about loss in property values for properties close to the railway line. Submission highlights that some properties would no receive compensation because they are not physically affected but are impacted in other ways (such as social impacts).	All affected property owners i.e. (within the 2K corridor) should be offered a fair price for their properties whether they are officially affected or not.	<p>Property acquisitions will be undertaken by DTMR as the Acquiring Authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967. This includes compensation for reasonable legal costs, valuation or other professional fees, costs related to purchase of replacement comparable land, storage and removal costs and other reasonable financial costs incurred that are a direct consequence of the resumption of the land (Appendix X: Social Impact Assessment, Section 7.1.2).</p> <p>Where properties are affected by noise exceedances, noise mitigations measures would be triggered. There is no legislative requirement to pay compensation for a loss in value unless land is acquired from a property.</p> <p>Appendix X: Social Impact Assessment, Section 8.5.3 acknowledges that the Project has resulted in stress and anxiety for some landowners and residents. In addition to the ongoing community engagement process which aims to provide information and enable consideration of landholders' concerns, ARTC has invested in a mental health partnership to enable people affected by the proposed Project to access mental health support services.</p> <p>ARTC will also provide supporting information for people who need to relocate, including referral to DCHDE housing support programs where necessary.</p>	Appendix X: Social Impact Assessment Section 7.1.2 Section 8.5.3
005e	5e.0038	Private	Groundwater	Private groundwater bore/ s	Concern about impacts to bore water due to rail alignment and the requirement for excavation works near submitters property. Submitter claims this will impact on their ability to care for cattle on their property.	All affected property owners i.e. (within the 2K corridor) should be offered a fair price for their properties whether they are officially affected or not.	<p>The location of the alignment was selected in part as it is located within the existing Southern Freight Rail Corridor, gazetted as a future rail corridor in 2010. However, some excavations will be required to achieve a suitable grade for operation of freight rail line. Groundwater drawdown as a result of seepage in excavations (deep cuts which intersect groundwater) is anticipated to be limited to the immediate vicinity of deep cuts. Groundwater modelling conducted as part of the draft EIS indicated drawdown will likely only extend a maximum of 43 m horizontally from the deepest cut. This modelling was revised as part of the revised draft EIS and is included in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.</p> <p>The predicted impacts are expected to be temporary (construction works stage) and localised to the deep cuts that intersect groundwater.</p>	Chapter 15: Groundwater Section 15.6.2 Appendix U: Groundwater Technical Report Section 6.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
005e	5e.0039	Private	Project alignment	Aquatic fauna	Concern about the process undertaken for the EIS by ARTC for consideration of options and determining rail alignment. Submission notes that despite the current alignment being the cheaper option than the forestry route, the Project still required to ask for \$5 billion more.	The number of families affected by taking the route through green field sites, unnecessarily close to towns (particularly Pittsworth and Southbrook) should be considered, with the use of an independent assessor.	<p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020 (Section 2.9.3 of Chapter 2: Project Rationale). Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs multi-criteria analysis (MCA). <p>Chapter 2: Project Rationale, Figure 2-28, shows that alignment OPT2 (blue) follows the edge of the study area outside Pittsworth and Southbrook townships. Based on local topographical constraints, the OPT2 alignment generated circa twice the volume of earthworks compared to the reference design alignment that parallels the Gore Highway where possible. Supported by the MCA process, ARTC note, relative to the alternative alignments investigated through this area, the reference design reduced its exposure to the challenging topography. Additionally, the reference design creates a multi-modal transport corridor that offers significant benefits in greenfield environments including co-location of major transport infrastructure, less earthworks, less farms with severance impact and less overland flow path crossings. Chapter 2: Project Rationale, Section 2.9 and 2.10 presents outcomes of the Option 1 and Option 2 assessments.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15 Figure 2.28 Appendix E: Consultation Report
005e	5e.0040	Private	Flora and Fauna	Koala	Suggests realignment, better justification for current alignment, assessment by independent assessor, and better compensation for affected property owners.	Alignment will traverse essential Koala habitat on the submitter's property.	<p>Since the submission of the draft EIS, ARTC has developed a number of key documents including the Appendix P: Fauna Connectivity Strategy, Appendix M: Draft Koala Management Plan and Appendix N: Draft Fauna Management Plan. These documents will be appendices for the revised draft EIS.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during both the construction works and operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. Chapter 24: Draft Outline Environmental Management Plan include management and mitigation measures to protect vulnerable and endangered species. Strategies to encourage cross-rail movement of fauna and to prevent the injury and mortality of fauna from train collision are contained in Appendix P: Fauna Connectivity Strategy.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
005f	5f.0041	Private	Air Quality		Concern about air quality impacts during construction, particularly deposition of particulate matter at concentrations of PM10, dust odours and volatile organic compounds (from fuel tanks). Submission makes note of serious health effects.	Re-route rail alignment. Taking it a further North to Gladstone an underused Port with a huge capability to increase its load which is also a deep water port meaning larger ships can be accommodated and they then start the journey nearer to their destination only seems sensible.	<p>The scope of the revised draft EIS is to assess the route selected by the Australian Government as detailed in Chapter 2: Project Rationale. In Chapter 12: Air Quality, Section 12.5.1, construction dust emissions have been assessed for the potential to impact human health (airborne dust, which can be inhaled) and cause nuisance or amenity impacts (deposited dust). The assessment of construction dust emissions has considered the type of emission sources during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households).</p> <p>The implementation of recommended mitigation measures outlined in Chapter 12: Air Quality, Section 12.9, are expected to result in a low or negligible significance impacts to health and nuisance/ amenity by construction dust impacts. Chapter 12: Air Quality, Section 12.9 and Appendix R: Air Quality Technical Report, Section 8.3 also identify and recommend dust management and mitigation measures which are considered to represent best practice environmental management, such as:</p> <ul style="list-style-type: none"> The application of water on unsealed vehicle paths (approximate reduction of 50 per cent) Establish designated stockpile locations within the corridor Installation of rumble grids or similar at locations where construction traffic departs from the construction site and joins the public road network Development of an Air Quality and Dust Management Plan. The management Plan includes the following measures (but not limited to): <ul style="list-style-type: none"> Minimise major dust generating activities Routing roads away from sensitive areas wherever practically possible Restricting vehicle speeds Long-term stockpiled material will be covered or seeded to prevent wind erosion. <p>These management and mitigation measures will be included in the Construction Environmental Management Plan (CEMP) and are included in Chapter 24: Draft Outline Environmental Management Plan for the Project. In addition, an Air Quality and Dust Management Plan will be prepared as part of the CEMP. A further quantitative assessment of potential dust deposition at sensitive receptors from construction activity will be completed in future stages (before construction) when more detailed construction information is available.</p> <p>Impacts of odour and volatile organic compounds (VOC) emissions from non-resident workforce accommodation facility and fuel storage at laydown areas have been assessed in Chapter 12: Air Quality, Section 12.5.1. As discussed in Chapter 12: Air Quality, Section 12.5, a minimum separation distance of 50 metres is recommended for fuel storage tanks to mitigate potential impacts from odour and VOC emissions. The 50-metre minimum separation distance is based on guidance previously provided by Brisbane City Council for service stations for a fuel throughput that is higher (annual throughput of between 1, 2 and 9 megalitres) than expected for the fuel storage tanks (Brisbane City Plan 2014 Service Station Development Code v19). This minimum separation distance can be achieved for all proposed fuel storage areas. Therefore it is expected that health and nuisance impacts associated with emissions from fuel storage will not be significant.</p> <p>Based on the air quality assessment results, the proposed alignment will not result in significant air quality impacts to sensitive receptors, and an alternate alignment is not required for air quality reasons.</p>	Chapter 2: Project Rationale Chapter 12: Air Quality Section 12.5 Section 12.5.1 Section 12.9 Chapter 24: Draft Outline Environmental Management Plan Appendix R: Air Quality Technical Report Section 8.3
005f	5f.0042	Private	Air Quality		Concern about air quality impacts during operation, including coal dust. Submission questions if return trains will be subject to the same controls and veneer spray. Submission notes that ARTC will not be in control of goods transported.	Re-route rail alignment. Taking it a further North to Gladstone an underused Port with a huge capability to increase its load which is also a deep water port meaning larger ships can be accommodated and they then start the journey nearer to their destination only seems sensible.	<p>ARTC presently has no foreseeable market-driven demand for coal to be transported on the Inland Rail network between NSW/QLD border to Gowrie. Therefore, the revised draft EIS has not considered potential emissions or impacts from these sources; however, should this change during operations in the future, the potential for coal dust generation would require management by a Coal Dust Management Plan (CDMP).</p> <p>Should coal be planned to be transported as part of future operations, prior to transportation of coal, engagement would be undertaken with existing stakeholders and members of the South West Supply Chain regarding coal dust management and monitoring requirements necessary to maintain the integrity of the existing South West Supply Chain Coal Dust Management Plan (2019).</p> <p>The air quality assessment investigated the potential impact of emissions from the proposed Project during its operation. The operational air quality assessment determined that the adopted ambient air quality goals established to protect human health and minimise potential nuisance can be achieved for all households (referred to as sensitive receptors in Chapter 12: Air Quality for all pollutant and relevant averaging periods (Chapter 12: Air Quality, Section 12.5.2).</p> <p>Based on the air quality assessment results, the proposed rail alignment will not result in significant air quality impacts to sensitive receptors, and an alternate alignment is not required for air quality reasons. The scope of the revised draft EIS is to assess the route selected by the Australian Government as detailed in Section 2.3 of Chapter 2: Project Rationale.</p>	Chapter 2: Project Rationale Section 2.3 Chapter 12: Air Quality Section 12.3 Section 12.5.2
005f	5f.0043	Private	Project alignment		Submission questions the rationale with the alignment, noting that taking millions of tons of coal through a beautiful city of Brisbane to a shallow water port which is struggling with the coal it has at the moment to only increase the load is ridiculous.	Re-route rail alignment. Taking it a further North to Gladstone an underused Port with a huge capability to increase its load which is also a deep water port meaning larger ships can be accommodated and they then start the journey nearer to their destination only seems sensible.	<p>ARTC acknowledges the commentary relates to the broader Inland Rail business case and alignment in Queensland, outside of scope of the EIS. For completeness, the following response has been provided, where more information on Project Rationale can be found in Chapter 2: Project Rationale.</p> <p>Australia's population is predicted to increase by 60 per cent over the next 40 years with high levels of growth in South-East Queensland, metropolitan Brisbane and Melbourne. Australia will need a reliable and efficient rail network to meet the increasing freight needs and take the strain off the already congested road network. Future freight demand is discussed in Chapter 2: Project Rationale, Section 2.2.2.</p> <p>Trains currently run to the port and will continue to do so once Inland Rail is operational; however, trains accessing the Port of Brisbane will not be required to be double stacked as they will be transporting bulk freight such as coal or grain for export. The Australian Government and Queensland Government are undertaking a joint study of options and requirements for port/ rail connections that will consider current and future demand and the relationship with the Inland Rail Project.</p> <p>Coal is currently railed along the Queensland Rail West Moreton Line to the Port of Brisbane. The 2015 Inland rail Programme Business Case forecast that coal and minerals accounts for circa 25% of the forecast total traffic that will be carried on Inland Rail (on a net tonne kilometre basis (NTK basis)). The vast majority of freight carried on Inland Rail (on a NTK basis) will be bulk container freight destined for domestic intermodal terminals and further distributed throughout SEQ (Chapter 2: Project Rationale, Section 2.5). Although Gladstone may offer benefits to international exports whose origin is in central Queensland, Brisbane is fundamental to allowing domestic goods to their final destination much faster and more efficiently. The 2010 Inland Rail alignment Study that found terminating at Toowoomba rather than continuing to Gladstone would:</p> <ul style="list-style-type: none"> Reduce demand to use IR by 50 per cent Reduce IR revenue by 60 per cent Reduce the Inland Rail Benefit Cost Ratio by 80 per cent. 	Chapter 2: Project Rationale Section 2.2.2 Section 2.5
006a	6a.0004	Private	Traffic and Transport	construction traffic	ARTC should be conditioned to provide details of road alignment during construction and these details should come back out for public comment.	Provide details of road alignment during construction. These details should be subject to public comment.	<p>ARTC notes that there will be seven road diversions associated with the Project. The detailed road diversion assessment is provided in Section 5.9.4 of Appendix AA: Traffic Impact Assessment. The requirement for temporary roads to facilitate construction will be subject to on-going discussions and agreement with DTMR, relevant Councils and directly affected landowners.</p> <p>The revised draft EIS containing the revised road and rail alignments will be available for public comment.</p>	Appendix AA: Traffic Impact Assessment Section 5.9.4
006a	6a.0005	Private	Traffic and Transport		ARTC should be conditioned to provide details to the public about the increased time for emergency services to attend emergencies because of road closures and rail crossings.	Provide details about increased time for emergency services to attend emergencies because of road closures and rail crossings.	<p>As part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response time during construction works and operations stages, and ensuring that access is retained as required. QPS and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>The construction Traffic Management Plan will identify and include secondary/ alternative construction routes which can be used by construction traffic in the event that a primary construction route is blocked by an accident or emergency situation. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Table 5.69 in Appendix AA: Traffic Impact Assessment provides the individual wait times for the level crossing locations along the alignment. The wait times determined for each individual level crossing were calculated using:</p> <ul style="list-style-type: none"> Level crossing specific operating speeds (up to maximum design speed of 115 km/hr). The operating speed is impacted by topography and curvature of the alignment. Time taken for the train to cross the level crossing Distance from train crossing loops Train length. <p>Consultation with the community and relevant government agencies (inc. emergency services) will continue through the detailed design and construction works stages to ensure that safety concerns and issues are addressed.</p>	Appendix AA: Traffic Impact Assessment Table 5.69

006b	6b.0006	Private	Flora and Fauna		There is no evidence to support the claim that the Project has been aligned to minimise impacts on vegetation and habitat.	Nil.	<p>A number of alternative routes for the Project footprint have been considered during the concept assessment stage (from early 2016 to late 2017) (Chapter 2: Project Rationale, Section 2.8 and 2.9) of the Project. In all instances, the guiding principles of ecologically sustainable development have been factored into the assessment and selection of corridor and alignment options for the Project.</p> <p>The Project footprint has been subject to historical disturbance and clearing, with one-third of the alignment length located within brownfield (areas already subject to previous development). The remaining greenfield portions of the Project footprint extend largely through areas subject to agricultural land uses. The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross drainage and rail maintenance access roads. Refer to Appendix B3: Changes to Reference Design since draft EIS to reflect the alignment maturity.</p> <p>Chapter 11: Flora and Fauna, Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report provide strategies that have been used to minimise impacts through the detailed design stage of the Project to avoid habitat for threatened species wherever possible.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Report Appendix B3: Changes to Reference Design since draft EIS</p>
006b	6b.0007	Private	Flora and Fauna	Koala	ARTC should be conditioned not to destroy a single Koala tree.	Preserve Koala trees	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix M: Draft Koala Management Plan. This document is an appendix for the revised draft EIS and it was developed because of direct engagement with various Commonwealth and State agencies, community conservation groups. Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including Koalas, during the construction stage. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report.</p> <p>In instances where a significant residual impact has been identified as per the EPBC Act 1999 Significant Assessment Criteria, biodiversity offsets will be secured. ARTC has prepared a revised appendix Q: Environmental Offset Delivery Strategy that outlines the properties that make up the Project offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES. Specifically, see Section 6.7 of Appendix Q: Environmental Offset Delivery Strategy for a summary of how the proposed offset portfolio will acquit the anticipated offset requirements for the Koala to achieve a no net loss.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix M: Draft Koala Management Plan Appendix O: Matters of National Environmental Significance Report Appendix Q: Environmental Offset Delivery Strategy</p>
006c	6c.0008	Private	Stakeholder Engagement	construction traffic	At no time ARTC has contacted us regarding the impact of the Inland Rail line will have on our place and neighbourhood. ARTC should be conditioned to provide details of road re-alignments during construction and these details should be displayed and consulted for public comment. These include:	<p>Provide details of road re-alignments during construction. Details to be subject to public comment and consultation. These include:</p> <ul style="list-style-type: none"> Re-alignment of Athol School Road Purcell Rd Athol Southbrook Biddeston Rd Southbrook. 	<p>ARTC has engaged with landowners on the Project reference design, including impacts to local roads. Details are included in Appendix E: Consultation Report, Section 5.5, with examples of fact sheets produced for community consultation provided in Section 6.3. Local communities and road users have been engaged and have provided input into road design through Community Consultative Committees, fact sheets, one-on-one landowner meetings, community information sessions, letterbox drops, newsletters, interactive mapping (Social Pinpoint), website and social media, as detailed in Appendix E: Consultation Report.</p> <p>Engagement with stakeholders who are impacted by road changes is ongoing, and will continue through detailed design, further details that during construction a travel demand management awareness campaign will be developed to inform the public of the proposed construction works and its potential effect on local road network operations. The purpose of this awareness campaign would be to relieve congestion by encouraging travel outside of peaks and increase public awareness of planned construction works.</p>	<p>Appendix E: Consultation Report Section 5.5 Section 6.3</p>
082b	82b.0004	State Agency	Economics	Workforce and employment	construction labour availability subsection, 16.6.1.3 p.16.10: The degree or magnitude of construction labour supply constraints at the regional (i.e. study area) level is discussed with reference to the results of a national and state survey. It would be more appropriate to discuss this topic in relation to the regional economic environment, i.e., the region has a relatively small labour force and given that other Projects comprising of the Inland Rail Program will be underway in adjacent regions during the same time period, it is likely that there will be some labour supply shortages for construction workers.	The slack labour market assumption should be reviewed more up to date data should be used to confirm the conclusions are still valid. Changing the modelling to a tight labour market makes a big difference: the employment numbers drop by about two thirds as the price of labour is much higher, for example.	<p>ARTC acknowledges the construction labour supply required for the Project includes technical and specialised skill sets such as engineering capability. The nature of these jobs is quite mobile, where professionals tend to travel to Project sites from major urban centres, interstate and internationally where required. As such, labour market statistics for this supply group are summarised at a national and state level. More general labour market statistics are summarised in Appendix Y: Economic Impact Assessment, Section 5.2 of the revised draft EIS, and refer to general labour market conditions in the SIA study area and regional economic catchment area.</p> <p>In regards to the proposed solution, ARTC has recently updated the EIS economic modelling to reflect current labour market conditions. If labour market conditions at the national and state level remain in the recent range, the Project's construction works stage will be completed in the context of a relatively tight labour market, especially in the market for skilled labour relevant to the construction sector. However, the economic assessment (Appendix Y: Economic Impact Assessment) indicates in Section 5.2, that there is some slack in the Darling Downs – Maranoa labour markets, which provides opportunities for recruiting, training and re-skilling available workforces in the region to supply a significant portion of the workforce requirements of the Project. The ability for the local economy to supply labour to the Project, depends on the specific location of works along the alignment. At the time of construction, local employment is dependent on a number of factors including labour market conditions, skills availability, and the existence of workforce training and participation programs to support local, Indigenous and youth employment.</p>	<p>Chapter 18: Economics Section 18.4 Section 18.6 Section 18.8 Appendix Y: Economic Impact Assessment Section 5.2</p>
082b	82b.0005	State Agency	Economics	Workforce and employment	Labour force subsection, 16.6.1.4 p.16.10 and 16.11, Tables 16.3 and 16.4: Various labour force characteristics are presented for the March quarter 2019 and December 2019. However, the youth labour force data and all participation rates presented in these Tables are for the 2016 ABS Census of Population and Housing. Generally, when conducting an analysis of labour market conditions, it is more appropriate to consider indicators at a consistent point in time to avoid distortion or misrepresentation of facts.	The provision of such common use infrastructure could substantially increase the catalytic impact of the Project. Similarly, any other assistance the Project may provide to proponents of Projects connecting into Inland Rail would strengthen the case for Project benefits.	<p>ARTC has recently updated the EIS economic modelling to reflect current labour market conditions in the revised draft EIS. ARTC has updated all labour force characteristics in Chapter 17: Social of the revised draft EIS to reflect the following data sets:</p> <ul style="list-style-type: none"> National Skills Commission 2021, Small Area Labour Markets (SALM), LGA data tables, September quarter 2021 ABS 2022, Labour Force, Australia, Detailed: Table 16b. Labour force status by labour market region (ASGS) and sex, annual averages of the previous 12 months QGSO 2021, Population estimates: Regions, Age and sex indicators, LGA and SA2, 30 June 2020p ABS 2021, 2021 Census - Counting Persons, Place of Usual Residence (MB), LGA & SA4 (UR) by AGE5P - Age in Five Year Groups by LGA & SA (UR) by LFSP Labour Force Status (used for youth labour force calculations) <p>These datasets represented the most recent publicly available data metrics for labour force in Queensland at the time of preparation of the EIS.</p> <p>There are no intermodal hubs which form part of the revised draft EIS. All assumptions relating to demand modelling, including the connection to intermodal terminals, are considered in the Inland Rail Programme Business Case (2015). The revised draft EIS reflects the information contained in the Business Case and does not include any new assumptions. As such considering the development of other infrastructure (such as intermodal terminals) or Project options is outside the scope of this EIS. It is noted the location of future intermodal terminals will have a material impact on the way benefits of Inland Rail are realised.</p> <p>For further information on possibilities for investment along the rail line, refer to Australia's report 'Inland Rail Regional Opportunities' (March 2020). This report goes beyond the 2015 Business Case to look at:</p> <ul style="list-style-type: none"> Long-term potential for growth in investment, employment and economic value Supply chain efficiencies and value chain growth Specific opportunities to invest alongside Inland Rail, what those investments might look like and growth forecasts for different regions International case studies and the way business hubs form around transport Some of the challenges and enablers for investment. <p>The report can be found here: inlandrail.gov.au/understanding-inland-rail/publications-and-reports/inland-rail-regional-opportunities-ey-australia.</p> <p>In addition, the Australian Government has jointly funded a business case to consider the development of an intermodal terminal to support Inland Rail in Queensland. See link: investment.infrastructure.gov.au/Projects/ProjectDetails.aspx?Project_id=111245-20QLD-MRL.</p>	<p>Chapter 17: Social Chapter 18: Economics Section 18.4 Section 18.8</p>
082b	82b.0006	State Agency	Economics	Workforce and employment	Industry by employment subsection, 16.6.2.1, p. 16.12 and 16.13: This subsection, including Table 16.4, comprises of data and associated discussion as that contained in Subsection 16.6.1.1. To avoid unnecessary duplication, it is recommended that these subsections are merged.	This would seem to be a missed opportunity of providing some actual legacy benefit from the Project, especially in the areas with significant impact and little obvious benefit.	<p>ARTC notes the information contained in Chapter 18: Economics Section 18.4, represents 'employment by industry', or the industries which the working residents of the study area are employed in. Subsection 18.4 represents 'industry by employment', or the industries of employment which make up the study area. The two statistics are not mutually exclusive.</p> <p>As detailed in the Social Impact Assessment (Chapter 17: Social), there is the potential for the Project to provide long term legacy benefits to local communities from Project investments which remain after Inland Rail is constructed and operational. The legacy impacts have been identified through local consultation undertaken by ARTC. Legacy benefits include:</p> <ul style="list-style-type: none"> local skills and business capacity road safety economic development community Projects community values monitoring and planning resource digital connectivity. <p>As a component of the larger Inland Rail Program, the potential benefits of the Project cannot be separated from those that are attributed to the full Brisbane to Melbourne alignment. The full suite of potential benefits associated with the Inland Rail Program can only be realised once this Project and the 11 other Inland Rail Projects are complete and operational. The EIS considers a range of benefit types which may be a direct result of the Project and which can be quantified or identified as part of the Project, rather than the broader Inland Rail Program. These are captured under two broad benefit streams; providing competitive freight transport and supporting regional and local business; and are summarised in Section 5.2 of the Executive Summary (pages 6-7). The revised draft EIS also summarises the broader program benefits identified in the 2015 Investment Case in Section 5.1 of the Executive Summary (page 5-6). Some regional and local legacy benefits include:</p> <ul style="list-style-type: none"> Opportunities to encourage, develop and grow indigenous, local and regional businesses through the supply of resources and materials for construction and operation The potential to stimulate business and industry development at the Toowoomba Enterprise Hub at Wellcamp by providing efficient transport access to intrastate and interstate markets and acting as a catalyst for further private sector investment The creation of a more direct rail freight corridor for freight operators. 	<p>Chapter 17: Social Chapter 18: Economics Section 18.4 Section 18.4 Section 18.5 Section 18.11</p>
082b	82b.0007	State Agency	Economics	Workforce and employment	To derive the freight benefits of the Project, future freight demand must be calculated. In doing so, it is assumed that all future contestable freight is carried by rail (this is consistent with the assumption contained in the Inland Rail Program Business Case). This results in a shift of the total freight task from road to rail. As this assumption is open to conjecture, EA suggest that sensitivity testing is performed on changes to this assumption.	Nil.	<p>ARTC notes that all assumptions relating to demand modelling are considered in the Inland Rail Programme Business Case (2015). As such the revised draft EIS reflects the information contained in the Business Case and does not include any new assumptions.</p> <p>Sensitivity testing was undertaken in the Inland Rail Programme Business Case (2015).</p>	<p>Chapter 18: Economics Section 18.3 Appendix Y: Economic Impact Assessment Section 5.3</p>
082b	82b.0008	State Agency	Economics		Subsection 16.9.4, p 16.20: In reporting the results of the full CBA conducted for the Inland Rail Program business case, the benefit cost ratio (BCR) and net present value (NPV) are highlighted at the 4% discount rate rather than at the usually highlighted 7% discount rate. As such, EA suggest that the BCR and NPV results at the 7% discount rate are highlighted.	When conducting an analysis of labour market conditions, it is more appropriate to consider indicators at a consistent point in time to avoid distortion or misrepresentation of facts.	<p>The results have been presented at a 4% discount rate consistent with the Inland Rail Programme Business Case (2015).</p> <p>The 2015 Business Case was to inform the Commonwealth's decision on whether or not to invest in the progression of the Inland Rail Project. It evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution. The financial (investment) decision has been made to proceed with the Project as such the discount rate is not to be revised for this point in time decision.</p>	<p>Chapter 18: Economics Section 18.7 Appendix Y: Economic Impact Assessment Section 5.3</p>

082b	82b.0009	State Agency	Economics		<p>Economic impacts estimated with a CGE model are generally very sensitive to the assumptions used. The following information would be required to fully validate the economic impacts of the CGE modelling conducted for this Project</p> <ul style="list-style-type: none"> the choice of model closure or economic environment used to simulate the impacts of the B2G Project; details of the model database (i.e., the CGE core drawn from the base year input-output tables); input data used to derive shocks to the model (e.g. to investment, output etc.) that represent the direct impacts of the Project and to derive any changes to model parameters; Project specific adjustments such as changes to model theory or equations that deal with the complexity of the Project; a full set of modelling results – represented as percentage deviations from baseline for all of the key variables. At present, only specific results are shown for the Darling Downs – Maranoa regional economy; and access to the model files to be able to replicate and test the assumptions used to set up the simulation. <p>Without this information it is only possible to make some general observations in respect of the CGE modelling and estimated regional economic impacts, as follows:</p> <ul style="list-style-type: none"> A significant limitation of the regional economic impact assessment results from modelling the links of the Inland Rail Program separately only enables construction phase impacts to be considered A further limitation results from the use of a comparative static version of the CGE model used for the calculation of economic impacts. This type of CGE model measures impacts relative to a snapshot of the economy that does not include the capital expenditure (capex) associated with the B2G Project construction phase. The use of a dynamic CGE model would be more appropriate, however, as this type of model measures impacts on an annual basis relative to a baseline or business as usual Projection of the economy. This enables the adjustment path of the economy to the shocks associated with the B2G Project to be traced. As there is likely to be overlap in the timing of the construction phases of Projects comprising of the Inland Rail Program in adjacent regions, modelling each link in isolation may lead to an underestimation of supply side constraints, particularly those on labour. As such, two scenarios were modelled by KPMG in which assumptions regarding the labour market differ. In the first scenario, the availability of skilled workers in the region is such that there is no pressure on real wages to increase, resulting in a “slack” labour market. In the second scenario, skilled workers must be sourced via an increase in real wages, resulting in a “tight” labour market. The choice of assumption regarding the labour market has a significant bearing on the magnitude of Project impacts, as household incomes and consumption increase to a much greater degree under the slack labour market scenario due to a much greater increase in employment in Darling Downs - Maranoa. It is stated in the report that current labour market conditions in the region are consistent with the slack labour market assumption. However, the influence of supply side constraints resulting from the overlap in timing of the construction of other Inland Rail links in adjacent regions is ignored in this argument. Further, the likely significant future demand for skilled construction workers in Darling Downs – Maranoa and surrounding regions resulting from a range of factors (such as increased numbers of major Projects and continuing population growth) is also not raised. As such, EA are of the view that the tight labour market assumption is more consistent with these factors. The use of a dynamic CGE model would alleviate the requirement for differing assumptions for the labour market at the regional level, as the theory underpinning the dynamic model enables more sophisticated labour market adjustment mechanisms. 	Merge mentioned subsections.	<p>ARTC’s modelling is purpose-specific and has been done in the context of a process where a separate EIS is being conducted for each segment of the Inland Rail Project. The relevant limitations of the modelling for this type of analysis (separate EISs) are set out in each report.</p> <p>ARTC has recently updated the EIS economic modelling to reflect current labour market conditions. If labour market conditions at the national and state level remain in the recent range, the Project’s construction works stage will be completed in the context of a relatively tight labour market, especially in the market for skilled labour relevant to the construction sector. However, Appendix Y: Economic Impact Assessment indicates in Section 6.4 that there is some slack in the Darling Downs – Maranoa labour markets, which provides opportunities for recruiting, training and re-skilling available workforces in the region to supply a significant portion of the workforce requirements of the Project. The ability for the local economy to supply labour to the Project, depends on the specific location of works along the alignment. At the time of construction, local employment is dependent on a number of factors including labour market conditions, skills availability, and the existence of workforce training and participation programs to support local, Indigenous and youth employment.</p>	<p>Chapter 18: Economics Section 18.8</p> <p>Appendix Y: Economic Impact Assessment Section 6.4</p>
082b	82b.0010	State Agency	Economics	Cumulative impacts	The cumulative economic impacts of the five sections of the Inland Rail program that fall in Queensland are also quantified using the KPMG-SD CGE model. As such, most of the limitations discussed with regard to modelling the regional impacts of the B2G Project also apply for the cumulative impact assessment.	Nil.	ARTC has recently updated the revised draft revised EIS cumulative economic modelling which undertakes a quantitative assessment of the cumulative macroeconomic impact of the Inland Rail Program on the economy, resulting from the construction of adjacent sections of the Inland Rail Program. When the modelling for the Economic Impact Assessment was undertaken, there were five sections of the Inland Rail Program that fall in Queensland, including the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert, Calvert to Kagaru and Kagaru to Acacia Ridge and Bromelton. In addition to this, the assessment also includes the CAPEX programs of two Inland Rail sections in New South Wales that have an overlapping timeline with the construction of Project – Narrabri to North Star and North Star to Border. The limitations identified in the Project’s economic impact assessment for the modelling apply in this case. Since then, the Kagaru to Acacia Ridge Project has been removed from the Inland Rail Program in Queensland, post the release of the Inland Rail Independent Review (2022).	Chapter 18: Economics Section 18.10
082b	82b.0011	State Agency	Economics	Cumulative impacts	It is worth noting that, due to some crowding out effect in the market for construction industry workers during the construction phases of these Projects, there is a small negative impact on overall employment in the regions outside of the those directly impacted by these Projects (i.e. the Remainder of Queensland and Remainder of Australia).	Nil.	ARTC has recently updated the revised draft EIS economic modelling to reflect current labour market conditions. It is estimated that over the construction works stage an additional 332 direct and indirect jobs will be generated on average each year for Darling Downs – Maranoa and 107 jobs for the rest of Queensland. The displacement of some economic activity in other Australian states is expected to result in total employment being lower than in the baseline by 93 jobs.	
082c	82c.0012	State Agency	Surface Water	construction water supply	Issue: water usage (construction and operation) The draft EIS estimates that the following water demands will occur during the Project: There does not seem to be an allowance for water during the establishment of vegetation planted as part of the landscaping design just a statement that these elements will be self-sustaining once established and will not require watering. Post construction whilst there is an acknowledgement that water may be required to support local maintenance activities such as high-pressure cleaning of culverts but the volumes required will be dependent on the specific activities and frequency of undertaking, and therefore cannot be quantified at this stage of the Project. Water demand is already oversubscribed in the Project area with emergency water supply measures only recently ceasing in Stanthorpe. While there was some reference to hierarchy of preferred water sources in the Agency briefing, I could not find that in the EIS documentation, nor could I find anything firmly undertaking to what extent the hierarchy would be followed.	Water security is a constant topic within the region, perhaps the application of a legacy lens could be used to support infrastructure that would not only support the Project construction need but provide longer term benefit to the impacted area.	Discussion regarding construction water in Section 5.6.24 of Chapter 5: Project description has been substantially revised since release of the draft EIS. This includes the water requirements for revegetation. Detailed discussion of ARTCs approach to construction water are outlined in Appendix B5: Construction Water Requirements Report.	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements Report
082c	82c.0013	State Agency	Groundwater		Investment attraction opportunities are already being limited by the lack of available water and this Project, and the juggernaut of expectation of completion timeframes, that will come once construction commences would seem to provide limited protection for existing and potential water users or to make allowances for climatic conditions or increased water demands.	Nil.	<p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. Currently the hierarchy of water supply source preferences prioritises non-potable sources to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. The findings of the construction water options assessment are provided in Section 5.6.24, Chapter 5: Project Description of the revised draft EIS. Detailed discussion of ARTC’s approach to construction water is outlined in Appendix B5: Construction Water Requirements Report.</p> <p>As the alluvial and MRV aquifers within the impact assessment area are currently near or overallocated, it is unlikely that a temporary water permit would be issued for the additional take of water from these units.</p> <p>In the instance a temporary water permit is warranted during construction, the licenced extraction volume would be within the allowable extraction limits for the relevant Water Plan. Therefore, the Project is not expected to impact on, or alter, the identified relevant Water Plans or other plans under the Water Act outside of their designated use and objectives.</p> <p>The use of existing sustainable groundwater allocated entitlements to supplement the construction demand for the Project may be considered if private owners of registered bores have capacity under their water entitlement that they wish to sell to ARTC or the Contractor under private agreement. Therefore, the volumes extracted would be within the existing licencing limits and the extent of drawdown experienced would be localised and consistent with that which is currently permissible for each licenced bore.</p> <p>Domestic needs will be prioritised above construction water supply and existing sustainable allocated water entitlements will be sourced where possible. The buying or sharing of groundwater from existing water licence/ entitlement/ permit is an option to be considered in the instance bore water is selected as a preferred source of construction water.</p>	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements Report

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
082c	82c.0014	State Agency	Groundwater		The capacity for the increased demand for treated water would also need to be a matter for consultation with the TRC or alternate provider.	Nil.	<p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. Currently the hierarchy of water supply source preferences prioritises non-potable sources to minimise impacts to communities and water users (Table 15.20 of Chapter 15: Groundwater). Further, the use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, it would be secured through private agreement through trading or purchasing of existing allocated entitlements, and the licenced capacity of existing bores will not be exceeded as described in Table 15-17 and 15-20. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements Report. If the use of TRC bores is to be considered for construction water supply, the appropriate approval process will be complied with and monitoring will be conducted as per standard processes (Section 15.7 and Table 15-20 of Chapter 15: Groundwater).</p> <p>Government bodies and local stakeholder have been consulted by ARTC regarding Water consultation as outlined in Table E-42 (Section 5.4) of Appendix E: Consultation Report. Following Project approval, ARTC is committed to upholding the engagement and consultation commitments, as the Project transitions through to construction.</p> <p>ARTC's future engagement responsibility during detailed design and construction are outlined in Section 7.2, Table E-72 of Appendix E: Consultation Report.</p> <p>Ongoing consultation with DRDMW and potentially impacted landowners regarding groundwater resources. Additionally, the commitment to a landowner bore make-good process is outlined in Section 15.7 of Chapter 15: Groundwater.</p>	<p>Chapter 15: Groundwater</p> <p>Section 15.7</p> <p>Table 15-17</p> <p>Table 15-20</p> <p>Appendix B5: Construction Water Requirements Report</p> <p>Appendix E: Consultation Report</p> <p>Section 5.4</p> <p>Section 7.2</p> <p>Table E-42</p> <p>Table E-72</p>
082c	82c.0015	State Agency	Groundwater		Ongoing, the need to maintain the culverts would seem vital to any flood management strategy and there is potentially a water demand for this task.	Nil.	<p>Appendix S: Surface Water Table 7.1 outlines the requirements for ARTC to perform maintenance works and activities to maintain features such as bridges, culverts and other drainage infrastructure (detailed in Section 1.4) during the operation of the Project. This is also outlined in Chapter 5: Project Description Section 5.8.4.</p> <p>Appendix S: Surface Water Quality, Table 7.1 states that drainage structures will be inspected to assess physical condition, performance and structural integrity, with corrective measures implemented, as required. Maintenance of surface and subsurface drains will be required to ensure continued effectiveness and to minimise risk of impact to surrounding and downstream environments and structures.</p>	<p>Appendix S: Surface Water Quality</p> <p>Section 1.4</p> <p>Table 7.1</p> <p>Chapter 5: Project Description</p> <p>Section 5.8.4</p>
082c	82c.0016	State Agency	Stakeholder Engagement		Issue: Consultation is dated, and a level of fatigue has developed due to lack of closure. The Project has not been widely consulted locally since 2019. There is a reported level of fatigue amongst the business community we engage with from what is felt to be a one-way conversation.	<p>Consultation should be a two-way process. The process for receiving and resolving concerns raised by stakeholders about negative impacts should be detailed transparently and publicly so that stakeholders know how their issues will be considered and adjudicated. This would include the principles used to determine how ARTC acts to reduce impacts or compensate those affected. Involvement of an independent mediator would help alleviate concerns stakeholders might have about how fairly negotiations will be conducted. With construction of Projects underway in other states it would be concerning if ARTC did not already have clearly defined processes that could be referenced.</p>	<p>As detailed in Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report, ARTC has undertaken broad engagement with the community during the development of the revised draft EIS using a variety of communication methods.</p> <p>Appendix E: Consultation Report, Section 2.5 outlines ARTC's stakeholder feedback process, including mechanisms for responding to stakeholder concerns and complaints. Local councils have also been engaged in how ARTC manages complaints, as detailed in Appendix E: Consultation Report, Section 4.3. In some instances, stakeholder feedback has resulted in reference design changes or mitigation measures, and these examples are outlined in Appendix E: Consultation Report, Section 4.1.</p> <p>An independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to the Project, as well as other relevant tasks.</p>	Appendix E: Consultation Report
082c	82c.0017	State Agency	Stakeholder Engagement		Concerns are repeatedly raised without a sense of being heard or receiving a response.	Nil.	ARTC's response to stakeholder concerns and consultation outcomes is detailed in Appendix E: Consultation Report, Section 5. Without specific examples, ARTC is unable to provide a meaningful response to this Section of the submission.	Appendix E: Consultation Report Section 5
082c	82c.0018	State Agency	Stakeholder Engagement		Consultation needs to be more regular and Inland Rail needs to have a mechanism to allay business fears.	Nil.	ARTC will ensure the development and implementation of an Australia Industry Participation Plan focusing on opportunities for involvement by local business in construction and operation of the Project. ARTC will continue to engage with Toowoomba and Surat Basin Enterprise (TSBE), Chambers of Commerce and local business groups/associations throughout reference design and into detailed design. The revised draft EIS outlines the consultation outcomes from engagement with local businesses along the alignment, including grazing and farm businesses, tourism operators and other businesses impacted by the Project. Details can be found in Appendix E: Consultation Report, Section 5.	Appendix E: Consultation Report Section 5
082c	82c.0019	State Agency	Stakeholder Engagement		Significant businesses in the region have advised that they receive acknowledgement of emails, but no actual responses.	Nil.	Details of ARTC's stakeholder feedback process is outlined in Appendix E: Consultation Report, Section 2.5. As noted in Appendix E: Consultation Report, Table E-5, ARTC aims to provide an initial response to all email enquiries within 48 hours. Without specific examples, ARTC is unable to provide a meaningful response to this section of the submission.	Appendix E: Consultation Report Section 2.5
082c	82c.0020	State Agency	Stakeholder Engagement		Key Government department representatives have also reported not having current consultation with the Project.	Nil.	<p>During the development of the draft EIS, ARTC undertook engagement with Government agencies as detailed in Appendix E: Consultation Report, Section 4.2 and Table E-18; however, this engagement was largely placed on hold during 2020 during the Coordinator-General's review of the draft EIS and due to COVID-19. During this period, ARTC has provided regular Project updates via email to the stakeholder database as detailed in the revised draft EIS.</p> <p>ARTC notes that engagement with DSDILGP has been ongoing at an operational level during 2021 and 2022 to inform the development of the revised draft EIS.</p>	Appendix E: Consultation Report Section 4.2 Table E-18
082c	82c.0021	State Agency	Economics		Issue: failure to quantified economic impact on the current intensive livestock operations within the Project footprint (3 cattle feedlots, 1 piggy and 1 poultry farm) or the current intensive livestock operations within proximity to the Project footprint (3 Cattle feedlots and 1 Piggery)". As detailed in Chapter 7 : Land Use and Tenure, potential land severances may cause a disruption in farm operations through impacts to essential farming infrastructure, services or access routes. The specific impact on the economic viability of farming operations as a result of this potential disruption to access and infrastructure is not quantified in this assessment, and the extent of these impacts will be confirmed during detailed design. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. "While identified as a potentially impacted properties, there would seem to be no effort to measure the impact of both the construction and operational stages, not only to the individually identified 'impacted property', but to the communities themselves due to the linkages of employment and as drivers of the local economy. For example, one impacted business is a substantial vertically integrated poultry operation, that is a significant driver for the economy of Millmerran and of the wider Darling Downs. It would be considered within the top 20 employers and businesses within the region and contributes significantly to the economy via grain and transport supply chain requirements. The change from what is currently a disused rail line to the proposed 26 trains per 24-hour period traversing at speed within 100 m of the infrastructure that houses their poultry and processing operations represents a significant impact to the business viability, none of this quantifiable impact would seem to have been captured.	That an effort be made to quantify the value of the impact, at a minimum the 5 properties identified within the Project footprint and to the wider community in which they support.	<p>An assessment of the economic impacts (EIA) per lot and commodity is not in the scope of the Environmental Impact Statement (EIS) assessment process. The requirements for EIA is outlined in Section 5.1 and 11.141 of the Project's final Terms of Reference (ToR). The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. These outcomes have been summarised in the revised draft EIS.</p> <p>In response to public notification of the draft EIS, ARTC has refined the Project alignment which has changed the potential impacts for a number of agricultural enterprises including cattle feedlots, piggeries and poultry farms. ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community being:</p> <ul style="list-style-type: none"> Removal of two active level crossings, increasing safety benefits for the community (for more information refer to Section 20.5 and 20.6 in Chapter 20: Traffic, Transport and Access). This is particularly important for: <ul style="list-style-type: none"> Community members travelling to the Millmerran Waste Management Facility Workers travelling to the Millmerran Power Station, the piggery on Lindenmayer Road and landowners travelling within their community (home and local townships). Reducing the potential impacts on transport requirements for logistical operations required for the current and future farming operations. Rail alignment traverses less area impacted by the 1% AEP Condamine Floodplain event (for more information please refer to Section 14.7, Section 14.8 and Section 14.9 of Chapter 14: Flooding and Geomorphology of the revised draft EIS) The new alignment indicates no changes to 1% AEP Condamine Floodplain impact objectives (i.e. afflux, velocities, inundation, and directional flows) on properties housing infrastructure for major regional employer's business infrastructure. Reduces the adverse economic and social impacts by: <ul style="list-style-type: none"> Creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks associated with Inland Rail's operational noise, vibration, light emissions, and potential biosecurity risks. For more information refer to Chapter 17: Social and Chapter 16: Noise and Vibration of the revised draft EIS. Avoids direct impacts to future planned infrastructure. The access road for the piggery infrastructure (Lindenmayer Road) no longer requires a level crossing, eliminating any direct impacts to associated traffic for future operations. <p>For more information refer to Chapter 18: Economics of the revised draft EIS.</p> <p>The revised Appendix Y: Economic Impact Assessment (EIA) in the revised draft EIS, included the calculation of potential loss for rural communities. Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential impacts to DA Hall and Co infrastructure and their piggy, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible.</p> <p>As outlined in the mitigation measures, ARTC will continue to work with impacted landowners and businesses regarding this change from the draft EIS and will continue to consult with key stakeholders during the detailed design stage.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.7</p> <p>Section 14.8</p> <p>Section 14.9</p> <p>Chapter 16: Noise and Vibration</p> <p>Chapter 17: Social</p> <p>Chapter 18: Economics</p> <p>Section 18.3</p> <p>Section 18.9</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.5</p> <p>Section 20.6</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 5.5</p> <p>Section 6</p>
082c	82c.0022	State Agency	Economics		Not quantifying this negative impact would seem to provide a skewed presentation of the economic impacts of the Project, particularly to the community of Millmerran and of the wider Darling Downs.	Nil.	The 'negative impact not quantified' has been assumed to be the Project costs. Due to the nature of the incremental assessment approach adopted for this revised draft EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with the Qld Government, costs have not been included in the Appendix Y: Economic Impact Assessment. Costs were considered in the Investment Case (Inland Rail Programme Business Case, 2015), which was developed to inform the Commonwealth's decision on whether or not to invest in the progression of the Inland Rail Project. It evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution.	<p>Chapter 18: Economics</p> <p>Section 18.7</p> <p>Section 18.5</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 2.2</p>
082c	82c.0023	State Agency	General Project opinion - negative		Issue: Currency of data Cumulative impact Projects timeframes etc	A more up to date consideration of the impact given significant changes in both the broader economic environment following COVID 19 and the construction methodology/ procurement structure and timeframe.	Additional assessments of the potential cumulative impacts of the Project have been conducted since submission of the draft EIS. These assessments have been used to update revised draft EIS Chapter 23: Cumulative Impacts.	Chapter 23: Cumulative Impacts

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
082c	82c.0024	State Agency	Economics		Issue: cost benefit analysis done on Programme wide not Project specific basis and limited analysis on impact post construction The EIS reflects the Inland Rail Program Business Case (ARTC, 2015) noting positive economic benefits that it includes, without offering comment on the veracity of those general claims or commenting on their relevance to the B2G Project. For Example "Lower prices for consumers as a result of lower inter-capital freight transport costs, which reduces the cost of living for households. " "Enhanced competition between rail and road freight, by providing a credible transport alternative, which will drive further innovation and efficiency" "Potential to promote the expansion and development of freight precincts around Inland Rail terminals as a result of the benefits from co-location and clustering of industries (as a result of reduced transport costs to warehousing, economies of scale and knowledge-sharing opportunities). While there is some specificity around construction impact the impact of the Project post construction would seem to retract to the all of program view. There does not appear to be any context within the EIS around opportunities outside the origination and termination points of the model:24hr model train and therefore the implied benefit may be condensed to only a few locations along the whole of program alignment not within the Project area. There is reference to the establishment of an Inland Rail Academy, which is described as a collection of Projects and partnerships, with the aim to facilitate local employment and procurement opportunities and build Inland Rail's social licence to operate the Inland Rail Program.	It would be good if more Project specific (operational) impacts could be identified and included. Such as determination and allowances for a set number of intermodal access points to be developed. Such detail will likely strengthen the case for tangible Project benefits.	ARTC acknowledges that as a component of the larger Inland Rail Program, the potential benefits of the Project cannot be separated from those that are attributed to the full Brisbane to Melbourne alignment. The full suite of potential benefits associated with the Inland Rail Program can only be realised once this Project and the 12 other Inland Rail Projects are completed and operational. The EIS considers a range of benefit types which may be a direct result of the Project and which can be quantified or identified as part of the Project, rather than the broader Inland Rail Program. These are captured under two broad benefit streams; providing competitive freight transport and supporting regional and local business; and are summarised in Section 5.2 of the Project EIS, Executive Summary. The revised draft EIS also summarises the broader program benefits identified in the 2015 Investment Case in the Executive Summary. Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific CBA has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in the Appendix Y: Economic Impact Assessment. As detailed in Section 7.4.9 of Appendix X: Social Impact Assessment and in Appendix E: Consultation Report, there is the potential for the Project to provide long term legacy benefits to local communities from Project investments which would remain after Inland Rail is constructed and operational. The legacy impacts have been identified through local consultation undertaken by ARTC. Legacy benefits include: <ul style="list-style-type: none"> local skills and business capacity road safety economic development community projects community values monitoring and planning resource digital connectivity More specifically, the Project's provision of training and employment opportunities will build the skills base within the study area, enabling ongoing opportunities for local workers in major Projects, and providing a greater skills base for local businesses. The Inland Rail Skills Academy is central to this, supporting skills and capability development for both construction and operation. In regard to opportunities outside of the origination and termination points of the model: All assumptions relating to demand modelling, including the connection to intermodal terminals or other supporting freight infrastructure, are considered in the Inland Rail Program Business Case (2015). The EIS reflects the information contained in the Business Case and does not include any new assumptions. As such considering the development of other infrastructure (such as intermodal terminals or supporting freight infrastructure) or Project options is outside the scope of this EIS. Benefits arising from Projects such as intermodals may bring additional local benefit, however this is not captured under the scope of the Project. Due to the nature of the Project, the operational economic impacts of the Project will only be fully realised once all components of Inland Rail are completed. Assessing each link of the Inland Rail Program individually and in isolation of the whole Program will not capture all the benefits expected to be generated upon completion of the entire Melbourne to Brisbane connection.	Chapter 18: Economics Section 18.7 Section 18.11 Appendix E: Consultation Report Section 7.4 Appendix X: Social Section 7.4.9
082c	82c.0025	State Agency	Stakeholder Engagement		Issue: Access to the line and intermodal points within the Project area. "Continuing to seek clarity about the planned operations of trains. This includes asking about train length, frequency, what will be transported, how trains will cope with winds, potential spur lines and how emergencies will be dealt with. The community and business operators are interested in opportunities to transport grain and other goods, as well as the potential for local employment for maintenance and operations and potential sidings and planned future intermodal developments. ARTC response "ARTC recruited a Business Development Manager based in Toowoomba to identify potential opportunities for the community and potential business operators who are interested in potentially transporting grains and other goods. Information about the service offering including length and frequency of trains was publicly available and promoted. "	It would be good if more Project specific (operational) impacts could be identified and included. Such as determination and allowances for a set number of intermodal access points to be developed. Such detail will likely strengthen the case for tangible Project benefits.	There is no predetermined location or number of sidings for the Project and ARTC does not develop sidings. The development of sidings is driven by the market. Private enterprise determines where it is viable to locate and operate a siding or terminal. Additionally, the Federal and State government are jointly undertaking a business case into intermodal terminals in south-east Queensland. Details can be found on the Australian Government website at investment.infrastructure.gov.au/Projects/ 111245-20qld-mrl . Potential opportunities for the community and business operators who are interested in potentially transporting agricultural freight and other goods have been and will continue to be identified. Information about the service offering including length and frequency of trains was publicly available and promoted.	N/A
082c	82c.0026	State Agency	Social Impact Assessment	Workforce and employment	Issue: Local Content and Indigenous and local participation. Project Employment – ARTC Commitment ... "Minimum local employment targets will be negotiated and agreed between ARTC and the Principal Contractor "Local Business and Industry Participation ... "Implementation of ARTC's Sustainable Procurement Policy" "Indigenous participation and local participation are included as key elements of construction tender assessment "Both local content and local employment opportunities have been consistent themes throughout consultation undertaken by ARTC. However, at this point no specific targets have been set by ARTC, instead leaving this to be negotiated with the Principal Contractor. There seems to be a softening of language, in Appendix Z – Proponent Commitments there is a line "Minimum local employment targets will be a requirement in tender documentation" I am unclear if that is ARTC tender documentation but it is changed to "Minimum local employment targets will be negotiated and agreed between ARTC and the Principal Contractor "In Chapter 16. There is also no reference to the Southern Queensland Correctional Centre facility being constructed at Gatton and the 500 + staff that will be needed operationally once complete. Additionally as some significant program wide contracts have already been awarded (steel tracks and sleepers) and some future work packages are known to have limited potential capability in Australia (comms and signalling etc), let alone rural Queensland, the need to direct a large percentage of the remaining Project spend to the impacted areas and communities is vital.	Details on how the Project will practically go about ensuring opportunities to create economic benefits are realised would strengthen the case for Project benefits. For example, there is an undertaking to ". . . build businesses' capacity to participate in the Project's supply chain through business development, mentoring and pre-qualification Projects. " This could be as little as a few advertisements, newsletters and/or video clips or it could be extensive direct assistance, including investment, in businesses The clear establishment of targets and or further information on how these elements will be weighted for consideration in the tender process would bring some clarity and confidence to this widely held area of interest and one of the more tangible benefit areas identified. It would also be important to understand what value of the budget for B2G remains uncommitted in arrangements external to the Project area.	As noted in Appendix X: Social Impact Assessment, Section 7.2.2, The Project will underpin its planning with the minimum participation targets set by related Commonwealth and Queensland policy. The Project will drive outcomes toward aspirational or incentivised targets with contractors to exceed these minimum benchmarks. The Project's contractual negotiations will remain commercial in confidence. Where policy benchmarks do not exist, minimum targets have been set with consideration for baseline labour and supply chain conditions, likely cumulative demand and competition for roles or supply at the time of Project construction, and with respect for input from related key stakeholder consultation. The Project is committed to a minimum local employment target of 15% (i.e. employment of residents of the SIA study area), which ensures that Project employment targets are enabling local employment choice, while managing the potential for regulated Project employment targets to accelerate or exacerbate local labour draw, which is a serious concern raised by both GRC and TRC. The Project's aspiration is for its Contractors to exceed this employment target should local labour capacity support this, without significant adverse impact to other local industry or supply chains, at the time of Project delivery. During its construction works stage, the Project will also align with the Queensland Government commitment to achieving an 11% female participation target, and aspires to the Department of Employment, Small Business and Training's recently set 15% target for women in frontline construction roles (Queensland Government, 2022). Updated analysis of the likely availability of construction labour from the SIA study area will be required prior to construction, to enable the refinement of local and regional recruitment and training strategies. The Southern Queensland Correctional Centre expansion is being built in Gatton. It was not considered as part of the cumulative Project set in the draft EIS. Construction of the expansion commenced in March 2021, and is expected to be complete in 2023. As such its peak construction period is unlikely to overlap with that of the Project. The Centre is also unlikely to require workers with similar skill-sets as Inland Rail to fill its operational roles. Appendix X: Social Impact Assessment, Section 7.6 has been revised to address this. Appendix X: Social Impact Assessment, Section 8.6.3 has been revised to include further details regarding the business capacity building programs delivered and planned for future Project stages. Appendix X: Social Impact Assessment, Section 8.3.3 and 8.6.3 have been updated to provide examples of and commentary regarding aspirational targets relevant to local and Indigenous procurement and workforce participation.	Appendix X: Social Impact Assessment Section 7.2.2 Section 7.6 Section 8.3.3 Section 8.6.3
082c	82c.0027	State Agency	Economics		Issue: Currency of data and labour market assumption "Since the completion of the economic modelling detailed in this report, there have been changes to the Project and the Project environment. These changes include alterations to the Inland Rail construction programme and the economic shock associated with the 2020 quarter 2 market conditions which are not reflected in the economic analysis or economic impact assessment contained within this report at the request of ARTC".2 Australian Government's Small Area Labour Markets publication, December 2019; ABS, Labour Force Survey, Australia, December 2019 (12-month moving average) published 28 March 2020; ABS 2016 Census of Population and Housing Participation rate for working age population 15 to 64 years # June 2016". Data from earlier than 2015 used to support the business case and employment and demographic data from 2019 and 2016 is used to describe existing labour market conditions. There have been significant labour market changes since 2019 which could lead to different conclusions in the baseline assessment and impact assessment. The assumption of a slack labour market is particularly concerning. Unemployment levels in the region are low and have been for some years. With acute employment shortages highlighted across businesses broadly within Toowoomba and across the Darling Downs. Notably that agricultural sector has been severely impacted due to international travel restrictions prohibiting the movement and access of foreign labour. This may have further negative impacts upon the rural businesses in these communities who are unable to compete for labour. There has been a better than anticipated recovery post COVID and a positive year in many areas of the agricultural sector for the first time in many years. There would seems to be little consideration made to the information in 15.11.2.1 around the scheduling of Projects and the cumulative impact on labour.	The slack labour market assumption should be reviewed more up to date data should be used to confirm the conclusions are still valid. Changing the modelling to a tight labour market makes a big difference: the employment numbers drop by about two thirds as the price of labour is much higher, for example.	ARTC has recently updated the EIS economic modelling (EIA) to reflect current labour market conditions. If labour market conditions at the national and state level remain in the recent range, the Project's construction works stage will be completed in the context of a relatively tight labour market, especially in the market for skilled labour relevant to the construction sector. However, the economic assessment indicates in Appendix Y: Economic Impact Assessment, Section 4, that there is some slack in the Darling Downs – Maranoa labour markets, which provides opportunities for recruiting, training and re-skilling available workforces in the region to supply a significant portion of the workforce requirements of the Project. The ability for the local economy to supply labour to the Project, depends on the specific location of works along the alignment. At the time of construction, local employment is dependent on a number of factors including labour market conditions, skills availability, and the existence of workforce training and participation programs to support local, Indigenous and youth employment. ARTC has updated all labour force characteristics in Chapter 18: Economics, Section 18.6 of the revised draft EIS to reflect the following data sets: <ul style="list-style-type: none"> National Skills Commission 2021, Small Area Labour Markets (SALM), LGA data tables, September quarter 2021 ABS 2022, Labour Force, Australia, Detailed: Table 16b. Labour force status by labour market region (ASGS) and sex, annual averages of the previous 12 months QGSO 2021, Population estimates: Regions, Age and sex indicators, LGA and SA2, 30 June 2020p ABS 2021, 2021 Census - Counting Persons, Place of Usual Residence (MB), LGA & SA4 (UR) by AGE5P - Age in Five Year Groups by LGA & SA (UR) by LFSP Labour Force Status (used for youth labour force calculations) These datasets represented the most recent publicly available data metrics for labour force in Queensland, at the time of preparing the revised EIA.	Chapter 18: Economics Section 18.6 Appendix Y: Economic Impact Assessment Section 4 Section 5.2
082c	82c.0028	State Agency	Economics		Issue: lack of detail or involvement in implied benefit "As part of Inland Rail, the Project has the potential to stimulate business and industry development at the Toowoomba Enterprise Hub in Wellcamp. By providing efficient transport access to intrastate and interstate markets, the Project may act as a catalyst for further private sector investment in this area, particularly for freight and logistic operations. The further development of the Toowoomba enterprise Hub has the potential to unlock greater economic activity in the region, such as though promoting greater international export opportunities via Wellcamp Airport. "It is unclear from this if the Project will build, contribute to, or otherwise assist with development of any intermodal facilities in the Toowoomba Enterprise Hub or any other assistant to proponents of Projects connecting to Inland Rail. If, for example, the Project will involve construction of one or more intermodal facilities for use in the construction process, and such facilities could be designed in such a way that they would be useful as commercial facilities and be sold, or otherwise made available to industry after completion of the build.	The provision of such common use infrastructure could substantially increase the catalytic impact of the Project. Similarly, any other assistance the Project may provide to proponents of Projects connecting into Inland Rail would strengthen the case for Project benefits.	There are no intermodal hubs which form part of the revised draft EIS. All assumptions relating to demand modelling, including the connection to intermodal terminals, are considered in the Inland Rail Programme Business Case (2015). The EIS reflects the information contained in the Business Case and does not include any new assumptions. As such considering the development of other infrastructure (such as intermodal terminals) or Project options is outside the scope of this EIS. It is noted the location of intermodal will have a material impact on the way benefits of Inland Rail are realised. Further information on possibilities for investment along the rail line, include: <ul style="list-style-type: none"> Long-term potential for growth in investment, employment and economic value Supply chain efficiencies and value chain growth Specific opportunities to invest alongside Inland Rail, what those investments might look like and growth forecasts for different regions International case studies and the way business hubs form around transport Some of the challenges and enablers for investment. Delivery of intermodal terminals by third party service providers. The Australian Government has jointly funded a business case to consider the development of an intermodal terminal to support Inland Rail in Queensland. See link: investment.infrastructure.gov.au/Projects/ ProjectDetails.aspx?Project_id=111245-20QLD-MRL	Chapter 18: Economics Section 18.5

082c	82c.0029	State Agency	Economics		Issue: lack of detail or involvement in implied benefit "Inland Rail is planning telecommunications systems as part of construction requirements and ongoing safe rail operations. ARTC is working with telecommunications carrier network operators to provide services for construction site offices, non-resident workforce accommodation and the railway corridor. While the focus will mainly be for the provision of voice and high speed data services around the rail track vicinity, it is envisaged that the extended wireless telecommunications network coverage and optical fibre systems will add benefit to the local communities (such as businesses) in those areas where previously such services did not exist. "As connectivity in regional areas is the subject of significant focus and investment, detail around the permanency of some of this infrastructure and the intention to construct infrastructure with a legacy benefit in mind may strengthen both the economic and the social benefit presented.	This would seem to be a missed opportunity of providing some actual legacy benefit from the Project, especially in the areas with significant impact and little obvious benefit.	As detailed in Chapter: 17: Social and Appendix: Social Impact Assessment, there is the potential for the Project to provide long term legacy benefits to local communities from Project investments which remain after Inland Rail is constructed and operational. The legacy impacts have been identified through local consultation undertaken by ARTC. Refer to Appendix E: Consultation Report, Project Legacy Engagement. Legacy benefits may include: <ul style="list-style-type: none"> Local skills and business capacity Road safety Economic development Community values monitoring and planning resource Community Projects Digital connectivity. 	Chapter 17: Social Chapter 18: Economics Section 18.11 Appendix E: Consultation Report Section 7.4
083a	83a.0002	State Agency	Social Impact Assessment		QLD Health considers accommodation camps to be sensitive receptors, meaning the same human health and well-being goals/ criteria applied to prescribed sensitive receptors in the EIS should be extended to areas where accommodation camps are located. For this reason, the proposed accommodation camp should be strategically located to minimise health risks.	Nil.	The Department's concern regarding the health of workers is noted. The proposed locations for the Yelarbon accommodation facility is the nearest to the rail corridor at approximately 2 km, whilst the Inglewood facility are located at a greater distance, and the Millmerran facility site is yet to be determined. ARTC will consider whether there is a need for air quality monitoring stations to be provided as part of the accommodation facilities but considers it unlikely that the air quality or noise impacts resulting from the Project would affect environmental conditions within the facilities. Appendix X: Social Impact Assessment, Section 7.3.4 has been revised in this regard.	Appendix X: Social Impact Assessment Section 7.3.4
083a	83a.0003	State Agency	Social Impact Assessment		The following measures should be addressed to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities population group: <ul style="list-style-type: none"> Outline the source and storage of the Potable water in the accommodation camps and subsequent disinfection if required; Ensure medical and first aid services provided in the accommodation camps comply with Health (Drugs and Poisons) Regulation 1996 and that the relevant local health authorities are aware of the camp prior to it being established Consideration should be given to implementing strategies to reduce advise health effects resulting from social isolation; ARTC should regularly monitor Chief Health Office Public Health Directions for latest information on any potential impacts on workforce or propose accommodation arrangements. 	Nil.	As part of the Accommodation Management Plan, the following planning for healthy environmental conditions within the non-resident workforce accommodation facilities will be implemented: <ul style="list-style-type: none"> Provision and storge (and subsequent disinfection if required) of potable water Compliance with the Health (Drugs and Poisons) Regulation 1996 with respect to the provision of medical and first aid services Mitigation of potential noise impacts from the use of generators for power generation Strategies to improve social connectedness for workers and avoid social isolation such as enabling access to nearby towns, internet access and provision of social activities How pests and vermin will be appropriately managed to prevent infestation Monitoring Public Health Directions for the latest information on any potential impacts on the workforce or proposed accommodation arrangements. Appendix X: Social Impact Assessment, Section 8.4.4 has been revised in this regard.	Appendix X: Social Impact Assessment Section 8.4.4
083a	83a.0004	State Agency	Air Quality		Darling Downs Public Health Unit recommends a series of monitoring and mitigation actions to be considered to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities. See proposed solution column.	The following measures should be addressed to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities population group: - Consideration should be given to potential noise impact from the accommodation camps and site these accordingly based on predominant wind predictions;	The placement of non-resident workforce accommodation facility will consider nearby air emissions sources such as fuel storage (50-metre separation distance) and construction laydown areas. Further mitigations have been considered for detailed design and construction of the placement of non-resident workforce accommodation facilities, such as concrete batching plants and locomotive emissions, and consideration of the prevailing wind directions as outlined in Table 8.2 of Appendix R: Air Quality Technical Report. The mitigation measures in Chapter 12: Air Quality (Section 12.6.3, Table 12-36) have been updated to include considerations with respect to impacts to non-resident workforce accommodation facilities.	Chapter 12: Air Quality Section 12.6.3 Table 12-36 Appendix R: Air Quality Technical Report Table 8.2
083a	83a.0005	State Agency	Noise and Vibration	Mitigation measures	Darling Downs Public Health Unit recommends series of mitigation and monitoring actions to be considered to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities. See proposed solution column.	The following measures should be addressed to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities population group: Consideration should be given to potential noise impact from the use of the diesel generator for power generation	Noise impacts to the workforce is a matter of workplace health and safety, and is not considered an environmental impact. As such, these noise impacts have not been assessed as part of the revised draft EIS. Temporary workforce accommodation camps would be designed and constructed to meet workplace health and safety legislation. It should be noted however that sensitive receptor impacts relating to the operations of the temporary accommodation camps have been assessed as part of the revised draft EIS (Section 16.6 of Chapter 16: Noise and Vibration and Section 6 of Appendix Y: Noise and Vibration Assessment - Construction and Road Traffic). The assessment factors in the use of generators within the temporary workforce accommodation camps. With respect to impacts to the residential sensitive receptors, no exceedance of the CoP Vol 2 noise criteria has been predicted for the Yelarbon and Inglewood accommodation camps.	Chapter 16: Noise and Vibration Section 16.6 Appendix Y: Noise and Vibration Assessment - Construction and Road Traffic Section 6
083a	83a.0006	State Agency	Flora and Fauna		Darling Downs Public Health Unit recommends series of mitigation and monitoring actions to be considered to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities. See proposed solution column.	The following measures should be addressed to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities population group: <ul style="list-style-type: none"> Consideration should be given to implementing strategies (including monitoring) on how pests and vermin will be managed to prevent infestation in camps; The Proponent should assess the sites potential (both construction and the camp) to create breeding sites for biting insects and describe strategies (including monitoring) to prevent the spread of mosquito born diseases in the area. 	Approvals and operations of the workforce accommodation facilities will be managed by the contractor, and will be in line with Workplace Health and Safety legislation. Management Plans will be developed for the facilities, and will include appropriate and suitable management measures to ensure the health, safety and well-being of residents. Outline measures are included in Chapter 24: Draft Outline Environmental Management Plan.	Chapter 24: Draft Outline Environmental Management Plan
083a	83a.0007	State Agency	Groundwater	Mitigation measures	Darling Downs Public Health Unit recommends series of mitigation and monitoring actions to be considered to appropriately assess and manage the increased risk to human health in the temporary accommodation facilities. See proposed solution column.	Further information needs to be provided on what mitigation measures will be implemented where current, proposed and future bore water is affected, other than where supply is disrupted through regular flooding or drawdown processes, such as contamination on groundwater.	Consideration of potential for groundwater contamination has been incorporated in a preliminary contamination assessment in Chapter 15: Groundwater (Table 12-17) and supported by Chapter 9: Land Resources (Sections 9.4.5, 9.5.9 and 9.510), including a site history study and limited soil and groundwater sampling and analysis. The sites subject to potentially contaminating activities identified as part of the preliminary contamination assessment have been reviewed in the context of potential for groundwater contamination and potential for extraction of groundwater as part of the Project (i.e. groundwater seepage into deep cuts) in that area. Further, analysis of a broad suite of contaminants has been included as part of the baseline groundwater monitoring program. More detailed soil and groundwater investigations will be undertaken in detailed design stage, including the identification of areas with potential for groundwater contamination with a focus on locations of proposed deep cuts with potential to intercept the groundwater table and the findings of the contamination conceptual site model and risk-based approach to site management. Revised draft Appendix X: Social Impact Assessment in Table 8.11, notes that "The Project's non-resident workforce accommodation will be self-sufficient with respect to water management and sewage treatment".	Chapter 9: Land Resources Section 9.4.5 Section 9.5.9 Section 9.5.10 Chapter 15: Groundwater Table 12-17 Appendix X: Social Impact Statement Table 8.11
9	9.0002	Private	Noise and Vibration	Mitigation measures	Noise mitigation plans for Yelarbon School and Scout hall should be fully described prior to acceptance of the draft EIS statement. Appendix T Figure 24 suggests a 4 m high sound barrier of unspecified material with or without associated earthworks like retaining walls and earth mounds. There also appears to be no reason from the picture provided why the wall could not extend another 70 m east and west for further benefit. There is no commitment to a specific acoustic absorbing material, only a listing of potential options. The submitter highlights the lack of commitment to noise and scenic mitigation and consultation with the community about these issue prior to the start of the Project.	Provide data on the wall to be provided. Extend the wall another 70 m east and west for further benefit. Make commitment to specific acoustic absorbing material.	The railway noise assessment has been revised in accordance with Department of Transport and Main Road's DTMR's Interim Guideline (2019), including examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. The noise and vibration assessment information, including discussion on noise mitigation, can be found in Section 16 of Appendix W (Railway operations) and Section 16.10 Chapter 16: Noise and Vibration of the revised draft EIS. Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations provides a review of the noise barrier options for the Project. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. Brookstead and Yelarbon State Schools are located within 200 m of the Project footprint and the Southbrook Central State School is located 900 m from the alignment. These schools may be impacted by construction and/or operational noise and construction activities. Consultation with these schools and the Department of Education (DoE) commenced in 2017. Engagement with DoE and the school principals in 2018, 2021 and 2022 has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. Details of these meetings are outlined in Appendix E: Consultation Report, Section 4.2, Queensland Government engagement. The agreed approach is to work with the schools and DoE during detailed design to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through operations.	Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Section 4.2 Appendix W: Noise and Vibration Assessment - Railway Operations Section 17 Section 17.4
9	9.0003	Private	Noise and Vibration	Mitigation measures	For the remaining 17 receptors still not meeting the watered down guidelines (instead of the WHO recommendation for Night noise levels,) there is no indication which on-property mitigations will be offered, what the criteria will be for qualifying for them, and whether these further measures will bring levels within the guidelines.	Provide information to the remaining 17 receptors about on-property mitigations, what the criteria will be for qualifying them and whether these further measures will bring levels within the guidelines. This should be done before the draft EIS is accepted, and further required to compensate property owners where these requirements cannot be met.	The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors along the alignment. The assessment of noise from railway operations is conducted in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration (refer to Chapter 16: Noise and Vibration, and Appendix W: Noise and Vibration Assessment - Railway Operations). The sleep disturbance assessment has been based on the Queensland Noise and Vibration EIS Information Guide (DES, 2024), which references the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 (enHEALTH 2018). The enHEALTH 2018 publication includes review of international evidence on the influence of environmental noise on sleep, cardiovascular disease and cognitive outcomes. It is based on over 200 research papers, publications and policies from January 1994 to March 2014. Compliance with the enHEALTH threshold does not preclude the potential for sleep disturbance in some individuals. Inland Rail recognise that lower thresholds for sleep disturbance have been proposed in Europe (44dBA Leq.night) (World Health Organization, 2018). The 44 dBA night-time level as an evidence-based threshold is not strongly supported in the enHEALTH guideline as it only accounts for about 3% probability of being highly sleep disturbed based on the research literature reviewed. Comparatively, the 55 dBA threshold has about 10% probability of being highly sleep disturbed. The enHEALTH publication has considered these aspects in developing the 55 dBA threshold for Australian conditions. It is important to note that the night-time threshold of 55 dBA is a lower, and more stringent, noise level criterion than the requirements of the Interim Guideline. Furthermore, the application of a 55 dBA Leq.night noise level criterion is deemed more stringent than any noise management threshold that has been implemented on rail Projects in Queensland. Results of the assessment are discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. The assessment notes that majority of the exceedances are observed to be in towns. These receptors would benefit from any noise barriers being implemented. The review of noise barrier options is discussed in Section 17.4 of Appendix W: Noise and Vibration Assessment - Railway Operations. Outside of these towns and/or barrier locations presented in the assessment, the remaining receptors are observed to be isolated, even if the predicted levels were to be exceeded (by 2-3 dB for a theoretical worst-case scenario). Therefore, mitigation to these receptors would be limited to property treatments, subject to further investigations. Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project, making it premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design. As per the Department of Transport and Main Roads Interim Guideline – Operational Rail Noise and Vibration, where noise criteria is exceeded, reasonable and practicable mitigation options should be implemented at ARTC's expense. ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations. 091a	91a.0009	Private	Project alignment		Summary of original 10-page submission - broadly supportive, but request that attention be given to the proposal for all but 7 km of the 216 km Project to be dual gauge (as opposed to just standard gauge with some conversion of narrow to standard gauge or some other track in South Western Qld), and other issues including curvature, level crossings, emissions and external costs.	Nil.	<p>As described in Section 5.4.2 of Chapter 5: Project Description, the Project comprises dual gauge track to accommodate both standard gauge and narrow-gauge trains. This design enables seamless interoperability between the new Inland Rail infrastructure, the existing QR network, and their respective operators. The primary goal is to meet the operational needs of existing services in Queensland while also facilitating the transportation of freight between Melbourne, Brisbane, and various intermodal hubs.</p> <p>It is important to note that the operation of the QR network and any upgrades or modifications to it fall under the jurisdiction of the Department of Transport and Main Roads, acting as the rail authority. If there are proposed modifications that go beyond the scope of the current Inland Rail Program, such as upgrading from narrow gauge to standard gauge, the appropriate course of action would be to directly submit those proposals to the respective rail authority.</p>	<p>Chapter 5: Project Description Section 5.4.2</p>
98	98.0002	State	Noise and Vibration	Mitigation measures	The preferred treatments for achieving acceptable environmental noise standards for impacted housing in Yelarbon, Brookstead and Pittsworth, including any noise barrier treatments, need to be made available for State Agency review before the commencement of these works and the operation of the rail line.	As the preferred treatments for achieving acceptable environmental noise standards for housing, including any noise barrier treatments, are to be identified in the Project's detailed design phase, this information should be included in any upgraded SIMP and EMP and made available for State Agency review via a condition of any approval granted by the Coordinator-General	<p>Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.4 discusses noise barrier options for the Project. Noise barrier treatment is recommended as a reasonable and practicable noise mitigation option in the assessment, and ARTC will determine its further implications and viability during the detailed design and construction works stages of the Project.</p> <p>ARTC has now included in the revised draft EIS, some additional artist's impressions showing the potential for mitigation measures to reduce the visual impact and to improve visual amenity where noise walls are proposed within the Border to Gowrie LVIA study area (e.g. in the vicinity of Yelarbon, Brookstead and Pittsworth). Refer to Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4 Visual impact assessment, and Appendix K: Landscape and Visual Impact Assessment, Section 8.2. The existing Viewpoint 2 (VP02) and associated visualisation in Yelarbon have now been updated to show and describe the potential impact of conceptual noise walls in this location. In addition, a new viewpoint (VP03) and visualisation has been prepared to discuss and represent potential impacts as viewed from the Yelarbon Silo Art viewing area (VP03 and VP04).</p> <p>It must be noted that these are indicative only and that detailed mitigation measures are subject to detailed design and liaison with relevant landowners and managers and to ensure compliance with detailed site constraints (e.g. frangible vegetation zone requirements and sightlines) that cannot be resolved at this stage. ARTC will comply with any conditions of approval relating to consultation with State agencies on noise mitigation.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment Section 10.5.4</p> <p>Appendix K: Landscape and Visual Impact Assessment Section 8.2</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17.4</p>
