172	172.0003	State Agency	Groundwater		Chapter 13, Table 13.5 of the dEIS describes features associated with the Surat Basin and Clarence-Moreton Basins.	<p>Advice The Gubberamunda Sandstone has not been included here as a formation nor aquifer within the Kumbarella Beds sequence.</p> <p>Under the previous Water Plan (Water Resource (Great Artesian Basin) Plan 2006), the Kumbarella Beds was the recognised geological name for the group of aquifers and as such, was managed as a group. Under the new Water Plan (Great Artesian Basin and other Regional Aquifers) 2017, the Kumbarella Beds has been separated into the separate formations for management purposes. The Gubberamunda Sandstone is identified as a management unit with both stock and domestic licences and volumetric licences attached to land parcels located within the vicinity of the Inland Rail route.</p> <p>Surrounding CSG wells, Blu Indigo 2A and Indigo 2, show the presence of Gubberamunda Sandstone in their stratigraphic logs. Additionally, the Updated Geology and Geological Model for the Surat Cumulative Management Area 2019 contains mapping of the interpreted thickness of Gubberamunda Sandstone that clearly shows the unit is present in the area</p> <p>Further consultation is required between DRDMW and ARTC to discuss this potential difference in interpretation.</p> <p>The EIS should acknowledge the presence of water licences to take from the Gubberamunda Sandstone that are currently issued and the existence of this significant aquifer in this area.</p>	The revised draft EIS has been reviewed and updated accordingly. See Chapter 15: Groundwater, Table 15.1.	Chapter 15: Groundwater Table 15.1
172	172.0004	State Agency	Groundwater		Chapter 13, 13.6.5 of the dEIS states The search identified 439 registered bores within the impact assessment area of which 156 were excluded from further evaluation due to an absence of data.	<p>Advice DRDMW requires clarification to establish if these bores are considered as part of any make good arrangements. Despite no information on depth/strata, there are still in many cases a working bore and may even be attached to a current water licence. All 439 registered bores need to be included as part of impact assessment and make good arrangements implemented.</p>	The revised draft EIS identified 197 registered bores with no aquifer or bore construction attributes. Therefore, these bores were excluded from the EIS groundwater conceptualisation (see Chapter 15: Groundwater, Section 15.5.4). However, these bores were still considered as part of the bore survey and the make-good process outlined in Section 15.7.4 of Chapter 15: Groundwater will apply to all of these bores. Registered and Project investigation bores in the groundwater impact assessment area are detailed in Section 15.2a-h.	Chapter 15: Groundwater Section 15.5.4 Section 15.7.4 Section 15.2a-h
172	172.0005	State Agency	Groundwater		Incorrect references in text and figures. Data listed for the Main Range Volcanics is missing approx.10,000 ml of entitlement	<p>Correct references and figures provided for Chapter 13, Table 13.7 'Summary of groundwater entitlements for the impact and surrounding area'. Include data li for the Main Range Volcanics unit</p>	<p>The summary of groundwater entitlements has been updated as part of the revised draft EIS.</p> <p>Chapter 15: Groundwater, Table 15.7 has been updated to reflect groundwater entitlements associated to real properties (lot/plan) that fall within the impact assessment area only.</p>	Chapter 15: Groundwater Table 15.7
172	172.0006	State Agency	Groundwater		Chapter 13, Table 13.15 of the dEIS states where a groundwater bore is expected to be decommissioned or have access to it impaired as a result of the Project, make good measures will be agreed in consultation with the affected landowner. Such measures may include the provision of an alternate water supply/new bore.	<p>Include Provide details of the options that will be provided to landowners regarding a new bore and acknowledgment that an authorisation to drill may need to be obtained.</p> <p>Advice It is recommended ARTC clarify if the new bores are/are not replacement bores under the relevant code (Code for Self-assessable development of replacement bores).</p> <p>In some cases, and depending on what aquifer the bore is tapping, a new bore may need to be assessed for its possible impacts to groundwater dependent ecosystems and existing entitlements. Authority to drill may also be required under a development permit.</p>	<p>Reference in the revised draft EIS has been updated (Edition 4, 2020). To be included in the make good process framework.</p> <p>As stated in Table 15-20 of Chapter 15: Groundwater, currently the water supply strategy does not include provision for new groundwater bores or licences in order to minimise impacts to aquifers and water users.</p> <p>Table 15-17 (Section 15.6.3) of Chapter 15: Groundwater, outlines that "the establishment of new groundwater bores for sourcing construction water is not considered a practical sourcing solution due to:</p> <ul style="list-style-type: none"> ▶ The existing pressure placed on groundwater as a resource in the region ▶ The licencing and approval requirements to establish new groundwater bores ▶ The flow rates required to meet construction water demands may not be appropriately met through reliance on groundwater ▶ Challenges regarding the management of groundwater quality ▶ Aquifers in the region are close to full allocation through existing water entitlements. However, the use of existing sustainable groundwater allocated entitlements to supplement the construction demand for the Project may be considered if owners of registered bores have capacity under their water entitlement that they wish to lease to ARTC or the Contractor under a water trading agreement. Therefore, the volumes extracted would be within the existing licencing limits and the extent of drawdown experienced would be localised and consistent with that which is currently permissible for each licenced bore. <p>Construction water sources will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS) and will be documented as part of the Construction Water Plan. Potential sources include supplemented, unsupplemented and recycled sources. The current construction water sourcing strategy is summarised in Chapter 5: Project Description, Section 5.6.24. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Section 15.6.3 Table 15-17 Table 15-20 Appendix B5: Construction Water Requirements
172	172.0007	State Agency	Land Use and Tenure		Chapter 5, 5.17 of the dEIS states The Project has the potential to result in direct and permanent impacts to land use and tenure within the Project footprint, with the majority of impacts occurring on commencement of land acquisition and construction. Potential impacts to land use and tenure associated with the Project are assessed in Chapter 7: Land Use and Tenure.	<p>Advice Unless held by a local government or a mining lease holder, a water licence is attached to a parcel of land.</p> <p>Under Section 43 of the Water Regulation 2016, if a water licence is attached to part of land taken under the Acquisition of Land Act 1967, the licence may be amended by the Department of Regional Development, Manufacturing and Water if the source of water is still able to be taken on the main property. If the remaining part of land no longer adjoins the original source, on the day the acquisition happens the water licence is taken to be held jointly by all owners of the land to which the licence applies.</p> <p>This situation remains in force until the joint owners apply to amend and/or transfer the jointly held water licence under the Water Act 2000.</p>	<p>Advice is noted.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.2, states that where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Sections 8.5.1 and 8.6.2 of the revised draft EIS for further detail.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> ▶ Landowners' needs regarding access to the properties and the closure of private roads. ▶ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority. ▶ The potential for changes to groundwater access. 	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2
172	172.0008	State Agency	Surface Water		Chapter 5, Pages 5-99 and 5-100 of the dEIS state the following: <ul style="list-style-type: none"> ▶ Page 5-99 Alternative surface water storages, identified in or otherwise, may be accessed for the sourcing of construction water subject to obtaining the appropriate water allocation or licence under the Water Act 2000 (Qld). ▶ Page 5-99 Consultation with the Dumaresq-Barwon Border Rivers Commission, SunWater, GRC and TRC during the process will be required to establish the availability of water from dams and weirs in proximity to the Project ▶ Page 5-100 Extraction of water from a watercourse typically requires: ▶ A water allocation, water licence or water permit. Applications for resource entitlements are assessed against relevant criteria in the Water Act and relevant water resource plan and resource operations plan. 	<p>Amend Replace existing text to that shown in bold and delete that shown in strikethrough:</p> <ul style="list-style-type: none"> ▶ Page 5-99, Alternative surface water storages, identified in or otherwise, may be accessed for the sourcing of construction water subject to obtaining the appropriate access to construction water from water markets, water licences or water permits under the Water Act 2000 appropriate water allocation or licence under the Water Act 2000 (Qld). ▶ Page 5-99, Consultation with the DRDMW, Dumaresq-Barwon Border Rivers Commission, SunWater, GRC and TRC during the process will be required to establish the availability of water from dams and weirs in proximity to the Project. ▶ Page 5-100, A water allocation, water licence or water permit. Applications for resource entitlements are assessed against relevant criteria in the Water Act and relevant water resource plan, and resource operations plan and resource operations plan, water management protocols and Water supply schemes operation manuals. <p>Reason</p> <ul style="list-style-type: none"> ▶ Amendment required to reflect potential avenues to access water to use for construction (i.e. via water markets, water licences or water permits under the Water Act 2000). ▶ ARTC should consult with DRDMW regarding access to water to use for construction. ▶ Amendment required to reflect water planning document changes. Information on water planning and policy is available on the Business Queensland website: Water Business Queensland 	<p>Discussion regarding construction water in Section 5.6.24 of Chapter 5: Project Description has been revised substantially since release of the draft EIS and the text referenced by this submission has either been modified or removed. Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>ARTC has consulted with each of the potential water suppliers identified in Section 5.6.24, Appendix E: Consultation Report.</p>	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements Appendix E: Consultation Report
172	172.0009	State Agency	Surface Water		Name of river - Chapter 12, Table 12.14 of the draft EIS has an entry that states: <ul style="list-style-type: none"> ▶ Condamine River (Northern Branch) (Ch 148.7) 	<p>Amend Replace existing text to that shown in bold and delete that shown in strikethrough:</p> <ul style="list-style-type: none"> ▶ Condamine River (North Northern Branch) (Ch 148.7) <p>Reason Amendment required in order to accurately reference this watercourse as per the Queensland Globe watercourse identification map.</p>	<p>References to this watercourse have been amended throughout the revised draft EIS to "Condamine River (North Branch)".</p> <p>Changes to the reference design since release of the draft EIS means that the chainage at this watercourse is now Ch 150.0.</p>	N/A
172	172.0010	State Agency	Groundwater		Chapter 12, 12.7.1.3 of the draft EIS states: <ul style="list-style-type: none"> ▶ Water Plans are part of the Basin Plan 2012 (Cth) and set new rules on how much water can be taken from the system (as licenced water harvesting). 	<p>Amend Replace existing text to that shown in bold and delete that shown in strikethrough:</p> <p>Water Plans are part of the Basin Plan 2012 (Cth) and set new rules on how much water can be taken from the system (such as licenced water authorised water harvesting).</p> <p>Reason Amendment required to reflect that not all water is managed as licenced water harvesting</p>	<p>Chapter 13: Surface Water has since been revised, wording relating to Water Plans and the <i>Basin Plan 2012</i> (Cth) are outlined in Section 13.22 Regulatory Environment, Table 13-1. Details regarding these plans are listed under the <i>Water Act 2007</i> (Cth) as follows:</p> <p>The <i>Water Act 2007</i> (Cth) provides the legislative framework for ensuring that the Murray–Darling Basin is managed in accordance with Australia's national interests. The <i>Water Act 2007</i> recognises that Australian States manage water resources within their jurisdictions that occur within the Murray–Darling Basin. The Project traverses the Murray-Darling Basin Plan, the Basin Plan and the Queensland Water Plan, as described below:</p> <p>The Murray-Darling Basin Plan (Basin Plan) is prepared under the <i>Water Act 2007</i> (Cth) subparagraph 44(3)(b)(i) and is the overarching plan to manage the Basin as a whole connected system.</p> <p>The Basin Plan was agreed to in 2012 by all the Basin jurisdictions, including the Queensland Government. Under the Basin Plan, each Basin State and Territory government is required to prepare a water resource plan for each catchment identified in the Basin Plan.</p> <p>The <i>Queensland Water Plan (Condamine and Balonne) 2019</i> and <i>Water Plan (Border Rivers and Moonie) 2019</i> have each been accredited by the Australian Government minister as being consistent with the Basin Plan.</p>	Chapter 13: Surface Water Section 13.22

172	172.0011	State Agency	Surface Water		Chapter 12, pages 12-111 and 12-112 of the draft EIS has two instances where it is stated: <ul style="list-style-type: none"> Extraction of water from a watercourse typically requires: <ul style="list-style-type: none"> A water allocation, water licence or water permit. Applications for resource entitlements are assessed against relevant criteria in the Water Act and relevant water resource plan and resource operations plan 	Amend Replace existing text to that shown in bold, italicise that shown in italics and delete that shown in strikethrough: <ul style="list-style-type: none"> Extraction of water from a watercourse typically requires: <ul style="list-style-type: none"> A water allocation, water licence or water permit. Applications for resource entitlements are assessed against relevant criteria in the Water Act 2000, the Water Regulation 2016, relevant water resource plans, water protocols and Water Supply Schemes operations manuals and resource operations plan Reason Amendment required to reflect water planning document changes.	Wording has been amended in the revised draft EIS as per suggestion. Information regarding sourcing of construction water and associated approvals (allocations, licences, permits) are described in detail in Chapter 5: Project Description, Section 5.6.24. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements
172	172.0012	State Agency	Editorial		Where requirements under the Water Act 2000 are discussed, the draft EIS references the Department of Natural Resources, Mines and Energy as the responsible agency.	Amend Where the Department of Natural Resources, Mines and Energy is referenced in relation to requirements under the Water Act 2000, it is recommended the department name be changed to the Department of Regional Development, Manufacturing and Water. Reason The Water Act 2000 was previously regulated by the former Department of Natural Resources, Mines and Energy. As a result of recent machinery of government restructure, the Water Act 2000 is now regulated by the Department of Regional Development, Manufacturing and Water.	A detailed review of all Government department names has been undertaken throughout the EIS to ensure currency and continuity.	N/A
172	172.0013	State Agency	Approvals/ conditions/ recommend-ations		The Terms of reference compliance Table states The assessment and supporting information are considered sufficient for the Coordinator General and administering authority to decide whether approvals sought through the EIS process should be granted.	Any approvals for water related development will need to be applied for after the Coordinator Generals evaluation report is issued. There is insufficient information in the eEIS to enable DRDMW to assess and condition appropriately for any approvals and authorisations that may be required under the Planning Act 2016 and/or Water Act 2000.	The revised draft EIS is not seeking approval or stated conditions associated with any ERAs. Preparation of ERA application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the Detailed Design and Construction Works stage (see Chapter 3: Legislation and Project Approvals Process, Table 3-2 and Section 3.21).	Chapter 3: Legislation and Project Approvals Process Section 3.21 Table 3-2
173	173.0001	State Agency	Traffic and Transport	Construction traffic	Construction traffic should avoid school bus routes, school zones.	Include Education Department as a stakeholder in the development of the Traffic Management sub-plans due to impacts on safety around schools and along bus routes	Appendix AA: Traffic Impact Assessment, Section 5.10.4 details the impact of the Projection school bus routes. The EIS commits that, given that the school bus routes do not tend to have designated bus stops, apart from the termini, prior to the Construction Works stage of the Project, suitable mitigation measures for all of the affected services, including the location of bus stops, should be identified in consultation with bus operators, local councils, impacted schools, Department of Education and the local community and be documented in the TMP to ensure school bus safety and understand any impacts to journey times, if any. These stakeholders should be consulted as part of the Project and made aware of the proposed changes to the school bus routes. The construction Contractor will also be made aware of the presence of school bus routes and bus stops and their operational hours as part of the Project induction process. The Education Department will be included in review of Traffic Management Plans.	Appendix AA: Traffic Impact Assessment Section 5.10.4
173	173.0003	State Agency	Surface Water	Flood immunity	Schools and associated grounds and infrastructure are flood sensitive receptors.	Department of Education to be a key stakeholder due to impacts on school infrastructure, playgrounds, outdoor learning and recreation spaces including ovals.	A full review of Flood Sensitive Receptors (FSR) has been carried out within the areas that were hydraulically modelled. Yelarbon State School has been included in the FSR list and can be identified by FSR IDs - MCB_ID_293, MCB_ID_294, MCB_ID_295, MCB_ID_425 and MCB_ID_536.	N/A
174	174.0001	Private	Groundwater	Private groundwater bore/s	ARTC has stated that the drawdown of bores (that is the depth that water will be available from) will drop down from between 15 m to 80 m. This will mean that the majority of bores utilising the aquifers drained by ARTC will become dry. Once water is struck during drilling of bores the drilling stops as it is expensive. Few bores would be 80 m deeper than the water level. ARTC have also said they will decommission landowners bores. This contravenes the TOR statement of volumes and quality of water resources are maintained, and current lawful users of water are not adversely affected by the development". See Appendix 1 of submission for bore logs.	ARTC need to be conditioned to make good on all bores that experience lower water levels.	The water level was predicted to be previously reduced by ~12 m, and up to a lateral distance of 80 m. This has now been updated with revised predictive modelling results, to ~9 m vertically and up to a 43 m horizontally from the cut (rail centreline) where the water level is being reduced to create a safe working environment (Chapter 15: Groundwater, Section 15.6.2). Bores are required to be decommissioned to enable the Project. The Project utilises the existing South Western Line and Millmerran Branch Line rail corridors as much as possible (71.2 kilometres), thereby minimising the need to develop land and impact on water resources that have not previously been subject to disturbance for transport infrastructure purposes. ARTC has engaged with water users/landowners likely to be impacted to determine an appropriate make-good mitigation strategy for bores impacted by the rail alignment on a case-by-case basis. Details of the proposed potential make-good process and potential measures are detailed in Section 15.7.4 and Table 15-20, Chapter 15: Groundwater of the revised draft EIS.	Chapter 15: Groundwater Section 15.6.2 Section 15.7.4 Table 15-20
174	174.0002	Private	Groundwater	Private groundwater bore/s	Bores cannot be decommissioned, and the alignment of the rail needs to change to ensure that no bores are decommissioned. Bores are the lifeblood of the inner downs. The small lot sizes and the black soil mean that there is not sufficient space for dams and that dams will not hold water anyway due the porous nature of the high-quality soil. The alignment of the track needs to be on existing corridors which will not require excavation and dissection of the water Table or blasting which will fragment the aquifer. Deep drainage will only exacerbate the drawn down of bores and in addition this will mean that water on those properties is lost in perpetuity as the water is moved deeper into the underground system.	ARTC should be prohibited from deep draining the seepage into the rail line.	The preferred alignment for the proposed rail corridor was identified based on an analysis of multiple corridor options, with the final preferred alignment presenting the strongest benefits for industry and the community in general, while minimising impacts to the natural and rural landscape. The location of the alignment was selected in part as it is located within the existing Southern Freight Rail Corridor, gazetted as a future rail corridor in 2010. However, some excavations (cuts) will be required to achieve suitable landform within the Border to Gowrie section. Where bores are located within the Project footprint and are required to be decommissioned for construction of the Project, ARTC will ensure 'make good' measures are agreed in consultation with the affected landholder (see Section 15.7.4 and Table 15.20 of Chapter 15: Groundwater). These 'make-good' measures will be commensurate with the level of impact anticipated and may include replacement bores on the same property. As modelling has indicated drawdown will likely only extend a maximum of 43 m horizontally from the deepest cut, impacts to bores outside the groundwater investigation area are unlikely. Groundwater monitoring will continue throughout the Construction Works and Operations stages of the Project to monitor for potential impacts as a result of the Project. Only temporary (during construction) and isolated drawdown in the vicinity of deep cuts is anticipated. No regional groundwater drawdown/wider impact on the aquifer is anticipated. See predictive modelling results in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.	Chapter 15: Groundwater Section 15.6.2 Section 15.7.4 Table 15-20 Appendix U: Groundwater Technical Report Section 6.3
174	174.0003	Private	Flooding	Directly impacted landowner	ARTC state the hydrologic and flooding assessment undertaken has demonstrated the Project is predicted to result in impacts on the existing flooding regime that generally comply with the flood impact objectives. • This statement can only be true if ARTCs flood impact objective was to ensure wholesale destruction of farmlands. The map indicates that more than 50 per cent of my property will be inundated with flood water. In addition, ARTC state, changes to the duration of the design flood events within the Gowrie Creek floodplain are negligible. Flood Map 1 shows the depth of water changes. The water will increase by greater than 50cm, and probably much more but ARTC did not include a scale greater than the 50 cm depth. There is no map in the EIS indicating directional flow of water either prior to the construction of the line or after completion.	ARTC need to redo the modelling to include directional flow, directional changes and sediment changes. ARTC should also be required to undertake this assessment with the alignment heading further north across dryland property and join the QR line at a reduced angle, to demonstrate the lesser impacts of this alignment on flood impacts.	Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. In order to support this, additional mapping has been generated by ARTC to provide further information and justification to the Expert Flood Panel. This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report – Volume 2 and the online digital platform. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
174	174.0004	Private	Land Use and Tenure		ARTCs claim that the Regional Planning Interests Act does not apply. The Project should be rejected based on the definition of a regulated activity from the act. Other rail lines in Queensland have needed to comply with this act. In fact ARTC claim that 25% of the rail freight on Inland Rail will be coal, which may make the RPI act applicable from a Resource Activity perspective as well. Submission includes map showing strategic cropping overlay on submitter's property. In addition, the inner downs is considered a Priority Agricultural Area in the Darling Downs Regional Plan. This plan also has Millmerran, Pittsworth and Southbrook are Priority Living Areas.	The project route should be reconsidered a regulated activity due to the considerable negative impacts on strategic cropping. The impact on the Millmerran, Pittsworth and Southbrook priority living areas needs to be addressed by ARTC.	As discussed in Chapter 8: Land Use and Tenure, Section 8.2, the Regional Planning Interests Act 2014 (Qld) regulates areas of regional interest and requires a resource activity or regulated activity proposed to be located in an area of regional interest to obtain a regional interests development approval. As the Project is not a resource activity nor a regulated activity under the Regional Planning Interests Act 2014 (Qld), the Act does not apply. As such, the Regional Planning Interests Act 2014 (Qld), and the alignment's impact on the matters protected under Regional Planning Interests Act 2014 (Qld), do not have a bearing on the EIS process, nor is the approval of the EIS contingent on the assessment of the Project's impact on areas of regional interest (Chapter 3: Legislation and Project Approvals Process, Section 3.426). Notwithstanding this, the Project's impact on areas of regional interest protected under the Regional Planning Interests Act 2014 (Qld) has been assessed to provide a comprehensive assessment of the Project's impact on agricultural, environmental and societal values present within both the temporary and permanent disturbance footprints of the alignment. To quantify the impact of the Project on recognised areas of regional interest however, an analysis is presented in Chapter 8: Land Use and Tenure, Table 8-9, which provides a total of areas of regional interest in relation to the Project footprints. Impacts of the Project on agricultural land and their associated values including Agricultural Land Classification Class A and Class B and Important Agricultural Areas have been avoided, minimised or mitigated through design and construction considerations. Chapter 8: Land Use and Tenure, Table 8-46 (Section 8.5.4), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible. A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners (Chapter 8: Land Use and Tenure, Section 8.6.2). The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Section 8.6.2 of Chapter 8: Land Use and Tenure). ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises.	Chapter 3: Legislation and Project Approvals Process Section 3.426 Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.2 Table 8-46

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
174	174.0005		Economics		ARTC have not undertaken any defensible economic analysis of the project, either providing financial benefits of outlining financial losses due to land becoming sterilised or loss on income to local communities when landowners do not spend money locally. This is supported by the Economic Chapter being the shortest at 39 pages of the 14,000 pages of the EIS. ARTC stakeholder engagement has been substandard. Submitter includes further details about their farming operations to demonstrate ARTC has understated impacts and has not attempted to work with landowners on a solution.	ARTC need to provide a proper economic analysis that includes the economic losses that will be imposed on rural communities.	<p>ARTC acknowledges that due to the nature of the Project, the operational economic impacts of the Project will only be fully realised once all components of Inland Rail are completed. Assessing each link of the Inland Rail Program individually and in isolation of the whole Program will not capture all the benefits expected to be generated upon completion of the entire Melbourne to Brisbane connection. . Therefore, as agreed with Queensland Government costs have not been included in the Economic Technical Report.</p> <p>In response to public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the revised draft EIS, including to the calculated potential loss for rural communities. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year. Note, only the direct impacts of the Project have been captured in the EIS. Follow on impacts such as those related to discretionary spending by agricultural producers have not been captured in Appendix Y: Economic Impact Assessment.</p> <p>Due to the extensive Project footprint, numerous engineering, planning and environmental technical aspects of the Project, needed to be investigated as part of the revised draft EIS and be communicated to key stakeholders. This has included, but not limited to the following areas:</p> <ul style="list-style-type: none">➤ Directly impacted landowner consultation on alignment development➤ Land acquisition➤ Hydrology and flooding➤ Noise➤ Traffic, transport, emergency access and road–rail interfaces➤ Indigenous stakeholder consultation➤ State forest revocation process➤ Development of the draft SIA➤ Economic impact assessment➤ Non-resident workforce accommodation facilities➤ Groundwater assessment➤ Construction water➤ Utilities/engineering interfaces➤ Fauna connectivity➤ Development of the draft Koala Management Plan. <p>Consultation has been undertaken with a cross-Section of stakeholders to share information and receive feedback on multiple specific technical studies and assessments to prepare the revised draft EIS. This has included a wide range of stakeholders from: Elected representatives, Commonwealth and State agencies, Regional Councils (Goondiwindi and Toowoomba Regional Councils), Border to Gowrie Community Consultative Committees, community and conservation groups, businesses and agricultural enterprises, directly and indirectly impacted landowners. Refer to Appendix E: Consultation Report.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none">➤ Direct impacts on properties e.g. severance and loss of productive land➤ Impacts on property accesses and connectivity, including the location of level crossings on private roads➤ Impacts on the movement of stock, water, produce and equipment.	Chapter 18: Economics Section 18.7 Section 18.12 Appendix E: Consultation Report Appendix Y: Economic Impact Assessment Section 5.5
174	174.0006	Private	Stakeholder engagement	Directly impacted landowner	When the IR corridor was released, submitter contacted ARTC in good faith to ask a series of questions. After meetings with ARTC both on farm and in their Toowoomba office, they would not answer any of my questions and did not seem to understand farming and definitely did not understand irrigation farming where the water infrastructure needs to be connected to the paddocks in order to irrigate.	nil.	<p>Chapter 6: Stakeholder Engagement, Section 6.6 and Appendix E: Consultation Report, Section 5.1 details the engagement undertaken with landowners in the study area, including letter, phone calls, and one-on-one meetings. Landowners have also been involved in broad-scale community engagement activities such as community information sessions and CCC meetings.</p> <p>ARTC notes that following ongoing direct engagement with the submitter the design in across the submitter's property was altered to improve access across the alignment and minimise impacts to agricultural operations.</p> <p>During preparation of the Project reference design and EIS, it was not within ARTC's scope to investigate alternative routes outside the study area that was set by the Australian Government following its review of the four alternative routes in the Yelarbon to Gowrie Corridor Options Report (DIRD 2016).</p> <p>ARTC will continue to consult with landowners during future stages of the Project to ensure they are fully informed of the design process and the proposed mitigation measures specific to their respective properties.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Appendix E: Consultation Report Section 5.1
174	174.0007	Private	Project alignment		The farm adjacent to the submitter's property is dryland and meets the creek at a better angle for a bridge. The submitter proposed that the line be moved west to less productive land, and ARTC refused saying they would just be impacting a different land holder. Surely if the IR is to provide economic benefit it should also be designed to protect the current productive areas of land. However, after saying they could not move the line, ARTC have in fact moved the line in numerous cases to benefit big business. Again, this demonstrated ARTCs poor decision making skills.	If alternative alignments are to be considered, ARTC should have set criteria that are transparent and defensible so everyone can understand why the line can be moved for one person and not another.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 meters (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">➤ ability to enhance the Inland Rail service offering➤ construction and operating costs➤ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)➤ approvals and stakeholder engagement: 12.5 per cent➤ technical viability: 17 per cent➤ safety: 16.5 per cent➤ constructability: 12.5 per cent➤ operations: 16.5 per cent. <p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
174	174.0008		Economics		ARTC is very sly, one sided and determined to shut down every small business, lifestyle property and self-funded retiree investment property. There are numerous people affected here and ARTC will not listen. There are 440 dissected properties in our Section of the IR, which will be rendered useless. Traditionally the owners of the smaller blocks spend considerable sums of money in advancing their properties, and owners of the larger ones spend considerable sums of money on bulk agricultural inputs. However, if we work on an average over the whole 440 blocks of \$100,000 a year in expenditure, that is \$44,000,000 removed from the regional economy in expenditure. This of course does not account for any income that would also be spent in the local area. In addition, the 1,100 blocks sitting in the 2 km corridor will have reduced expenditure as these property values will be negatively affected also, and people won't spend money on improving them if they are going to lose money when they come to sell.	This needs to be accounted in the business case.	<p>The purpose of the EIS process is to inform decision-makers and the public of the environmental consequences of implementing a proposed Project. The impact assessment identifies, predicts, and analyses impacts on the physical environment, as well as social, cultural, economic and health impacts. The proponent is required to produce documentation describing the proposal, the potential environmental impacts and how these impacts would be managed. The economic analysis provided in this revised draft EIS response is tailored to consider these impacts and appropriate mitigation measures.</p> <p>Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Qld Government costs have not been included in Appendix Y: Economic Impact Assessment.</p> <p>The Investment Case (Inland Rail Programme Business Case 2015) evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution.</p>	
174	174.0009	Private	Stakeholder engagement		ARTC's community consultation is problematic. Submitter provides examples of consultation activities that suit ARTC but not the community. Community Consultation Committees do not provide genuine opportunities for the community to ask questions.	<ol style="list-style-type: none">1. Re- examine the route with an overlay of economic impacts, so that the money lost to regional community is accounted for;2. If the route must proceed, then detailed route must minimise the impacts on high production farms and be moved to less productive blocks of land3. Sack ARTC so IR can be managed professionally like a major project should be4. Have the new builder of the rail engage in proper consultation and be willing to change the route when there is overwhelming evidence that the chosen route will only result in a disaster.	<p>During preparation of the Project reference design and EIS, it was not within ARTC's scope to investigate alternative routes outside the study area that was set by the Australian Government following its review of the four alternative routes in the Yelarbon to Gowrie Corridor Options Report (DIRD 2016). Subsequent to the submission of the EIS to the Coordinator-General, at the request of the Deputy Prime Minister, in 2020, ARTC prepared the Inland Rail Information Paper, which considered alternative Project alignments via Whetstone State Forest and Cecil Plains.</p> <p>It concluded that the alternative alignment would result in a longer distance and transit time, increased costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The methodologies employed in the Information Paper were reviewed by GTA Consultants and were found to be suitable. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Appendix E: Consultation Report details the breadth of community engagement which supported the draft EIS and revised draft EIS development. Section 5.12 in Appendix E: Consultation Report details the engagement undertaken to inform the Social Impact Assessment (Appendix X: Social Impact Assessment) and Social Impact Management Plan (SIMP). This included engagement through one-on-one landowner meetings, Community Consultative Committees, interactive mapping (Social Pinpoint), fact sheets, website, social media, newsletters, community information sessions and the 1800 free call phone number.</p> <p>ARTC will continue to engage with stakeholders, including key emergency and social services in the region, through the finalisation of the revised draft EIS and development of detailed design. Appendix X: Social Impact Assessment, Section 8 outlines the Project's Social Impact Management Plan (SIMP), which describes how the Project will engage with communities and stakeholders including emergency services, to mitigate social impacts, enhance Project benefits for the SIA study area, and monitor and report on the delivery and effectiveness of management measures.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Appendix E: Consultation Report Section 2 Section 5.12 Appendix X: Social Impact Assessment Section 8
175	175.0001	Private	Flora and Fauna	Koala	The EIS fails to identify the extent of the known and significance of koala habitat that exists adjacent to the proposed IR corridor from Millmeran to Gowrie. It is known that the territory in which koalas move is extensive, therefore it is concerning that the project's construction will pose such a threat to their movements and biodiversity. Pittsworth Landcare and local residents have identified the extent of the habitat and significance of the local koala population.	<ol style="list-style-type: none">1. Failure to reroute the alignment will destroy koala habitat for 100s of kilometres.2. All attempts must be made to preserve koala habitat.	<p>Appendix O: Matters of National Environmental Significance Report outlines the assessment undertaken to determine the degree of significance of impacts on koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan (DKMP). The DKMP proposes specific management and mitigation measures for koalas during both construction and railway operations.</p> <p>The preferred location for the proposed Project rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">➤ Ability to enhance the Inland Rail service offering➤ Construction and operating costs➤ Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken in Section 2.8-2.10. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix O: Matters of National Environmental Significance Report Appendix P: Fauna Connectivity Strategy

176	176.0002	Private	Noise and Vibration	Operational rail noise	Height of structures over the Oakey to Pittsworth Road and Lochabar Road will mean operational noise will be disturbingly audible to more residents than identified in the EIS. No detail is given of the dimensions of noise barriers. Effectiveness of noise barriers is questionable.	<ol style="list-style-type: none"> 1. EIS does not comply with the TOR 2. EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design. 3. True noise and vibration impact on Pittsworth cannot be determined until detailed design. 4. Review alignment - the route is unsuitable. 	<p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community. The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors, commercial operations, and businesses along the Project alignment (Chapter 16: Noise and Vibration, Section 16.8). Both the construction and operational noise assessment study areas cover an area within a 2 km radius of the revised draft EIS project alignment. The study area is substantially larger than normally applied on transport infrastructure projects, which usually only consider an area large enough to capture the closest receptors. The DTMR Interim Guideline only requires an impact area of up to 150 metres from the railway.</p> <p>As noted in Section 2.8 of the Chapter 2: Project Rationale in the revised draft EIS, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>Concept visualisations for the noise walls at Brookstead and Pittsworth have been included in the Landscape and Visual Amenity Technical Report for the revised draft EIS, noting that the design of noise walls will be further developed during detailed design. Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork. Viewpoint 22 (Pittsworth-Felton Road near Pittsworth Motor Inn) in Chapter 10: Landscape and Visual Impact Assessment, Section 10.5.4, has been updated to include an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and Regional Councils.</p> <p>Regarding proposed solution, it is not feasible to place a night-time curfew on trains travelling through the towns of Pampas, Brookstead and Pittsworth, as one of the remits of Inland Rail is to move freight between Melbourne and Brisbane within 24 hours. However, ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.5.4</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 17</p>
176	176.0004	Private	Traffic and Transport		Five laybys of varying area to be located in close proximity to Pittsworth will result in considerable machinery movements - another source of noise and dust and a potential impediment to local traffic movement.	<ol style="list-style-type: none"> 1. EIS does not comply with the TOR 2. EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until detailed design. 3. True noise and vibration impact on Pittsworth cannot be determined until detailed design. 4. Review alignment - the route is unsuitable. 	<p>The revised draft EIS has been updated to address potential impacts from construction noise and vibration to sensitive receptors along the Project alignment. ARTC acknowledges the concern from the community that noise and vibration may impact lifestyle and amenity for some sensitive receptors during the construction stage of the Project.</p> <p>The construction noise impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case 15-minute construction noise levels based on a preliminary construction methodology (Section 6 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic). Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. Construction noise impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The revised draft EIS has identified the potential for sensitive receptors to be impacted by construction stage noise and vibration in exceedance of the nominated criteria. During detailed design, further detailed engineering, and acoustic assessments, including noise modelling, will be undertaken and will consider sensitive receptors in the vicinity of the Project. Specific and reasonable mitigation measures will be developed and implemented following this detailed assessment. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 7</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
177	177.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents due to the on-going noise and vibration from the rolling stock combined with additional signals form alarm bells and train horns, resulting in daytime disruptions and night-time sleep disturbance. The height of structures over the Oakey to Pittsworth Road and Lochabar Road will mean that Operational Noise will be disturbingly audible to more residents than have been identified in the Noise Abatement Section of the EIS Appendix T 15.4.4. The 5 laybys of varying area to be located in close proximity to the township, will result in considerable machinery movements, another source of noise and dust and a potential impediment to the movement of local traffic. Vibration of a train of the length and tonnage has not been quantified. Vibration and noise that will affect the entire town population, during the driving of piles to the required depth.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the project footprint have been completed. ARTC provide scant details that fail to identify the true impact this project will have on urban areas like Pittsworth.	<p>ARTC acknowledge the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the Construction Works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the Detailed Design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline Operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Section 16.8 and Section 16.10 within Chapter 16: Noise and Vibration, Railway Noise Assessment.</p> <p>Ground borne vibration is assessed in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 13.2It is identified that any receivers with 12 metres from the alignment has potential to exceed the human comfort criteria. Further assessment of these impact is recommended during the Detailed Design stage to verify the screening assessment outcomes.</p> <p>ARTC acknowledges that during the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well-being, ARTC has partnered with various Private Health Networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 16: Noise and Vibration Section 16.10 Chapter 17: Social Chapter 24: Draft Outline Environmental Management Plan Appendix W: Noise and Vibration – Railway Operations Section 13 Section 17
177	177.0004	Private - Brookstead	Social Impact Assessment	Property Devaluation	<ul style="list-style-type: none"> Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. Families with young children living on the northern side of the town will be impacted by real estate devaluation. 	Review the entire alignment, this route is not suitable.	The EIS is required to assess the Project alignment as detailed throughout the revised draft EIS Chapter 5: Project Description.	Chapter 5: Project Description
177	177.0005	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC have failed to engage with residents and inform them of the impacts of the train noise and vibration. 	The true noise and vibration impact on the community cannot be determined until all details of the project footprint have been completed. ARTC provide scant details that fail to identify the true impact this project will have on urban areas like Pittsworth.	<p>Engagement about noise and vibration impact is ongoing as the Project progresses its noise modelling, noise impact assessment and baseline monitoring as part of the development of the EIS and reference design.</p> <p>As part of the noise and vibration consultation program, all directly impacted landowners and sensitive receptors identified in the assessment in 2019 were contacted via letter and/or face-to-face meeting. The engagement plan also identified indirectly impacted stakeholders, with an interest or concern about noise along the alignment. Nine community information sessions were held to provide the wider community with an opportunity to engage with ARTC about noise and vibration.</p> <p>Following the public notification of the draft EIS in early 2021, ARTC has continued to meet with landowners regarding noise, how noise modelling works and what mitigation may be considered.</p> <p>Further assessment of rail noise and vibration was undertaken as part of the revised draft EIS. Details are provided in Appendix V: Construction noise and vibration and operational road traffic noise technical report and Appendix W: Operational railway noise and vibration technical report.</p> <p>Additional noise consultation will be undertaken in 2024 with all sensitive receptors identified in the revised draft EIS. ARTC recognises that ongoing and transparent engagement with landowners and community on noise will be critical during detailed design as the design development continues and additional modelling is conducted.</p> <p>ARTC will continue to develop and refine the construction methodology to minimise noise and vibration impacts to sensitive receptors. The results of refined construction noise and vibration modelling will be communicated to potentially affected residents and occupants (sensitive receptors) where noise criteria is exceeded.</p>	Appendix E: Consultation Report Section 5
178	178.0001	Private	Stakeholder engagement	Directly impacted landowner	ARTC's consultation has not been appropriate, it has been superficial. The records and experience of the submitter's family with floods over a century has been ignored by ARTC. Submitter's concerns are validated by the findings published in the draft report of the Independent Panel of Experts for Flood Studies in Queensland and Toowoomba Regional Council's proposed submission to the CG on the draft EIS.	Do not accept ARTC's draft EIS and the final EIS- request ARTC revise its draft EIS to address the flaws identified by affected landowners. Panel of Experts and Senate Inquiry require the revised draft EIS to be released for public comment - visit submitter's property and properties of their neighbours to see evidence of the past flooding events and understand the risks of the unknowns, omissions and other-reliance on desktop assumptions in ARTC's flawed draft EIS.	<p>ARTC notes that it has undertaken extensive engagement with the submitter, including visiting the submitter's property, and those of his neighbours, on multiple occasions with a number of technical experts to view evidence of flooding events.</p> <p>Since submission, significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the floodplain crossings. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable, and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.</p> <p>ARTC will continue consultation with impacted stakeholders will continue through detailed design of the Project to ensure that alterations to the design and its impacts are communicated back to landowners. Impacts are to be determined at all drainage structures and waterways affected by construction works. The change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event.</p>	Appendix E: Consultation Report Section 5
178	178.0002	Private	Flooding		There are multiple route options through the neighbouring DA Hall & Co properties which present varying impact scenarios that are not presented in the EIS. Therefore, there is no way to know what impacts the project will have on homes, businesses or livelihoods of local residents. It is not possible to quantify the extent of levels of future flood events and volumes of water diverted onto the submitter's property, the rates of erosion or amount of debris. ARTC has not address the TOR.	Do not accept ARTC's draft EIS and the final EIS- request ARTC revise its draft EIS to address the flaws identified by affected landowners. Panel of Experts and Senate Inquiry require the revised draft EIS to be released for public comment - visit submitter's property and properties of their neighbours to see evidence of the past flooding events and understand the risks of the unknowns, omissions and other-reliance on desktop assumptions in ARTC's flawed draft EIS.	<p>Construction and operations flood impacts on land in the Condamine River floodplain have been described in Section 14.8 of the revised draft EIS Chapter 14: Flood and Geomorphology and Section 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Chapter 14: Flooding and Geomorphology Section 14.8 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 7.5.3 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
179	179.0001	Community Group	Social Impact Assessment	Workforce accommodation village	The proposed non-resident workforce camp at Turallin would have significant difficulties to overcome for the camp to be successful. Areas of concern include low quality, narrow, frequently flooded road requires more travel to the construction site north and south of Millmerran.	Locate the camp in the vicinity of Millmerran-Inglewood Road - distanced from populated areas of Millmerran to allow ease of travel both north and south of Millmerran and using an arterial road not a minor road. Bussing construction staff to daily worksites would be less travel time. Off duty staff could also be bussed into Millmerran for shopping and recreation without impacting limited car parking spaces in town.	<p>As described in Chapter 5: Project Description, Section 5.6.4 of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and the Millmerran area. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation to likely construction sites for fatigue-management purposes Land tenure and ownership of each site Available land area Proximity to supporting infrastructure and services Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation To avoid areas that are within the 1% AEP floodplains where possible Constraints such as significant vegetation communities, threatened species or heritage sites Road access Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities and have been included in the revised draft EIS (one each in the Yelarbon and Inglewood areas). The location of the third site in the Millmerran area will be undertaken in detailed design and subject to further review and approval.</p> <p>While possible locations for non-resident workforce accommodation facilities have been identified, final locations will be subject to detailed design. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project.</p> <p>Opportunities for the future beneficial re-use of the non-resident workforce accommodation facilities, once construction has been completed, will be further investigated. This will include further consultation with the relevant Local Governments and the relevant stakeholders. As discussed in Chapter 17: Social, Section 17.5, the ARTC and Contractor will consult with TRC and landowners in the Millmerran area to identify a suitable site for the accommodation facility. The selection of the site will also be informed by consideration of any potential for impacts on the health, amenity or privacy of local community members, as well as local businesses' feedback about potential benefits for businesses (discussed below). Preliminary consultation with TRC and GRC indicated that the non-resident workforce accommodation facilities was likely to bring the benefits of local supply opportunities and workforce expenditure, and also noted the potential for workforce accommodation to leave legacy values that would increase town amenity and/or tourism potential; however, possible limitations on waste, water, and sewage infrastructure were noted.</p> <p>An engagement session with the Turallin community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facilities to be located within Millmerran Township and for further engagement from the Project. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Further consultation regarding non-resident accommodation locations will be undertaken with the community, Appendix E: Consultation Report, Section 5.11.</p>	Chapter 5: Project Description Section 5.6.4 Chapter 17: Social Section 17.5 Appendix E: Consultation Report Section 5.11

180	180.0002	Private	Social Impact Assessment		Unbelievable that the railway line will be just metres from the Brookstead State School. How will those children be able to work with the noise and vibration happening daily, and also travel to and from school with increased road risk due to the rail proximity and crossing?	nil.	<p>Assessment of the Project's potential operational noise impacts is detailed in Appendix W: Noise and Vibration Assessment - Railway Operations of the revised draft EIS and indicates the potential for noise to exceed the assessment criteria at the Brookstead State School, where noise mitigation measures may be required.</p> <p>ARTC has engaged with Department of Education and the agreed approach is to work with the Department of Education during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. ARTC has also advised Department of Education about the need for permanent road realignments at Brookstead, and committed to consultation with the Brookstead community in the development of more detailed traffic management measures during the Detailed Design stage (Appendix X: Social Impact Assessment, Section 6.2.4).</p> <p>As further discussed in Appendix X: Social Impact Assessment, Section 7.4.1 and 8.5.8 ARTC will consult with the Department of Education and Yelarbon, Brookstead and Southbrook State Schools during the development of the detailed design and confirmation of construction methodology to:</p> <ul style="list-style-type: none"> ▶ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks ▶ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to local traffic during construction, any disruptions to school bus routes and traffic management measures (e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways) ▶ Conduct an audit of the affected schools' sites layouts, to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, which may include façade treatments, fence treatments or air conditioning ▶ Confirm all relevant school bus services and contact details for their operators to enable consultation with the operators ▶ Identify any specific considerations (e.g. off-campus sports or activities) which should be considered in the Project's RUMP and Traffic Management Plan. 	Appendix X: Social Impact Assessment Section 6.2.4 Section 7.4.1 Section 8.5.8
180	180.0003	Private	Flora and Fauna	Koala	Koala habitats along the railway line from Pampas to Southbrook will be impacted. This is the breeding ground for an extensive koala community. No ecological survey sites were taken between Pittsworth and Southbrook and no koala communities are identified at Yarranlea nor between Pittsworth and Southbrook.	Studies from Millmerran to Southbrook need to revisit surveys of and impacts on local wildlife. Specifically, EIS Chapter on flora and fauna needs to be redone to include accurate information on the koala numbers and habitat from Millmerran to Southbrook. Without accurate numbers impacts and mitigation cannot be determined in an acceptable and sustainable way.	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan (DKMP).</p> <p>The Fauna Connectivity Strategy (Appendix P: Fauna Connectivity Strategy) provides additional information on the management and mitigation measures to ensure fauna connectivity is maintained. The strategy looks at specific listed species and proposes tailored design strategies accordingly.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ Ability to enhance the Inland Rail service offering ▶ Construction and operating costs ▶ Multi-criteria analysis (MCA). <p>As described in Section 2.8-2.10 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix M: Draft Koala Management Plan Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy
180	180.0004	Private	Noise and Vibration	Operational rail noise	Detail of train signalling will only be provided in the Detailed Design phase subsequent to the EIS, and this does not provide an opportunity to adequately respond to the EIS as we do not have sufficient information on potential noise issues. The EIS does not provide the necessary level of detail around noise levels and mitigation options and in itself is a failing of the TOR.	The draft EIS should be rejected based on the incomplete nature of information we need to effectively comment on noise and vibration and social impact.	<p>Information on signalling and communications is provided in Section 5.4.14 of the revised draft EIS Chapter 5: Project Description. The Project will be operated initially using Centralised Train Control with the infrastructure installed upgradable to accommodate future deployment of the Advanced Train Management System (ATMS). ATMS is a digital train management solution with real-time monitoring of trains with GPS and mobile technology and will support ARTC's objectives of improving rail network capacity, operational flexibility, train service availability, transit times, rail safety and system reliability. Interfaces between the ARTC and QR Network, including signalling systems are subject to ongoing discussions between ARTC and QR now and during the Project's Detailed Design stage.</p> <p>With respect to operational railway noise impacts, ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline Operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS (Section 6.3 of Appendix W: Noise and Vibration Assessment - Railway Operations). The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Section 16.10 of Chapter 16: Noise and Vibration, Railway Noise Assessment and Mitigation and Management Measures.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 5: Project Description Section 5.4.14 Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 6.3 Appendix D

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
180	180.0005	Private	Traffic and Transport		The detail of road and rail design will only be provided in the Detailed Design phase subsequent to the EIS, and this does not provide an opportunity to adequately respond to the EIS as we do not have sufficient information. This in itself is a failing of stakeholder engagement and the planning and communication process.	The consultation in the Pittsworth region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The draft EIS should be rejected based on the incomplete nature of information we need to effectively comment on environmental and social impact.	<p>The revised draft EIS provides detail on the road and rail design in the Pittsworth region is outlined in the EIS.</p> <ul style="list-style-type: none"> Chapter 2: Project Rationale details the route selection for the Pittsworth area (Section 2.9.3). Chapter 5: Project Description Section 5.4.8 discusses the road rail interfaces and reference design. This is further supported by the Appendix design drawings Part 1 and 2. Appendix E: Consultation Report talks to the roads engagement in Pittsworth. Chapter 20: Traffic, Transport and Access and Appendix AA: Traffic Impact Assessment discuss all of the impacts of the road and rail design on the road network, including roads, intersections, road-rail interfaces, and accesses, as well as assessing the impacts on relevant road users and stake holders. Each other Section of the report also addresses this region based on the road and rail design set out for this area. <p>Further, regarding road-rail interface design and updates to the reference design since this submission:</p> <p>In 2021, eight community information sessions were held in Pittsworth to address community concerns about Project impacts, including road, rail and bridge design. Residents were engaged on design treatments for French Road and Tip Road level crossing, and grade separation design for Oakley Pittsworth Road, Quilbet Road and Dallman Road, Lochaber Road, McEwan Lane and Paint Mine Road, and Linthorpe Road. The rail bridge design at Pittsworth is a topography assisted grade separation (rail bridge over the road) at Oakley Pittsworth Road. The rail bridge spans a natural depression in the landscape as the alignment continues to rise to the highest point on the alignment towards Southbrook. Community information sessions are detailed in Appendix E: Consultation Report, Section 4.6 of the revised draft EIS.</p> <p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.9.3 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.9.3 Chapter 5: Project Description Section 5.4.8 Chapter 20: Traffic, Transport and Access Appendix AA: Traffic Impact Assessment Appendix E: Consultation Report Section 4.6</p>
181	181.0002	Private	Social Impact Assessment		Unbelievable that the railway line will be just metres from the Brookstead State School. How will those children be able to work with the noise and vibration happening daily, and also travel to and from school with increased road risk due to the rail proximity and crossing?	nil.	<p>Assessment of the Project's potential operational noise impacts is detailed in Appendix W: Noise and Vibration Assessment - Railway Operations of the revised draft EIS and indicates the potential for noise to exceed the assessment criteria at the Brookstead State School, where noise mitigation measures may be required.</p> <p>ARTC has engaged with Department of Education and the agreed approach is to work with the Department of Education during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. ARTC has also advised Department of Education about the need for permanent road realignments at Brookstead, and committed to consultation with the Brookstead community in the development of more detailed traffic management measures during the Detailed Design stage (Appendix X: Social Impact Assessment, Section 6.2.4).</p> <p>As further discussed in Appendix X: Social Impact Assessment, Section 7.4.1 and 8.5.8 ARTC will consult with the Department of Education and Yelarbon, Brookstead and Southbrook State Schools during the development of the detailed design and confirmation of construction methodology to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks Describe the construction schedule and the nature of road rail interface treatments, temporary disruptions to local traffic during construction, any disruptions to school bus routes and traffic management measures e.g. supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways Conduct an audit of the affected schools' sites layouts, to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, which may include façade treatments, fence treatments or air conditioning Confirm all relevant school bus services and contact details for their operators to enable consultation with the operators Identify any specific considerations (e.g. off campus sports or activities) which should be considered in the Project's RUMP and Traffic Management Plan. 	<p>Appendix X: Social Impact Assessment Section 6.2.4 Section 7.4.1 Section 8.5.8</p>
181	181.0003	Private	Flora and Fauna	Koala	Koala habitats along the railway line from Pampas to Southbrook will be impacted. This is the breeding ground for an extensive koala community. No ecological survey sites were taken between Pittsworth and Southbrook and no koala communities are identified at Yarranlea nor between Pittsworth and Southbrook.	Studies from Millmerran to Southbrook need to revisit surveys of and impacts on local wildlife. Specifically, EIS Chapter on flora and fauna needs to be redone to include accurate information on the koala numbers and habitat from Millmerran to Southbrook. Without accurate numbers impacts and mitigation cannot be determined in an acceptable and sustainable way.	<p>Appendix O: Matters of National Environmental Significance Report of the revised draft EIS, outlines the assessment undertaken to determine the degree of significance of impacts on koala populations, against the Commonwealth's EPBC Act referral guidelines for the vulnerable listed koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance of the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the Draft Koala Management Plan (DKMP).</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA). <p>As described in Section 2.8 of Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale Section 2.8 Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix M: Draft Koala Management Plan Section 2.3 Appendix N: Draft Fauna Management Plan Appendix O: Matters of National Environmental Significance Appendix P: Fauna Connectivity Strategy</p>
181	181.0004	Private	Noise and Vibration	Operational rail noise	Detail of train signalling will only be provided in the Detailed Design phase subsequent to the EIS, and this does not provide an opportunity to adequately respond to the EIS as we do not have sufficient information on potential noise issues. The EIS does not provide the necessary level of detail around noise levels and mitigation options and in itself is a failing of the TOR.	The draft EIS should be rejected based on the incomplete nature of information we need to effectively comment on noise and vibration and social impact.	<p>Information on signalling and communications is provided in Section 5.4.14 of the revised draft EIS Chapter 5: Project Description. The Project will be operated initially using Centralised Train Control with the infrastructure installed upgradable to accommodate future deployment of the Advanced Train Management System (ATMS). ATMS is a digital train management solution with real-time monitoring of trains with GPS and mobile technology and will support ARTC's objectives of improving rail network capacity, operational flexibility, train service availability, transit times, rail safety and system reliability. Interfaces between the ARTC and QR Network, including signalling systems are subject to ongoing discussions between ARTC and QR now and during the Project's Detailed Design stage.</p> <p>With respect to operational railway noise impacts, ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's - Interim Guideline Operational Railway Noise and Vibration includes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS (Section 6.3 of Appendix W: Noise and Vibration Assessment - Railway Operations). The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. Refer to Section 16.10 of Chapter 16: Noise and Vibration, Railway Noise Assessment and Mitigation and Management Measures.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detail Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 5: Project Description Section 5.4.14 Chapter 16: Noise and Vibration Section 16.10 Appendix W: Noise and Vibration Assessment - Railway Operations Section 6.3</p>
181	181.0005	Private	Traffic and Transport		The detail of road and rail design will only be provided in the Detailed Design phase subsequent to the EIS, and this does not provide an opportunity to adequately respond to the EIS as we do not have sufficient information. This in itself is a failing of stakeholder engagement and the planning and communication process.	The consultation in the Pittsworth region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The draft EIS should be rejected based on the incomplete nature of information we need to effectively comment on environmental and social impact.	<p>The revised draft EIS provides detail on the road and rail design in the Pittsworth region is outlined in the EIS.</p> <ul style="list-style-type: none"> Chapter 2: Project Rationale details the route selection for the Pittsworth area (Section 2.9.3). Chapter 5: Project Description Section 5.4.8 discusses the road rail interfaces and reference design. This is further supported by the Appendix design drawings Part 1 and 2. Appendix C Stakeholder Engagement Report talks to the roads engagement in Pittsworth. Chapter 20: Traffic, Transport and Access and Appendix AA: Traffic Impact Assessment discuss all of the impacts of the road and rail design on the road network, including roads, intersections, road-rail interfaces, and accesses, as well as assessing the impacts on relevant road users and stake holders. Each other Section of the report also addresses this region based on the road and rail design set out for this area. <p>Further, regarding road-rail interface design and updates to the reference design since this submission:</p> <p>In 2021, eight community information sessions were held in Pittsworth to address community concerns about Project impacts, including road, rail and bridge design. Residents were engaged on design treatments for French Road and Tip Road level crossing, and grade separation design for Oakley Pittsworth Road, Quilbet Road and Dallman Road, Lochaber Road, McEwan Lane and Paint Mine Road, and Linthorpe Road. 182	182.0004	Private	Land Resources		Crop trials - any changes to the Condamine floodplain and hydrology will impact on the Tosari research facility	Model the effects of water flows on the Tosary research facility at the Yarramalong Weir	<p>Construction and operations flood impacts on land in the Condamine River floodplain have been described in Section 14.8 of the revised draft EIS Chapter 14: Flooding and Geomorphology and Section 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling methodology followed is consistent with Australian guidelines and industry standard practice and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government, to assure the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices, adequately identify and mitigate flood risks, and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree on appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 7.5.3</p>
182	182.0005	Private	Surface Water		Surface water and hydrology - Terms of Reference not addressed (listed), Appendices Q1 and Q2 on hydrology, inaccuracies in flood modelling, flawed flood model, inundation maps are unacceptable, under-prediction of flood levels.	Inaccuracy of flood modelling and hydrology - calibration, validation, community consultation around the flood model, rail design plans, (details provided of impacts and data unreliability), extent of Condamine flood plain. The Condamine Main Branch Bridge extended by 400 m; Condamine South Branch extended to Milmeran-Leyburn road; suggest bridge from Milmeran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design of this area.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2</p>
182	182.0006	Private	General project opinion - negative		Independent Panel of Experts for Flood Studies	Coordinator-General withdraw the EIS and ensure the Panel's advice on flood modelling and best practice for design of waterway structures be included in draft EIS and provided to stakeholders for comment. Coordinator-General not make a determination on the draft EIS until the release of the Panel's advice	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2</p>
182	182.0007	Private	Surface Water		Hydrologic modelling. Draft EIS does not comply with ToR. Project footprint data required.	Include an assessment of uncertainty in the flood model outputs, including predictions of peak height, flow velocity and inundation time for flood events. Project footprint data required before flood impacts can be determined.	<p>The estimated 'errors' or 'measures of uncertainty' is described in Section 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS, with a comparison of modelled versus observed flood levels presented in Table 7.31.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.3 Table 7.31</p>
183	183.0001	State Agency	Land Use and Tenure		Energy infrastructure - project will impact on existing and planned infrastructure. Identify infrastructure to be relocated, easements, properties.	Continue to work with Energy Queensland to address clashes between the route and electricity infrastructure and assets as soon as possible to identify impacts on electricity network.	<p>ARTC will continue to work with Energy Queensland during detailed design.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.3 Table 8-51 states the following:</p> <ul style="list-style-type: none"> ▶ Designs for utility protection, where necessary, will be developed in consultation with the relevant utility owner. ▶ The utility interface solutions that have been included in the reference design have been discussed with individual utility owners and are presented in Section 8.5.1 and Table 8-43 of Chapter 8: Land Use and Tenure. The exact methodology for utility modification, upgrade, diversion or realignment will be subject to confirmation once the revised reference design is finalised and will be determined through further consultation with the affected utility owners. Details on consultation undertaken through the reference design process is provided within Appendix E: Consultation Report. ▶ Outcomes of consultation with individual utility providers have been integrated into the reference design. Specific outcomes included methodologies for treating impacted utilities, providing indications of construction timeframes and the current status of the rail design. The methodology for the mitigating the impact of the interface between utilities and the alignment include modification to the utilities, upgrade of the utilities, and diversion or realignment of the rail. Specific methodologies for individual utilities will be finalised through further consultation with providers and integrated into the design of the alignment in detailed design (Chapter 8: Land Use and Tenure, Table 8-51). ▶ ARTC will continue to liaise with Energy Queensland to address interface requirements between the Project and electricity infrastructure to avoid any impacts to the local electricity network. The consultation approach is further detailed in Chapter 6: Stakeholder Engagement. The Detailed Design stage will refine any utilities relocations and these will be discussed with Energy Queensland. Effective stakeholder engagement develops and enhances awareness about the Project and establishes two-way conversations. These conversations are key for identifying and reducing risks, optimising the route alignment, securing statutory approvals, and minimising social and environmental impacts. The integration of local knowledge and stakeholder feedback is a key element in informing the detailed design. 	<p>Chapter 6: Stakeholder Engagement. Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.3 Table 8-51 Appendix E: Consultation Report</p>
184	184.0002	Private	Project alignment		The submitter has concerns about the possible closure of property accesses which crosses the rail line and the proposed relocation of the stock route crossing at Yelarbon which may run through his property based on the designs they have been provided.	All current accesses to the submitter properties must be maintained. The stock route crossing near Yelarbon may be combined with one of his property access crossings adjacent to the Cranbourne homestead	<p>Severance and fragmentation of rural properties are considered in Chapter 8: Land Use and Tenure, and the results are summarised in Section 8.5.1 and 8.5.4. It is identified that property severance could affect the configuration of a property, affecting efficiency, productivity and viability, for example as a result of changes in access arrangement for the movement of farm machinery or stock to different areas of a property. Other identified property impacts include impeded access and changes to internal roads.</p> <p>ARTC will continue to addressed this issue through the Detailed Design and Construction Works stages. In accordance with mitigation measures in Section 8.6 the design will continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. Noting the primary purpose of the identified level crossing is to service the Stock Route Network and as such, consultation with the Department of Resources and Goondiwindi Regional Council is required.</p> <p>Where the proposal affects internal property access arrangements, input will be sought from relevant landowners prior to finalising the detailed design. Where changes to internal property access arrangements are required, ARTC will consult with relevant property owners/occupants regarding alternative access arrangements, and identify any feasible and reasonable measures to minimise impacts on existing operational arrangements/properties.</p>	<p>Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6</p>
184	184.0003	Private	Groundwater	Operational water supply	The submitter has informed that there is a water pipeline crossing joining properties that he owns on both sides of the railway.	He wants the existing pipeline to be maintained to ensure continuity of water to stock on both sides of the railway.	<p>As described in Section 5.4.11 in Chapter 5: Project Description of the revised draft EIS, general utility interface treatment types are: protection, relocation/realignment, abandoned or no treatment where the reference design can be configured to avoid direct impacts to the utility.</p> <p>Privately owned utility asset impacts are considered to fall within accommodation works as part of DTMR's compulsory acquisition process. The acquisition process will be carried out in accordance with the Acquisition of Land Act 1967. This legislation sets out the process for acquisition, landowner rights and the assessment of compensation.</p> <p>ARTC will continue consultation with landowners to document and discuss options for these private utilities in the Detailed Design stage.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, utilities within the Project footprint will be surveyed and marked prior to the commencement of construction. Where protection or relocation of a utility is required as an outcome of consultation with asset owners and detailed design, these works will be undertaken prior to the commencement of construction to reduce the likelihood of impacts to those services. Protection or relocation of utilities will be conducted in accordance with relevant legislation, Australian Standards and guidelines.</p> <p>Chapter 24: Draft Outline Environmental Management Plan details that utility interface treatments that have been included in the reference design have been discussed with individual utility owners. The exact methodology for utility modification, upgrade, diversion or realignment will be subject to confirmation once the reference design is finalised and will be determined through further consultation with the affected utility owners.</p> <p>Designs for utility protection, where necessary, will be developed in consultation with the relevant utility owner and be in accordance with the relevant legislation, Australian Standards and guidelines.</p>	<p>Chapter 5: Project Description Section 5.4.11 Chapter 24: Draft Outline Environmental Management Plan</p>
185	185.0001	Private	Land Use and Tenure	Directly impacted landowner	The proposed line impacts on 2 parcels of the submitters farm land. L102 MH 643 and L4 MH 75. The submitter currently has access to these properties off the Inglewood/Milmeran Road.	The submitter wants to continue having reasonable and practical access to these properties.	<p>ARTC acknowledges this issue, which will continue to be addressed as the Detailed Design and Construction Works stages.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.6.1, where possible, the Project footprint has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties.</p> <p>The detailed design for the Project will be developed to ensure that legal access for private properties is maintained.</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect property access.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.2, states that where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6.2 of the revised draft EIS for further detail.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> ▶ Landowners' needs regarding access to the properties and the closure of private roads. ▶ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority. ▶ The potential for changes to groundwater access. 	<p>Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.1 Section 8.6.2</p>
185	185.0002	Private	Surface Water	Directly impacted landowner	The water supply sites for the submitter's cattle grazing business are situated in the proposed alignment. The supply to these dams comes from the western side of the road so flow would need to not be hindered and new sites would need to be found for these dams.	Nil.	<p>As stated in Table 13-16 of Chapter 13: Surface Water, the detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to decommissioning or relocation of the structure. This may also include the usage or relocation of stored water and compensation (if applicable).</p>	<p>Chapter 13: Surface Water Table 13-16</p>
186	186.0001	Private	Surface Water	Directly impacted landowner	Submitter concerned about surface water and hydrology impacts on their property associated with the approx.2.5 km long rail bridge and approx. 1 km long with 11 groups of culverts.	nil.	<p>Flood impact objectives (FIO) have been developed for the Project to provide guidance as to the point at which a more detailed consideration of impacts is required when they are exceeded. The Project will be designed to target achieving the FIOs for events up to and including the 1 per cent AEP (without climate change) for land, receptors, and/or infrastructure that is potentially impacted by the Project. Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case-by-case basis, including through consultation with stakeholders and landowners.</p> <p>The hydrologic and flooding assessment undertaken as part of the revised draft EIS has demonstrated that the Project will result in impacts on the existing flooding regime. A summary of whole-of-Project impacts is provided in Table 14-124 of Chapter 14: Flooding and Geomorphology. Location-specific impacts are mapped throughout Chapter 14: Flooding and Geomorphology and Appendix T2: Hydrology and Flooding Technical Report - Volume II.</p> <p>A comprehensive consultation exercise has been undertaken to provide the community with detailed information and certainty around the flood modelling and the revised reference design. In future stages, ARTC will continue to work with:</p> <ul style="list-style-type: none"> ▶ Landowners who are concerned with hydrology and flooding throughout the Detailed Design, Construction Works and Operations stages of the Project ▶ Directly impacted landowners affected by the alignment throughout the Detailed Design, Construction Works and Operations stages of the Project ▶ Local councils, State government agencies and local flood specialists throughout the Detailed Design, Construction Works and Operations stages of the Project. 	<p>Chapter 14: Flooding and Geomorphology Table 14-124 Appendix T2: Hydrology and Flooding Technical Report Volume 2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
186	186.0001	Private	Land Use and Tenure		The submitter is concerned about the effect and impact that the rail will have on the environment in her property. She will lose any means of self-sufficiency that she had planned for her future years. It will completely destroy any chance that this parcel of land has had in the past to provide feed for her animals. The land will remain a desolate piece of land that will not produce anything but weeds and impact neighbouring land parcels.	Nil.	<p>Chapter 8: Land Use and Tenure, Section 8.6.1, states that where possible, the Project has been aligned such that it avoid or minimise impacts to private access, property operations and private agricultural infrastructure (e.g. water storages, groundwater bores, irrigation infrastructure, etc.). In some instances, these property features could not be avoided. Where land is fragmented or isolated, any impacts on operational farm requirements, such as impacts on access, infrastructure and services, will be managed and reinstated as soon as possible. ARTC will work with individual landowners to develop suitable solutions based on individual farm management practices. Solutions may include the provision of crossing points or underpasses for access to fragmented or isolated properties. Where disruption to water supply occurs, crossing points will be provided or the relocation of dams or irrigation systems will be undertaken in consultation with landowners.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case by case basis, with consultation occurring with individual landowners to determine if the agricultural enterprise can remain viable. Refer to Chapter 8: Land Use and Tenure, Section 8.6.2 of the revised draft EIS for further detail.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties which could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads. Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority. The potential for changes to groundwater access. <p>Chapter 8: Land Use and Tenure, Section 8.6.2 states that where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld) (refer of the EIS). Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance.</p> <p>Costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation. Costs related to the purchase of replacement comparable land. Storage and removal costs. Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. 	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.1</p> <p>Section 8.6.2</p>
187	187.0001	Private	General project opinion - positive		The submitter supports the Inland Rail Project due to the economic benefit this infrastructure will bring to the region both during and after construction. It will provide Toowoomba with the opportunity to establish as a nationally significant transport and logistics hub with access to air transport via Wellcamp Airport and road via the region's extensive highway network, including the new Toowoomba Bypass.	nil.	ARTC note the submitters support of the Inland Rail Project and the benefits for the Toowoomba region.	N/A
187	187.0002	Private	Social Impact Assessment		The submitter believes that there needs to be a minimum local business participation target set within the EIS for ARTC and any contractors to adhere to and regularly report on to the local community.	The definition of "local business" should be the same as the definition provided in Toowoomba Regional Council's procurement policy. Appendix X should similarly be updated to provide a minimum target for local business participation which will improve local employment outcomes for this project. TSBE (submitter), as an economic development organisation with over 450 members and an in-depth knowledge of local supply chains, is ideally placed to promote capable local contractors to work on the project and requests to be engaged to do so. Local Chambers of Commerce also have these capabilities and should be consulted. TSBE is also currently undertaking a study to understand the capability of the region's businesses to be able to work on the Inland Rail project. They will provide a list of names to ARTC.	<p>Appendix X: Social Impact Assessment, Section 8.3.1 notes that "the Project's procurement process for the construction contract enables competitive bidding for local employment targets and procurement targets, incentivising the contractors to maximise local benefits."</p> <p>As outlined in Section 8.7.3, the Contractor will be required to monitor the number and value of contracts with businesses located in the Goondiwindi and Toowoomba LGAs in line with targets, and report on outcomes.</p> <p>Appendix X: Social Impact Assessment, Section 8.6.3 notes "In recognition of stakeholders' expectations, and to ensure local business benefit from the Project, ARTC has developed subgroups to further categorise and define the geographical boundaries of what constitutes local, as discussed in Section 8.3, and will report on local supplier participation from within the Goondiwindi and Toowoomba LGAs, as well as at regional, state and national level".</p> <p>Appendix X: Social Impact Assessment, Section 8.3.3 has been updated to provide examples of and commentary regarding aspirational targets relevant to local and Indigenous procurement and workforce participation.</p> <p>ARTC welcomes further engagement and cooperation with TSBE, and has provided a formal commitment to continue to engage with TSBE, chambers of commerce and local business groups/associations Appendix X: Social Impact Assessment, Section 8.6.5.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 8.3.3</p> <p>Section 8.6.3</p> <p>Section 8.6.5</p> <p>Section 8.7.3</p>
187	187.0003		Economics		The submitter (TSBE) requests that the supply opportunities are shared with their organisation to improve local content outcomes, based on the Chapter 15, p.108 proposal that the "...notice of supply opportunities through Chambers of Commerce and to businesses registered through Inland Rail and/or ICN...".	The submitter organisation wants the supply opportunities are shared with their organisation to improve local content outcomes.	<p>The Project's Social Impact Assessment report (Appendix X: Social Impact Assessment) further specifies that construction contractors are required to liaise with Regional Skills Initiative Strategy officers in Goondiwindi and Toowoomba to identify potential cooperation or partnerships for the development of employment and business capacity in the region. It is identified in Appendix Y: Economic Impact Assessment (EIA) the Project is likely to offer opportunities in secondary service and supply industries (such as retail, hospitality and other support services) for businesses in close proximity to the construction footprint and non-resident workforce accommodation facilities. The expansion in construction activity has the potential to support additional temporary flow-on demand and additional spending by the construction workforce in the local community, this may lead to increased trading levels for small businesses, such as food and beverage businesses in the impact assessment area.</p> <p>ARTC will aim to maximise the benefit to local business and industry participation the following measures will be delivered by ARTC as outlined in the EIA:</p> <ul style="list-style-type: none"> Promote the business registration process on the ARTC website. Development and implementation of an AIP Plan focusing on opportunities for involvement by local business in construction and operation of the Project that involves: <ul style="list-style-type: none"> Identifying businesses within 125 km of the Project with potential capacity to supply the Construction Works stage. Engagement with local business to identify opportunities to develop and promote local business participation. Engagement with DESBT and DSDTI to develop business capacity building strategies. Continue to engage with TSBE, chambers of commerce and local business groups/associations. Consider providing the Local Content Report to the Australian Industry and Skills Committee when developed. <p>In accordance with the Australian Jobs Act 2013 (Cth), ARTC has prepared an Australian Industry Participation Plan (AIP Plan) for the Inland Rail Program which identifies how Australian entities, particularly businesses operating within the Goondiwindi, Toowoomba and nearby Local Government areas (LGAs), will be provided full, fair and reasonable opportunity to bid to supply goods and services to the Project. ARTC is also committed to ensuring that Indigenous businesses, including those operating within the SIA study area, are identified and encouraged to participate in the Project's supply chain. In recognition of stakeholders' expectations, and to ensure local business benefit from the Project, and define the geographical boundaries of what constitutes local, as discussed in Section 17.6 of Chapter 17: Social, and will report on local supplier participation from within the Goondiwindi and Toowoomba LGAs, as well as at regional, state and national level.</p> <p>The majority of supply opportunities for businesses will be with the construction contractors and their supply chains, not directly with ARTC. Tenderers for Project construction will be made aware of the need to engage loc businesses and required to ensure they have a full, fair and reasonable opportunity to tender. ARTC will implement Inland Rail's Sustainable Procurement Policy (available at https://inlandrail.artc.com.au/inlandrail-sustainable-procurement-policy/) for the Project (Appendix X: Social Impact Assessment, Section 7.5.3 and Table 8-1). The Sustainable Procurement Policy aims to maximise the involvement of businesses, and includes a focus on building local businesses' capacity, to increase the number of businesses in the SIA study area that can successfully compete for Project supply opportunities (Appendix X: Social Impact Assessment, Section 8.6.3). ARTC is engaging with the Contractors regarding acceptable standards for subcontracting, and will also work with small businesses to provide information about how to engage with major contractors (Appendix X: Social Impact Assessment, Table 8-13 and 9-3).</p> <p>ARTC will also consider aspirational targets identified in the Queensland Procurement Policy (Department of Energy and Public Works, 2021) in evaluating the Contractor's targets (Appendix X: Social Impact Assessment, Section 8.3.1 and Table 8-13). The Queensland Procurement Policy's targets include:</p> <ul style="list-style-type: none"> Increasing government procurement with Aboriginal and Torres Strait Islander businesses to three per cent of addressable spend post EIS approval and during the Construction Works stage Sourcing at least 30 per cent of procurement by value from Queensland small and medium enterprises, increasing to 30 per cent during the Construction Works stage at a designated milestone date that will be determined between ARTC and the Contractor 	<p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Chapter 18: Economics</p> <p>Section 18.12</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 5.4 - Regional Economic Analysis</p> <p>Section 5.5 - Business and Industry Impacts</p> <p>Section 6 - Impact Management</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.5.3</p> <p>Section 8.3.1</p> <p>Section 8.6.3</p> <p>Table 8-1</p> <p>Table 8-13</p> <p>Table 9-3</p>
187	187.0004		Economics		TSBE wants commitment from the proponent on including local businesses to derive benefit from Inland Rail and build capability. They want the draft EIS to note how these economic principles and measures will be take up, outlining opportunities for local companies to bid on ongoing operational work. TSBE requests to be included in local participation outcomes and engagement during the design process due to our organisation's strong link to local supply chains.	TSBE has identified that the simplest way to enable local businesses to derive benefit from Inland Rail and build capability is to unbundle packages to require smaller financial commitments from local organisations. They want reasonable timeframes on work packages to ensure that local companies have time to develop skills and capability. Contractors need to be transparent with tender opportunities and give long enough timeframes to allow local contractors to scale-up if necessary. Also, local training organisations should be given priority to provide pre-qualification training for Inland Rail staff.	<p>The Project's Social Impact Assessment report (Appendix X: Social Impact Assessment) further specifies that construction contractors are required to liaise with Regional Skills Initiative Strategy officers in Goondiwindi and Toowoomba to identify potential cooperation or partnerships for the development of employment and business capacity in the region. It is identified in Appendix Y: Economic Impact Assessment (EIA) the Project is likely to offer opportunities in secondary service and supply industries (such as retail, hospitality and other support services) for businesses in close proximity to the construction footprint and non-resident workforce accommodation facilities. The expansion in construction activity has the potential to support additional temporary flow-on demand and additional spending by the construction workforce in the local community, this may lead to increased trading levels for small businesses, such as food and beverage businesses in the impact assessment area.</p> <p>ARTC will aim to maximise the benefit to local business and industry participation the following measures will be delivered by ARTC as outlined in the EIA:</p> <ul style="list-style-type: none"> Promote the business registration process on the ARTC website. Development and implementation of an AIP Plan focusing on opportunities for involvement by local business in construction and operation of the Project that involves: <ul style="list-style-type: none"> Identifying businesses within 125 km of the Project with potential capacity to supply the Construction Works stage. Engagement with local business to identify opportunities to develop and promote local business participation. Engagement with DESBT and DSDTI to develop business capacity building strategies. Continue to engage with TSBE, chambers of commerce and local business groups/associations. Consider providing the Local Content Report to the Australian Industry and Skills Committee when developed. <p>In accordance with the Australian Jobs Act 2013 (Cth), ARTC has prepared an Australian Industry Participation Plan (AIP Plan) for the Inland Rail Program which identifies how Australian entities, particularly businesses operating within the Goondiwindi, Toowoomba and nearby Local Government areas (LGAs), will be provided full, fair and reasonable opportunity to bid to supply goods and services to the Project. ARTC is also committed to ensuring that Indigenous businesses, including those operating within the SIA study area, are identified and encouraged to participate in the Project's supply chain. In recognition of stakeholders' expectations, and to ensure local business benefit from the Project, and define the geographical boundaries of what constitutes local, as discussed in Section 17.6 of Chapter 17: Social, and will report on local supplier participation from within the Goondiwindi and Toowoomba LGAs, as well as at regional, state and national level.</p> <p>The majority of supply opportunities for businesses will be with the construction contractors and their supply chains, not directly with ARTC. Tenderers for Project construction will be made aware of the need to engage loc businesses and required to ensure they have a full, fair and reasonable opportunity to tender. ARTC will implement Inland Rail's Sustainable Procurement Policy (available at https://inlandrail.artc.com.au/inlandrail-sustainable-procurement-policy/) for the Project (Appendix X: Social Impact Assessment, Section 7.5.3 and Table 8-1). The Sustainable Procurement Policy aims to maximise the involvement of businesses, and includes a focus on building local businesses' capacity, to increase the number of businesses in the SIA study area that can successfully compete for Project supply opportunities (Appendix X: Social Impact Assessment, Section 8.6.3). ARTC is engaging with the Contractors regarding acceptable standards for subcontracting, and will also work with small businesses to provide information about how to engage with major contractors (Appendix X: Social Impact Assessment, Table 8-13 and 9-3).</p> <p>ARTC will also consider aspirational targets identified in the Queensland Procurement Policy (Department of Energy and Public Works, 2021) in evaluating the Contractor's targets (Appendix X: Social Impact Assessment, Section 8.3.1 and Table 8-13). The Queensland Procurement Policy's targets include:</p> <ul style="list-style-type: none"> Increasing government procurement with Aboriginal and Torres Strait Islander businesses to three per cent of addressable spend post EIS approval and during the Construction Works stage Sourcing at least 30 per cent of procurement by value from Queensland small and medium enterprises, increasing to 30 per cent during the Construction Works stage at a designated milestone date that will be determined between ARTC and the Contractor 	<p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Chapter 18: Economics</p> <p>Section 18.12</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 5.4 - Regional Economic Analysis</p> <p>Section 5.5 - Business and Industry Impacts</p> <p>Section 6 - Impact Management</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 7.5.3</p> <p>Section 8.3.1</p> <p>Section 8.6.3</p> <p>Table 8-1</p> <p>Table 8-13</p> <p>Table 9-3</p>
187	187.0005	Private	Social Impact Assessment		The submitter has raised the concern that Toowoomba and the surrounding regions have experienced significant housing demands since the draft EIS was undertaken. Hence there is a possibility of pressure on an already tight housing market.	They believe it would be beneficial to undertake an independent study into local housing to determine the best options for the Inland Rail project. Utilising a local workforce where possible will minimise the impacts on an already tight housing market. If workers cannot be sourced locally or within a reasonable drive market, TSBE requests that Wellcamp Airport is utilised to enable qualified staff to travel directly to the region which will provide further opportunities for local employment. Also, TSBE requests that any camps be required to interface with the local community and for the EIS to set minimum targets of local business participation including food and other consumables for the camps to be sourced locally, where possible.	<p>ARTC has observed the change in housing conditions during 2020-23. This has been addressed through updates to the relevant baseline data sets in Appendix X: Social Impact Assessment, Section 5.5, revision of relevant impact assessment sections (Section 7.3, and revision of relevant management measures (Section 8.3 and 8.4 of Appendix X: Social Impact Assessment).</p> <p>The EIS has also been revised to note that the Project will avoid use of rental housing in postcodes where vacancy rates are below 2.5% (see Section 8.4.4 of Appendix X: Social Impact Assessment).</p> <p>The Project will consult further with GRC and TRC, local communities and landowners who are adjacent to the Project's proposed accommodation facilities. The Project will consider stakeholder feedback in the planning, design and development of the facilities and relevant management procedures, including the Project's Accommodation Management Plan. This process will include consultation with local businesses about potential opportunities to supply the facilities with goods or services (Appendix X: Social Impact Assessment, Section 8.4.4).</p> <p>ARTC will monitor the outcomes of its Accommodation Management Plan to identify any strains on local rental housing stock (as indicated by declining rental vacancy rates) and will also monitor short-term accommodation providers' capacity to service tourists (as indicated by consultation with local tourism associations).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 5.5</p> <p>Section 7.3</p> <p>Section 8.3</p> <p>Section 8.4</p> <p>Section 8.4.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
187	187.0006		Economics		TSBE requests for the EIS to demonstrate how Inland Rail will interface with the construction of the intermodal facilities at Wellcamp and the long-term opportunities for these operators.	nil.	<p>The Inland Rail Project in Queensland will support regional economic growth by facilitating the development of intermodal facilities that will sustain employment and business activity for the long term. The Project runs via the Toowoomba Trade Gateway, which combines an internationally capable airport with a major freight facility and over 2,000 hectares of industrial land on the western fringe of Toowoomba LGA. The Toowoomba Trade Gateway is a major industrial precinct supporting Toowoomba and regional south Queensland, involving aviation, logistics, transport, corporate and mining services. It is privately owned and managed and includes Toowoomba Wellcamp Airport, Wellcamp Business Park, InterLinkSQ, Witmack Industry Park and Charlton Logistics Park. The airport became operational in 2014 and provides domestic passenger and international freight transportation. Development of the industrial precinct is ongoing (Appendix X: Social Impact Assessment, Section 7.5.4).</p> <p>The Project's route via the airport and industrial precincts may provide the opportunity to supplement airfreight movements with access to the national rail freight network, facilitate access to efficient rail transport for businesses in the region and at the Toowoomba Trade Gateway, and stimulate business development in the Toowoomba Trade Gateway (Appendix X: Social Impact Assessment, Section 7.5.4).</p> <p>The current reference design for the revised draft EIS does not yet have a connection at these locations. This does not preclude ARTC or another 3rd party constructing such a facilities at a later date. Such facilities would require a specific business case, a review of the operational efficiencies of the Inland Rail alignment, and be subject to further approvals. Discussions with key stakeholders, including major agricultural producers, intermodal terminal operators can occur a later date should there be identified a future need for such rail infrastructure at these locations.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.4</p> <p>Section 7.6</p> <p>Section 7.5.4</p>
187	187.0007	Private	Editorial		The Toowoomba Enterprise Hub is now known as the Toowoomba Trade Gateway, therefore the EIS should update all references to reflect the name change	nil.	Noted. The name description of the Toowoomba Trade Gateway has been revised where occurrences occur such as Chapter 2: Project Rationale and Chapter 8: Land Use and Tenure.	Chapter 2: Project Rationale Chapter 8: Land Use and Tenure
188	188.0001	Community Group	Flora and Fauna		The Toowoomba Wilderness Society, a regional branch of The Wilderness Society, is concerned about the vulnerability of very special local flora and fauna, across the Darling Downs including the Western and Southern Downs to be affected by the Inland Rail Project. According to them the draft EIS doesn't adequately address the TOR including the project's potential environmental impacts and the effectiveness of measures the proponent proposes to manage those impacts.	The have requested to locate detailed information about our healthy fauna populations in this corridor via research and consultation with local carers and landowners. The have asked to consider the need for good soil and the necessity for biodiversity through healthy understorey to provide for a range of species - e.g. echidna, wallaby, ground birds , small birds , large birds, insects, quoll. They also don't want the mitigation areas to be near the dangerous tracks but in the areas where the wildlife is living seeking to make these areas more pristine and removed from human contacts (speed and light). Engagement of ecological experts who have local knowledge should be done.	<p>A detailed assessment of potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Some examples of identified impacts include Habitat loss and degradation, displacement of threatened species, barrier/edge effects, lighting, dust, erosion, and contamination.</p> <p>Additional ecology surveys were also undertaken by Cardno (2021) and AusEcology (2022), which ground-truthed the Project footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and Construction Works stage of the Project. Results of these surveys including locations and quantification of ecological values, including threatened species, is provided in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Mitigation measures have been considered to reduce the potential impacts on flora and fauna within the Project alignment and these are outlined in Chapter 11: Flora and Fauna.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, provides further context and the framework for implementation of these proposed mitigation and management measures.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5, 11.6 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Section 4</p>
188	188.0002	Community Group	Flora and Fauna	Koala	The submitter has raised concerns for the local koala population. The TWS goal is to develop fodder farms for koalas in care, including fundraising and reforestation to restore understorey habitat it improve corridors across the region. Via local farmers, TWS is aware that there are remnant koala populations with very healthy DNA who are living in mature trees on the proposed rail route in the Southbrook/Pittsworth area. As a result of a long drought small population of koala west of the Great Dividing Range are extremely stressed. Since Border to Gowrie has a long history of human activity and other disturbances Koalas are already impacted negatively. The submitter highlights that any notion of relocation should be informed by the lack of success this has had in others areas, as koalas are not flexible in terms of changing diet and territorial. TWS is also concerned about the possibility of fox and wild dog attacks on marsupials in underground tunnels. Koalas also need strong mature trees for physical development, and relocating may pose a problem where proper trees and diet is not available and they are likely to starve.	The submitter has proposed the following solutions: 1. Rerouting if possible to ensure koala survival. 2. Mitigation should ensure a large number of trees for the koalas	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from AusEcology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ➤ Ability to enhance the Inland Rail service offering ➤ Construction and operating costs ➤ Multi-criteria analysis (MCA), including detailed environmental considerations. <p>As described in Chapter 2: Project Rationale, Section 2.8 of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>In instances where a significant residual impact has been identified as per the EPBC Act 1999 Significant Assessment Criteria, biodiversity offsets will be secured. ARTC has prepared a revised Appendix Q: Environmental Offset Delivery Strategy that outlines the properties that make up the Project offset portfolio and their suitability to acquit significant residual impacts on MNES and MSES. Appendix Q: Environmental Offset Delivery Strategy includes a summary of how the proposed offset portfolio will acquit the anticipated offset requirements for the koala to achieve no net loss.</p> <p>In addition, ARTC has commenced two key research initiatives relating the koala (<i>Phascogaleos cinereus</i>) to better understand populations, potential impacts and to develop targeted mitigation and management measures. Regarding the proposed solution, ARTC has partnered with ERM, a multinational consultancy firm, to undertake a study koala genetics that focusses on population genetics and dietary analysis for koalas across eight of the Inland Rail Projects. The purpose of this study to:</p> <ul style="list-style-type: none"> ➤ Increase baseline data on koala population resilience and restoration requirements. ➤ Informs koala conservation controls as required in conditions of approval. ➤ Informs fauna connectivity plans. ➤ Informs koala offset management decisions. ➤ Contribute to Infrastructure Sustainability Council credits. <p>The expected completion date for these studies is June 2023.</p> <p>ARTC is engaging with stakeholders to determine opportunities for community Projects that will provide legacy benefits. Initiatives outlined in this submission can be further investigated during the Detailed Design stage.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>
189	189.0001	Private	Social Impact Assessment	Directly impacted landowner	The submitter raises an intolerable impact on their finances and future income. The have been waiting for a notice of intention to resume their property 'Feneton' 258 Hall Rd, Yandilla since Dec 2020. This wait has affected their mental health and wellbeing. The banks don't lend them due to uncertainty. They can't sell the property as potential buyers are turned off due to the rail project. Due to uncertainty they can't plan their retirement. The are also recovering from drought. No timeframe has been provided to the submitter about the acquisition process. This has been extremely traumatic for the family and the future of their children who would not be able to continue with the use of Feneton as third generation farmer.	nil.	<p>Property acquisitions will be undertaken by DTMR as the Acquiring Authority. ARTC notes that acquisition of this property is now underway by the Department of Transport and Main Roads in accordance with the terms of the Acquisition of Land Act 1967.</p> <p>ARTC acknowledges the uncertainty that project development can create. Revised draft EIS Appendix X: Social Impact Assessment, Section 7.1.2 details the strategies that ARTC has implemented to support affected residents. This included creating a partnership with the local primary health network, which provides greater access to mental health support services.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.1.2</p>
189	189.0002	Private	Flora and Fauna		The submitter is worried about the natural flora and fauna.	nil.	Mitigation measures have been developed to reduce potential impacts to flora and fauna which include: maximising use of existing rail corridors and co-locating with existing road infrastructure; restricting the clearing of remnant vegetation to the minimum requirements; minimising disturbance of sensitive areas; minimising impacts to watercourses, riparian vegetation and habitats; development of fauna crossings and fauna fencing; relocation of plants and habitats for threatened species where possible; and weed management protocols. See Chapter 11: Flora and Fauna for further details on mitigation measures.	Chapter 11: Flora and Fauna Section 11.6
189	189.0003	Private	Surface Water		The submitter is concerned about water quality and how the construction phase and dust will affect them especially with traffic and heavy machinery access.	nil.	<p>The revised draft EIS includes management and mitigation measures to avoid and minimise environmental impact during the Construction Works stage. These measures are documented in Chapter 24: Outline Environmental Management Plan and will be continued through into the Contractor's Construction Environmental Management Plan. This Construction Environmental Management Plan will be developed in consultation with regulatory stakeholders and submitted for review and approval by the Environmental Monitor for the Project - an independent entity engaged to oversee the Project's compliance with conditions of approval.</p> <p>Water quality mitigation measures are presented in the Surface water Section of Chapter 24: Draft Outline Environmental Management Plan. Dust control measures are presented in the Air quality Section of Chapter 24.</p>	Chapter 24: Draft Outline Environmental Management Plan
189	189.0004	Private	Flooding		The submitter is worried about flooding especially inundation and peak water levels and how that will affect their stock and damage to their crops.	nil.	Operational flood impacts on land in the Condamine River floodplain have been described in Section 14.9.1 of the revised draft EIS Chapter 14: Flood and Geomorphology. Construction impacts are discussed in Section 14.8.1 Chapter 14: Flooding and Geomorphology and Section 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 7.5.3</p>
190	190.0001	NGO	General project opinion - positive		The Toowoomba Chamber recognises that the proposal has the potential to provide significant and long-lasting benefits to Toowoomba, the region, Queensland, and the nation. Overall, they are strong supporters of this project	nil.	ARTC acknowledges the support of the Toowoomba Chamber of Commerce for this national infrastructure Project - to Toowoomba and the region, as well as at the wider state and national level.	N/A

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
190	190.0002		Economics		The submitter expects the outcome of this process is that any potential impacts on existing business operations will be adequately mitigated to ensure the protection of people's livelihoods. Prima facie, there appears to be lack of information or commitment on how these potential opportunities will convert into local jobs, future investment, and the specific use of local businesses in the Toowoomba region.	<p>They have requested the following conditions be included for approval:</p> <ol style="list-style-type: none"> 1. A minimum 75% of goods and/or services for the project are to be provided by businesses located within the Toowoomba Regional Council boundaries. 2. Quarterly reporting is to be released identifying number of jobs created, businesses engaged, their location and value in dollar terms spent with those businesses. 3. State and Australian Government incentives be provided to facilitate business and industry development in the region, such as but not limited to the enhancement of the digital network and creating electricity provider competition. 	<p>The Project's Social Impact Assessment report (Appendix X: Social Impact Assessment) further specifies that construction contractors are required to liaise with Regional Skills Initiative Strategy officers in Goondiwindi and Toowoomba to identify potential cooperation or partnerships for the development of employment and business capacity in the region. It is identified in Appendix Y: Economic Impact Assessment (EIA) the Project is likely to offer opportunities in secondary service and supply industries (such as retail, hospitality and other support services) for businesses in close proximity to the construction footprint and non-resident workforce accommodation facilities. The expansion in construction activity has the potential to support additional temporary flow-on demand and additional spending by the construction workforce in the local community, this may lead to increased trading levels for small businesses, such as food and beverage businesses in the impact assessment area.</p> <p>ARTC will aim to maximise the benefit to local business and industry participation the following measures will be delivered by ARTC as outlined in the EIA:</p> <ul style="list-style-type: none"> ➤ Promote the business registration process on the ARTC website. ➤ Development and implementation of an AIP Plan focusing on opportunities for involvement by local business in construction and operation of the Project that involves: <ul style="list-style-type: none"> ➤ Identifying businesses within 125 km of the Project with potential capacity to supply the Construction Works stage. ➤ Engagement with local business to identify opportunities to develop and promote local business participation. ➤ Engagement with DESBT and DSDTI to develop business capacity building strategies. ➤ Continue to engage with TSBE, chambers of commerce and local business groups/associations. ➤ Consider providing the Local Content Report to the Australian Industry and Skills Committee when developed. <p>In accordance with the Australian Jobs Act 2013 (Cth), ARTC has prepared an Australian Industry Participation Plan (AIP Plan) for the Inland Rail Program which identifies how Australian entities, particularly businesses operating within the Goondiwindi, Toowoomba and nearby Local Government areas (LGAs), will be provided full, fair and reasonable opportunity to bid to supply goods and services to the Project. ARTC is also committed to ensuring that Indigenous businesses, including those operating within the SIA study area, are identified and encouraged to participate in the Project's supply chain. In recognition of stakeholders' expectations, and to ensure local business benefit from the Project, ARTC has developed subgroups to further categorise and define the geographical boundaries of what constitutes local, as discussed in Chapter 17: Social, and will report on local supplier participation from within the Goondiwindi and Toowoomba LGAs, as well as at regional, state and national level.</p> <p>The majority of supply opportunities for businesses will be with the construction contractors and their supply chains, not directly with ARTC. Tenderers for Project construction will be made aware of the need to engage loc businesses and required to ensure they have a full, fair and reasonable opportunity to tender. ARTC will implement Inland Rail's Sustainable Procurement Policy (available at https://inlandrail.artc.com.au/inlandrail-sustainable-procurement-policy/) for the Project refer Chapter 17: Social Impact Assessment. The Sustainable Procurement Policy aims to maximise the involvement of businesses, and includes a focus on building local businesses' capacity, to increase the number of businesses in the SIA study area that can successfully compete for Project supply opportunities. ARTC is engaging with the Contractors regarding acceptable standards for subcontracting, and will also work with small businesses to provide information about how to engage with major contractors.</p> <p>ARTC will also consider aspirational targets identified in the Queensland Procurement Policy (Department of Energy and Public Works, 2021) in evaluating the Contractor's targets see Chapter 17: Social Impact Assessment. The Queensland Procurement Policy's targets include:</p> <ul style="list-style-type: none"> ➤ Increasing government procurement with Aboriginal and Torres Strait Islander businesses to three per cent of addressable spend post EIS approval and during the Construction Works stage. ➤ Sourcing at least 30 per cent of procurement by value from Queensland small and medium enterprises, increasing to 30 per cent during the Construction Works stage at a designated milestone date that will be determined between ARTC and the Contractor. 	<p>Chapter 18: Economics</p> <p>Section 18.12</p> <p>Chapter 17: Social</p> <p>Appendix X: Social Impact Assessment</p> <p>Chapter 18: Economics</p> <p>Section 18.12</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Section 5.2</p> <p>Section 5.5</p> <p>Section 5.7</p>
191	191.0001	Private	Flora and Fauna		The submitter is concerned about whether the fauna fencing will take place or not, given it is contradictorily stated in the draft EIS. He writes that in Appendix M it is stated that fencing is to be extended 150 m beyond the proposed crossing location to guide fauna to the bridge structure. However, it then also notes that this opportunity is located on the Condamine River Floodplain. The rail corridor will not be fenced across this floodplain to avoid the possibility of debris accumulation in fencing during flood events. Therefore, the fauna fencing may not be practicable from a safety perspective. He thinks that this contradictory statement is confusing. He also refers to the Figure 3.1c (location of fauna fencing) to see the fauna exclusion fence in each of these crossings.	nil.	<p>Appendix M: Draft Koala Management Plan has been updated to ensure that conflicting information is not presented.</p> <p>In terms of fencing design, for interfaces along the alignment, Chapter 21: Hazard and Risk, Section 21.6.2 Table 21-16, notes that 'Specific fencing requirements are to be agreed through discussion with adjoining landowners and asset owners through the design development'. There are various types of fencing that will be required. ARTC has standard drawings for the various types of fences. These eleven standards can be found on the ARTC website at extranet.artc.com.au/eng_track-civil_drawings.html.</p> <p>As there are various standards depending on the type of fence, it is not proposed to list these standards. Typically, not all design standards have been listed.</p> <p>Since the submission of the draft EIS, ARTC has developed Appendix P: Fauna Connectivity Strategy to support the revised draft EIS. This document will be standalone Appendix for the revised draft EIS and was developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes. Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The revised draft Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the Detailed Design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the Detailed Design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g., revegetation). These scenarios will be used to inform design workshops and community consultation at the Detailed Design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010 respectfully). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the Detailed Design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.6</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix P: Fauna Connectivity Strategy</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p>
191	191.0002	Private	Stakeholder engagement		The submitter outlines that any actual description or information about fauna fencing has not been discussed with landowners with regard to fencing type or location throughout the consultation process. There may be acquisition of land as a result of fence construction and hence the landowners should be consulted.	The planning and consultation process around fencing should be discussed with all affected parties to consider appropriate solutions whose inputs are valuable to any solution.	<p>ARTC notes that fencing is one aspect of the "property impacts" key issue described in Appendix E: Consultation Report, Section 5.1. ARTC has developed a standard fencing strategy and a fact sheet on managing corridor fencing, which is available on the ARTC website at www.artc.com.au</p> <p>Following consultation with landowners regarding debris mobilisation during flood events, it removed the proposed fencing on the Condamine floodplain, in the vicinity of the submitter's property, from the revised reference design.</p> <p>As noted in the Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p>
192	192.0001	Community Group	Project scope		The draft EIS fails to detail matters at a relevant scale for the localised impacts to be assessed and mitigated for businesses, infrastructure, environment, agricultural operations and local communities.	<p>Millmerran Rail Group calls on the Coordinator-General to:</p> <ol style="list-style-type: none"> 1. Not accept the draft EIS as the final EIS (as per Section 34A(2)) of State Development and Public Organisation Act 1971. On the basis that the Draft EIS: <ol style="list-style-type: none"> a. does not meet the Terms of Reference b. Contains information gaps considered relevant to the project. i. Main project aspects to be developed that ARTC has conceded in Chapter 23 of the draft EIS. ii. The deficiencies identified by draft report by the Independent Panel of Experts for Flood Studies, should be addressed. iii. Additional information gaps identified. c. will cause impact of local, regional and state significance. <ol style="list-style-type: none"> 2. Require additional information and this should require public notification (as per Section 34B(2)(c). 3. Release the revised draft EIS for public submission (as per Sections 34C(3) and 34C(4)). 4. Consider the findings and recommendations, and the comments on it by stakeholders, as part of assessment of the draft EIS of the ongoing investigation by the all-party Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021. 	<p>As described in the revised draft EIS at Chapter 1: Introduction, Section 1.5, between 23 January 2021 and 4 May 2021, the draft EIS was made available for public comment under Section 33 of the SDPWO Act and public submissions were received. Appendix A2: Terms of Reference Cross Reference Table has been updated for the revised draft EIS in Appendix A2: Terms of Reference - Cross Reference Table. On 4 January 2022 the Coordinator-General requested additional information under Section 34B(2) of the SDPWO Act. The Coordinator-General additional information requirements and the proponent's (ARTC) responses to the public submissions received comprise the basis of assessment for the revised draft EIS.</p> <p>The revised draft EIS revised reference design has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and an additional information request by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>ARTC worked collaboratively with the Independent International Panel of Experts for Flood Studies (the Panel) in their review & recommendations of the Project. ARTC has committed to implement the six recommendations outlined in the Panel's Final Report.</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC fully cooperated with the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p>	<p>Chapter 1: Introduction</p> <p>Section 1.5</p> <p>Chapter 5: Project Description</p> <p>Section 5.3.3</p> <p>Appendix A2: Terms of Reference - Cross Reference Table</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0002	Community Group	Project alignment	Baseline/backgr ound sampling	ARTCs process for route selection, route alignment, detailed design, impact assessment and mitigation strategies has failed to avoid or minimise impact.	<p>Millmerran Rail Group calls on the Coordinator-General to:</p> <ol style="list-style-type: none"> Not accept the draft EIS as the final EIS (as per Section 34A(2)) of State Development and Public Organisation Act 1971. On the basis that the Draft EIS: <ol style="list-style-type: none"> does not meet the Terms of Reference contains information gaps considered relevant to the project <ol style="list-style-type: none"> main project aspects to be developed that ARTC has conceded in Chapter 23 of the draft EIS. The deficiencies identified by draft report by the Independent Panel of Experts for Flood Studies, should be addressed Additional information gaps identified. will cause impact of local, regional and state significance. <p>2. Require additional information and this should require public notification (as per Section 34B(2)(c)).</p> <p>3. Release the revised draft EIS for public submission (as per Sections 34C(3) and 34C(4)).</p> <p>4. Consider the findings and recommendations, and the comments on it by stakeholders, as part of assessment of the draft EIS of the ongoing investigation by the all-party Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021.</p>	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment, and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ ability to enhance the Inland Rail service offering ▶ construction and operating costs ▶ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ▶ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ▶ approvals and stakeholder engagement: 12.5 per cent ▶ technical viability: 17 per cent ▶ safety: 16.5 per cent ▶ constructability: 12.5 per cent ▶ operations: 16.5 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d) document, ARTC notes complementary initiatives being led by the Australian Government, such as the \$44 million Inland Rail Interface Improvement Program, which may provide future opportunities for regional communities along the alignment to connect to Inland Rail.</p> <p>As described in Chapter 1: Introduction, Section 1.5, between 23 January 2021 and 4 May 2021, the draft EIS was made available for public comment under Section 33 of the SDPWO Act and public submissions were received. By publicly notifying the draft EIS under Section 33, the Coordinator-General had deemed that the ToR was satisfactorily addressed. Terms of reference compliance has been updated for the revised draft EIS in Appendix A2: Terms of Reference - Cross Reference Table. On 4 January 2022 the Coordinator-General requested additional information under Section 34B(2) of the SDPWO Act. The Coordinator-General additional information requirements and the proponent's (ARTC) responses to the public submissions received comprise the basis of assessment for the revised draft EIS.</p> <p>The revised draft EIS revised reference design has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>ARTC will continue to work collaboratively with the flood panel in their review & recommendations of the Project.</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p>	<p>Chapter 1: Introduction</p> <p>Section 1.5</p> <p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Chapter 5: Project Description</p> <p>Section 5.3.3</p> <p>Appendix A2: Terms of Reference - Cross Reference Table</p> <p>Appendix E: Consultation Report</p>
192	192.0003		Economics		Much of the information refers to the 2015 Base Case, which by its own admission requires more detailed assessments to determine impacts and costs. Since 2015, commitments have been made by the Australian Government that the EIS process would involve assessment of the detailed design to determine and address impacts.	<p>Millmerran Rail Group calls on the Coordinator-General to:1. Not accept the draft EIS as the final EIS (as per Section 34A(2)) of State Development and Public Organisation Act 1971. On the basis that the Draft EIS, does not meet the Terms of Reference, contains information gaps considered 'relevant to the project. "main project aspects to be developed" that ARTC has conceded in Chapter 23of the draft EIS. The deficiencies identified by draft report by the Independent Panel of Experts for Flood Studies, should be addressed. Additional information gaps identified. c. will cause impact of local, regional and state significance.2. Require additional information and this should require public notification (as per Section 34B(2)(c)).3. Release the revised draft EIS for public submission (as per Sections 34C(3) and 34C(4)).4. Consider the findings and recommendations, and the comments on it by stakeholders, as part of assessment of the draft EIS of the ongoing investigation by the all-party Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021.</p>	<p>The reference design for the revised draft EIS for the Project has been updated in light of public submissions and further detailed consultation with Commonwealth, State and Local Government agencies, businesses, community groups and the general public. In 2020, ARTC prepared a budget reset to reflect the revised CAPEX figures associated with the Border to Gowrie reference design. The CAPEX figures have been converted to a 2021-2022 dollar value. Refer to Appendix Y: Economic Impact Assessment, Appendix C.</p> <p>On 23 January 2021, the Coordinator-General released the draft EIS for public consultation, as it was deemed to have suitably met the final Terms of Reference that was approved by the Coordinator-General. Post notification period and receipt of EIS submissions, the Coordinator-General requested additional information to enable the Coordinator-General to make an informed decision on accepting the EIS as final. The revised draft EIS has been updated to address these additional information requirements. In relation to the information gaps identified in the submissions, ARTC has updated Chapter 24: Draft Outline Environmental Plan and Chapter 8: Land Use and Tenure. The revised draft EIS will be released for a second round of public consultation in accordance with the requirements of the <i>State Development and Public Works Organisation Act 1971</i>.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both of these made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?q=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&rlz=1C1GCEB_enAU1015AU1015&oq=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aqs=chrome..69i57.9731j0j4&sourceid=chrome&ie=UTF-8.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p> <p>Section 5.3</p> <p>Section 5.12</p> <p>Appendix Y: Economic Impact Assessment</p> <p>Appendix C</p>
192	192.0004	Community Group	Stakeholder engagement		The Millmerran Rail Group and community are frustrated and disappointed with the lack of detailed information and opportunity to assess impacts as part of a transparent and accountable process.	<p>Millmerran Rail Group calls on the Coordinator-General to:</p> <ol style="list-style-type: none"> Not accept the draft EIS as the final EIS (as per Section 34A(2)) of State Development and Public Organisation Act 1971. On the basis that the Draft EIS: <ol style="list-style-type: none"> does not meet the Terms of Reference contains information gaps considered 'relevant to the project' <ol style="list-style-type: none"> main project aspects to be developed" that ARTC has conceded in Chapter 23 of the draft EIS. The deficiencies identified by draft report by the Independent Panel of Experts for Flood Studies, should be addressed Additional information gaps identified. will cause impact of local, regional and state significance. <p>2. Require additional information and this should require public notification (as per Section 34B(2)(c)).</p> <p>3. Release the revised draft EIS for public submission (as per Sections 34C(3) and 34C(4)).</p> <p>4. Consider the findings and recommendations, and the comments on it by stakeholders, as part of assessment of the draft EIS of the ongoing investigation by the all-party Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021.</p>	<p>The Coordinator-General has requested ARTC prepare a revised draft EIS, which will be placed on public notification and will be available for submissions to be lodged. The stakeholder engagement process to support public notification is outlined in Appendix E: Consultation Report, Section 7.1.</p> <p>ARTC has addressed the matters raised in the report by the Independent Panel of Experts for Flood Studies, as detailed in Chapter 14: Hydrology and geomorphology.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Appendix E: Consultation Report</p> <p>Section 7.1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0005	Community Group	Project alignment		The route assessment process has lacked transparency and accountability and has resulted in a route from Border to Gowrie that fails to avoid major impacts associated with the Condamine Floodplain and land use. Impacts have been communicated since 2016 and fail to be addressed in the EIS, current route selection and design. The proposed alternative Cecil Plains forestry route had no comparison assessment. Does not include DA Hall & Co current multiple route options. Fails to demonstrate like for like Multi Criteria Assessment of all route options. Fails to include and compare updated cost scenarios at \$10.5. Lacks evidence to support and justify final route selection	nil.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> ➤ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson ➤ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton ➤ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton ➤ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined 2 km wide study area is referenced within Chapter 2 Project Rationale of the draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 (m) wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ➤ ability to enhance the Inland Rail service offering ➤ construction and operating costs ➤ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ➤ approvals and stakeholder engagement: 12.5 per cent ➤ technical viability: 17 per cent ➤ safety: 16.5 per cent ➤ constructability: 12.5 per cent ➤ operations: 16.5 per cent. <p>The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006-2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie.</p>	Chapter 2: Project Rationale Section 2.8 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
192	192.0006	Community Group	Social Impact Assessment		The EIS does not identify how ARTC plans to provide tangible and direct benefits to the Border to Gowrie community.	nil.	Appendix X: Social Impact Assessment, Section 7.4.9 describes the potential legacy benefits that would eventuate in the Project region, and has been further detailed in response to submissions.	Appendix X: Social Impact Assessment Section 7.4.9
192	192.0007	Community Group	Flooding	Modelling	One of the biggest and potentially damaging gaps in critical information that has been repeatedly raised with the ARTC are the flaws in the current flood modelling that inform infrastructure design and impact and influenced the route selection decision. Evidence has been produced and submitted based on real life experience that shows a shortfall and variations to the predicted flooding levels and areas. The service commitments for time and efficiency will be undermined when the rail is damaged due to flooding. The mitigation measures to flood proof the rail only transfers the risk and impact to adjacent land use and infrastructure.	nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Chapter 14: Flooding and Geomorphology Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
192	192.0008		Economics		There is a significant lack of information and evidence to support benefit claims for the Darling Downs and 'Border to Gowrie' project. Claims are based on access to market for agricultural products to domestic markets and to port. The data provided and referenced is for the entire 'Melbourne to Brisbane' project. The evidence is sourced from the Inland Rail Business Case 2015 which does not go to port.	Information request for a cost benefit analysis of road freight (direct from farm to market and port) and current rail services for the Darling Downs region and 'Border to Gowrie' project area, and full detailed proposed services, costs and time of Inland Rail within the project area for agricultural product, to satisfy the claims for: Improved access to and from regional markets Reduced costs for the market Improved reliability and certainty of transit time Reduced distances travelled Improved safety Enable complementary market-driven investments	<p>ARTC notes the purpose of the Investment Case (Inland Rail Programme Business Case 2015) was to inform the Commonwealth's decision on whether or not to invest in the progression of the Inland Rail Project. It evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution. Once the financial (investment) decision had been made to proceed with the Project, the statutory approval process commenced. Inland Rail, as a State Significant Project in Queensland, is required to respond to the Terms of Reference (ToR) with an Environmental Impact Assessment (EIS) as required under the <i>State Development and Public Organisation Act 1991</i>.</p> <p>The purpose of the EIS process is to inform decision-makers and the public of the environmental consequences of implementing a proposed Project. The EIA identifies, predicts, and analyses impacts on the physical environment, as well as social, cultural, economic and health impacts during construction and operation of the Project. The economic analysis provided in the EIS response is tailored to consider these impacts during construction and operation with appropriate mitigation measures.</p> <p>As a component of the larger Inland Rail Program, the potential benefits of the Project cannot be separated from those that are attributed to the full Brisbane to Melbourne alignment (those quoted by the submitter). The full suite of potential benefits associated with the Inland Rail Program can only be realised once this Project and all other Inland Rail Projects are complete and operational. The EIA was prepared at a specific point in time for the revised draft EIS. Since the Inland Rail Independent Review (2022), the Kagaru to Acacia Ridge and Bromelton Project was removed from the Inland Rail Program in Queensland. The EIS considers a range of benefit types which may be a direct result of the Project and which can be quantified or identified as part of the Project, rather than the broader Inland Rail Program. These are captured under two broad benefit streams; providing competitive freight transport and supporting regional and local business. The EIS also summarises the broader program benefits identified in the 2015 Investment Case.</p> <p>In regards to the proposed solution, due to the nature of the incremental assessment approach adopted for this revised draft EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in Appendix Y: Economic Impact Assessment.</p> <p>In addition, Inland Rail will have a connection direct to the Port of Brisbane from day one of full operations via connection in the vicinity of the Acacia Ridge terminal to the existing dual-gauge freight line operated by QR connecting to the Port. Further, trains going through to the Port of Brisbane (including obviously grain trains) do not need to be double-handled after the grain is loaded on to the train. Grain producers will seek to make use of the most efficient and cost effective method of transporting grain to the Port, and within a certain distance from the Port that may well be via road transport rather than rail.</p>	Chapter 18: Economics Section 18.6 Section 18.7 Appendix Y: Economic Impact Assessment Section 2.2 Section 5.4

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0009		Economics		The EIS fails to demonstrate a cost benefit analysis of a) current road freight (direct from farm and grain depots to market and port),b) current rail services for the Darling Downs region (QR Brookstead to Brisbane Port), and c) Inland Rail 'Border to Gowrie', including full detailed proposed services, costs and time of Inland Rail within the project area for freight of agricultural products, relating to their claims for: improved access to and from regional markets Reduced costs for the market Improved reliability and certainty of transit time Reduced distances travelled Improved safety Enable complementary market-driven investments	Substantiate direct benefit claims with specific reference to the project area 'Border to Gowrie'. For the B2G project area: Substantiate the direct benefit claim that the Darling Downs will have improved accessed via rail to key local and international markets, compared to current road transport. Substantiate the direct benefit claim that agricultural freight operating costs will be reduced by rail relative to road transport. Include the cost and time analysis associated with road freight from Inland Rail Terminal in Acacia Ridge to Brisbane Port. Substantiate a cost analysis that incorporates the Acacia Ridge to Brisbane Port options and construction costs, addressing a potential material impact on the overall cost benefit analysis. Include scenarios of cost and time analysis that account for impacts to service due to flooding of the Condamine Floodplain Crossing, Confirm and detail proposed services from Brookstead and integration with QR and Grain Corp facilities.	<p>ARTC acknowledges that as a component of the larger Inland Rail Program, the potential benefits of the Project cannot be separated from those that are attributed to the full Brisbane to Melbourne alignment (those quoted by the submitter). The full suite of potential benefits associated with the Inland Rail Program can only be realised once this Project and all other Inland Rail Projects are complete and operational. The EIS considers a range of benefit types which may be a direct result of the Project and which can be quantified or identified as part of the Project, rather than the broader Inland Rail Program. These are captured under two broad benefit streams; providing competitive freight transport and supporting regional and local business; and are summarised in the Executive Summary. The EIS also summarises the broader program benefits identified in the 2015 Investment Case in Section 5.1 of the Executive Summary. Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific CBA has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Qld Government costs have not been included in the Economic Technical Report.</p> <p>There are no intermodal hubs which form part of the revised draft EIS. All assumptions relating to demand modelling, including the connection to intermodal terminals, are considered in the Inland Rail Program Business Case (2015). The EIS reflects the information contained in the Business Case and does not include any new assumptions. As such considering the development of other infrastructure (such as intermodal terminals) or Project options is outside the scope of this EIS. This is reflected in the recent request for further information from the Office of the Coordinator-General. It is noted the location of intermodal will have a material impact on the way benefits of Inland Rail are realised. The Australian Government has also jointly funded a business case to consider the development of an intermodal terminal to support Inland Rail in Queensland. See link: https://investment.infrastructure.gov.au/Projects/Project_Details.aspx?Project_id=111245-20QLD-MRL</p> <p>Regarding connections to local and international markets, the Inland Rail Project in Queensland will support regional economic growth by facilitating the development of intermodal facilities that will sustain employment and business activity for the long term. The Project runs via the Toowoomba Trade Gateway, which combines an internationally capable airport with a major freight facility and over 2,000 hectares of industrial land on the western fringe of Toowoomba LGA. The Toowoomba Trade Gateway is a major industrial precinct supporting Toowoomba and regional south Queensland, involving aviation, logistics, transport, corporate and mining services. It is privately owned and managed and includes Toowoomba Wellcamp Airport, Wellcamp Business Park, InterLinkSQ, Witmack Industry Park and Charlton Logistics Park. The airport became operational in 2014 and provides domestic passenger and international freight transportation. Development of the industrial precinct is ongoing. The Project's route via the airport and industrial precincts may provide the opportunity to supplement airfreight movements with access to the national rail freight network, facilitate access to efficient rail transport for businesses in the region and at the Toowoomba Trade Gateway, and stimulate business development in the Toowoomba Trade Gateway. The current reference design for the revised draft EIS does not yet a connection at these locations. This does not preclude ARTC or another 3rd party constructing such a facility at a later date. Such facilities would require a specific business case, a review of the operational efficiencies of the Inland Rail alignment and be subject to further approvals. Discussions with key stakeholders, including major agricultural producers, intermodal terminal operators can occur a later date should there be identified a future need for such rail infrastructure at these locations.</p> <p>Inland Rail will have a connection direct to the Port of Brisbane from day one of full operations via connection in the vicinity of the Acacia Ridge terminal to the existing dual-gauge freight line operated by QR connecting to the Port. Further, trains going through to the Port of Brisbane (including grain trains) do not need to be double handled after the grain is loaded on to the train. Grain producers will seek to make use of the most efficient and cost-effective method of transporting grain to the Port, and within a certain distance from the Port that may well be via road transport rather than rail. It is noted that in the revised draft EIS only 2 of 19 trains using Inland Rail in year 2028 will be Queensland grain trains travelling from Yelarbon to Fisherman's Island at the Port of Brisbane and only 3 of 24 in 2040 will be such trains.</p> <p>The Project crosses approximately a 12.5 km Section of the Condamine River floodplain. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aq=chrome.69157.9731j0j4&sourceid=chrome&ie=UTF-8. Flood modelling impacts and related mitigation measures for the Condamine River floodplain are outlined in Section 14.8.1 and 14.9.1 of Chapter 14: Flooding and Geomorphology in the revised draft EIS.</p> <p>The current reference design for the revised draft EIS for Project, includes connecting the existing sidings at the GrainCorp silos, which will facilitate faster transport of grain to market. In addition, Inland Rail will have a connection direct to the Port of Brisbane from day one of full operations via connection in the vicinity of the Acacia Ridge terminal to the existing dual-gauge freight line operated by QR connecting to the Port. Further, trains going through to the Port of Brisbane (including obviously grain trains) do not need to be double handled after the grain is loaded on to the train. Grain producers will seek to make use of the most efficient and cost-effective method of transporting grain to the Port, and within a certain distance from the Port that may well be via road transport rather than rail. The Inland Rail alignment terminates at Acacia Ridge and Bromelton in South-East Queensland. According to the Department of Infrastructure, Transport, Regional Development and Communications, "the Australian Government has committed up to \$20 million in funding for Port of Brisbane further planning with Queensland Government to provide an in-kind matching contribution. https://investment.infrastructure.gov.au/Projects/Project_Details.aspx?Project_id=104938-19QLD-MRL. ARTC will upgrade the existing Southwestern Line and Millmerran Branch Line that is operated by Queensland Rail. The use of these existing rail lines is in line with ARTC's approach to minimise additional linear infrastructure, minimise impacts to properties and create operational efficiencies.</p>	Chapter 14: Flooding and Geomorphology Section 14.8.1 Section 14.9.1 Chapter 18: Economics Section 18.7 Section 18.9
192	192.0010		Economics		The Inland Rail claims to provide the Darling Downs with improved access to key local and international markets for grain. Compared to current road and rail transport, it does not describe how this improved access is achieved. . It references direct connectivity with Millmerran Branch Line, which is already in operation for grain freight from Brookstead via QR rail direct to Brisbane Port. The Millmerran connection has been closed since the 2010/11 floods and there is no mention of reinstating the siding connection from Millmerran (Grain Corp Millmerran) to the Inland Rail. The Inland Rail stops at Acacia Ridge, which still requires logistics handling and freight to port adding to costs and time, which is not accounted for in their claim that there is market access and efficiencies to be gained.	ARTC to provide 'make good' benefit opportunity to the agricultural industry by: Reinstating and upgrading the Millmerran Grain Corp Siding and Millmerran Branch Line to connect with Inland Rail in a timely manner to satisfy claims for delivery of direct benefits to the Millmerran community, Darling Downs agriculture, and the Border to Gowrie community. Require a commitment of ARTC and governments for the timely connection of Acacia Ridge Terminal to Brisbane Port to comply with claims for delivery of direct benefits to the 'Border to Gowrie' project and for the success of the entire project 'Melbourne to Brisbane'.	<p>As a component of the larger Inland Rail Program, the potential benefits of the Project cannot be separated from those that are attributed to the full Brisbane to Melbourne alignment. The full suite of potential benefits associated with the Inland Rail Program; such as improved connections to international markets, can only be realised once this Project and all other Inland Rail Projects are complete and operational. The revised draft EIS considers a range of benefit types which may be a direct result of the Project and which can be quantified or identified as part of the Project, rather than the broader Inland Rail Program. These are captured under two broad benefit streams; providing competitive freight transport and supporting regional and local business; and are summarised in Section 5.2 of the Executive Summary. The EIS also summarises the broader program benefits identified in the 2015 Investment Case in Section 5.1 of the Executive Summary.</p> <p>Regarding connections to local and international markets, the Inland Rail Project in Queensland will support regional economic growth by facilitating the development of intermodal facilities that will sustain employment and business activity for the long term. The Project runs via the Toowoomba Trade Gateway, which combines an internationally capable airport with a major freight facility and over 2,000 hectares of industrial land on the western fringe of Toowoomba LGA. The Toowoomba Trade Gateway is a major industrial precinct supporting Toowoomba and regional south Queensland, involving aviation, logistics, transport, corporate and mining services. It is privately owned and managed and includes Toowoomba Wellcamp Airport, Wellcamp Business Park, InterLinkSQ, Witmack Industry Park and Charlton Logistics Park. The airport became operational in 2014 and provides domestic passenger and international freight transportation. Development of the industrial precinct is ongoing. The Project's route via the airport and industrial precincts may provide the opportunity to supplement airfreight movements with access to the national rail freight network, facilitate access to efficient rail transport for businesses in the region and at the Toowoomba Trade Gateway, and stimulate business development in the Toowoomba Trade Gateway. The current reference design for the revised draft EIS does not yet a connection at these locations. This does not preclude ARTC or another 3rd party constructing such a facility at a later date. Such facilities would require a specific business case, a review of the operational efficiencies of the Inland Rail alignment and be subject to further approvals. Discussions with key stakeholders, including major agricultural producers, intermodal terminal operators can occur a later date should there be identified a future need for such rail infrastructure at these locations.</p> <p>Inland Rail will have a connection direct to the Port of Brisbane from day one of full operations via connection in the vicinity of the Acacia Ridge terminal to the existing dual-gauge freight line operated by QR connecting to the Port. The use of these existing rail lines is in line with ARTC's approach to minimise additional linear infrastructure, minimise impacts to properties and create operational efficiencies.</p>	Chapter 18: Economics Section 18.7.4 Section 18.12
192	192.0011	Community Group	Project alignment		The process for assessment of options lacks accountability, transparency and supporting evidence. The draft EIS fails to provide sufficient detail to convey why certain option or courses of action are preferred and why other are rejected, against transparent and consistent criteria and the principles of ecological sustainable development.	nil.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">➤ ability to enhance the Inland Rail service offering➤ construction and operating costs➤ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)➤ approvals and stakeholder engagement: 12.5 per cent➤ technical viability: 17 per cent➤ safety: 16.5 per cent➤ constructability: 12.5 per cent➤ operations: 16.5 per cent.	Chapter 2: Project Rationale Section 2.8 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
192	192.0012		Economics		The cost blow out of the project indicates a material change in costings and potential to influence the outcomes of the route options assessment that was undertaken.	nil.	<p>ARTC notes the purpose of the Investment Case (Inland Rail Program Business Case 2015) was to inform the Commonwealth's decision on whether or not to invest in the progression of the Inland Rail. It evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution. Once the financial (i.e. investment) decision had been made to proceed with the Project, the statutory approval process commenced. Inland Rail, as a State Significant Project in Queensland, is required to respond to the Terms of Reference (ToR) with an Environmental Impact Assessment (EIS) as required under the <i>State Development and Public Organisation Act 1971</i> (Qld).</p> <p>The EIS has been prepared to address the Terms of Reference issued by the Coordinator-General, dated 16 November 2018. The objective of the EIS is to ensure all relevant environmental, social and economic impacts of the Project are identified and assessed and to demonstrate that the Project is based on sound environmental principles and practices.</p> <p>Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in Appendix Y: Economic Impact Assessment.</p>	

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0013	Community Group	Project scope	Mitigation measures	The reference designs fail to provide detail to assess local impacts, with constant referral to the preparation of detailed designs in the next phase to inform impact assessments and management plans. Fails to provide detail to assess impacts and inform management conditions. Detailed design will be developed on an individual site basis, no account for how area wide, flow on and cumulative impacts will be managed as a result. No further public and transparent consultation process or impact assessment on designs or management plans. Flaws confirmed in flood modelling by Flood Panel review that will impact design	nil.	<p>The revised draft EIS revised reference design has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and an additional information request by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3 and Appendix B3: Changes to reference design since draft EIS. To support design and construction of the project, Construction Environmental Management Plans will be developed during detailed design. Ongoing consultation will continue during all future stages of the Project.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Panel) to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Panel draft and final reports are publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (mtr.qld.gov.au).</p> <p>The Queensland and Australian governments have accepted the Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The final report presents the outcomes of the Panel's review of the flood models and reference designs developed by ARTC for the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Project sections.</p> <p>ARTC has undertaken a substantial amount of work to identify existing flooding characteristics and to assess and mitigate potential impacts associated with the 4 Project sections. This work includes responding to the issues raised by the Panel in its respective draft reports. ARTC has responded to all issues raised in the draft reports, including:</p> <ul style="list-style-type: none"> ▶ providing additional information which addressed the queries raised ▶ completing additional work to address issues and committing to incorporating the revised results in future documentation (specifically revised draft EIS documentation) ▶ committing to undertake additional works to address the Panel's comments and incorporating the results in future documentation (specifically revised draft EIS documentation) ▶ recommending that some issues raised are dealt with at Detailed Design stage. <p>A detailed summary of these issues and ARTC's responses are presented in the Issues Management Register (IMR) in Appendix A to Appendix D in the final report.</p> <p>Next Steps:</p> <ul style="list-style-type: none"> ▶ ARTC have committed to implement the Panel's six recommendations outlined in the Final Report. ▶ ARTC's flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event. ▶ Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project Approvals and Corridor Acquisition, Detailed Design, Construction Works, Operations). ▶ A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions. ▶ Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p>	<p>Chapter 5: Project Description Section 5.3.3</p> <p>Chapter 14: Flooding and Geomorphology Section 14.4</p> <p>Appendix B3: Changes to reference design since draft EIS</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4</p> <p>Appendix A</p>
192	192.0014	Community Group	Stakeholder engagement		The experience of the Millmerran community with the engagement process has been tokenistic and contributions actively disregarded in the decision-making process. There is no process, transparency or accountability for consultation and engagement in place. The information and submissions provided through formal channels such as the PRG have not been acknowledged, responded to or acted on. Submissions have not informed decisions or assessments and there is no transparency of how this information is recorded and considered. When landowners and stakeholders have provided information, given their time or made genuine requests, these have not been acknowledged. It has been the experience of many landowners that ARTC have been argumentative and disrespectful. Furthermore, individual landowners have been approached without proper process and diligence causing distress.	nil.	<p>ARTC notes the concerns and acknowledges these. The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.3. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.3. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback as illustrated in Appendix B3: Changes to Reference Design since Draft EIS, showing changes to the reference design since the draft EIS in response to engagement with key stakeholders and identification of Project improvements.</p> <p>The Community and Stakeholder Engagement Plan describes how the Project will communicate and engage with community members and other stakeholders throughout the Project's Detailed Design and Construction Works stages, and when the Project is operational as part of the Inland Rail program. It includes a monitoring and reporting framework and describes how stakeholder inputs will be incorporated in ongoing development and implementation of Social Implementation Management Plan (SIMP) measures.</p> <p>A complaints management procedure will be developed that applies to all Project employees, contractors and site visitors. The aim of the procedure is to ensure that complaints are dealt with efficiently and effectively, and that stakeholders have confidence in the Project's complaint system, refer Section 6.2.4.2 in Chapter 6: Stakeholder Engagement.</p> <p>Complaints can be lodged by any member of the public, landowners or other stakeholders.</p> <p>The complaints management system will include:</p> <ul style="list-style-type: none"> ▶ The capacity for community members to make enquiries or complaints on a 24 hour, seven days a week basis during the Construction Works stage ▶ Promotion of the complaints procedure through direct information to people within 500 m of the Project's temporary footprint, the ARTC Inland Rail website, advertisements and newsletters ▶ A database to track complaints and actions taken in response to complaints, to support provision of information to the Community Relations Monitor about complaints and their resolution as well as regular reporting via the monthly environmental report ▶ Reasonable access by the community to the Community Relations Monitor. 	<p>Appendix E: Consultation Report, Section 2</p> <p>Chapter 6: Stakeholder Engagement, Section 6.3</p> <p>Section 6.6</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p>
192	192.0015	Community Group	Stakeholder engagement		Dissatisfied with matters remaining unresolved, the Millmerran Rail Group are now depending on this EIS process to assess and address the issues raised and bring accountability and transparency into the development process. We insist you read through the body of correspondence attached, dating back to 2016, that supports each of these claims. It further demonstrates the genuine attempts of Millmerran Rail Group to engage and hold ARTC and the government accountable to a robust decision making process for the best outcome for both Inland Rail and the Condamine Floodplain community. The submission to the Senate Inquiry is a fair explanation of the concerns raised with both the project and the process, by Millmerran Rail Group (29 November 2019).	nil.	<p>During preparation of the Project reference design and EIS, it was not within ARTC's scope to investigate alternative routes outside the study area that was set by the Australian Government following its review of the four alternative routes in the Yelarbon to Gowrie Corridor Options Report (DIRD 2016). Subsequent to the submission of the EIS to the Coordinator-General, at the request of the Deputy Prime Minister, in 2020, ARTC prepared the Inland Rail Information Paper, which considered alternative Project alignments via Whetstone State Forest and Cecil Plains.</p> <p>Notwithstanding that, since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to reference design since draft EIS to reflect the alignment maturity.</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC fully cooperated with the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p>	<p>Appendix B3: Changes to reference design since draft EIS</p> <p>Appendix E: Consultation Report Section 2.1</p>
192	192.0016	Community Group	Stakeholder engagement		The biggest risk now lies in the post EIS phase, where the management and mitigation of the major issues raised will be "addressed" by the detailed designs, management plans, and individual impact mitigation measures. There is no further transparency or opportunity for consultation, and therefore no accountability of the final project development and its impacts.	nil.	<p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will continue to consult with impacted landowners in regard to the results of local catchment modelling through finalisation of the EIS and development of the detailed design. The purpose of this consultation will be to ensure that impacts to property-scale water balance features, such as irrigation channels and dams, are appropriately considered in the EIS and revised reference design. Feedback from this consultation will be used to update flood modelling for the Project, if appropriate to do so. Outcomes of this consultation and revised local catchment modelling will be incorporated into the Project.</p> <p>Consultation with impacted stakeholders will continue through detailed design of the Project to ensure that alterations to the design and its impacts are communicated back to landowners. Impacts are to be determined at all drainage structures and waterways affected by construction works. The change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event.</p>	Chapter 24: Draft Outline Environmental Management Plan
192	192.0017	Community Group	Stakeholder engagement		At the commence of the project, commitments were made by the government to the affected communities that their issues would be heard, considered and addressed, and that detailed designs would inform resolutions to impacts as part of the EIS process. The draft EIS has proceeded in the absence of detailed designs and resolution of the specific range of issues raised during prior consultation.	Meet Ministerial commitments and community expectation for consultation on the Detailed Designs, detailed impact assessments and detailed management plans, subscribing to an accountable, transparent and respectful consultation process. Community responses during consultation, including on the appropriateness of the alignment selection, to be incorporated into the design and outcomes of the project, ARTC to provide a full description of the detailed issues raised from consultation conducted for the Condamine Floodplain, and provide a detailed description of how they have been assessed and incorporated into the design and outcomes of the project, particularly in relation to the validation of the flood modelling as per engagement goal 2.1. ARTC to demonstrate to the satisfaction of the stakeholders and the Government how the issues raised through stakeholder engagement have been addressed and incorporated into the EIS. The Coordinator Generals Office and ARTC to provide a description of the process and risk assessment for managing the consequence of issues that are raised during stakeholder consultation and not adequately addressed, and the subsequent action, liability and compensation should the raised issue occur.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the revised reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6, Section 6.6. The Project has made changes to the reference design based on consultation with stakeholders refer Appendix B3: Changes to Reference Design since Draft EIS.</p> <p>Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS and this submission. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022.</p> <p>ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>The Condamine floodplain crossing design has been updated to incorporate community feedback. Key changes include:</p> <ul style="list-style-type: none"> ▶ extending the proposed bridge over the North Branch by approximately 250 m north ▶ moving the proposed Yandilla rail bridge further south and combining with the proposed Grasstree Creek bridge ▶ increasing the number of proposed culverts near Yandilla grain silos to ensure the drainage channel to the south of the silos has sufficient culverts to convey flood water. <p>Chapter 6: Stakeholder Engagement, Table 6-11: Project design changes and mitigation measures in response to stakeholder feedback describes the design changes and mitigation measures made in response to stakeholders concerns. ARTC has commenced quarterly surveys of its stakeholder to help guide its future communication and engagement.</p>	<p>Chapter 6: Stakeholder Engagement Section 6.6</p> <p>Table 6-11</p> <p>Appendix E: Consultation Report Section 2</p> <p>Section 5.3</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p>
192	192.0018	Community Group	Stakeholder engagement		<ul style="list-style-type: none"> ▶ Consequence – not incorporating the stakeholder engagement feedback and fully considering the issues raised will result in fatally flawed designs and causal impacts may occur as predicted by landowners. The flow on lack of recognition of impacts will skew the perceived value of and entitlement to compensation. Landowners are faced with liability and risk to their land, operations and safety. ▶ Causal impacts to adjoining landowners who do not have access to compensation entitlement is not addressed. ▶ Where the issues and risks have been raised, and they are not addressed, who is liable in an event, and how can the landholder access compensation for loss? ▶ How is the issue managed in perpetuity if there is a fatal design flaw? The issues are common and have been raised repeatedly by Millmerran Rail Group on behalf of landowners in the district. 	nil.	<p>The Project's reference design has been developed to avoid and minimise impacts on the local and regional environment, and impacts on the community and landowners, as far as practicable. Engagement undertaken to date has contributed to the Project team's understanding of the potential impacts and has enabled the design to respond to, and minimise, potential impacts, where practicable. The reference design process has evolved since 2017, and has involved many iterations and refinements, incorporating a range of considerations at each stage.</p> <p>Through the revised draft EIS engagement program, ARTC continued to develop and refine the reference design. Engagement with directly and indirectly impacted stakeholders resulted in areas of refinement to the reference design, as well as mitigation measures incorporated to manage stakeholder concerns. In several areas, engagement with individual landowners or community groups has resulted in feedback and interests being captured by the Project team and these matters will be taken through into detailed design where possible, as the Project progresses.</p> <p>Appendix E: Consultation Report, Section 4.1 demonstrates some key examples of some of the design changes and mitigation measures incorporated by the Project, in response to feedback received from directly and indirectly impacted stakeholders, such as landowners, asset owners, community and environmental groups, local businesses, impacted road users, local councils, and State Government agencies. Ongoing consultation with these groups, and additional stakeholder groups such as schools, tourism operators, Traditional Owners and the broader community, will take place during detailed design development as part of the ARTC collaborative framework with the contractor during Detailed Design and Construction Works stages.</p> <p>Consultation with impacted stakeholders will continue through detailed design of the Project.</p>	<p>Appendix E: Consultation Report Section 4.1</p>

192	192.0020		Economics		The guiding principles relating to ecologically sustainable development have not been followed and failure to adhere to project commitments will result in extraordinary impacts to businesses in the Condamine Floodplain compared to any other business along the entirety of the Inland Rail project or compared to other B2G alternative route options. ARTC cannot justify their decisions to impact the Condamine Floodplain and claim they have met their commitment to "Base decision on balanced consideration of technical, economic, environmental and social issues". The Multi Criteria Analysis has not considered the long and short term economic, environmental, social and equity considerations as they relate to the regionally significant impacts within the Condamine Floodplain. Cost savings in freight from Melbourne to Brisbane does not justify the extraordinary economic impacts imposed on local businesses and community. Imbalanced consideration of technical, economic, environmental and social issues and associated decisions as they relate to the Condamine Floodplain.	Based on the evidence provided in this submission, reject claims that ARTC have applied the guiding principles of ecologically sustainable development and decisions have not balanced economic, environmental, social and equity considerations in the long and short term.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG), in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie:</p> <ul style="list-style-type: none">▶ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson▶ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton▶ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton▶ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG), that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment as the preferred concept alignment for the Project. The Corridor Options Report, the preparation of which was overseen by a Project Reference Group appointed by the Australian Government and chaired by Mr Bruce Wilson AM, was made publicly available by the Australian Government on 21 September 2017. The estimate of quantities used in cost estimates contained in the report was subject to an independent review by RPS in August 2017, with no shortcomings identified.</p> <p>The base case via Wellcamp Charlton alignment formed the centreline of a two-kilometre-wide study area to be progressed through ARTC's phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. Chapter 2: Project Rationale of the draft EIS describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ Ability to enhance the Inland Rail service offering▶ Construction and operating costs▶ Multi-criteria analysis (MCA). <p>As described in Section 2.8 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">▶ Environmental impacts – 12.5% (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)▶ Community impacts - 12.5% (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)▶ Approvals and stakeholder engagement – 12.5%▶ Technical viability – 17%▶ Safety – 16.5%▶ Constructability – 12.5%▶ Operations – 16.5%. <p>In response to public notification of the draft EIS, ARTC has refined the Project alignment. Refer to Appendix B3: Changes to Reference Design since Draft EIS.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Chapter 18: Economics</p> <p>Section 18.4</p> <p>Section 18.9</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p>
192	192.0021	Community Group	Land Resources		The route option traverses the greatest number of agricultural properties, and greatest area of permanent sterilisation of Class A and Class B good quality agricultural land. This impact is higher than other route options. \$2.85 m pa loss in gross agricultural product, is not properly and grossly under accounted due to impact to intensive poultry operations 1,451 ha of IAA permanently sterilised, 70% of the corridor The Inland Rail route Section through the Inglewood Forestry was selected to minimises impact to agriculture. However, the new option presented for the route to bypass the Condamine Floodplain through the Cecil Plains forestry however was not given the same consideration.25 trains/24 hrs at road crossings will impact operations Landowners not directly impacted by footprint have no access to compensation	nil.	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ multi-criteria analysis (MCA). <p>As described in Section 18.9, Chapter 18: Economics of the EIS, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. According to Chapter 8: Land Use and Tenure, Section 8.5.1, at a local government level, within the Goondiwindi Local Government Area, the permanent disturbance footprint traverses:</p> <ul style="list-style-type: none">▶ 0.02 per cent of Class A land,▶ 0.19 per cent of Class B land, and▶ 0.01 per cent of IAA land (Important Agricultural Area) <p>Within the Toowoomba, the permanent disturbance footprint traverses approximately:</p> <ul style="list-style-type: none">▶ 0.17 per cent of Class A land,▶ 0.22 per cent of Class B land, and,▶ 0.19 per cent of IAA land <p>Overall, the permanent disturbance footprint will traverse 0.22 percent of the impact assessment area's productive agricultural land.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>The revised draft EIS Chapter 18: Economics of the revised draft EIS, Table 18-11, summarises the proposed management and mitigation measures for agricultural impacts. ARTC will continue to consult with farmers, graziers and owners of agricultural businesses that are directly affected or adjacent to the Project footprint during detailed design to develop measures to mitigate impacts. Further details are provided in Chapter 7: Sustainability Section 7.5 of the revised draft EIS.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, the environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ multi-criteria analysis (MCA). <p>As described in Section 2.8 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">▶ environmental impacts - 12.5% (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)▶ community impacts - 12.5% (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)▶ approvals and stakeholder engagement - 12.5%▶ technical viability - 17%▶ safety - 16.5%▶ constructability - 12.5%▶ operations - 16.5%. <p>ARTC has committed to a comprehensive range of environmental and social impact management strategies which will reduce the potential for impacts on amenity, use or environmental qualities of properties near the rail corridor. Rights and entitlements of landowners and interest holders are determined in accordance with the Acquisition of Land Act 1967. This legislation sets out the process for acquisition, landowner rights and the assessment of compensation.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Chapter 7: Sustainability</p> <p>Section 7.5</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Chapter 18: Economics</p> <p>Section 18.9</p> <p>Table 18.11</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0022	Community Group	Land Use and Tenure	Directly impacted landowner	The issues associated with the route alignment through 368 freehold properties including a large portion of agricultural cropping and grazing operations are significant. At the highest level, the issues are listed, however the significance and cost of their impact is not reflected. The designs do not demonstrate how impacts to agricultural operations have been avoided. It does not acknowledge the impact to value add and supply chain services and costs. The alignment through intensive animal operations is simply unacceptable where planning could avoid the impact to these critical businesses supporting our community, employment, local economy and animal welfare.	nil.	<p>ARTC are committed to minimising loss of agricultural land and livestock operations as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that there will be a loss of agricultural land and land that is used for livestock operations that cannot be avoided.</p> <p>The Project will sterilise productive agricultural land located within the Project footprint and this has been quantified in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1. Based on the analysis, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. At a local government level, within Goondiwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none">▶ 0.02 per cent of Class A land,▶ 0.02 per cent of Class B land, and▶ 0.01 per cent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none">▶ 0.17 per cent of Class A land,▶ 0.22 per cent of Class B land, and,▶ 0.19 per cent of IAA land. <p>Chapter 8: Land Use and Tenure, Table 8-46 (Section 8.5.4), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners (Chapter 8: Land Use and Tenure, Section 8.6.2). The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none">▶ Landowners' needs regarding access to the properties and the closure of private roads▶ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority▶ The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>The Project will impact intensive livestock operations as outlined in Chapter 8: Land Use and Tenure, Section 8.5.1, Table 8-33. The potential impacts include partial acquisition of land, land fragmentation, accessibility and temporary use of land for the Construction Works stage of the Project.</p> <p>Where land containing intensive animal husbandry activities is to be permanently acquired for the Project, this will be undertaken in accordance with the requirements of the AL Act, as outlined in Chapter 8: Land Use and Tenure, Section 8.6.2. Where the Project footprint interfaces with public and private roads that provide access to intensive animal husbandry, accessibility impacts will be managed as per Chapter 8: Land Use and Tenure, Section 8.6.2. The detailed design for the Project will be developed to ensure that legal access for private properties is maintained. ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect property access.</p> <p>Details on consultation undertaken for the Project, including with operators of intensive animal husbandry operations, are included within Appendix E: Consultation Report. Discussion on the selection and development of the revised reference design in minimising impacts to these operations is included in Section 2.10 of Chapter 2: Project Rationale.</p> <p>As stated in Chapter 8: Land Use and Tenure, Section 8.5.1 and Section 8.7, in addition to the potential adverse impacts identified, the Project has the potential to result in beneficial impacts. Beneficial impacts of the Inland Rail Program, and this Project, include:</p> <ul style="list-style-type: none">▶ Improved access to and from regional markets▶ Reduced inter-capital freight costs▶ Improved reliability and certainty of transit time▶ Increased capacity of the freight transport network▶ Reduces freight transportation distances▶ Improved safety▶ Improved sustainability.	Chapter 2: Project Rationale Section 2.10 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Section 8.7 Table 8-33 Table 8-46 Appendix E: Consultation Report
192	192.0023	Community Group	Land Resources		Route selection and alignment fail to avoid or minimise impacts to Good Quality Agricultural Land. Impacts to the numerous intensive animal operations could have been avoided with appropriate route alignment. The direct and cumulative impact of floods to GQAL caused by the Inland Rail alignment and design is not avoided or mitigated. The cumulate impacts beyond the footprint of the alignment are not recognised or mitigated. The permanent footprint traverses 440 properties and 34 easements. The temporary footprint traverses 542 properties and 43 easements. Other route alignments offered considerably less number of properties impacted, and presumably associated cost of compensation and mitigation measures.	Disclose all route alignments, including current alignments under consideration to be included in the EIS Impacts, risk assessments and mitigation measures associated with land use and impact of the inland rail corridor and infrastructure to be conducted at a local catchment scale to appropriately account for localised impacts and cumulative impact of designs, flood models and mitigation measures. Review and conduct a fair and equitable route selection process that considers and seeks to avoid impact to Good Quality Agricultural Land. Access to compensation and mitigation measures is granted to property owners who are directly affected by the 'Developed Case' of flood depths, inundation length, time of submergence and peak water levels and impacts on private land outside the rail disturbance footprint for 1% AEP should be included as directly affected (as determined by validated flood models)	<p>The Project has been aligned to be co-located with existing rail and road infrastructure, where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. However, due to a number of reasons, including topography and operational design parameters, a portion of the alignment has to traverse agricultural land. ARTC will continue to engage with affected landowners to minimise impacts on existing agricultural practices within Chapter 9: Land Resources.</p> <p>As described in Section 2.8 within Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>ARTC has prepared a comprehensive review detailing the alignment changes to the reference design for the revised draft EIS. Refer to Appendix B3: Changes to Reference Design since Draft EIS.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 9: Land Resources Appendix B3: Changes to Reference Design since Draft EIS
192	192.0024	Community Group	Flooding	Directly impacted landowner	The land use impacts should be assessed at a local scale, including impacts from change in land use associated with the inland rail infrastructure and influence on localised flooding to surrounding land use and potential cumulative impacts associated with site based mitigation measures.	Access to compensation and mitigation measures is granted to property owners who are directly affected by the 'Developed Case' of flood depths, inundation length, time of submergence and peak water levels and impacts on private land outside the rail disturbance footprint for 1% AEP should be included as directly affected (as determined by validated flood models)	<p>Construction and operations flood impacts on land in the Condamine River floodplain have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 7.5.3.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
192	192.0025	Community Group	Flooding		Local Government Planning Schemes. Whilst the Toowoomba Regional Planning Scheme has been made exempt from assessment, the intent of the Flood Hazard Overlay Code (Part 8 Overlays) should be considered and applied to avoid impacts to direct and indirect land, use and property. The Impact Assessment and Management Plans should ensure all matters are addressed as intended by this Code. The EIS states that acceptable impacts will be determined on a site basis in the detailed design stage, and by accepting impacts implies breach of the intent of the Flood Hazard Overlay Code outcomes which would be unacceptable for any other development. There is no transparency or opportunity for consultation of these impacts. The impacts need to be known so that cumulative impact to other future developments through the proper assessment codes can be accounted for.	nil.	<p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Section 14.4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p>	Chapter 14: Flooding and Geomorphology Section 14.4 Section 14.11,14.10,1 Table 14-117 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5-17

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0026	Community Group	Land Use and Tenure		Obtaining tenure for the Project.368 Freehold land properties noted. ARTCs preference is to negotiate the purchase of the land required for the Project based on independent market valuation. Landowners do not understand the process for purchase and compensation for a severance portion of their property and how the value to the remaining property is impacted.	nil.	<p>As identified within the Social Impact Management Plan (Appendix X: Social Impact Assessment, Section 8.2.2, Table 8.7), an engagement mechanism for the remainder of the EIS stage is to: Provide communications collateral (website updates and fact sheet) and opportunities for engagement (community information sessions, Council briefings and CCC meetings) to encourage access to the draft EIS and community participation in the public submission process. Consultation with directly affected landowners and the community will continue through the Detailed Design stage.</p> <p>The approach to acquisition of property is further detailed in the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.6.2, for clarity:</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption. Injurious affection will be applied to landowners impacted by severance or to the balance of the land (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> ➤ Landowners' needs regarding access to the properties and the closure of private roads ➤ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority ➤ The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>Chapter 8: Land Use and Tenure, Section 8.6.2 states that where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld) (refer of the EIS). Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance.</p> <p>Costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> ➤ Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation. ➤ Costs related to the purchase of replacement comparable land. ➤ Storage and removal costs. ➤ Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. 	Chapter 8: Land Use and Tenure Section 8.6.2 Appendix X: Social Impact Assessment Section 8.2.2 Table 8.7
192	192.0027	Community Group	Social Impact Assessment		Assessment of compensation is based on the market value of the property at the date of gazettal of the acquisition. There is no provision to compensate property owners that are not directly affected by the Project." It is not clear, the market value of the land is based on the entire property, how is the value of a portion of the property fairly valued for a severance portion and its impact on future property value of the remaining property?	nil.	<p>Property acquisitions will be undertaken by DTMR as the Acquiring Authority. DTMR will negotiate acquisitions and compensation in accordance with the Acquisition of Land Act 1967.</p> <p>Where only part of a land parcel is acquired, compensation for damage caused by the severance of land the resumed land and the impact upon the remaining land may also apply. The process for claiming compensation is set out in the ALA. If the parties do not agree on compensation, a dispute about compensation can be referred to the Land Court.</p> <p>Details regarding land acquisition and consultation processes for the Project are outlined in Chapter 8: Land Use and Tenure and Appendix E: Consultation Report.</p>	Chapter 8: Land Use and Tenure Appendix E: Consultation Report
192	192.0028	Community Group	Land Resources		The Millmerran Rail Group and community rejects the claim for Inland Rail to sterilise 1,451.31 ha of Eastern Darling Downs Important Agricultural Area. The Darling Downs soils are known to be some of the most fertile and productive soils in the country, and the world. Other route options would avoid the extent of productive land sterilisation which is critical to future food production and security and the local economy. The EIS documents do not demonstrate that impacts to Class A or Class B land have been avoided. Other assessment criteria have taken priority over this outcome and has led to a large number of properties and hectares of Class A in particular to be impacted, segregated and productive land sterilised. This outcome for the sake of a few minutes in transit time and unsubstantiated cost claims is entirely unacceptable to our community and the broader State community. Class A land only occurs on 1.5% of Queensland's land area, it is a scarce, finite resource that should be protected.	nil.	<p>The Project has been aligned to be co-located within existing rail and road infrastructure, where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes. However, due to a number of reasons, including topography and operational design parameters, a portion of the alignment has to traverse agricultural land.</p> <p>As described in Section 2.8 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. Class A or Class B Land has been addressed during the assessment of alignment options across all alignment sections as outlined in Section 2.10.</p> <p>ARTC will continue to engage with affected landowners to minimise impacts on existing agricultural practices.</p>	Chapter 2: Project Rationale Section 2.10
192	192.0029	Community Group	Land Use and Tenure		Permanent change in tenure and loss of property. State forest revocation and local industry. Route review. The assessment was not conducted as a like for like using the multi criteria assessment to demonstrate suitability against other options. It is unacceptable that the Inland Rail route alignment design and selection process decided that it was appropriate to directly impact and traverse properties on or in close proximity of nine intensive animal operations. The impact to these operations is not listed, including, but not limited to production impacts from vibration, noise and light, biosecurity, fragmentation and disruption, supply chain interruption, animal welfare issues from flooding, impact to development opportunities.	nil.	<p>Chapter 8: Land Use and Tenure, Table 8-46 (Section 8.5.4), states that where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA. Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>The Project footprint traverses, or is in proximity to, several current intensive animal husbandry operations as detailed in Chapter 8: Land Use and Tenure Section 8.4.1. Details of potential impacts to these feedlots, piggeries and poultry farm are provided in Section 8.5.1. Details on consultation undertaken for the Project, including with operators of intensive animal husbandry operations, are included within Appendix E: Consultation Report.</p> <p>Where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld). Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of:</p> <ul style="list-style-type: none"> ➤ Landowners' needs regarding access to the properties and the closure of private roads ➤ Property infrastructure such as fences, water storages, groundwater bores and irrigation infrastructure that would be affected and need to be considered in compensation arrangements for the property ➤ The potential for changes in access to natural resources, such as groundwater and overland flow. <p>Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis using the market value of the land as at the date of resumption.</p> <p>As described in Section 2.8 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	Chapter 2: Project Rationale Section 2.8 Chapter 8: Land Use and Tenure Section 8.4.1 Section 8.5.1 Section 8.5.4 Section 8.6.2 Table 8-46 Appendix E: Consultation Report
192	192.0030	Community Group	Project alignment	Directly impacted landowner	Agricultural operations will be affected by extended travel time along alternative access roads. As the final designs are not complete, an estimation of these diversions is not clear. There may be significant interruptions to agriculture activities particularly during peak times of 24 hour operations, such as crop harvest, where there are constant truck and machinery movements.	nil.	<p>Severance and fragmentation of rural properties are considered in Chapter 8: Land Use and Tenure, and the results are summarised in Section 8.4.1 and Section 8.5.1. It is identified that property severance could affect the configuration of a property, affecting efficiency, productivity and viability, for example as a result of changes in access arrangement for the movement of farm machinery or stock to different areas of a property. Other identified property impacts include impeded access and changes to internal roads.</p> <p>ARTC acknowledges this issue, which will continue to be addressed as the design and construction planning progress. In accordance with mitigation measures in Section 8.6, the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners would be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. Where the proposal affects internal property access arrangements, input would be sought from relevant landowners prior to finalising the detailed design. Where changes to internal property access arrangements are required, ARTC would consult with relevant property owners/occupants regarding alternative access arrangements, where feasible alternatives are available and identify feasible and reasonable measures to minimise impacts on existing operational arrangements/properties.</p> <p>Chapter 18: Economics, Table 18-14, summarises the proposed management and mitigation measures for agricultural impacts. ARTC will continue to consult with farmers, graziers and owners of agricultural businesses that are directly affected or adjacent to the Project footprint during detailed design to develop measures to mitigate impacts. Further details are provided in Chapter 8: Land Use and Tenure.</p>	Chapter 8: Land Use and Tenure Section 8.4.1 Section 8.5.1 Section 8.6 Chapter 18: Economics Table 18-14
192	192.0031	Community Group	Traffic and Transport	Level crossing	Diversions will cause additional time delays and impact normal efficiency and costs. In addition, there are concerns for safety, particularly where there are no level crossings provided for 23 crossing, and is especially risky during night operations. Operations will need to account for up to 25 trains per 24 hours with delays of3.3 minutes per pass. During harvest, up to three trucks per hour, 24 hours/day will exit a property, with travel time not only extended due to re-routing, but increasing the probability of time delays waiting for trains. Through the Condamine Floodplain a large portion of affected properties are under cropping, the impact to operations is significant and frustrating to land owners.	nil.	<p>ARTC notes the general issues regarding level crossing wait times, level crossings and road detours.</p> <p>In the majority of circumstances, road detours are from a road closure to a grade separation and therefore does not induce a level crossing wait time.</p> <p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ➤ The Office of the National Rail Safety Regulators (ONRSR) Level Crossing policy (ONRSR, 2019) ➤ Queensland Level Crossing Safety Strategy 2012-2021 <p>In response to the above, ARTC have updated the revised draft EIS with details regarding Public level crossing treatment methodology in Appendix BT of Appendix AA: Traffic Impact Assessment. This is intended to provide Agencies and the Community with further transparency on the design process undertaken. Noting all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout the Border to Gowrie section.</p> <p>ARTC have updated the revised draft EIS with details regarding Public level crossing treatment methodology in Appendix BT of Appendix AA: Traffic Impact Assessment. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Appendix AA: Traffic Impact Assessment Appendix BT
192	192.0032	Community Group	Traffic and Transport	Directly impacted landowner	153 private unformed roads and 62 private formed roads will be impacted, but the final number is not determined as the detailed designs are not available. Landowners who may be impacted should have the right to know and respond in the EIS process to adequately communicate their impacts. The lack of transparency in the detailed design phase may cause unidentified and unaddressed interruptions and cumulative impacts to localised areas.	nil.	<p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include:</p> <ul style="list-style-type: none"> ➤ measures to minimise property impacts, including on agricultural operations ➤ specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible ➤ measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities ➤ required adjustments to affected structures. <p>Further, Appendix AA: Traffic Impact Assessment Section 5.12.3 details ARTC commitments to a Construction Environmental Management Plan (CEMP) and Traffic Management Plan. A CEMP will be prepared prior to construction commencing by the construction contractor. The CEMP will include a TMP, attached as an Appendix to the CEMP. The TMP will reflect the finalised TIA, undertaken once a construction contractor has been appointed and construction routes are finalised. It will be developed in consultation with DTMR, the relevant LGA, Department of Education, affected stakeholders and an accredited road safety auditor. The plan will also take into account communications received and will be aligned with the Construction Community and Stakeholder Management Plan. The TMP will identify the impacts that construction traffic is likely to have on the transport infrastructure and detail ameliorative measures required to mitigate all identified impacts of the Project. This may include potential temporary or permanent intersection works. The TMP will detail measures to:</p> <ul style="list-style-type: none"> ➤ Safely manage traffic when undertaking works in the road reserve ➤ Minimise traffic delays resulting from the development/construction ➤ Manage construction vehicles entering and exiting the site ➤ Maintain satisfactory property access ➤ Minimise disruption to adjacent properties ➤ Minimise disturbance to the environment ➤ Meet the requirements of legislation and codes of practice regarding traffic management ➤ Cater for special events 	Appendix AA: Traffic Impact Assessment Section 5.123.

192	192.0033	Community Group	Flooding	Mitigation measures	The design and layout of occupational crossing solutions should also account for the impact of increased flooding risk associated with the Inland Rail infrastructure, as changes in water flows, levels and drainage will increase erosion risk to roads. The flood modelling is flawed and there is little confidence in the current designs to avoid and mitigate impacts. Again, the cumulative or flow on impact of changed infrastructure in the floodplain should be made public and available for consultation to account for potential impacts to neighbours and for floodplain management.	nil.	Operational flood impacts on land in the Condamine River floodplain have been described in Chapter 14: Flood and Geomorphology Section 14.8.1. Construction impacts are discussed in Chapter 14: Flooding and Geomorphology Section 14.9 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 7.5.3. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
192	192.0034	Community Group	Flooding - Condamine River	Erosion	The Condamine Floodplain crossing of the Inland Rail between Millmerran and Brookstead is characterised by cracking clay soils. The erosion potential of cracking clay soils in the region, and the hydrological modelling and design, will result in seriously increased risk of erosion. The severity of the erosion risk and impact has not been represented in the EIS, and the engineering mitigation measures are both flawed and will contribute to the exacerbation of risk.	Locally experienced soil experts should inform the draft EIS reference design on the appropriateness of the Inland Rail alignment and design measures relevant to the soils of the Condamine Floodplain. The Coordinator General's Office should consult with the QDNRM&E soil scientists relating to the appropriateness of the Inland Rail design measures as presented and seek more detailed assessment to address impacts to a level of high confidence to protect soil assets. Conduct soil sampling and site assessments along the Condamine Floodplain for more informed and appropriate design to be included in the draft EIS.	A detailed soil assessment was undertaken in accordance with the Coordinator-General additional requirements at a scale of 1:10,000 mapping scale and reviewed by a Certified Professional Soil Scientist. This assessment has been used to inform the design and management measures to mitigate the impacts to soils from construction. This information was also used in the erosion hazard assessment and geomorphological assessment. Scour and erosion protection downstream of culverts has developed since the reference design stage. During the initial reference design stage, the scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the recommended soil velocity thresholds. An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised reference design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised reference design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design (refer to Section 5.1 of Appendix H: Geomorphology Assessment). Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk. Further analysis of erosion risk is detailed in Appendix H: Geomorphology Assessment.	Appendix H: Geomorphology Assessment Section 5.1
192	192.0035	Community Group	Flooding - Condamine River	Mitigation measures	These culverts will create flood shadowing in small and mid-sized events. The culverts will concentrate the naturally widely spread flow into narrow flow lines that then persist for considerable distance downstream of the structure. Areas previously covered by flow are now 'shadowed' by the structure. In large flows, overall water depths are likely to be great and the impact of shadowing from structures is less likely to occur. However, in mid-sized events the flood shadowing resulting from flow concentration by culverts can be expected to be quite pronounced. The impacts include uneven wetting of land, causing significant spatial impact to pasture and crop growth and loss of overland flow into dams, leading to overall economic losses. Another more insidious impact is the gradual removal of soil along the concentrated lines of flow, leading to irreversible erosion over time.	nil.	Significant bridge openings and cross drainage culverts have been allowed for in the Reference Design to retain the existing flow of flood water. Flood flow distribution has been assessed and is discussed in Chapter 14: Flooding and Geomorphology, Section 14.8.1. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2
192	192.0036	Community Group	Land Resources	Erosion	Further to this, the vibration from the Inland Rail will cause 'liquefaction', where cracking clay soils to disperse when wet as they have low cohesion and resistance to detachment. Essentially turning the soil structures to 'mud slurry' when wet, putting the rail infrastructure itself at high risk as the foundations move. Engineering fixes and more cement will not address this problem. Extended flood inundation caused by the rail embankment will exacerbate the problem. Dr. Rob Loch demonstrates soil liquefaction in this video, where he is replicating the vibrating effect of a train passing over a bridge structure (with pylons into the black soil) and how it eventually turns the soil into mush. This evidence speaks for itself! facebook.com/MillmerranRailGroup/videos/443586656264599	nil.	A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 3.2, Section 5.0 and Table 5.3. This level of investigation is sufficient to allow the determination of the suitability of the soils and identify areas of cracking clay soils for earthworks. Findings from the detailed soil investigation have informed soil-specific management measures and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning. This enabled the management the risks of the Project's topsoils and subsoils as per the Interim TMR Soil Management Manual (SMM), SMM Appendix 2 soil forms and TMR Soil Group classifications map and CSIRO Clay Mineralogy Maps. The methodology for the detailed soil investigation was developed in consultation with DoR and in accordance with the <i>Guidelines for surveying soil and land resources</i> (McKenzie et al. , 2008), the <i>Australian soil and land survey field handbook</i> (National Committee on Soil and Terrain, 2009) and the <i>Guidelines for Soil Survey along Linear Features</i> (Soil Science Australia, 2015). ARTC has updated Appendix J: Soil Assessment Report to include a detailed soil assessment completed at an approximate 1:10,000 scale in consultation with DoR. The soil investigation report provides detailed soil profile descriptions and laboratory test results. Findings from the detailed soil investigation have been incorporated into Chapter 9: Land Resources, Section 9.4.2. Appendix AB: Earthworks Strategy and Draft Soil Management Plan also presents mitigation measures for soil units present within the Project footprint (refer to Sections 3.2 and 3.3).	Chapter 9: Land Resources Section 9.4.2 Appendix J: Soil Assessment Report Section 3.2 Section 5.0 Table 5.3 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3
192	192.0037	Community Group	Flooding - Condamine River		This raised linear infrastructure across the Condamine Floodplain will change the flow and drainage patterns of flood waters. Normally free flowing flood waters will be dammed, peak flood levels will rise, and flows will be diverted and concentrated through culverts. The flow volume and velocity of water will increase erosion risk. Debris from farming land will block culverts, further backing up water and creating safety hazards.	nil.	Significant bridge openings and cross drainage culverts have been allowed for in the Reference Design to retain the existing flow of flood water. Flood flow distribution has been assessed and is discussed in Chapter 14: Flooding and Geomorphology Section 14.8.1. Construction and operations flood impacts on land in the Condamine River floodplain have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 7.5.3. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3
192	192.0038	Community Group	Flooding	Flood immunity	The rail infrastructure is predicted to cause impacts within the floodplain up to 19 kilometres from the rail. Fences have largely been removed from the landscape to manage flooding impacts. The construction of railway fencing will create further hazards such as trapping debris that causes damming, erosion and property destruction. Should the rail design fail in flood events, the degree and extent of impact could be catastrophic.	nil.	Based on feedback from adjacent landowners indicates that fencing on the Condamine River floodplain fencing of the rail corridor has not been included in the revised reference design across floodplain areas. Instead, guideposts or other alternative means of rail corridor boundary protection will be installed in order to demarcate the rail corridor and deter access to the rail corridor. The track elevation through these areas will also act as a deterrent to trespass or livestock access to the railway, where this may otherwise occur.	N/A
192	192.0039	Community Group	Flooding		The Toowoomba Regional Planning Scheme Flood Hazard Overlay Code specifically aims to ensure development in identified flood hazard areas protects the safety of people and property and does not adversely affect floodplain functions. This is achieved through the overall outcome for development use, siting, design and layout avoids or mitigates the flood risk to people, property and infrastructure. Without accountability to this Code, the Inland Rail development will change flood characteristics in ways that will result in: a. changes to flow paths; b. acceleration or retardation of flows; c. increase in the depth or duration of flood or overland flow waters; and d. worsen flood flows and drainage on adjacent properties.	nil.	The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5-17
192	192.0040	Community Group	Flooding		The failure of ARTC to validate flood models with ground truthing and incorporate feedback from landowners raised serious concerns. The consequence of informing the alignment and design of the Inland Rail based on flawed flooding models is immeasurable and unplanned direct and cumulative impacts to all land use within the floodplain.	Local and site based validation of flooding levels and behaviour, and rail detail design impacts, need to be additionally assessed and costed. Stakeholders should have the right to consult on the project based on draft detailed designs and costings, to appropriately respond to quantifiable and more accurately assessed local and cumulative impacts.	The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5-17
192	192.0041	Community Group	Flooding		In April 2019, a meeting was held between Dr Markar and FFJV and ARTC to review the models where ongoing issues were identified with the models, methodology and data references. These are documented in the meeting notes from 2 April 2017 (attached 190402_Meeting Record Future Freight JV). Dr Markar provided a briefing note to DA Hall & Co on the matters of concern raised (Attachment 190408_Brief_DA Hall_WRM).	nil.	The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations. ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the Border to Gowrie revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River and Back Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.6 Section 8.6

192	192.0044	Community Group	Flooding	Flood immunity	<p>There was no consultation or agreement by the community of these flood impacts, they have been imposed. Acceptable flood impact objectives are stated up to 400 mm to adjacent landowners. They have been set as a consequence of unavoidable impacts due to the route alignment decision to traverse the Condamine Floodplain. The extent of flood impacts could be avoided by an alternative route alignment. The assessment process that led to and enables acceptance of 400 mm of increased flooding levels to a large number of landowners is unacceptable to this community.</p>	<p>The exceedance of flood objectives is unacceptable. The change in peak water level tolerance should be 0 mm, or 10 mm for all properties, structures, infrastructure, agricultural land and other areas. The objective for change in duration of inundation simply states to identify changes to duration of inundation and to justify the acceptability of changes. There is no action to avoid or mitigation a change. The objective for change in duration of inundation should be no change in Time of Submergence. The objective for flood flow distribution aims to minimise changes in natural flow patterns and flood flow distribution. Again, the objective seeks to identify any changes and justify acceptability of changes. The flood objective for flood flow distribution should be no change in natural flow patterns and flood flow distribution.</p>	<p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Chapter 14: Flooding and Geomorphology, Section 14.4.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2.In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Chapter 14: Flooding and Geomorphology, Section 14.11.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.4</p> <p>Section 14.10.1</p> <p>Table 14-117</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 5-17</p>
192	192.0045	Community Group	Flooding		<p>The Flood Impact Objectives should meet the overall outcome of the Toowoomba Regional Planning Scheme Flood Hazard Overlay Code for development use, siting, design and layout avoids or mitigates the flood risk to people, property and infrastructure. • The Condamine Floodplain crossing is categorised as Level FR4 Extreme and FR3 High in large sections, and under any other development proposal the Code seeks to limit development in areas of intolerable risk (FR3 and FR4) so as to avoid the risk presented by the flood hazard. The Code is in place to protect property and the safety of people, and exemption and contempt for the outcomes of this code presents unacceptable risk and flood hazard for the community. The rail development will have a direct and cumulative impact within the floodplain by changing flood levels and characteristics and undermining previous and future developments that are built within the Code. The flaws and lack of confidence in the flood models presents further difficulty and risk for Toowoomba Regional Council to assess future developments to meet the Code and adequately manage risk and hazards under the unknown local changes to flood conditions.</p> <p>tr.qld.gov.au/component/edocman/part-08-overlays-v25-pdfdocument/download</p>	nil.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.11</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 5-17</p>
192	192.0046	Community Group	Stakeholder engagement	Flood immunity	<p>The Millmerran Rail Group would like access to a copy of ARTC's Flood Study Engagement Framework 2020 to cross reference the actual engagement experience with what was intended. This document does not seem to be available in the draft EIS material.</p>	nil.	<p>The Flood Study Engagement Framework has been included in the revised draft EIS for stakeholders to reference. It can be found in Chapter 6: Stakeholder Engagement, Section 6.6 and further details on engagement with key stakeholder groups for floodplains, including the Millmerran Rail Group can be found in Appendix E: Consultation Report, Section 5.3.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.3</p>
192	192.0047	Community Group	Surface Water		<p>The impacts to water availability and users cannot be assessed due to the lack of detailed design of the Inland Rail and flawed flood modelling determining impact type and extent.</p>	nil.	<p>Chapter 13: Surface Water, Section 13.26 states that the revised reference design will minimise the changes to flow and potential impact to downstream surface water users. A flooding and hydrology study has been undertaken detailing potential impacts to flow. Whilst change to hydraulic regimes may occur (due to new infrastructure) at 1% AEP conditions, changes to base-flow and low-flow conditions are not expected (refer Appendix T1 and T2: Hydrology and Flooding Technical Report Volume 1 and 2) and will not significantly impede current surface water resource use.</p> <p>Operational flood impacts on flow distribution have been described in Section 14.8.1 of the revised draft EIS Chapter 14: Flooding and Geomorphology and the 'Flood Impact Objective outcome' Section of each catchment Section of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Mapping to support the flow distribution assessment is provided in Appendix T2: Hydrology and Flooding Technical Report – Volume 2 (Sub-Appendix Q).</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Chapter 13: Surface Water</p> <p>Section 13.26</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 5-17</p> <p>Appendix T2: Flooding and Hydrology Technical Report - Volume 2</p> <p>Appendix Q</p>
192	192.0048	Community Group	Flooding		<p>The entire length of the Inland Rail route alignment and across the Condamine Floodplain intercepts and interferes with overland flow. The floodproofing of the Inland Rail is essentially a weir across the floodplain. The diversion of flow to culverts will cause shadowing where particularly medium size flood events will see areas miss out on overland flow. There is no assessment conducted on impact to dam catchments, uneven crop infiltration and associated economic loss.</p>	nil.	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS.</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures (Section 22 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 22</p> <p>Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
192	192.0049	Community Group	Groundwater	Groundwater drawdown	<p>It is unacceptable that the project will draw against existing licences to supply 2,551 ml for earthworks and concrete during construction. There is an unaccounted loss of access to groundwater due to the project interference with groundwater aquifers, overland recharge and aquifer permeability, change in groundwater flow and seepage from construction. This displacement of valuable water for agriculture, existing industries and communities impacts resilience and future water security.</p>	nil.	<p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. Currently the hierarchy of water supply source preferences prioritises non-potable sources for construction water (i.e. dust suppression) to minimise impacts to communities and water users (see Section 5.6.24 of Chapter 5: Project Description). Further, the use of groundwater for construction water is not a preferred water source for the Project.</p> <p>Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.24</p> <p>Chapter 15: Groundwater</p> <p>Table 15-20</p> <p>Appendix B5: Construction Water Requirements</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0050	Community Group	Groundwater	Groundwater drawdown	Landowners have planned their farming operations based on the availability and security of water. Impacting the availability or quality of water will have lasting effects. The changed impact in the aquifers may not be seen for some time and occur outside of the project footprint area, with delayed and prolonged impacts to the availability and security of water. Groundwater is essential for stock watering, especially during times of drought.	The make good scenario of drilling a new bore will need to account for the full impact of changed operations. In these cases, it is likely that farming operations are already significantly impacted and loss of bore access is just another management mitigation requirement.	<p>Only isolated drawdown in the vicinity of deep cuts is anticipated. No regional groundwater drawdown/wider impact on the aquifer is anticipated. See predictive modelling results in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.</p> <p>Baseline groundwater monitoring has been conducted and is ongoing at Project bores along the Project alignment. The baseline groundwater dataset, in addition to regular groundwater monitoring during the construction works and Operations stages of the Project (e.g. quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project during the construction works and part of Operations stages of the Project.</p> <p>Bores required to be decommissioned within the Project footprint or access restricted as a result of the Project will have 'make-good' measures agreed in consultation with the landholder to ensure the agreed make-good solution is commensurate with the level of impact anticipated (see Chapter 15: Groundwater, Section 15.7.4 and Table 15-20).</p>	Chapter 15: Groundwater Section 15.6.2 Section 15.7.4 Table 15-20 Appendix U: Groundwater Technical Report Section 6.3
192	192.0051	Community Group	Groundwater	Land acquisition/ compensation	To have valuable and essential water resources impacted is unacceptable in any other situation. Landowners effected by groundwater impacts may fall outside the project footprint area, or impacts may not be realised until after project compensation, limiting opportunities for impact assessments and compensation.	nil.	<p>Only isolated drawdown in the vicinity of deep cuts is anticipated. No regional groundwater drawdown/wider impact on the aquifer is anticipated. Currently no registered bores are located within the anticipated extent of drawdown associated with deep cuts and ARTC have undertaken a groundwater bore survey to help identify any unregistered bores within 80 m from the deep cuts. The results of this survey have been included in Chapter 15: Groundwater, Section 15.5.4. See predictive modelling results in Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3.5.</p> <p>Baseline groundwater monitoring has been conducted and is ongoing at Project bores along the Project alignment.</p> <p>Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 and 15.4.4). Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset. The baseline groundwater dataset, in addition to regular groundwater monitoring during the Construction Works and Operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project during the Construction Works and part of Operations stages of the Project(see Chapter 15: Groundwater, Section 15.7.3 and Appendix U: Groundwater Technical Report, Section 8.3.1).</p>	Chapter 15: Groundwater Section 15.4.2 Section 15.4.4 Section 15.5.4 Section 15.6.2 Section 15.7.3 Appendix U: Groundwater Technical Report Section 6.3.5 Section 8.3.1
192	192.0052	Community Group	Social Impact Assessment	Workforce and employment	There has been unacceptable and undue stress placed on stakeholders through consultation process, a general lack of information and failure to avoid and address issues raised. Agricultural industry is already experiencing extreme issues due to labour shortages, exacerbated by COVID. Policies for local employment will draw down on local labour availability will further impact local businesses and agriculture production operations. Despite awareness of these issues, there are no real strategies to avoid this impact or mitigation strategies identified. There is no indication of what the employment legacy for the Border to Gowrie project is.	<ul style="list-style-type: none"> ▶ Avoid labour impact to agriculture industry. ▶ Avoid impact to business operations. ▶ Consult the community to avoid impacts from the non-resident workforce accommodation at Turalin. ▶ ARTC to provide a labour sourcing strategy including the impacts of Covid to mitigate impacts on local labour availability. ARTC to liaise with agricultural industry bodies in addition to construction industry bodies to develop labour sourcing strategies. ▶ Consult with the community and affected landowners regarding the site selection and impacts of the Turalin Workers Accommodation. 	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 7.5.2 and Section 8.6.2 addresses the potential for Project impacts on tourism-related businesses and describes ARTC's commitments to ensuring that local and regional businesses benefit from the Project. This includes work with local industry representatives (Section 8.6.4) and business capability building programs that will be delivered by the Inland Rail Skills Academy, and as part of the Australian Industry Participation Plan (Section 8.6.3).</p> <p>The proposed site for a non-resident workforce accommodation facility in Turalin is not being pursued in the revised draft EIS. The Contractor is currently undertaking due diligence to identify a site in the Millmerran area, and will consult with TRC and the Millmerran community when this has progressed. An Accommodation Management Plan (described at Appendix X: Social Impact Assessment, Section 8.4.4) will be prepared for the Project in consultation with TRC and a range of other stakeholders.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.3 notes that the Contractor will be required to set local and Indigenous employment goals and report on the outcomes. This will include quarterly monitoring of the number of people from SIA study area that are employed in construction in line with targets, and reporting on outcomes as part of SIM reporting. Appendix X: Social Impact Assessment, Section 4.1.7 identified the number of long term operational jobs for the project as 10-15 FTE.</p> <p>The potential for labour draw has been identified in Appendix X: Social Impact Assessment, Section 7.2.2. Inland Rail Skills Academy programs are a key commitment to increasing the availability of suitably qualified local employees to reduce the drawdown on local labour. The workforce will also include specialist workers with skills and experience which isn't available locally. Although Project recruitment has not commenced, the Inland Rail Skills Academy has delivered preliminary training programs for local people to develop skills relevant to local industries including agriculture including:</p> <ul style="list-style-type: none"> ▶ Skills training for local residents focusing on transferrable agricultural skills held in December 2020 (Goondiwindi) ▶ Skills training for local Indigenous residents held in 2020-2022 ▶ Various initiatives for local school students to raise awareness of both STEM-based and trade careers available on Inland Rail held in 2020-2022 <p>Additionally, ARTC has partnered with Goondiwindi Regional Council to support a "Local Employment Roadmap" which aims to attract skilled workers to the region. Appendix X: Social Impact Assessment, Section 8.3.4 has been updated in this regard.</p> <p>Appendix X: Social Impact Assessment, Section 7.4.9 describes the potential legacy benefits that would eventuate in the Project region, and has been further detailed in response to submissions.</p>	Appendix X: Social Impact Assessment Section 4.1.7 Section 7.2.2 Section 7.4.9 Section 7.5.2 Section 8.3.3 Section 8.3.4 Section 8.4.3 Section 8.6.2 Section 8.6.3 Section 8.6.4
192	192.0053	Community Group	Social Impact Assessment	Workforce and employment	<ul style="list-style-type: none"> ▶ No consultation process regarding workforce accommodation site selection and impacts. ▶ Affected parties not described - Turalin community and DA Hall & Co poultry operations near Turalin consultation and impacts not described relating to the selection of the site for the non-resident workforce accommodation at Turalin. ▶ No legacy indication for increased employment for the project area. 	<ul style="list-style-type: none"> ▶ ARTC commitment to tourism and recreation initiatives in Millmerran. ▶ ARTC commitment to community legacy projects ▶ ARTC commitment to non-resident workforce accommodation and associated legacy commitments, once an agreed site is decided following consultation. ▶ ARTC commitment for an initiative in Millmerran to encourage workers to relocate to the region. ▶ ARTC to provide a housing strategy to mitigate impacts to local rent market and availability and affordability for local residents in Millmerran. Severance and amenity impacts ▶ Independent support provided to landowners were requested to help identify and plan for individual impacts and mitigation measures. ▶ Cost recovery for landowners available to engage independent expert advice on impact mitigation strategies during detailed design consultation and negotiation process. Local businesses ▶ ARTC commitment for an initiative to fund service providers (local Chambers, RDA) to provide procurement preparedness and capacity support for local and small businesses to competitively tender, and risk associated with temporary contracts. 	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 7.5.2 and Section 8.6.2 addresses the potential for Project impacts on tourism-related businesses and describes ARTC's commitments to ensuring that local and regional businesses benefit from the Project. This includes work with local industry representatives (Section 8.6.4) and business capability building programs that will be delivered by the Inland Rail Skills Academy, and as part of the Australian Industry Participation Plan (Section 8.6.3).</p> <p>The proposed site for a non-resident workforce accommodation facility in Turalin is not being pursued in the revised draft EIS. The Contractor is currently undertaking due diligence to identify a site in the Millmerran area, and will consult with TRC and the Millmerran community when this has progressed. An Accommodation Management Plan (described at Appendix X: Social Impact Assessment, Section 8.4.4) will be prepared for the Project in consultation with TRC and a range of other stakeholders.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.3 notes that the Contractor will be required to set local and Indigenous employment goals and report on the outcomes. This will include quarterly monitoring of the number of people from SIA study area that are employed in construction in line with targets, and reporting on outcomes as part of SIM reporting. Appendix X: Social Impact Assessment, Section 4.1.7 identified the number of long term operational jobs for the project as 10-15 FTE.</p> <p>The potential for labour draw has been identified in Appendix X: Social Impact Assessment, Section 7.2.2. Inland Rail Skills Academy programs are a key commitment to increasing the availability of suitably qualified local employees to reduce the drawdown on local labour. The workforce will also include specialist workers with skills and experience which isn't available locally. Although Project recruitment has not commenced, the Inland Rail Skills Academy has delivered preliminary training programs for local people to develop skills relevant to local industries including agriculture including:</p> <ul style="list-style-type: none"> ▶ Skills training for local residents focusing on transferrable agricultural skills held in December 2020 (Goondiwindi) ▶ Skills training for local Indigenous residents held in 2020-2022 ▶ Various initiatives for local school students to raise awareness of both STEM-based and trade careers available on Inland Rail held in 2020-2022 <p>Additionally, ARTC has partnered with Goondiwindi Regional Council to support a "Local Employment Roadmap" which aims to attract skilled workers to the region. 192	192.0054		Economics		The draft EIS fails at the highest level to provide the economic cost of the project to the agriculture industry. Given 70% of the Inland Rail footprint will involve land use change and sterilisation of Important Agricultural Areas, a matter of state importance, the full cost of this impact should be accounted. The impact extends beyond the direct footprint of land acquisition, but also disruption to operations, access, loss of production and value add, water resources and flooding impacts. Landowners well outside the rail footprint will have operations due to access impacted which is not recognised. The cost to operations and supply chain disruption from extended flood impacts on infrastructure and road networks is also not accounted.	nil.	<p>ARTC acknowledges that due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific CBA has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in the Economic Technical Report.</p> <p>In response to public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the revised draft EIS, including to the calculated potential loss for rural communities. The revised economic technical report Section 5.5 within Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr. qld. gov. au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?q=independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&rlz=1C1GCEB_enAU1015AU1015&oq=independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aqs=chrome..69i57j31j0j4&sourceid=chrome&ie=UTF-8.</p> <p>The flood modelling, impact assessment and subsequent community consultation has also considered potential flooding impacts that fall outside of the Project's permanent and temporary foot prints. This information is detailed in Chapter 14: Flooding and Geomorphology and in Appendix E: Consultation Report in the revised draft EIS.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> ▶ Direct impacts on properties e.g. severance and loss of productive land ▶ Impacts on property accesses and connectivity, including the location of level crossings on private roads ▶ Impacts on the movement of stock, water, produce and equipment. 	Chapter 14: Flooding and Geomorphology Chapter 18: Economics Section 18.7.4 Section 18.9.1 Appendix E: Consultation Report Section 5.3 Appendix Y: Economic Impact Assessment Section 5.5
192	192.0055		Economics		Loss of agriculture land is calculated at a high level with no real assessment of actual loss based on commodity or added value. It fails to document cost of acquisition. It further fails to document any cost associated with disruption to agricultural operations, services, water, increased travel time and operational impacts. Furthermore, the impact to agricultural production and infrastructure as a result of increased inundation, velocity, erosion, and flood damage from the Inland Rail has not been accounted for. This impact surpasses the 2 km footprint and will have wide reaching impacts to adjoining landowners that have not been costed or considered beyond acknowledging there will be an impact. These landowners do not have access to compensation.	The current design and cost benefit assessments should be rejected based on a lack of and inaccurate cost information.	<p>ARTC acknowledges that due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific CBA has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in Appendix Y: Economic Impact Assessment.</p> <p>In response to public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the revised draft EIS, including to the calculated potential loss for rural communities. The revised economic technical report Section 5.5 within Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. This information is detailed in Chapter 14: Flooding and Geomorphology in the revised draft EIS and in Appendix E: Consultation Report.</p> <p>The Construction Authority for the Inland Rail Project in Qld, will be the Qld Department of Transport and Main Roads (DTMR). In relation to compensation matters, DTMR will be responsible for all land acquisition and resumptions required for the construction of the Project. Property acquisition, whether it be whole or partial, will be determined on a case-by-case basis, with negotiations being led by DTMR. Compensation for loss of land and interests in land will be assessed in accordance with the <i>Acquisition of Land Act 1967</i>.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> ▶ Direct impacts on properties e.g. severance and loss of productive land ▶ Impacts on property accesses and connectivity, including the location of level crossings on private roads ▶ Impacts on the movement of stock, water, produce and equipment 	Chapter 18: Economics Section 18.7.4 Section 18.9.1 Appendix E: Consultation Report Section 5.3 Appendix Y: Economic Impact Assessment Section 5.6

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
192	192.0056		Economics		The draft EIS and supporting economic impact assessment technical report simply describes that there will be economic impacts to agriculture and fails to provide an assessment of these costs in real terms.	Full assessment of economic impact and cost to agriculture: Loss of agricultural land, acquisition of land and loss of production and value add Acquisition of land used for intensive livestock operations and loss of production and value add Temporary and permanent disruption to access and infrastructure Temporary and permanent disruption to stock ad product movement Improvements in supply chain efficiency and impacts to supply chain; and Flood inundation of direct and indirectly impacted land use and supply chains, accounting for mitigation measures and cumulative impacts. Cost benefit analysis of economic impact compared to other route options, including cost to agriculture, land acquisition, impact to operations, mitigation measures and flooding.	<p>Due to the nature of the incremental assessment approach adopted for this revised draft EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Qld Government, costs have not been included in the Economic Technical Report.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 m of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p> <p>In response to public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the EIS, including to the calculated potential loss for rural communities. The revised economic technical report Section 5.5 within Appendix Y: Economic Impact Assessment outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential impacts to DA Hall and Co infrastructure and their piggery, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible.</p> <p>In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Independent Panel), to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel was to provide finalised reports and recommendations to the Joint Working Group for review. Both levels of made a commitment that both draft and final reports would be made publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au). In October 2022, the Queensland and Australian governments have accepted Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice, adequately identify and mitigate flood risks and are fit-for-purpose. Refer to: google.com/search?q=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&rlz=1C1GCEB_enAU1015AU1015&oq=Independent+panel+of+experts+for+flood+studies+in+Queensland+final+report&aqs=chrome..69i57.9731j0j4&sourceid=chrome&ie=UTF-8.</p> <p>The flood modelling, impact assessment and subsequent community consultation has also considered potential flooding impacts that fall outside of the Project's permanent and temporary foot prints. This information is detailed in Section 14.8.1 of Chapter 14: Flooding and Geomorphology and in Appendix E: Consultation Report in the revised draft EIS.</p> <p>As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties. Regarding the proposed location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ➤ Ability to enhance the Inland Rail service offering ➤ Construction and operating costs ➤ Multi-criteria analysis (MCA). <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> ➤ Direct impacts on properties e.g. severance and loss of productive land ➤ Impacts on property accesses and connectivity, including the location of level crossings on private roads ➤ Impacts on the movement of stock, water, produce and equipment. 	<p>Chapter 2: Project Rationale Section 2.7</p> <p>Chapter 14: Flooding and Geomorphology Section 14.8.1</p> <p>Chapter 18: Economics Section 18.7</p> <p>Section 18.9.1</p> <p>Appendix E: Consultation Report Section 5.3</p> <p>Appendix Y: Economic Impact Assessment Section 5.5</p>
192	192.0057		Economics		Due to the scale and extent of the impact to agricultural land, covering 70% of the footprint, and the rail impacting a large portion of the Condamine Floodplain, it would be appropriate for a more detailed assessment of economic impacts to be conducted for a proper consideration of impacts, management strategies and offset provisions. The current level of detail does not provide a full cost and mitigation strategies managed at an individual site basis will have cumulative economic impacts that are not accounted for.	Provide full and updated cost analysis of the project delivery, economic impact to local industries and communities. Conduct an updated assessment of route options based on revised costs.	<p>ARTC acknowledges that due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific CBA has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in Appendix Y: Economic Impact Assessment.</p> <p>In response to public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the revised draft EIS, including to the calculated potential loss for rural communities. The revised economic technical report Section 5.5 within Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. 193	193.0001	Community Group	Social Impact Assessment	Directly impacted landowner	Impact to local and regionally significant business operating dryland crop production, irrigated crop production, various intensive animal production unit, feedmill and grading floor. DA Hall properties directly impacted by alignment.	nil.	<p>ARTC has revised the Project's design to avoid the Doug Hall (Moyness) piggery and poultry farm. Revised draft EIS Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts on farm infrastructure and operations.</p> <p>Appendix X: Social Impact Assessment, Section 7.2.1 notes that consultation with council and business community indicated there is a skilled workforce available as a result of workforce participation in other major infrastructure Projects in the region (including construction of the gasfields in the Western Downs and the Toowoomba Bypass).</p> <p>The potential for labour draw has been identified in Appendix X: Social Impact Assessment, Section 7.2.2 and management measures addressing potential labour draw are detailed in Appendix X: Social Impact Assessment, Section 8.3.7. The Project will supply accommodation to minimise any workforce impacts on local accommodation stocks.</p>	<p>Appendix X: Social Impact Assessment Section 7.2.1</p> <p>Section 7.2.2</p> <p>Section 8.3.7</p> <p>Section 8.6.1</p>
193	193.0002	Community Group	Project alignment	Directly impacted landowner	The current route alignment has failed to avoid major impacts directly to DA Hall poultry and piggery and farming operations. The proposed alignment impacts on both existing and future proposed development at chainage 133 km to 140 km. DA Hall have been presented with a number of potential alignment options traversing their property and provided feedback to ARTC. DA Hall are left uncertain about the final alignment and impacts to be caused to business operations including future expansion.	nil.	<p>The Millmerran Alternative Alignment is described in Chapter 2: Project Rationale, Section 2.10.9 and Figure 2-25.</p> <p>Advantages of the revised reference design include:</p> <ul style="list-style-type: none"> ➤ Completely avoids severing highly intensive animal and agricultural industries, including avoidance of severing Class A, Class B and important agricultural areas (discussed in further detail in Chapter 8: Land Use and Tenure) ➤ Removal of two active crossings, increasing safety and travel benefits for the community ➤ Rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ➤ The new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ➤ Reduces adverse economic and social impacts by creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks, and avoids direct impacts to future planned infrastructure ➤ The access road on Lindenmayer Road no longer has any direct impacts to associated traffic for future operations. <p>Consultation with impacted stakeholders will continue to take place through the Detailed Design stage.</p>	<p>Chapter 2: Project Rationale Section 2.10.9</p> <p>Figure 2-25</p> <p>Chapter 8: Land Use and Tenure</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0003	Community Group	Project alignment	Flood immunity	Impacts associated with the alignment crossing the Condamine floodplain.	nil.	<p>The revised draft EIS revised reference design has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>In June 2020 the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies (the Panel) to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Panel draft and final reports are publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au) (Section 1.4, Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>The Queensland and Australian governments have accepted the Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The final report presents the outcomes of the Panel's review of the flood models and reference designs developed by ARTC for the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Project sections.</p> <p>ARTC has undertaken a substantial amount of work to identify existing flooding characteristics and to assess and mitigate potential impacts associated with the 4 Project sections. This work includes responding to the issues raised by the Panel in its respective draft reports. ARTC has responded to all issues raised in the draft reports, including:</p> <ul style="list-style-type: none">▶ providing additional information which addressed the queries raised▶ completing additional work to address issues and committing to incorporating the revised results in future documentation (specifically revised draft EIS documentation)▶ committing to undertake additional works to address the Panel's comments and incorporating the results in future documentation (specifically revised draft EIS documentation)▶ recommending that some issues raised are dealt with at Detailed Design stage. <p>A detailed summary of these issues and ARTC's responses are presented in the Issues Management Register (IMR) in Appendix A to Appendix D in the final report.</p> <p>Next Steps:</p> <ul style="list-style-type: none">▶ ARTC have committed to implement the Panel's six recommendations outlined in the Final Report.▶ ARTC flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event.▶ Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project Approvals and Corridor Acquisition, Detailed Design, Construction Works, Operations).▶ A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions.▶ Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p> <p>The Millmerran Alternative Alignment is described in Chapter 2: Project Rationale, Section 2.10.9 and Figure 2-25. The new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure.</p>	Chapter 2: Project Rationale Section 2.10.9 Figure 2-25 Chapter 5: Project Description Section 5.3.3 Chapter 14: Flooding and Geomorphology Section 14.4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Appendix A
193	193.0004	Community Group	Project alignment		<p>Route selection assessment process is not transparent and accountable</p> <ul style="list-style-type: none">▶ ARTC refusal of countenance local and expert advice is negligent▶ Route selection process fails to demonstrate like for like multi criteria assessment of all Route options and therefore lacks integrity▶ The draft EIS lacks evidence to support and justify The final Route selection	nil.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none">▶ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson▶ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton▶ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton▶ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none">▶ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions)▶ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts)▶ approvals and stakeholder engagement: 12.5 per cent▶ technical viability: 17 per cent▶ safety: 16.5 per cent▶ constructability: 12.5 per cent▶ operations: 16.5 per cent.	Chapter 2: Project Rationale Section 2.8 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
193	193.0005	Community Group	Project alignment	Directly impacted landowner	<ul style="list-style-type: none">▶ Draft EIS does not include current multiple route options through DA Hall and Co properties, with implication to adjoining landowners Draft EIS fails to recognise the significance of direct impacts on DA Hall and Co's business, employees, local community, and economy, and the route selection process has failed to avoid these impacts▶ Engagement in the consultation process on route alignment, investigation of impacts, and interrogation of ARTC information, has cost DA Hall and Co \$695,000 to date.	The draft EIS is considered following the finalisation of route alignment and associated impacts are fully assessed.	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>In accordance with mitigation measures in Chapter 8: Land Use and Tenure, Section 8.6 the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners would be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties.</p> <p>Chapter 18: Economics, Table 18.14, summarises the proposed management and mitigation measures for agricultural impacts. ARTC will continue to consult with farmers, graziers and owners of agricultural businesses that are directly affected or adjacent to the Project footprint during detailed design to develop measures to mitigate impacts. Further details are provided in Chapter 8: Land Use and Tenure.</p> <p>Compensation for loss of land and interests in land will be assessed in accordance with the <i>Acquisition of Land Act 1967</i> (Qld) in consultation with landowners on a case-by-case basis, in accordance with Appendix E: Consultation Report and Chapter 6: Stakeholder Engagement. Where acquisition is required, the Department of Transport and Main Roads (DTMR), as the constructing authority for the Project, will manage the compulsory land acquisition process under the <i>Acquisition of Land Act 1967</i> (Qld) for land required for the Project that is not State land.</p> <p>The Millmerran Alternative Alignment is described in Chapter 2: Project Rationale, Section 2.10.9 and Figure 2-25.</p> <p>Advantages of the revised reference design include:</p> <ul style="list-style-type: none">▶ Completely avoids severing highly intensive animal and agricultural industries, including avoidance of severing Class A, Class B and important agricultural areas (discussed in further detail in Chapter 8: Land Use and Tenure)▶ Removal of two active crossings, increasing safety and travel benefits for the community▶ Rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event▶ The new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure▶ Reduces adverse economic and social impacts by creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks, and avoids direct impacts to future planned infrastructure▶ The access road on Lindenmayer Road no longer has any direct impacts to associated traffic for future operations <p>Consultation with impacted stakeholders, including DA Hall, will continue to take place through Detailed Design stage of the Project regarding potential Project and economic implications.</p>	Chapter 2: Project Rationale Section 2.10.9 Figure 2-25 Chapter 6: Stakeholder Engagement Section 6.6.2 Chapter 8: Land Use and Tenure Section 8.6 Chapter 18: Economics Table 18.14 Appendix E: Consultation Report Section 5.2

193	193.0006	Community Group	Project alignment		The route selection assessment process is not transparent and accountable. ARTC's refusal to countenance local and expert advice is negligent. Route selection process fails to demonstrate like for like Multi Criteria Assessment of all route options and therefore lacks integrity. The draft EIS lacks evidence to support and justify the final route selection.	nil.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney (Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie (Chapter 2: Project Rationale, Section 2.9.3).</p> <ul style="list-style-type: none"> ➤ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson ➤ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton ➤ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton ➤ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017 (Chapter 2: Project Rationale, Section 2.9.3).</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale, Section 2.8 and 2.9 of the draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ➤ ability to enhance the Inland Rail service offering ➤ construction and operating costs ➤ multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ➤ approvals and stakeholder engagement: 12.5 per cent ➤ technical viability: 17 per cent ➤ safety: 16.5 per cent ➤ constructability: 12.5 per cent ➤ operations: 16.5 per cent. 	Chapter 2: Project Rationale Section 2.8 Section 2.8.2 Section 2.9 Section 2.9.3 Section 2.10 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
193	193.0007	Community Group	Project alignment	Modelling	EIS fails to address TOR item 6.7 - does not provide sufficient detail to convey why certain option or courses of action are preferred and why others are rejected, against transparent and consistent criteria and the principles of ecological sustainable development. The current route alignment causes significant impact with little opportunity to minimise impact, mitigation measures for the current route impacts seek to compensate.	An independent review of the route selection assessment process, data and evidence, and outcomes.	<p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney (Chapter 2: Project Rationale, Section 2.8.2). The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie (Chapter 2: Project Rationale, Section 2.9.3).</p> <ul style="list-style-type: none"> ➤ Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson ➤ Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton ➤ Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton ➤ Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. 193	193.0008	Community Group	Social Impact Assessment		Strategic options assessment - The EIS states (Appendix C) "the B2G communities, which will experience much of the impact without any direct benefit". Claims for direct benefits for the B2G communities are unsubstantiated. There are no direct or indirect benefits generated from the Inland Rail project identified for DA Hall.	nil.	<p>ARTC has revised the Project's design to avoid the Doug Hall (Moyness) piggery and poultry farm. Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts on farm infrastructure and operations.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 provides a description of local employment benefits and aspirational employment targets. Appendix X: Social Impact Assessment, Section 7.4.9 provides an updated description of project legacy benefits, and has been further detailed in response to submissions.</p>	Appendix X: Social Impact Assessment Section 7.4.9 Section 8.3.1 Section 8.6.1
193	193.0009	Community Group	Stakeholder engagement		<p>DA Hall are active participants in consultation with ARTC, the government and community processes over five years. The consultation has caused DA Hall business owners, managers and employees personal stress and high levels of uncertainty.</p> <ul style="list-style-type: none"> ➤ consultation has not led to informed decision making or alleviation of genuine concerns and impacts to DA Hall. ➤ the consultation process has failed to influence the project alignment, design, and development to avoid impacts to DA Hall. The multiple route alignments over DA Hall properties has created additional uncertainty and difficulty to assess potential impacts. ➤ following the EIS, there is no further transparency or opportunity for consultation, and therefore no accountability of the final project development and its impacts. 	nil.	<p>ARTC acknowledges the uncertainty that Project development creates; however, design is an iterative process and landowners have been provided with information as it becomes available. Section 7.1 of Appendix X: Social impact assessment details the strategies that ARTC has implemented to support affected residents, including the development of a Community Wellbeing Plan.</p> <p>The consultation approach for the Project was guided by the International Association of Public Participation (IAP2) engagement principles - also referred to as core values - which define the expectations and aspirations of the community engagement process. During the development of the revised draft EIS, stakeholder submissions and feedback have been incorporated into the reference design. Key examples of where DA Hall business and stakeholder feedback has resulted in design changes is shown in Chapter 6: Stakeholder Engagement, Section 6.6.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Appendix X: Social Impact Assessment Section 7.1
193	193.0010	Community Group	Hazard and Risk	Directly impacted landowner	The Inland Rail will create safety concerns for DA Hall as a result of changes to agricultural business operations, machinery movement, highway crossings and flooding from changes to overland and stream flows.	nil.	<p>The reference design has been revised since the revised draft EIS public consultation. The revised reference design now includes a Millmerran Alternative Alignment, which has been based upon ongoing consultation with local business and community, as well as the content of many public submissions provided to the Office of the Coordinator-General and ARTC engaged with stakeholders relating to potential impacts on a major regional business and employer for the Millmerran community (Chapter 2: Project Rationale, Section 2.9.3).</p> <p>In recognition of these potential impacts the revised reference design include:</p> <ul style="list-style-type: none"> ➤ Revised horizontal and vertical alignments for engineering design optimisation with reduced social impact ➤ Relocation of the Millmerran crossing loop to Chainage (Ch) 132.0 km to Ch 134.0 km without impacting the operational efficiency ➤ Road-over-rail grade separation (bridge) at Owen Scrub Road, rather than an active level crossing as previously proposed in the revised draft EIS ➤ Owen Scrub Road upgrade works to improve safety and increase design speeds in the approach to the rail crossing ➤ Removal of the Lindenmayer Road active level crossing, noting the design alignment no longer impacts this road. <p>The outcome of these design changes are:</p> <ul style="list-style-type: none"> ➤ An increase in safety and travel benefits for the community ➤ The rail alignment traverses less area impacted by the 1% Annual Exceedance Probability floodplain of the Condamine River ➤ A reduction in adverse economic and social impacts. <p>Details on the Millmerran Alternative Alignment are provided in Section 2.10.9 of Chapter 2: Project Rationale in the revised draft EIS.</p>	Chapter 2: Project Rationale Section 2.9.3 Section 2.10.9

193	193.0011	Community Group	Project scope		Design - fails to provide detail design to assess impacts - flaws in modelling informing design and impact assessments as confirmed by flood panel and other experts- process to decide final route alignment and detailed design to be developed on an individual side basis, lacks transparency, accountability and consultation on the various joint issues.	nil.	<p>The revised draft EIS revised reference design has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. Changes to the reference design since the draft EIS are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>ARTC worked collaboratively with the Independent International Panel of Experts for Flood Studies (the Panel) in their review & recommendations of the project. ARTC have committed to implement the Panel's six recommendations outlined in the Final Report.</p> <p>Following the Senate Inquiry into the management of Inland Rail by ARTC and the Commonwealth Government, the Rural and Regional Affairs and Transport References Committee released its final report on Wednesday 11 August 2021. ARTC provided full cooperation to the Inquiry since it was announced in September 2019, and will continue to work closely with the Government to address the recommendations of the report.</p>	Chapter 5: Project Description Section 5.3.3
193	193.0012	Community Group	Project alignment	Modelling	ARTC have agreed for DA Hall to proceed with an independent detailed impact assessment, which is currently being undertaken and will be presented to ARTC by end of June.	nil.	<p>ARTC will consider the independent assessment when it is received.</p> <p>The advantages of the Millmerran Alternative Alignment are described in Chapter 2: Project Rationale, Section 2.10.9 and shown on Figure 2-25 and include:</p> <ul style="list-style-type: none"> ➤ Avoids severing highly intensive animal and agricultural industries, including avoidance of severing Class A, Class B and important agricultural areas (discussed in further detail in Chapter 8: Land Use and Tenure Section 8.5.1) ➤ The removal of two active crossings, increasing safety and travel benefits for the community ➤ The alternative alignment traverses less area impacted by 1% AEP Condamine Floodplain event and modelling indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ➤ A reduction in adverse economic and social impacts by creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks, and avoids direct impacts to future planned infrastructure ➤ The access road on Lindenmayer Road no longer has any direct impacts to associated traffic for future operations <p>Consultation with impacted stakeholders will continue through the Detailed Design stage.</p>	Chapter 2: Project Rationale Section 2.10.9 Figure 2-25 Chapter 8: Land Use and Tenure Section 8.5.1
193	193.0013	Community Group	Project scope		Sustainability Guiding principles of ecologically sustainable development have not been followed. ARTC cannot justify their decisions to impact DA Hall and claim in the draft EIS that they have met their commitment to 'base the decision on balanced consideration of technical, economic and environmental and social issues'. - the MCA has not considered the long and short term economic, environmental, social and equity considerations as they relate to the regionally significant impacts to DA Hall- cost savings in freight from Melb to Bris to do not justify economic impacts on DA Hall and local community - imbalanced consideration of technical, economic, environmental and social issues and associated decisions as they relate to DA Hall and relevant broader projects.	Reject the claim that MCA has considered economic, environmental, social and equity considerations as they relate to DA Hall and sought to avoid or minimise them during the reference design development. - Reject claims that ARTC have met their commitments to ecologically sustainable development and associated ARTC policy commitments to sustainability and application.	<p>The Millmerran Alternative Alignment is described in Chapter 2: Project Rationale, Section 2.10.9 and Figure 2-25.</p> <p>Advantages of the revised reference design include:</p> <ul style="list-style-type: none"> ➤ Completely avoids severing highly intensive animal and agricultural industries, including avoidance of severing Class A, Class B and important agricultural areas (discussed in further detail in Chapter 8: Land Use and Tenure Section 8.5.1) ➤ Removal of two active crossings, increasing safety and travel benefits for the community ➤ Rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event ➤ The new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure ➤ Reduces adverse economic and social impacts by creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks, and avoids direct impacts to future planned infrastructure ➤ The access road on Lindenmayer Road no longer has any direct impacts to associated traffic for future operations <p>Consultation with impacted stakeholders will continue to take place through the Detailed Design stage.</p>	Chapter 2: Project Rationale Section 2.10.9 Figure 2-25 Chapter 8: Land Use and Tenure Section 8.5.1
193	193.0014	Community Group	Land Use and Tenure	Directly impacted landowner	<ul style="list-style-type: none"> ➤ Impacts have not been avoided or minimised to the greatest possible extent, whereby the route ➤ Alignment will result in impact to current and proposed developments of significant intensive animal ➤ Production. Route selection and alignment fail to avoid or minimise impacts to 500 ha of Good Quality ➤ Agricultural Land and locally and regionally significant intensive animal operations. 	ARTC to disclose all route alignments, including current alignments under consideration for DA Hall to be included in the draft EIS and available for public consultation.	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. Traversing State Forest is also to be minimised in balance with other environmental impacts. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that in some instances, impacts to existing agricultural operations cannot be avoided.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>The Project footprint traverses, or is in proximity to, several current intensive animal husbandry operations as detailed in Chapter 8: Land Use and Tenure. Details of potential impacts to these feedlots, piggeries and poultry farm are provided in Section 8.5.1 (Table 8-33). The potential impact to the operations of Doug Hall Poultry Pty Ltd is discussed further in this section. Details on consultation undertaken for the Project, including with operators of intensive animal husbandry operations, are included within Appendix E: Consultation Report.</p> <p>The alignment has been amended to avoid the Doug Hall Poultry Farm. Options considered for the Project alignment are discussed in Chapter 2: Project Rationale Section 2.8 and 2.9, as a requirement of the ToR.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.2 Table 8-33 Table 8-46 Appendix E: Consultation Report
193	193.0015	Community Group	Land Use and Tenure	Directly impacted landowner	Uncertainty of route alignment within the corridor and a number of options proposed has resulted in high uncertainty as to what land and operations owned by DA Hall would be impacted. The draft EIS does not present all options discussed between ARTC and DA Hall, therefore ARTC have not provided information on impacts associated with these route options.	Draft EIS land use impact assessments to consider all route alignment options and potential impacts and available for public consultation for affected landowners. ARTC to disclose all route alignments, include current alignments under consideration for DA Hall to be included in the draft EIS and available for public consultation.	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. Traversing State Forest is also to be minimised in balance with other environmental impacts. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that in some instances, impacts to existing agricultural operations cannot be avoided.</p> <p>The alignment has been amended via Millmerran Alternative Alignment route option, to avoid poultry and piggery farms.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>The Project footprint traverses, or is in proximity to, several current intensive animal husbandry operations as detailed in Chapter 8: Land Use and Tenure. Details of potential impacts to these feedlots, piggeries and poultry farm are provided in Section 8.5.1 (Table 8-33). The potential impact to the operations of Doug Hall Poultry Pty Ltd is discussed further in this section. Details on consultation undertaken for the Project, including with operators of intensive animal husbandry operations, are included within Appendix E: Consultation Report.</p> <p>Options considered for the Project alignment are discussed in Chapter 2: Project Rationale Section 2.8 and 2.9, as a requirement of the ToR.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.2 Table 8-33 Table 8-46 Appendix E: Consultation Report
193	193.0016	Community Group	Land Use and Tenure	Overland flow/diversion	The land use impacts are not able to be assessed at a local scale, including impacts from change in land use associated with the Inland Rail infrastructure and influence on localised flooding to land use and potential cumulative impacts associated with site based mitigation measures. Flood modelling is flawed and there is little confidence in the current design to avoid and mitigate impacts. Cumulative or flow on impact of changed infrastructure in the floodplain should be made public and available for consultation to account for potential impacts to and from neighbours and for floodplain management.	nil.	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. The flood mapping is based on a new model specifically developed for the Inland Rail Project Reference design and EIS. Flood modelling has been conducted for a range of design events (or AEPs - Annual Exceedance Probabilities) and tested for potential blockage, climate change and extreme event scenarios.</p> <p>In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 18.2.3 Appendix T2: Hydrology and Flooding Technical Report - Volume - Volume 2
193	193.0017	Community Group	Land Use and Tenure		Impact to Class A and B good quality agricultural land	Avoid fragmentation of Class A and B land into lot sizes inconsistent with the current or potential land use of the land for agriculture. Avoiding development that will have irreversible impact on, or adjacent to, ALC Class A or B land. Consider and manage the cumulative and flow-on impacts of proposed non-agricultural development on agriculture.	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. Traversing State Forest is also to be minimised in balance with other environmental impacts. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that there will be a loss of good quality agricultural land that cannot be avoided.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> ➤ Landowners' needs regarding access to the properties and the closure of private roads ➤ Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority ➤ The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>As described in Chapter 2: Project Rationale (Section 2.8-2.10) of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Chapter 8: Land Use and Tenure Section 8.5.4 Section 8.6.2 Table 8-46
193	193.0018	Community Group	Land Use and Tenure		No impact assessment included for the defined proposal developments of the temporary non-resident workforce accommodation, specifically at Turrallin.	The EIS should extend to include the temporary non-resident workforce accommodation developments as having impact to current and proposed land use activities and cumulative impacts to local areas from all Inland Rail development activities.	<p>Land use and zoning, as identified under the relevant local government planning schemes, is discussed in Chapter 8: Land Use and Tenure, Section 8.2. Section 8.5.1 Change in land use discusses in detail, potential impacts between potential impacts to land uses and the proposed rail infrastructure. As discussed in Chapter 3: Legislation and Project Approvals Process Sections 3.4.5 and 3.4.38, the approvals to build and operate non-resident workforce accommodation facilities will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing. The locations of the two workforce accommodation facilities (in Yelarbon and Inglewood) have been identified and have been contained to rural land uses.</p> <p>As stated in Section 5.6.4 of Chapter 5: Project Description, the location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation facilities will be undertaken during detailed design.</p> <p>Provision of non-resident workforce accommodation facilities and implementation of the Housing and Accommodation Management Plan in the Social Impact Management Plan will avoid the potential for impact to accommodation supply and diversity of housing within the townships in the impact assessment area as outlined in Appendix X: Social Impact Assessment.</p> <p>Following the construction of the Project, opportunities for the beneficial re-use of the non-resident workforce accommodation facilities will be investigated through consultation with local government and relevant stakeholders. If beneficial re-use cannot be identified, the non-resident workforce accommodation will be decommissioned, and the land will be subject to the following ARTC policies as a means of cleaning up, landscaping, and rehabilitating impacted land.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.4.5 Section 3.4.38 Chapter 5: Project Description Section 5.6.4 Chapter 8: Land Use and Tenure Section 8.2 Section 8.5.1 Appendix X: Social Impact Assessment

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0019	Community Group	Land Use and Tenure		Impact to a project of regional significance (DA Hall). Failed to avoid direct footprint impact to five important intensive animal operations and processing enterprises which have been identified by the Qld Government as important to the region and Qld.	Due to the nature of intensive animal operations, avoidance by the project area should be the first course of action.	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. Traversing State Forest is also to be minimised in balance with other environmental impacts. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that in some instances, impacts to existing agricultural operations cannot be avoided.</p> <p>The alignment has been amended to avoid the Doug Hall Poultry Farm.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>The Project footprint traverses, or is in proximity to, several current intensive animal husbandry operations as detailed in Chapter 8: Land Use and Tenure. Details of potential impacts to these feedlots, piggeries and poultry farm are provided in Section 8.5.1 (Table 8-33). The potential impact to the operations of Doug Hall Poultry Pty Ltd is discussed further in this section. Details on consultation undertaken for the Project, including with operators of intensive animal husbandry operations, are included within Appendix E: Consultation Report.</p> <p>Options considered for the Project alignment are already discussed in Chapter 2: Project Rationale Section 2.8 and 2.9, as a requirement of the ToR.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.5.2</p> <p>Table 8-33</p> <p>Table 8-46</p> <p>Appendix E: Consultation Report</p>
193	193.0020	Community Group	Land Use and Tenure	Baseline/backgroud sampling	Existing land use in the Millmerran and Pampas area.	Update Figure 7.5p and 7.5q to correctly identify DA Hall operations (piggery and grain storage) and relevant sections (Table 7.11) to include townships.	Updated land use figures are presented in Chapter 8: Land Use and Tenure, Section 8.4.1, Figures 8.5a-w.	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.4.1</p> <p>Figures 8.5a-w</p>
193	193.0021	Community Group	Social Impact Assessment		Good value for public funds would be to support the continuance of DA Hall business operations and development for long term economic security in the local community. The hundreds of local employees of DA Hall do not have access to compensation, nor do the local suppliers and businesses who currently benefit.	nil.	ARTC has revised the Project's design to avoid the Doug Hall (Moyness) piggery and poultry farm. Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts on farm infrastructure and operations.	<p>Appendix X: Social Impact Assessment</p> <p>Section 8.6.1</p>
193	193.0022	Community Group	Land Use and Tenure	Directly impacted landowner	DA Hall have necessitated engaging a range of experts and economists to determine that impact to the current land use operations and production, and development approvals. The impact to these operations include, but not limited to production impacts from vibration, noise and light, biosecurity, fragmentation and disruption, supply chain interruption, animal welfare issues from flooding, impact to development opportunities.	nil.	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. Traversing State Forest is also to be minimised in balance with other environmental impacts. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However, it is acknowledged that in some instances, impacts to existing agricultural operations cannot be avoided (Chapter 8: Land Use and Tenure, Section 8.6.1).</p> <p>The alignment has been amended to avoid the Doug Hall Poultry Farm.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>The Project footprint traverses, or is in proximity to, several current intensive animal husbandry operations as detailed in Chapter 8: Land Use and Tenure. Details of potential impacts to these feedlots, piggeries and poultry farm are provided in Section 8.5.1, Table 8-33. The potential impact to the operations of Doug Hall Poultry Pty Ltd is discussed further in this section. Details on consultation undertaken for the Project, including with operators of intensive animal husbandry operations, are included within Appendix E: Consultation Report.</p> <p>Options considered for the Project alignment are already discussed in Chapter 2: Project Rationale Section 2.8 and 2.9, as a requirement of the ToR.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.5.2</p> <p>Table 8-33</p> <p>Table 8-46</p> <p>Appendix E: Consultation Report</p>
193	193.0023	Community Group	Project alignment		The same assessment and consideration for the forestry route options was not given in the Condamine floodplain to avoid the sterilisation of Class A agricultural land and significantly impact DA Hall poultry and piggery operations. The justification for avoiding impacts to agriculture in one area and not another is unjust and discriminatory without basis.	nil.	<p>The Millmerran Alternative Alignment is described in Chapter 2: Project Rationale, Section 2.10.9 and Figure 2-25.</p> <p>Advantages of the revised reference design include:</p> <ul style="list-style-type: none"> Completely avoids severing highly intensive animal and agricultural industries, including avoidance of severing Class A, Class B and important agricultural areas (discussed in further detail in Chapter 8: Land Use and Tenure, Section 8.6.1) Removal of two active crossings, increasing safety and travel benefits for the community Rail alignment traverses less area impacted by 1% AEP Condamine Floodplain event The new alignment indicates no change to 1% AEP Condamine Floodplain impact objectives on properties housing infrastructure for major regional employer's business infrastructure Reduces adverse economic and social impacts by creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks, and avoids direct impacts to future planned infrastructure The access road on Lindenmayer Road no longer has any direct impacts to associated traffic for future operations <p>Consultation with impacted stakeholders will continue to take place through the Detailed Design stage.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.10.9</p> <p>Figure 2-25</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.1</p>
193	193.0024	Community Group	Traffic and Transport	Operational traffic	25 trains per 24 hours at road crossings will impact operational efficiencies for nationally important flood supply. Impacts to road network for poultry and piggery operations including access to feedmill, office and other farm facilities and the Gore Highway. Movement of heavy machinery between paddocks and properties will be re-routed from minor roads, onto the Highway due to farm segregation and impacts to road network.	nil.	<p>The revised reference design has updated the alignment near Millmerran and no longer impacts the poultry and piggery operations from a severance or road network perspective.</p> <p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>Further, Appendix AA: Traffic Impact Assessment Section 5.12.3 details ARTC commitments to a Construction Environmental Management Plan (CEMP) and Traffic Management Plan. A CEMP will be prepared prior to construction commencing by the construction contractor. The CEMP will include a TMP, attached as an Appendix to the CEMP. The TMP will reflect the finalised TIA, undertaken once a construction contractor has been appointed and construction routes are finalised. It will be developed in consultation with DTMR, the relevant LGA, Department of Education, affected stakeholders and an accredited road safety auditor. The plan will also take into account communications received and will be aligned with the Construction Community and Stakeholder Management Plan. The TMP will identify the impacts that construction traffic is likely to have on the transport infrastructure and detail ameliorative measures required to mitigate all identified impacts of the Project. This may include potential temporary or permanent intersection works. The TMP will detail measures to:</p> <ul style="list-style-type: none"> Safely manage traffic when undertaking works in the road reserve Minimise traffic delays resulting from the development/construction Manage construction vehicles entering and exiting the site Maintain satisfactory property access Minimise disruption to adjacent properties Minimise disturbance to the environment Meet the requirements of legislation and codes of practice regarding traffic management Cater for special events <p>Finally, ARTC will continue to engage in consultation with the community and relevant government agencies (inc. emergency services and school services) through the Detailed Design and Construction Works stages to ensure that safety concerns and issues are addressed.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.12.3</p>
193	193.0025	Community Group	Traffic and Transport		Pavement impact assessment - DA Hall private unformed and private formed roads will be impacted, as well as adjoining landowners, but the final number is not determined as the final route alignment and detailed designs are not available.	nil.	<p>The revised reference design has updated the alignment near Millmerran and no longer impacts the poultry and piggery operations from a severance or road network perspective.</p> <p>Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include:</p> <ul style="list-style-type: none"> measures to minimise property impacts, including on agricultural operations specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities required adjustments to affected structures. <p>Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts. However, in the case of a privately owned road, consultation will occur regarding restoring the privately owned road or access to at a minimum, it's pre-Project condition.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.6</p>
193	193.0026	Community Group	Flooding	Increase in flows	Design and layout of occupational crossing solutions should also account for the impact of increased flooding and risk associated with the Inland Rail infrastructure, as changes in water flows, levels and drainage will increase erosion risks to roads.	nil.	<p>Operational flood impacts on land have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Section 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>Further mitigation measures proposed are provided in Chapter 14: Flood and Geomorphology, Section 14.9 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.8.1</p> <p>Section 14.9</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 5-17</p> <p>Section 22</p>
193	193.0027	Community Group	Land Resources		Reference to the DA Hall soil conservation plan relating to 3RP16081, to inform Inland Rail design to avoid or mitigate impact is subject to multiple alignment options on 'Moyness' and therefore cannot be assessed. There is no indication of how soil management plans will be addressed, and maintenance of the objectives and functionality preserved and protected.	Assess opportunity to avoid impact to the area under the soil conservation plan on finalisation of the Inland Rail alignment.	<p>ARTC acknowledges that the currency of all soil conservation plans (SCPs) within the Project footprint will need to be verified through detailed design for proposed works. The verification process will involve a review of all available soil conservation plans (including all those listed in Chapter 9: Land Resources, Section 9.4.4) and engagement with affected stakeholders to identify if SCPs have been developed for a property, and not approved under the <i>Soil Conservation Act 1986</i> (Qld).</p> <p>ARTC will continue to work with the Office of the Coordinator-General and the Department of Resources in the Detailed Design stage and during the preparation of the required amendments to the SCPs required for the Construction Works stage.</p>	<p>Chapter 9: Land Resources</p> <p>Section 9.4.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0028	Community Group	Land Resources	Survey effort/field investigation data	Lack of ground truthing of land resource related impacts to DA Hall- Note, page 8-11 - no soil sampling sites were conducted on DA Hall properties, or neighbouring properties. - Table - 8.4 A SRIS mapping along the project alignment on p 8-42, relating to DA Hall properties include chainage 137.3 km to 150.5 km. The transition of soil type impact will depend on the final alignment selection. - p8-46 chainage 133 km to 138.2 km show the disperation is very high, sodic throughout and imperfectly drained. - Table 8.7 typically erodibility ratings for soils encountered along the project alignment state that sodosols have a high (4) and very high (5) erodibility rating.	Locally experienced soil experts should inform the draft EIS reference design on the appropriateness of the Inland Rail alignment and design measures relevant to soils of the Condamine Floodplain. The Coordinator-General's Office should consult with QDNRME soil scientists relating to the appropriateness of the Inland Rail design measures as presented and seek more detailed assessment to address impacts to a level of high confidence to protect soil assets. Conduct soil sampling and site assessment along the Condamine Floodplain for more informed and appropriate design to be included in the draft EIS.	<p>A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). The surveys were conducted by suitably qualified and experienced persons and the report was endorsed by Certified Professional Soil Scientist. Soil management units from the investigation are provided in Section 3.2, Section 5.0 and Table 5.3. This level of investigation is sufficient to allow determination of soil suitability and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. Findings from the detailed soil investigation have informed soil-specific management measures and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning.</p> <p>Chapter 9: Land Resources, Section 9.6.3. Table 9-29 also details the following: "An Erosion and Sediment Control Plan (ESCP) will be implemented as a component of the CEMP and will guide development of site or Section specific ESCPs and include detailed erosion hazard assessments and erosion and sediment control structure designs. The erosion and sediment control measures will be developed by a certified practitioner in erosion and sediment control, in accordance with the intent of Best Practice Erosion and Sediment Control (IECA, 2008) and the Soil Conservation Guidelines for Queensland (DSITI, 2015) and will be implemented during construction of the Project".</p> <p>Section 3.2 and 3.3 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan also details mitigation measures for soil units present within the Project footprint.</p> <p>ARTC have consulted QDNRME as a contributor to the study area for the North-South Rail Corridor study as indicated in Table E-6 of Appendix E: Consultation Report of the revised draft EIS. Consultation will continue with the relevant stakeholders for the Condamine floodplains. ARTC has also undertaken engagement with local soils experts through the Darling Downs Soils Group.</p>	<p>Chapter 9: Land Resources Section 9.6.3 Table 9-29 Appendix J: Soil Assessment Report Section 3.2 Section 5.0 Table 5.3 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3 Appendix E: Consultation Report Table E-6</p>
193	193.0028	Community Group	Land Resources	Erosion	As shown on Figure 8.6d, p8-63, the DA Hall property falls within the HG2 very high erosion risk and the kd10 medium erosion risk area. The lack of suitable design mitigation measures for the increased velocity of flood flows along the Inland Rail infrastructure will create erosion risk and tunnelling effect into adjacent land use at the point of culverts. Erosion risks from change in flow and velocity will be imposed on existing DA Hall infrastructure, including roads, and agricultural land. Undetermined impacts and erosion risk will be present to neighbouring properties. - p8-59 - vertosols are strongly sodic and when clay particles are exposed to water, the particles expand and disperse or slake. Inundation of soils, combined with vibration of the trains will result in soil liquification. This effect and impact have not been properly addressed or mitigated.	nil.	<p>A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 5.0. This level of investigation is sufficient to determine soil suitability and identify dispersive (sodic) soils and amelioration methods in relation to bulk earthworks. Findings from the detailed soil investigation have informed soil-specific management measures and assisted in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning.</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan also presents mitigation measures for soil units present within the Project footprint (see Section 3.2 and 3.3).</p>	<p>Appendix J: Soil Assessment Report Section 5.0 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3</p>
193	193.0029	Community Group	Land Resources	Erosion	p8-155 Permanent change to landform and topography. Management of landform is slope batter optimisation and put in erosion control matting. Soil experts will contest that these measurs are not appropriate to effectively manage erosion risk and effect for the conditions of the Condamine Floodplain. Waiting until the detailed design stage to engage soil experts to inform engineering management measures fails to seek avoidance of significant and persistent issues, that will have far reaching impact beyond the project footprint.	nil.	<p>A detailed soil investigation has been undertaken at an approximate 1:10,000 mapping scale (Appendix J: Soil Assessment Report). The surveys were conducted by suitably qualified and experienced persons and the report was endorsed by Certified Professional Soil Scientist. Soil management units from the investigation are provided in Section 5.0. This level of investigation is sufficient to allow determination of soil suitability including potential erosion risk in relation to bulk earthworks. Findings from the detailed soil investigation have informed soil-specific management measures and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning.</p> <p>Section 3.2 and 3.3 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan also presents mitigation measures for soil units present within the Project footprint.</p>	<p>Appendix J: Soil Assessment Report Section 5.0 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3.2 Section 3.3</p>
193	193.0030	Community Group	Land Resources	Directly impacted landowner	EIS reference 8.6.2 Loss of soil resources 500 ha would be lost due to direct impact of the project alignment. The project would directly result in a loss of production capacity of the soil resource, including a loss of \$58,800 per annum of income from 500 ha of cropping.	nil.	<p>An assessment of the economic impacts (EIA) per lot and commodity is outside the scope of the Environmental Impact Statement (EIS) assessment process. The requirements for the EIA is outlined in Section 5.1 and 11.141 of the Border to Gowrie final Terms of Reference (ToR). The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, and the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. Refer to Chapter 18: Economics and Appendix Y: Economic Impact Assessment. These outcomes have been summarised in the revised draft EIS.</p> <p>In response to public consultation, ARTC has made a number of updates to the draft EIS, including updates to the Project alignment. ARTC has refined the Project alignment which has changed the potential impacts for a number of agricultural enterprises including cropping lands, cattle feedlots, piggeries and poultry farms. This has resulted in a number of updates in the revised draft EIS, including to the calculated potential loss for rural communities. Refer to Chapter 18: Economics. The revised draft Appendix Y: Economic Impact Assessment, Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none">➤ Direct impacts on properties e.g. severance and loss of productive land➤ Impacts on property accessses and connectivity, including the location of level crossings on private roads➤ Impacts on the movement of stock, water, produce and equipment. <p>The Construction Authority for the Inland Rail Project in Qld will be the Department of Transport and Main Roads (DTMR). In relation to compensation matters, DTMR will be responsible for all land acquisition (either partial or whole property) required for the construction of the Project. Property acquisition, whether it be whole or partial, will be determined on a case-by-case basis, with negotiations being led by DTMR. Compensation for loss of land and interests in land will be assessed in accordance with Section 20 of the Acquisition of Land Act 1967 (ALA).</p>	<p>Chapter 6: Stakeholder Engagement Section 6.6 Section 6.7 Chapter 18: Economics Section 18.9.1 Appendix E: Consultation Report Section 4 Appendix Y: Economic Impact Assessment Section 5.5</p>
193	193.0031	Community Group	Land Resources	Erosion	Tunnel erosion is likely where concentrated flow along the IR alignment will result in breakout points, particularly around the culverts	nil.	<p>A detailed soil investigation has been undertaken at a 1:10,000 mapping scale (Appendix J: Soil Assessment Report). Soil management units from the investigation are provided in Section 5.0. This level of investigation is sufficient to allow determination of soil suitability including potential erosion risk in relation to bulk earthworks. Findings from the detailed soil investigation have informed soil-specific management measures and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning.</p>	<p>Appendix J: Soil Assessment Report Section 5.0</p>
193	193.0032	Community Group	Land Resources	Mitigation measures	Mitigation through reference design phase only three culverts proposed in Design Drawings at Moyeness despite the cross Section intersecting three local catchment areas. Bridge stricture and water movement in the area has not been appropriately considered resulting in scour and erosion.	nil.	<p>Scour and erosion protection downstream of culverts has developed since the reference design stage. During the initial reference design stage, the scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the recommended soil velocity thresholds. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection was allowed for within the revised Reference Design (refer to Section 5.1 of Appendix H: Geomorphology Assessment).</p> <p>Further analysis of erosion risk is detailed in Appendix H: Geomorphology Technical Report and Chapter 14: Flooding and Geomorphology, Section 14.7.6 and 14.8.2.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.7.8 Section 14.8.2 Appendix H: Geomorphology Assessment Section 5.1</p>
193	193.0033	Community Group	Land Resources	Mitigation measures	The Section of Inland rail crossing Moyeness is already highlighted as having very high erosion potential within the draft EIS. This area should be avoided at the design stage. The draft EIS process does not allow for site specific issues to be identified to be included in the final EIS.	The scale and detail of design elements are not appropriate to inform impact at the property scale. As the alignment is not finalised, site specific impacts are not known.	<p>ARTC has completed an assessment in Appendix J: Soil Assessment Report, of the Project's potential impacts on soils in accordance with the guidelines listed below:</p> <ul style="list-style-type: none">➤ DES Guidelines for Soil Survey along Linear Features➤ DoR Queensland Soil and Land Resource Survey Information Guideline, Version 2.00➤ CSIRO Guidelines for surveying soil and land resources and Australian soil and land survey field handbook <p>Appendix J: Soil Assessment Report was completed to a scale of 1:10,000 and has identified soil management units to inform appropriate soil management plans (as described in Appendix J: Soil Assessment Report, Section 1.3). Given the soil sampling intensity and the refinement of rail alignment in the revised reference design, it is considered that impacts at a property scale can be assessed and appropriate mitigation measures proposed in Section 3, Part B: Soil Management Plan of Appendix AB: Earthworks Strategy and Draft Soil Management Plan. This was undertaken by a Suitably Qualified Soil Scientist, and the review (including soil management plan) was undertaken by a third-party Certified Professional Soil Scientist. The soil survey work, data collection and laboratory analysis updates have been reflected in Chapter 9: Land Resources, Section 9.4.</p>	<p>Chapter 9: Land Resources Section 9.4 Appendix AB: Draft Earthworks Strategy and Soil Management Plan Section 3 Appendix J: Soil Assessment Report Section 1.3</p>
193	193.0034	Community Group	Land Resources	Cumulative impacts	Performance criteria states that project works do not cause erosion beyond the temporary or permanent works. The surface water Section and as evidenced in this section, the soil characteristics on Moyeness have high erosion potential, with swelling and cracking and will impact both Inland Rail infrastructure and will lead to soil loss and erosion on Moyeness with downstream impacts. The alignment has not avoided impact in this instance and fails to demonstrate suitable mitigation measures.	nil.	<p>Potential changes in velocity have been assessed and are discussed in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology and the "Flood impact objective outcomes" Section of each catchment within Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17).</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. The scour protection was designed in accordance with Austroads Guide to Road Design Part 5B: Drainage (AGRD). Scour protection was specified where the culvert outlet velocities for the 1% AEP event exceeded the allowable soil velocities shown in Table 3.1 of AGRD. An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection was allowed for within the revised Reference Design.</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures (including the need for flow spreaders and/or dissipaters) will be reviewed and confirmed during Detailed Design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5-17 Appendix B</p>

193	193.0035	Community Group	Landscape and Visual Amenity		DA Hall has not been identified as a visual receptor in the project assessment and the multiple options of route alignment makes it difficult to determine exact impact. Lighting impacts during construction (construction traffic, night works hours) and operation from train headlights. The elevation of the alignment over the flood plain would also direct light into the poultry sheds (Diamond Layer Farm).	Finalise route alignment for DA Hall properties in order to inform an impact assessment.	<p>The Millmerran Alternate Alignment (MAA) has been based on ongoing consultation with local business and community. The proposed updated reference design for the revised draft EIS is expected to reduce potential impacts or risks associated with Inland Rail operational noise, vibration, light emissions, and biosecurity risks on DA Hall's business by creating greater separation of the main business infrastructure and the alignment.</p> <p>Impacts of lighting on wildlife, as well as livestock and poultry, are not part of the Landscape and Visual Impact Assessment. Lighting impacts to native fauna are addressed separately within the Project flora and fauna assessment in Chapter 11: Flora and Fauna, which summarises there will be limited lighting associated with the construction (i.e. flashing beacon and temporary spot lights in support of short-duration night works, if required) and operation (i.e. head lamp on rollingstock and safety lighting at road-rail interfaces) of the Project. All lighting associated with the Construction Works stage will be short term in nature and for the Operations stage, will exist as pulses of short duration (e.g. for rollingstock).</p> <p>Measuring light to assess its effect on fauna is challenging and an emerging area of research and development. There is currently no globally-recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species visual system.</p> <p>The LVIA has been conducted in line with the methodology outlined in Appendix K: Landscape and Visual Impact Assessment and potential impacts associated with the Project, including Project lighting.</p> <p>A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (see Lighting Impact Assessment in Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), which is a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (see the Obtrusive Lighting Assessment Appendix of Appendix K: Landscape and Visual Impact Assessment).</p> <p>In regard to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. See the Obtrusive Lighting Assessment Appendix of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>ARTC will continue to work with impacted landowners and businesses regarding design changes from the revised draft EIS and will continue to consult with key stakeholders during the Detailed Design stage. This will include ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	Chapter 11: Flora and Fauna Section 11.5 Section 11.6 Section 11.7 Appendix K: Landscape and Visual Impact Assessment Appendix 3
193	193.0036	Community Group	Landscape and Visual Amenity		The visual impact assessment process was conducted for landscape amenity, which is not appropriate for site based impacts. The lack of relevant methodology is a gap in the process.	Conduct a visual impact assessment to DA Hall poultry operations.	<p>The Millmerran Alternate Alignment (MAA) has been based on ongoing consultation with local business and community. 193	193.0042	Community Group	Flora and Fauna		Biosecurity - Appendix attached - Dr Peter Scott Technical report - avian health and welfare	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens.	Chapter 24: Draft Outline Environmental Management Plan
193	193.0043	Community Group	Flora and Fauna	Directly impacted landowner	Biosecurity: impacts to the poultry and piggery operations have not been addressed. The risks of rail movements are low however the consequences of a change in disease status could have a serious impact on the business operations for DA Hall through loss of productivity and increased cost of preventative disease programs.	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens.	Chapter 24: Draft Outline Environmental Management Plan
193	193.0044	Community Group	Flora and Fauna	Directly impacted landowner	Biosecurity - depending on the avian pathogen aerosol transmission can be over metres to kilometres, particularly for viruses with the latter. Some pathogens can be present in multiple animal species and thus interspecies cross contamination.	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens.	Chapter 24: Draft Outline Environmental Management Plan
193	193.0045	Community Group	Flora and Fauna		Biosecurity - the objective of the biosecurity program is to ensure there is a functional exclusion boundary that prevents entry and spread of and diseases on the properties at all times and appropriate biosecurity procedures in place.	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens.	Chapter 24: Draft Outline Environmental Management Plan
193	193.0046	Community Group	Flora and Fauna		<p>Biosecurity DA Hall & Co have limited ability to put measures in place to control major disease transmission routes due to Inland Rail construction and operation, relating to:</p> <ul style="list-style-type: none"> Air - Aerosol transmission from trucks carrying chickens/waste... travelling past the farm. People – Contractors, maintenance personnel, neighbours, service personnel and visitors who have recently been on other poultry farms; people who have recently recovered from, or still suffering from, gastrointestinal disease. 	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens.	Chapter 24: Draft Outline Environmental Management Plan
193	193.0047	Community Group	Flora and Fauna	Directly impacted landowner	Biosecurity - the construction phase on Moyeness presents direct risk from people carrying unknown disease threats from unknown sources, with increased risk of unauthorised access to production and processing areas. The construction and operation of the workers' accommodation will pose the same level of threat to the adjoining poultry operations due the presence and movement of people.	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens.	Chapter 24: Draft Outline Environmental Management Plan
193	193.0048	Community Group	Flora and Fauna		ARTC have stated they can make no guarantee that the rail will not be used to freight livestock. The operation of the Inland Rail presents direct risk from air borne diseases from livestock freight of unknown origin. During outbreaks of diseases the Inland Rail will become a high risk vector for spread into or from Queensland	nil.	Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement. The Biosecurity Management Plan will include reference to relevant guidelines to control potential deleterious pathogens. For instance, Section 21.5.1 of Chapter 21: Hazard and Risk states that the transportation of livestock with potential to carry <i>Coxiella burnetii</i> (<i>C. burnetii</i>) bacteria), can cause Q-Fever in humans. Biosecurity mitigation measures will be further investigated in detailed design.	<p>Chapter 21: Hazard and Risk Section 21.5.1 Chapter 24: Draft Outline Environmental Management Plan</p>
193	193.0049	Community Group	Air Quality		TOR requirements 11.130 and 11.131 Draft EIS to describe the characteristics of potential airborne pathogens and diseases that may be transmitted/released by livestock on the Inland Rail.	nil.	<p>Poultry operations within 1 kilometre of the alignment have been included in the revised air quality assessment for the Project as sensitive receptors. Piggery operations are located further than 1 kilometre from the alignment, and are therefore outside the study area for the Project, and have not been included in the assessment as sensitive receptors (Chapter 12: Air Quality, Section 12.32).</p> <p>There are no relevant air quality goals set specifically for the protection of piggery and poultry land uses. However, the air quality assessment has considered potential impacts to ecological receptors due to nitrogen dioxide (NO2) (refer Section 12.52 in Chapter 12: Air Quality) and agricultural uses due to dust deposition (Section 12.51 in Chapter 12: Air Quality).</p> <p>Based on the results of dispersion modelling, which included the poultry operations as sensitive receptors, the air quality assessment has determined that the operation of the Project will not result in significant air quality impacts to ecological receptors or agricultural uses. On the basis of the dispersion modelling results, significant air quality impacts to the Millmerran chicken farm infrastructure and piggery operations are not anticipated.</p> <p>The Project alignment has been updated in the revised reference design to avoid direct severance of properties associated with a Millmerran based chicken farm infrastructure and piggery (the Millmerran Alternative Alignment), with the new alignment now located to the southeast of the chicken farm infrastructure and piggery operations.</p>	<p>Chapter 12: Air Quality Section 12.32 Section 12.51 Section 12.52</p>
193	193.0050	Community Group	Air Quality		Avian pathogen aerosol transmission can be over metres to kilometres and therefore a considerable risk to DA Hall poultry operations from the freight of poultry on Inland Rail, and similarly for the piggery. - The transmission of airborne/aerosol distribution of pathogens and diseases as an impact relating to air quality has not been acknowledged or addressed.	Piggery and poultry operations on DA Hall properties to be identified as sensitive air receptors within and adjacent to the footprint (depending on the final alignment).	<p>The Project alignment has been updated in the revised reference design to avoid direct severance of properties associated with a Millmerran chicken farm infrastructure and piggery operations (the Millmerran Alternative Alignment), with the new alignment now located to the southeast of the Millmerran chicken farm infrastructure and piggery operations. As a result, aerosol transmission of disease is not expected to be a risk to a Millmerran chicken farm infrastructure and piggery and a buffer zone is not considered to be required.</p> <p>Notwithstanding that, Section 12.31, Table 12-3 of Chapter 12: Air Quality describes the air quality pollutants of concern for the construction and operation of the Project. In addition to these common pollutants, a qualitative risk assessment of Q-fever has also been included in the assessment in Section 12.52 of Chapter 12: Air Quality. Section 12.52 of Chapter 12: Air Quality provides a description of <i>Coxiella burnetii</i> (<i>C. burnetii</i>) bacteria, which can cause Q-Fever in humans, and provides an assessment of risk.</p> <p>Overall, based on the information reviewed, the Project and the transport of livestock along the Inland Rail Project alignment is considered to present a low level risk for Q-fever. It is noted that as part of the assessment of Q-fever risk, Queensland Health was consulted. Queensland Health advised that the risk of Q-fever infection from livestock trains would be "broadly similar to a road train transporting cattle".</p> <p>The Project would not introduce any new pathway of transmission that doesn't already exist. Additionally, it is reasonable to expect that controls would already be in place to prevent/intercept these pathways, e.g. appropriate housing and screening of livestock.</p>	<p>Chapter 12: Air Quality Section 12.31 Table 12-3 Section 12.52</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0051	Community Group	Air Quality		The biosecurity risk associated with aerosol transmission of disease is addressed in Section 10 (of DA Halls submission).	Identify the potential impact zone from aerosol transmission of disease from freight of livestock on the Inland Rail and condition a minimum buffer zone of project area to all piggery and poultry operations.	<p>The Project alignment has been updated in the revised reference design to avoid direct severance of properties associated with a Millmerran based chicken farm infrastructure and piggery (the Millmerran Alternative Alignment), with the new alignment now located to the southeast of the poultry and piggery operations.</p> <p>Livestock trains are not proposed to use the majority of the Border to Gowrie alignment, but will join the Inland Rail Project alignment at Gowrie via the West Moreton System. The Project alignment has been updated in the revised reference design to connect to the existing Millmerran branch line, north of poultry and piggery operations, therefore livestock trains will not use the proposed draft EIS Project alignment adjacent to this poultry and piggery operation. As a result, aerosol transmission of disease is not expected to be a risk to these operations and a buffer zone is not considered to be required.</p> <p>Notwithstanding that, Section 12.31 of Chapter 12: Air Quality describes the air quality pollutants of concern for the construction and operation of the Project. In addition to these common pollutants, a qualitative risk assessment of Q-fever has also been included in the assessment in Section 12.52 of Chapter 12: Air Quality. Section 12.52.6 of Chapter 12: Air Quality provides a description of Coxiella Burnetii (C. burnetii) bacteria, which can cause Q-Fever in humans, and provides an assessment of risk.</p> <p>Overall, based on the information reviewed, the Project and the transport of livestock along the Inland Rail Project alignment is considered to present a low level risk for Q-fever. It is noted that as part of the assessment of Q-fever risk, Queensland Health was consulted. Queensland Health advised that the risk of Q-fever infection from livestock trains would be "broadly similar to a road train transporting cattle".</p>	Chapter 12: Air Quality Section 12.31 Section 12.52 Section 12.52.6
193	193.0052	Community Group	Air Quality		Draft EIS 11.7.3, Figure 11.15s - Doug Hall Enterprises, poultry farming, was identified as an existing emission source required to report annually. The Table 11.23 states that the distance from the project alignment is 1 km, however based on the multiple route alignment scenarios, the proximity may be much closer. The receptors omit the poultry and piggery operations, relating only to residences.	nil.	<p>Poultry operations within 1 kilometre of the alignment have been included as sensitive receptors in the revised air quality assessment for the Project. Piggery operations are located further than 1 kilometre from the alignment, and are therefore outside the study area for the Project, and have not been included in the assessment as sensitive receptors (Chapter 12: Air Quality, Section 12.32).</p> <p>Sensitive receptors considered in the assessment are discussed in Section 12.4.5 of Chapter 12: Air Quality. Major impacts to sensitive receptors outlined in Table 12-37 (Section 12.8) of Chapter 12: Air Quality of the revised draft EIS.</p>	Chapter 12: Air Quality Section 12.32 Section 12.4.5 Section 12.8 Table 12-37
193	193.0053	Community Group	Air Quality		Draft EIS 11.6.6 only addresses odour emissions from the freight of livestock on Inland Rail and does not present methodology for identifying and assessing the impact pf pathogens or disease transmission from livestock.	nil.	<p>The Project alignment has been updated in the revised reference design to avoid direct severance of properties associated with a Millmerran based chicken farm infrastructure and piggery (the Millmerran Alternative Alignment), with the new alignment now located to the southeast of the poultry and piggery operations.</p> <p>Notwithstanding that, Section 12.31 of Chapter 12: Air Quality describes the air quality pollutants of concern for the construction and operation of the Project. In addition to these common pollutants, a qualitative risk assessment of Q-fever has also been included in the assessment in Section 12.52 of Chapter 12: Air Quality. Section 12.52.6 of Chapter 12: Air Quality provides a description of Coxiella Burnetii (C. burnetii) bacteria, which can cause Q-Fever in humans, and provides an assessment of risk.</p> <p>Overall, based on the information reviewed, the Project and the transport of livestock along the Inland Rail Project alignment is considered to present a low level risk for Q-fever. It is noted that as part of the assessment of Q-fever risk, Queensland Health was consulted. Queensland Health advised that the risk of Q-fever infection from livestock trains would be "broadly similar to a road train transporting cattle".</p>	Chapter 12: Air Quality Section 12.31 Section 12.52 Section 12.52.6
193	193.0054	Community Group	Flooding	Directly impacted landowner	The route selection and design of the Inland Rail infrastructure will cause changes to the current Condamine River, Back Creek and Grasstree Creek catchments during flooding and flows, with potential to cause direct and considerable impact to DA Hall.	nil.	<p>Operational flood impacts on land have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>Further mitigation measures proposed are provided in Chapter 14: Flood and Geomorphology, Section 14.9.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	Chapter 14: Flooding and Geomorphology Section 14.8.1 Section 14.9.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5-17 Section 22
193	193.0055	Community Group	Flooding		TOR item 6.6 is not addressed, as a suitable assessment cannot, and has not, been conducted by ARTC relating to the flood impacts of the Inland Rail alignment and infrastructure design to the extent where is can be adequately assessed by DA Hall. There is no evidence of mitigation measures to avoid or minimise flooding impacts, rather the flood proofing of the Inland Rail infrastructure transfers the impacts away from the rail and on to the adjoining land use and DA Hall operations. The draft EIS material cannot demonstrate for DA Hall that the TOR is addressed.	Reject assessments and management strategies as being incomplete, on the basis of the lack of detail and the impact local account and failing to address impact identified during consultation.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIO) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Expert Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment.</p> <p>Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 4.2 and Chapter 14: Flooding and Geomorphology Section 14.6.3. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>Flood mapping has been provided in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the Digital Platform for each of the Flood Impact Objectives including:</p> <ul style="list-style-type: none"> Change in peak water levels Change in peak velocity Change in time of inundation Change in hazard Change in velocity (with FIO cut-off's applied) Change in hazard (with FIO cut-off's applied) Change in time of inundation (with FIO cut-off's applied) <p>The web-based Digital Platform will be publicly available at the same time as the revised draft EIS is available for public consultation and will remain available post-consultation of the revised draft EIS. The Digital Platform includes local and regional catchments for the Existing Case, Developed Case, Change Mapping and Exceedances.</p> <p>The PDF mapping in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 includes local and regional catchments for the Existing Case, Developed Case, Change Mapping and Exceedances aligned with the mapping requirements outlined in RFI 301, for the 1% and 20% AEP events. The PDF mapping includes the sensitivity runs and calibration events.</p> <p>Flooding mitigation and measurement measures applicable to the Project have been discussed in Section 14.9.1 of Chapter 14: Flooding and Geomorphology and Section 22 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.9.1 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 4.2 Section 5-17 Section 22 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
193	193.0056	Community Group	Flooding		193.0056 TOR items 6.4, 6.3, 11.53, 11.54 to adequately met	nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIO) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. 193	193.0061	Community Group	Flooding		12.6.3.1 Hydrologic design The design has been developed based on flood impact objectives set by ARTC for the adjoining land use which aims to justify the acceptability of changes to flooding as a result of the Inland Rail. Table 12.7 Project hydraulic design criteria. On the outset, the flood immunity performance criteria fail to meet the TOR requirement to avoid and minimise impact. The route alignment requires the design to protect the rail infrastructure from known flooding impacts, whilst deflecting these flooding impacts direct to adjacent DA Hall land use and property. The subsequent flood impact objectives Table 12.8 seek to justify acceptability of changes* to peak water levels, duration of inundation, flood flow distribution, velocities, and extreme event risks.	nil.	<p>Operational flood impacts on land have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>Further mitigation measures proposed are provided in Chapter 14: Flood and Geomorphology, Section 14.9.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2.In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1</p> <p>Section 14.9.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 5-17</p> <p>Section 22</p>
193	193.0062	Community Group	Flooding		The submissions provides detail as to how ARTC have failed to genuinely demonstrate incorporating design refinement and stakeholder and community feedback into reference design. Several reports have been prepared for ARTC to consider as well as meetings held to discuss findings: "Submission to the Yelarbon to Gowrie Project Reference Group", detailed review of models by Dr Markar and discussed in a meeting with ARTC, review by Dr Markar of the draft EIS material and Flood Panel report.	nil.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River and Back Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology Table 14-4</p> <p>Appendix T1: Flooding and Hydrology Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.6</p> <p>Section 8.6</p>
193	193.0063	Community Group	Flooding	Directly impacted landowner	No consultation or agreement by the community of these flood impacts, they have been imposed on DA Hall which will result in unacceptable and devastating impacts to the business and community.	There is no level of impact that is acceptable to DA Hall & Co from changes to flooding. Consultation with ARTC has previously established the consequence of impacts to DA Hall, and further evidenced in this submission, which are deemed to be extraordinary, and as such any increased impact should not be accepted as an objective in the draft EIS.	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS.</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2.In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Appendix T2: Hydrology and Flooding Technical Report - Volume II</p>
193	193.0064	Community Group	Flooding	Flood immunity	The Flood impact objectives should meet the overall outcome of the Toowoomba Regional Planning Scheme Flood Hazard Overlay Code for development use, siting, design and layout avoids or mitigates the flood risk to people, property and infrastructure* The Condamine Floodplain crossing is categorized as Level FR4 Extreme and FR3 High in large sections, and under any other development proposal the Code seeks to limit development in areas of intolerable risk (FR3 and FR4) so as to avoid the risk presented by the flood hazard.	The flood impact objectives should meet the overall outcome of the Toowoomba Regional Planning Scheme Flood Hazard Overlay Code for development use, siting, design and layout avoids or mitigates the flood risk to people, property and infrastructure* .	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. 193	193.0074	Community Group	Flooding	Modelling	ARTC has failed to be transparent, accountable and respectful in its conduct of community and stakeholder engagement, and has subsequently failed to validate model performance in an effort to gain acceptance of modelling and calibration outcomes. The review by the International Flood Panel addresses the inadequacy and appropriateness of the assessment methodology, which is also in addressed in Dr Markars review attached.	nil.	<p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Chapter 14: Flooding and Geomorphology, Section 14.5.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Sections 7.2 and 7.3.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.2 Section 7.2.2 Section 7.3</p>
193	193.0075	Community Group	Stakeholder engagement	Mitigation measures	DA Hall has participated in engagement and consultation to the greatest extent, providing expert review and documented information to inform the process. The issues raised have not been addressed and the impacts resulting from the project have not been avoided or mitigated.	nil.	ARTC notes that the reference design and revised draft EIS have been updated to incorporate an altered Project alignment through near DA Hall's property in direct response to their identified concerns. Appendix E: Consultation Report, Section 4 outlines key changes made to the reference design in response to stakeholder input.	<p>Appendix E: Consultation Report Section 4</p>
193	193.0076	Community Group	Flooding	Modelling	Calibration to historical flood events - where possible, modelling of each waterways catchment was calibrated against historical events, with results matched to recorded data from available and suitable stream gauges, community feedback and anecdotal flood data. Condamine River was calibrated to the 1991 and 2010 flood events. acceptable calibration of hydrological and hydraulic models was achieved for these catchments and the models were considered suitable for assessment of the Project. Refer to Dr Markars report attached.	nil.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Sections 7.2 and 7.3.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.2 Section 7.2.2 Section 7.3</p>
193	193.0077	Community Group	Flooding	Overland flow/diversion	The Inland Rail route alignment across the Grasree Creek and Condamine River intercepts and interferes with overland flow. The floodproofing of the Inland Rail is essentially a weir across this Section of the floodplain, with the culverts and bridge causing a tunnel effect. The diversion of flow to culverts will cause shadowing where particularly medium size flood events will see areas miss out on overland flow. There is no assessment conducted on impact to dam catchments, uneven crop infiltration and associated economic loss. The adjoining landowners to the alignment traversing DA Hall will be impacted by these effects, which are undetermined due to the multiple route alignments and related scenarios. The matter of Overland Flow, as opposed to flooding, has not been appropriately or adequately addressed.	nil.	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS.</p> <p>Significant bridge openings and cross drainage culverts have been allowed for in the Reference Design to retain the existing flow of flood water. Flood flow distribution has been assessed and is discussed in Chapter 14: Flooding and Geomorphology, Section 14.8.1.</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined inf Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
193	193.0078	Community Group	Flooding	Modelling	Comment on Section 12.10.2 of the draft EIS: Given the flaws with the flood models, and lack of local scale validation, there is no clear demonstration of how the impact assessment at a local scale of changed flooding was conducted. The tables for the Condamine River Hydrology and Flooding assessment against the objectives demonstrate that changes fall outside and significantly exceed the set objective levels. There is low confidence in the assessment and a high level of concern for the failure to meet objectives.	nil.	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS.</p> <p>Operational flood impacts on land in the Condamine River floodplain and local catchments have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Sections 7.5.3 and 18.6.3. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flood and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3 Section 18.6.3 Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
193	193.0079	Community Group	Flooding - Condamine River		Comment on Section 12.10.2.3 of the draft EIS: Table 12.75 demonstrates the change in peak water levels OUTSIDE the flood impact objectives levels which directly impact DA Hall. The design therefore does not meet its own objectives and fails to avoid and minimise impacts to DA Hall as per required by the EIS TOR. The determination of compensation as a result of the nominated breach of the objectives, and the subsequent impact as result of all flood impacts is not outlined. In some sections, under all flood events minor changes in peak water levels are expected to occur.	nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology, Section 14.6.3, of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3 Table 14-4</p>
193	193.0081	Community Group	Flooding	Flood immunity	Dr Markar reports under Existing Conditions several state-controlled roads have low flood immunity. For example, the Gore Highway has only about 10% AEP immunity and Millmerran-Leyburn Road and Pampas-Horrane Road have only about 50% AEP flood immunity from the Condamine River, and Millmerran-Inglewood Road has less than 20% AEP flood immunity from Back Creek. It is not known whether these roads (and other flood affected roads) would be upgraded in the near future to improve their flood immunity. The modelling undertaken for the Reference Design does not appear to consider any currently planned or proposed future State or TRC controlled road upgrades within the Condamine River and Back Creek floodplains. These will need to be considered and their impacts on the B2G Project FIOs must be assessed in the modelling undertaken for the Detail Design. • See WRM hydrology report for more.	nil.	Consultation with road managers has been undertaken as part of the revised draft EIS on planned and future roads. Responses were received from Department of Transport and Main Roads, Goondiwindi Regional Council and Toowoomba Regional Council with details provided in the "Planned and future roads" Section of each catchment within Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Each of these sections also identifies how planned and future roads have been considered within the hydraulic modelling.	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 5-17</p>
193	193.0083	Community Group	Flooding	Increase in velocities	Velocities based on the scale of Figure 20.20f, level of detail provided, and modelling flaws, it is unlikely that the scour protection designs are well informed and appropriate for the localised conditions, soils and changed flow patterns. Concentration of flow, changes in flow path, and even slight changes in velocity in small to mid-flow events will create erosion risk and impact over time.	nil.	<p>Potential changes in velocity have been assessed and is discussed in Chapter 14: Flooding and Geomorphology, Section 14.8.1 and the "Flood impact objective outcomes" Section of each catchment within Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 -17).</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk. An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised Reference Design.</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures will be reviewed and confirmed during Detailed Design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 5-17 Appendix B</p>
193	193.0084	Community Group	Groundwater	Directly impacted landowner	The Inland Rail construction will potentially impact groundwater resources and activities which DA Hall are dependent on for poultry and piggery operations.	nil.	<p>Assessment of registered bores and water entitlements within the 1 km investigation area around the proposed alignment has been undertaken as part of the EIS revision to identify bores/licences existing after the draft EIS was released (see Appendix U: Groundwater Technical Report, Section 4.7.5). ARTC is also undertaking an additional bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project (see Chapter 15: Groundwater, Section 15.5.4).</p> <p>As outlined in Section 15.5.4 of Chapter 15: Groundwater, the bore survey targeted landowners within the Project footprint and within 80 m of deep cuttings (>10 m BGL). The survey identified three unregistered groundwater bores within the Project footprint which are all used for stock watering and domestic usage. These unregistered bores are not considered further to inform the revised draft EIS due to limited bore information (i.e., construction details, geology, and chemistry). Registered bores identified within the groundwater impact assessment area are discussed in Section 15.5.4 of Chapter 15: Groundwater. No unregistered bores were identified outside the Project footprint with potential to be impacted by groundwater impacts from the Project.</p>	<p>Chapter 15: Groundwater Section 15.5.4 Appendix U: Groundwater Technical Report Section 4.7.5</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0085	Community Group	Groundwater	Private groundwater bore/s	On 4 October 2019, DA Hall & Co received a SARA Development Permit approval for Operational work for taking or interfering with water (drilling a water bore for stock intensive purposes), and construction of a bore on Lot 3 on RP16081. (SARA Reference 1909-13203 SDA). The draft EIS does not list all four bores and does not recognise the development approval for the drilling of a bore on Moyeness. There is not information provided by the draft EIS, or communicated by ARTC relating to the impact to the bores.	nil.	Assessment of registered bores and water entitlements within the 1 km investigation area around the proposed alignment has been undertaken as part of the EIS revision to identify bores/licences existing after the draft EIS was released (see Appendix U: Groundwater Technical Report, Section 4.7.5). ARTC is also undertaking an additional bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project (see Chapter 15: Groundwater, Section 15.5.4). As outlined in Section 15.5.4 of Chapter 15: Groundwater, the bore survey targeted landowners within the Project footprint and within 80 m of deep cuttings (>10 m BCL). The survey identified three unregistered groundwater bores within the Project footprint which are all used for stock watering and domestic usage. These unregistered bores are not considered further to inform the revised draft EIS due to limited bore information (i.e., construction details, geology, and chemistry). Registered bores identified within the groundwater impact assessment area are discussed in Section 15.5.4 of Chapter 15: Groundwater. No unregistered bores were identified outside the Project footprint with potential to be impacted by groundwater impacts from the Project.	Chapter 15: Groundwater Section 15.5.4 Appendix U: Groundwater Technical Report Section 4.7.5
193	193.0086	Community Group	Groundwater	Private groundwater bore/s	Four existing licenced bores are located on DA Hall properties within the Inland Rail footprint: 1 X bore on Moyeness Water Licences 614229; 614231; 190574 3 X bores on Diamond Layer Farm Water Licences 614229; 614230; 190574. A map of the proposed and existing bores is attached. (Attachments Property Map_Bores_DA Hall & Co; Moyeness New Bore Location Approved)	nil.	Assessment of registered bores and water entitlements within the 1 km investigation area around the proposed alignment has been undertaken as part of the EIS revision to identify bores/licences existing after the draft EIS was released (see Appendix U: Groundwater Technical Report, Section 4.7.5). ARTC is also undertaking an additional bore survey to confirm the location/presence of registered bores and to identify any unregistered bores that may be impacted from the Project (see Chapter 15: Groundwater, Section 15.5.4). As outlined in Section 15.5.4 of Chapter 15: Groundwater, the bore survey targeted landowners within the Project footprint and within 80 m of deep cuttings (>10 m BGL). The survey identified three unregistered groundwater bores within the Project footprint which are all used for stock watering and domestic usage. These unregistered bores are not considered further to inform the revised draft EIS due to limited bore information (i.e., construction details, geology, and chemistry). Registered bores identified within the groundwater impact assessment area are discussed in Section 15.5.4 of Chapter 15: Groundwater. No unregistered bores were identified outside the Project footprint with potential to be impacted by groundwater impacts from the Project.	Chapter 15: Groundwater Section 15.5.4 Appendix U: Groundwater Technical Report Section 4.7.5
193	193.0091	Community Group	Noise and Vibration	Operational rail noise	TOR item 11.121 not adequately addressed - the draft EIS doesn't map impact of the noise and vibration emissions from the operation of the project to the values of the receiving environment with respect to DA Hall. The lack of acknowledgement of impacts to poultry has omitted relevant assessment criteria for noise and vibration that would determine accepted levels of impact to the receiving environment, and where exceeded the type and extent of potential impact. Reference made to movement of trains along the mainline and at the operation of level crossings at Lindenmayer Road and Hall Road.	Animal welfare expert/s to identify criteria parameters for safe operating distance of Inland Rail to avoid adverse impact to DA Hall poultry and piggyery production.	Noise and vibration impacts to livestock are not assessable under the revised draft EIS terms of reference and relevant legislation. However, ARTC has commissioned an independent technical review into the impacts of freight rail noise and vibration on domestic livestock animals. The findings of this review are referenced by ARTC to establish benchmarks from which to evaluate the risk of potential noise and vibration impacts at intensive animal operations and, if required, identify reasonable and practicable measures to mitigate identified impacts. The findings and recommendations of the assessment are discussed in Section 16.9 of Chapter 16: Noise and Vibration of the revised draft EIS.	Chapter 16: Noise and Vibration Section 16.9 Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Section 7
193	193.0095	Community Group	Stakeholder engagement	Directly impacted landowner	ARTC has failed to demonstrate the conduct of a proper, fair and respectful consultation process with DA Hall as a major affected landholder. The company's experience to date undermines the prospect to engage in respectful planning and negotiations in future.	nil.	Prior to and since the draft EIS , the engagement program has been ongoing. Representatives of the submitter have corresponded with, and had face to face meetings with, senior ARTC representatives including the ARTC Chair and Inland Rail CEO. During preparation of the Project reference design and EIS, it was not within ARTC's scope to investigate alternative routes outside the study area that was set by the Australian Government following its review of the four alternative routes in the Yelarbon to Gowrie Corridor Options Report (DIRD 2016). ARTC notes that since the draft EIS the reference design and revised draft EIS have been updated to incorporate an alternative Project alignment near Millmerran moving it off the DA Hall's property to remove any impact to the business. The engagement supporting this is detailed in Appendix E: Consultation Report, Section 5.	Appendix E: Consultation Report Section 5.16
193	193.0096	Community Group	Stakeholder engagement	Directly impacted landowner	Community wellbeing - the project has caused enormous stress on DA Hall business owners, management and staff over the period of the project consultation.	nil.	ARTC acknowledges the uncertainty that Project development creates; however, design is an iterative process and landowners have been provided with information as it becomes available. Section 7.1 of Appendix X: Social Impact Assessment details the strategies that ARTC has implemented to support affected residents and the commitment to develop a Community Wellbeing Plan. Engagement with local councils and community stakeholders regarding community wellbeing is ongoing. Further details on legacy benefits can be found in Appendix X: Social Impact Assessment As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.	Appendix X: Social Impact Assessment Section 7.1 Chapter 24: Draft Outline Environmental Management Plan
193	193.0097	Community Group	Social Impact Assessment		The draft EIS documents refers to direct acquisition of the DA Hall properties affected by the Inland Rail footprint. However, the Inland Rail alignment options are not finalised, and correspondence with ARTC does not indicate a final decision for acquisition or compensation. Detailed impact assessments currently being undertaken will determine the extent of impacts to DA Hall and will inform further decision making for both parties. This level of uncertainty raises questions on the course of action and mitigation strategies directly referencing DA Hall and poultry operations stated throughout the draft EIS documents. Without the detailed impact assessment, the Coordinator General will not be informed to consider the full extent of impact to DA Hall business, employment and the local economy.	nil.	ARTC has revised the Project's design to avoid the Doug Hall (Moyness) piggyery and poultry farm. Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts on farm infrastructure and operations.	Appendix X: Social Impact Assessment Section 8.6.1
193	193.0098	Community Group	Social Impact Assessment	Workforce accommodation village	The draft EIS identifies the site location for the non-residents workforce accommodation at Millmerran which will directly impact on current and future operations of DA Hall poultry activities including traffic, biosecurity and safety.	nil.	The proposed site for a non-resident workforce accommodation facility in Turallin is not being pursued in the revised draft EIS. The Contractor is currently undertaking due diligence to identify a site in the Millmerran area, and will consult with TRC and the Millmerran community when this has progressed. An Accommodation Management Plan (described in Appendix X: Social Impact Assessment, Section 8.4.4) will be prepared for the Project in consultation with TRC and other stakeholders.	Appendix X: Social Impact Assessment Section 8.4.4
193	193.0099	Community Group	Stakeholder engagement	Workforce accommodation village	There has been no consultation process regarding workforce accommodation site selection and impacts. The affected parties and impacts considerations are not described, including to the local Turallin community and DA Hall poultry operations in close proximity to the proposed non-resident workforce accommodation site.	ARTC to consult with the local community and DA Hall and Toowoomba Regional Council to identify impacts from the non-resident workforce accommodation at Turallin.	As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of each site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing. Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report). The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).	Chapter 5: Project Description Section 5.6.4 Appendix E: Consultation Report Section 5.11 Table E-56 Appendix X: Social Impact Management Plan Section 8.4
193	193.0100	Community Group	Project scope	Workforce accommodation village	Through the EIS documentation there is no consultation reference on site location of the workforce accommodation. An assessment of the site selection process for the non-resident workforce accommodation is not evident and how ARTC came to identify suitable land parcels. Also not evident is consultation and documentation of impacts for the Turallin accommodation site. Appendix U Social Impact Assessment Technical Report p305 notes that communities and council are to be consulted and expectations incorporated into the AMP.	ARTC to consider an alternative site for the temporary non-resident workforce accommodation to avoid cumulative impacts on Turallin road and traffic management, safety, and biosecurity risk to poultry operations.	An engagement session with the community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement with ARTC and the Principal Contractor. ARTC has made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders. Details of non-resident workforce accommodation facilities are provided in Chapter 5: Project Description, Section 5.6.4. An initial assessment of workforce demand and safe commutable distances has identified a potential need for non-resident workforce accommodation in the vicinity of Yelarbon, Inglewood and Millmerran. Locations for non-resident workforce accommodation facilities in proximity to these townships have been identified with consideration for: <ul style="list-style-type: none"> ➤ The proximity of the accommodation to likely construction sites for fatigue-management purposes ➤ Land tenure and ownership of the site ➤ Available land area ➤ Proximity to supporting infrastructure and services ➤ Likelihood of noise, vibration and air quality impacts originating from the sites ➤ To avoid areas that are within the 1% AEP floodplains where possible ➤ Constraints such as significant vegetation communities, threatened species or heritage sites ➤ Road access ➤ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. ➤ The locations for the Yelarbon and Inglewood non-resident workforce accommodation facilities are provided in Table 5-22 and Figures 5-18 and 5-19. The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. Chapter 3: Legislation and Project Approvals, Section 3.4 states that approvals for the establishment and operation of non-resident workforce accommodation at Yelarbon and Inglewood will be sought through the revised draft EIS and the site selection and due diligence associated with locating the third, Millmerran based, non-resident workforce accommodation will be undertaken during detailed design. The approvals process for non-resident workforce accommodations will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Principal Contractor. The location, capacity and layout of the accommodations that are required will be confirmed and finalised during the Detailed Design stage of the Project. As mentioned in Chapter 3: Legislation and Project Approvals Section 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing. 193	193.0101	Community Group	Project scope	Workforce accommodation village	Failure to include the non-resident workforce accommodation as part of the project impact assessment area, means the current DA Hall development activities at Turallin were not identified. DA Hall have Development Approvals and ERAs for a project of regional significance at Ellerslie and Avondale and Glenferrie which will be directly impacted by the accommodation development activities and associated traffic and exposure to biosecurity risk.	nil.	<p>An engagement session with the community was held on Wednesday 13 October 2021 with the ARTC stakeholder engagement team. Feedback received from the attendees at this session expressed a strong preference for the non-resident workforce accommodation facility to be located within Millmerran Township and for further engagement from the Project and the Principal Contractor. ARTC have made note of community concerns received through this community engagement session and related EIS submissions and are committed to continued consultation with the relevant stakeholders.</p> <p>Details of non-resident workforce accommodation facilities are provided in Chapter 5: Project Description, Section 5.6.4. An initial assessment of workforce demand and the preference for accommodation within a safe commutable distances has identified a potential need for non-resident workforce accommodation in the vicinity of Yelarbon, Inglewood and Millmerran. Locations for non-resident workforce accommodations in proximity to these townships have been identified with consideration for a number of criteria including the potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa.</p> <p>The location for the Yelarbon and Inglewood non-resident workforce accommodation are provided in Table 5-22 and Figures 5-18 and 5-19.</p> <p>The location for a Millmerran based non-resident workforce accommodation has not been included in the revised draft EIS. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design.</p> <p>Chapter 3: Legislation and Project Approvals, Section 3.4.5 and 3.4.38 states that approvals for the establishment and operation of non-resident workforce accommodation at Yelarbon and Inglewood will be sought through the revised draft EIS and the site selection and due diligence associated with locating the third, Millmerran based, non-resident workforce accommodation will be undertaken during detailed design. The approvals process for non-resident workforce accommodations will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Principal Contractor. As mentioned in Chapter 3: Legislation and Project Approvals, Sections 3.4.5 and 3.4.38, non-resident workforce accommodation facility secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p>	<p>Chapter 3: Legislation and Project Approvals Process Section 3.4.5</p> <p>Section 3.4.38</p> <p>Chapter 5: Project Description Section 5.6.4</p> <p>Table 5-22</p> <p>Figure 5-18</p> <p>Figure 5-19</p>
193	193.0102	Community Group	Traffic and Transport	Cumulative impacts	Ellerslie is a large scale Free Range Poultry operation that has existing traffic management and biosecurity measures in place, which is accessed via Ellerslie Road on Turallin Road, just south of the proposed accommodation site. Adjacent to Ellerslie on Turallin Road is the Avondale property, which has potential development for large scale poultry operations. To the north of the accommodation site is Glenferrie property, another significant poultry operation. These poultry operations supply significant number of eggs daily and in addition to operational staff movements, trucks regularly deliver feed and collect eggs on a daily basis.	nil.	<p>As detailed in the revised draft EIS Chapter 5: Project Description (Section 5.6.4), ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities outlined in Section 5.6.4 of Chapter 5: Project Description included:</p> <ul style="list-style-type: none"> ▶ The proximity of the accommodation to likely construction sites for fatigue-management purposes ▶ Land tenure and ownership of each site ▶ Available land area ▶ Proximity to supporting infrastructure and services ▶ Likelihood of noise, demand for essential services, and traffic impacts originating from the accommodation ▶ To avoid areas that are within the 1% AEP floodplains where possible ▶ Constraints such as significant vegetation communities, threatened species or heritage sites ▶ Road access ▶ Potential for planned future developments to impact on the non-resident workforce accommodation, or vice versa. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project (see Section 5.11 and Table E-56 of Appendix E: Consultation Report).</p> <p>The Turallin site has been assessed as not a feasible location for the third non-resident workforce accommodation. A third non-resident workforce accommodation site will be required in the Millmerran area and feasibility assessments will be undertaken to identify the optimal location for the site. The site selection and due diligence associated with locating a Millmerran based non-resident workforce accommodation will be undertaken during detailed design. In March 2023 ARTC commenced engagement with key stakeholders including the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions are included in Appendix E – Consultation report. ARTC are committed to continued consultation with the relevant stakeholders and further analysis will be undertaken by ARTC on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment Section 8.4).</p>	<p>Chapter 5: Project Description Section 5.6.4</p> <p>Appendix E: Consultation Report Section 5.11</p> <p>Table E-56</p> <p>Appendix X: Social Impact Management Plan Section 8.4</p>
193	193.0103	Community Group	Social Impact Assessment	Workforce and employment	Employment: There is no indication of what the project and operational legacy is for increased employment for the local area. However, there are preliminary impact assessments to the potential employment loss to DA Hall from infeasibility of the Moyeness' development which have not been accounted.	ARTC to provide more accurate indication of employment legacy to the local area and considered and assessed as part of the draft EIS with respect to the impact to employment from overall interruption to the DA Hall business.	<p>ARTC has revised the Project's design to avoid the Doug Hall (Moyness) piggery and poultry farm. Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts on farm infrastructure and operations.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 provides a description of local employment benefits and aspirational employment targets. Appendix X: Social Impact Assessment, Section 7.4.9 provides an updated description of Project legacy benefits.</p>	<p>Appendix X: Social Impact Assessment Section 7.4.9</p> <p>Section 8.3.1</p> <p>Section 8.6.1</p>
193	193.0104	Community Group	Social Impact Assessment	Workforce and employment	Labour and skills availability - DA Hall are current experiencing labour shortages to cope with current operations. Currently, the business is operating with 63 direct FTE's less than needed. This has been exacerbated by COVID. DA Hall have been actively participating in the Regional Workforce Management program and has joined forces with Egg Farmers of Australia and other industry bodies including the National Farmers Federation to work towards solutions with the QLD Government and DAWE.	nil.	<p>The employment of local people is a key goal for the Project so the benefits of wages will extend to local and non-local residents. The potential for labour draw has been identified in revised draft EIS Appendix X: Social Impact Assessment, Section 7.2.2 and management measures addressing potential labour draw are detailed in Section 8.3.7.</p> <p>Appendix X: Social Impact Assessment, Section 8.3 notes that there may be a draw of existing staff or tradespeople away from some businesses. Some of the types of trades required (e.g. welders, concreters) may also be in demand by local residents and farmers.</p> <p>ARTC has established the Inland Rail Skills Academy (Appendix X: Social Impact Assessment, Section 8.3) to increase the availability of suitably qualified local employees to reduce the drawdown on local labour. The workforce will also include specialist workers with skills and experience which aren't available locally.</p> <p>Although Project recruitment has not commenced, the Skills Academy has delivered preliminary training programs for local people to develop skills relevant to local industries including agriculture including (Section 8.3.2 of Appendix X: Social Impact Assessment):</p> <ul style="list-style-type: none"> ▶ Skills training for local residents focusing on transferrable agricultural skills held in December 2020 (Goondwindi) ▶ Skills training for local Indigenous residents held in 2020-2022 ▶ Various initiatives for local school students to raise awareness of both STEM-based and trade careers available on Inland Rail held in 2020-2022 <p>Appendix X: Social Impact Assessment, Section 8.3 has been updated to reflect the Project's most recent skills development initiatives.</p>	<p>Appendix X: Social Impact Assessment Section 7.2.2</p> <p>Section 8.3</p> <p>Section 8.3.2</p> <p>Section 8.3.7</p>
193	193.0105	Community Group	Social Impact Assessment	Workforce and employment	The labour demand for the Inland Rail project will create direct competition for local labour with DA Hall. Mitigation strategies discussed later are inadequate and fail to state how labour competition and further impact to local businesses and industries will be avoided. Strategies simply seek to monitor the impact after the fact before adjusting strategies. Labour source is likely to be drawn from Toowoomba region – this strategy placing additional pressure on the significant labour shortage in agriculture and draws from other local employment opportunities with local businesses.	The draft EIS needs to further consider and reassess the impact of COVID on the labour force availability. The absence of overseas workers has significantly reduced the labour pool for agriculture and seasonal work. Government economic stimulus packages are focused on the manufacturing and construction industries for job creation. Therefore the job availability as discussed in the draft EIS relating to the construction industry may not be available.	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 5.4.6 described the effects of COVID-19 on labour availability. With time, issues such as border closures and travel restrictions are no longer relevant, and international migration and inter-state migration of workers has increased.</p> <p>Appendix X: Social Impact Assessment, Section 7.2.1 notes that consultation with council and business community indicated there is a skilled workforce available as a result of workforce participation in other major infrastructure Projects in the region (including construction of the gasfields in the Western Downs and the Toowoomba Bypass).</p> <p>The potential for labour draw has been identified in Appendix X: Social Impact Assessment, Section 7.2.2 and management measures addressing potential labour draw are detailed in Section 8.3.7.</p> <p>ARTC is working with Construction Skills Queensland to identify skills and labour shortages, noting that the availability of labour may change as the result of changes to economic conditions during the COVID-19 pandemic. ARTC notes that updated analysis of the likely availability of construction labour from the SIA study area will be required prior to construction to enable the refinement of local and regional recruitment and training strategies (see Section 7.2 of Appendix X: Social Impact Assessment).</p>	<p>Appendix X: Social Impact Assessment Section 5.4.6</p> <p>Section 7.2</p> <p>Section 7.2.1</p> <p>Section 7.2.2</p> <p>Section 8.3.7</p>
193	193.0106	Community Group	Social Impact Assessment	Workforce and employment	The draft EIS needs to further consider and reassess the impact of COVID on the labour force availability. The absence of overseas workers has significantly reduced the labour pool for agriculture and seasonal work. Government economic stimulus packages are focused on the manufacturing and construction industries for job creation. Therefore the job availability as discussed in the draft EIS relating to the construction industry may not be available.	nil.	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 5.4.6 described the effects of COVID-19 on labour availability. With time, issues such as border closures and travel restrictions are no longer relevant, and international migration and inter-state migration of workers has increased.</p> <p>Appendix X: Social Impact Assessment, Section 7.2.1 notes that consultation with council and business community indicated there is a skilled workforce available as a result of workforce participation in other major infrastructure Projects in the region (including construction of the gasfields in the Western Downs and the Toowoomba Bypass).</p> <p>The potential for labour draw has been identified in Appendix X: Social Impact Assessment, Section 7.2.2 and management measures addressing potential labour draw are detailed in Section 8.3.7.</p> <p>ARTC is working with Construction Skills Queensland to identify skills and labour shortages, noting that the availability of labour may change as the result of changes to economic conditions during the COVID-19 pandemic. ARTC notes that updated analysis of the likely availability of construction labour from the SIA study area will be required prior to construction to enable the refinement of local and regional recruitment and training strategies (see Section 7.2 of Appendix X: Social Impact Assessment).</p>	<p>Appendix X: Social Impact Assessment Section 5.4.6</p> <p>Section 7.2</p> <p>Section 7.2.1</p> <p>Section 7.2.2</p> <p>Section 8.3.7</p>
193	193.0107	Community Group	Social Impact Assessment	Workforce accommodation village	Impact: There will be an unconsidered cumulative impact to these poultry business operations, the local community, and local road network with the addition of 300 workers travelling on the road and in the area. The construction phase of the accommodation development will present further impact. Large numbers of additional people in the district will increase the risk of unauthorised access to the poultry properties and breach biosecurity measures with potential for spread of aviary diseases, and breach COVID management plans. Theft is also of concern.	nil.	<p>The proposed site for a non-resident workforce accommodation facility in Turallin is not being pursued in the revised draft EIS. The Contractor is currently undertaking due diligence to identify a site in the Millmerran area, and will consult with TRC and the Millmerran community when this has progressed. An Accommodation Management Plan (described in revised draft EIS Appendix X: Social Impact Assessment, Section 8.4.4) will be prepared for the Project in consultation with TRC and other stakeholders.</p>	<p>Appendix X: Social Impact Assessment Section 8.4.4</p>
193	193.0108	Community Group	Social Impact Assessment	Workforce and employment	Construction phase. DA Hall want to see details of the mitigation measures for avoiding drawdown on agricultural labour workforce as a result of the local employment policies. The measure for ARTC monitoring the workforce and "consulting with business" regarding any pressure on local labour availability is not avoidance. The mitigation strategy is to refine the project's recruitment and training strategies after the fact. This is an inadequate description of these strategies in the first instance and mitigation measures to provide confidence and assurance to the local agricultural industry that labour drawdown will not occur and will be addressed before the fact.	ARTC to consult directly with DA Hall in the construction phase as a significant employer in the local area and business directly affected by labour competition. KPI and monitoring measures to be agreed and put in place to assess the impact of the ARTC project on local employment and directly to DA Hall.	<p>ARTC has revised the Project's design to avoid the Doug Hall (Moyness) piggery and poultry farm. Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts on farm infrastructure and operations.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 provides a description of local employment benefits and aspirational employment targets. Appendix X: Social Impact Assessment, Section 7.4.9 provides an updated description of Project legacy benefits.</p>	<p>Appendix X: Social Impact Assessment Section 7.4.9</p> <p>Section 8.3.1</p> <p>Section 8.6.1</p>
193	193.0109	Community Group	Social Impact Assessment	Workforce and employment	Employment opportunities. The project is aligned to avoid impacts on the operation of the Commodore Mine, a major local employer. There is no mention of avoiding impacts to other major local employers – specifically DA Hall who have repeatedly expressed impacts directly to employment. There is no mention of mitigation strategies to avoid draw down on existing local labour workforces in agriculture. Community wellbeing. The project has caused enormous stress to DA Hall business owners, management, and staff over the period of project consultation. The measures to address residual impacts on p 15-140 disregard the source of the stress and impacts which are directly associated with landholder dealings with ARTC and contempt for respect. It also states that impacts will only be 'considered' and not addressed.	DA Hall should be considered as a major employer and as such the potential for job loss and local employment and local economy considered as a result of impact to the business.	<p>The reference design has been refined to minimise the need for land acquisition within the Doug Hall poultry farm property, and to avoid direct impacts on the farm's infrastructure. Revised draft EIS Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts.</p> <p>This is expected to have greatly reduced employees' anxiety and stress. ARTC also supports provision of mental health services which are available to local residents and employees who are affected by stress and anxiety (see Appendix X: Social Impact Assessment, Section 8.5.3).</p>	<p>Appendix X: Social Impact Assessment Section 8.6.1</p> <p>Section 8.5.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
193	193.0110	Community Group	Social Impact Assessment	Workforce and employment	DA Hall do not understand how the assessment was undertaken and concluded that B3 and B2 risk levels is appropriate for the potential loss of 340 local jobs and significant economic loss locally resulting from an acquisition of DA Hall properties and loss of related poultry and piggery operations.	nil.	The reference design was refined during preparation of the revised draft EIS including re-alignment of the rail corridor to avoid impacts on Doug Hall and Co's poultry and piggery operations which would have affected their employment numbers, and design refinements to avoid impacts on feedlot infrastructure. Revised draft EIS Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts.	Appendix X: Social Impact Assessment Section 8.6.1
193	193.0111	Community Group	Social Impact Assessment	Mitigation measures	The Social Impact Management Plan lists project management actions but fails demonstrate mitigation strategies for issues to avoid and minimise impact. Ch 22 Environmental Management Plan fails to document the Social Impact Management Plan a preconstruction, construction and operation plan with mitigation strategies.	nil.	Revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing all identified impacts, including community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry. The SIA including SIMP have been updated to reflect submissions to the EIS and stakeholder engagement outcomes since the draft EIS was submitted. Chapter 24: Draft Outline Environmental Management Plan includes reference to the SIMP but does not duplicate its contents.	Appendix X: Social Impact Assessment Chapter 24: Draft Outline Environmental Management Plan
193	193.0112	Community Group	Social Impact Assessment	Workforce and employment	Labour source is likely to be drawn from Toowoomba region – this strategy placing additional pressure on the significant labour shortage in agriculture and draws from other local employment opportunities with local businesses.	nil.	The employment of local people is a key goal for the Project so the benefits of wages will extend to local and nonlocal residents. The potential for labour draw has been identified in revised draft EIS Appendix X: Social Impact Assessment, Section 7.2.2 and management measures addressing potential labour draw are detailed in Section 8.3.7. Appendix X: Social Impact Assessment, Section 8.3 notes that there may be a draw of existing staff or tradespeople away from some businesses. Some of the types of trades required (e.g. welders, concreters) may also be in demand by local residents and farmers. ARTC has established the Inland Rail Skills Academy (Appendix X: Social Impact Assessment, Section 8.3.2) to increase the availability of suitably qualified local employees to reduce the drawdown on local labour. The workforce will also include specialist workers with skills and experience which aren't available locally. Although Project recruitment has not commenced, the Skills Academy has delivered preliminary training programs for local people to develop skills relevant to local industries including agriculture including: <ul style="list-style-type: none"> ➤ Skills training for local residents focusing on transferrable agricultural skills held in December 2020 (Goondiwindi) ➤ Skills training for local Indigenous residents held in 2020-2022 ➤ Various initiatives for local school students to raise awareness of both STEM-based and trade careers available on Inland Rail held in 2020-2022 Appendix X: Social Impact Assessment, Section 8.3 has been updated to reflect the Project's most recent skills development initiatives.	Appendix X: Social Impact Assessment Section 7.2.2 Section 8.3 Section 8.3.2 Section 8.3.7
193	193.0113		Economics		The dissecting of the current operations on the Moyeness and DA Hall properties would increase the cost on the movement of birds between sheds and farms.	nil.	An assessment of the economic impacts (EIA) per lot and commodity is not in the scope of the Environmental Impact Statement (EIS) assessment process. The requirements for EIA is outlined in Section 5.1 and 11.141 of the Border to Gowrie final Terms of Reference (ToR). The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. Refer to Chapter 18: Economics and Appendix Y: Economic Impact Assessment. These outcomes have been summarised in the revised draft EIS. In response to public notification of the draft EIS, ARTC has refined the Project alignment which has changed the potential impacts for a number of agricultural enterprises including cattle feedlots, piggeries and poultry farms (Appendix B3: Changes to Reference Design since Draft EIS). ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community being: <ul style="list-style-type: none"> ➤ Removal of two active level crossings, increasing safety benefits for the community (for more information refer to Chapter 20: Traffic, Transport and Access Section 20.5). This is particularly important for: <ul style="list-style-type: none"> ➤ Community members travelling to the Millmerran Waste Management Facility. ➤ Workers travelling to the Millmerran Power Station, the piggery on Lindenmayer Road and landowners travelling within their community (home and local townships). ➤ Reducing the potential impacts on transport requirements for logistical operations required for the current and future farming operations. ➤ Rail alignment traverses less area impacted by the 1% AEP Condamine Floodplain event (for more information please refer to Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS) ➤ The new alignment indicates no changes to 1% AEP Condamine Floodplain impact objectives (i.e. afflux, velocities, inundation, and directional flows) on properties housing infrastructure for major regional employer's business infrastructure. ➤ Reduces the adverse economic and social impacts by: <ul style="list-style-type: none"> ➤ Creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks associated with Inland Rail's operational noise, vibration, light emissions, and potential biosecurity risks. For more information refer to Chapter 17: Social and Chapter 16: Noise and Vibration of the revised draft EIS. ➤ Avoids direct impacts to future planned infrastructure. ➤ The access road for the piggery infrastructure (Lindenmayer Road) no longer requires a level crossing, eliminating any direct impacts to associated traffic for future operations. For more information refer to Chapter 18: Economics of the revised draft EIS. The revised Economic Impact Assessment (EIA) in the revised draft EIS, included the calculation of potential loss for rural communities. Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year. The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential impacts to DA Hall and Co infrastructure and their piggery, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible. Refer to Appendix E: Consultation Report. As outlined in the mitigation measures, ARTC will continue to work with impacted landowners and businesses regarding this change from the draft EIS and will continue to consult with key stakeholders during the Detailed Design stage.	Chapter 14: Flooding and Geomorphology Section 14.9.1 Chapter 17: Social Chapter 18: Economics Section 18.3 Section 18.9.1 Chapter 20: Traffic, Transport and Access Section 20.5 Appendix B3: Changes to Reference Design since Draft EIS Appendix E: Consultation Report Section 5.1 Section 5.12 Section 5.14 Appendix Y: Economic Impact Assessment Section 5.5
193	193.0114	Community Group	Flooding		Access to the poultry during increased impact from flooding events has been addressed in Section 12 relating to surface water and hydrology. In the 2010 flood, the Gore Highway was cut for four days, limiting access to the 'Diamond Layer Farm and freight access to market. The Inland Rail draft EIS indicates and extended timing of inundation of the Gore Highway at Pampas which will increase impacts of restricted access to market and supply of services. There is an unknown impact to access of Diamond Layer Farm at Yandilla, however Dr Markar identifies that the ARTC models under report the surveyed flood levels.	nil.	Operational flood impacts on State-controlled Roads in the Condamine River floodplain have been described in Chapter 14: Flood and Geomorphology, Section 14.8.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Sections 7.5.3. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3
193	193.0115	Community Group	Traffic and Transport		The route alignment through the DA Hall properties would interrupt current traffic movement around/between business activities. Impacts including daily refrigerated truck transport direct from the processing depot to markets; operation and coordination of production and processing; and transport access to production and processing operations.	nil.	The revised reference design has updated the alignment near Millmerran and no longer impacts the poultry and piggery operations from a severance or road network perspective. Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. However, during the property acquisition process, ARTC will seek to secure agreement with affected landowners, to guide property-level design requirements and the management of construction on, or immediately adjacent to, private properties. The agreements may include: <ul style="list-style-type: none"> ➤ measures to minimise property impacts, including on agricultural operations ➤ specific requirements to ensure that operations, including the movement of livestock and farm machinery are able to be maintained as efficiently as possible ➤ measures to manage severance impacts, where practicable, including appropriate access solutions and amalgamation opportunities ➤ required adjustments to affected structures. Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts. However, in the case of a privately owned road, consultation will occur regarding restoring the privately owned road or access to at a minimum, it's pre-Project condition.	Appendix AA: Traffic Impact Assessment Section 5.6
193	193.0116		Economics		See Attachment to submission: "Impact Assessment of Proposal Inland Rail on DA Hall and Co's Operation Located at Yandilla via Millmerran QLD 4352" prepared by Taylor and Byrne.	nil.	An assessment of the economic impacts (EIA) per lot and commodity is not in the scope of the Environmental Impact Statement (EIS) assessment process. The requirements for EIA is outlined in Section 5.1 and 11.141 of the Border to Gowrie final Terms of Reference (ToR). The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. Refer to Chapter 18: Economics and Appendix Y: Economic Impact Assessment. These outcomes have been summarised in the revised draft EIS. In response to public notification of the draft EIS, ARTC has refined the Project alignment which has changed the potential impacts for a number of agricultural enterprises including cattle feedlots, piggeries and poultry farms (Appendix B3: Changes to Reference Design since Draft EIS). ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community being: <ul style="list-style-type: none"> ➤ Removal of two active level crossings, increasing safety benefits for the community (for more information refer to Chapter 20: Traffic, Transport and Access Section 20.5). This is particularly important for: <ul style="list-style-type: none"> ➤ Community members travelling to the Millmerran Waste Management Facility. ➤ Workers travelling to the Millmerran Power Station, the piggery on Lindenmayer Road and landowners travelling within their community (home and local townships). ➤ Reducing the potential impacts on transport requirements for logistical operations required for the current and future farming operations. ➤ Rail alignment traverses less area impacted by the 1% AEP Condamine Floodplain event (for more information please refer to Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS) ➤ The new alignment indicates no changes to 1% AEP Condamine Floodplain impact objectives (i.e. afflux, velocities, inundation, and directional flows) on properties housing infrastructure for major regional employer's business infrastructure. ➤ Reduces the adverse economic and social impacts by: <ul style="list-style-type: none"> ➤ Creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks associated with Inland Rail's operational noise, vibration, light emissions, and potential biosecurity risks. For more information refer to Chapter 17: Social and Chapter 16: Noise and Vibration of the revised draft EIS. ➤ Avoids direct impacts to future planned infrastructure. ➤ The access road for the piggery infrastructure (Lindenmayer Road) no longer requires a level crossing, eliminating any direct impacts to associated traffic for future operations. For more information refer to Chapter 18: Economics of the revised draft EIS. The revised Economic Impact Assessment (EIA) in the revised draft EIS, included the calculation of potential loss for rural communities. Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year. The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential impacts to DA Hall and Co infrastructure and their piggery, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible. Refer to Appendix E: Consultation Report. As outlined in the mitigation measures, ARTC will continue to work with impacted landowners and businesses regarding this change from the draft EIS and will continue to consult with key stakeholders during the Detailed Design stage. 193	193.0119		Economics		TOR 5.1 and 11.21 (e) states that economic impacts must be identified and assessed. The draft EIS and supporting economic impact assessment technical report simply describes that there will be economic impacts to agriculture and fails to provide an assessment of these costs in real terms. It goes to great lengths however to describe the economic benefit of the Inland Rail project, which fail to relate to the local project area. The direct and indirect economic impact of the Inland Rail to DA Hall business and operations and its local and regional significance is not represented. Stating that impacts will be determined during detail design fails to meet any accountability and transparency of the cost and impact for the local community or facilitates an assessment process conducted by the Coordinator General.	The draft EIS is to include a full and updated cost analysis of the project delivery, economic impact to local industries and communities.	<p>An assessment of the economic impacts (EIA) per lot and commodity is not in the scope of the Environmental Impact Statement (EIS) assessment process. The requirements for EIA is outlined in Section 5.1 and 11.141 of the Border to Gowrie final Terms of Reference (ToR). 193	193.0121		Economics		TOR 11.21 The draft EIS has failed to acknowledge local and regional impacts in its description of the project benefits.	nil.	<p>As a component of the larger Inland Rail Program, the potential benefits of the Project cannot be separated from those that are attributed to the full Brisbane to Melbourne alignment. The full suite of potential benefits associated with the Inland Rail Program can only be realised once this Project and all other Inland Rail projects are complete and operational. The EIS considers a range of benefit types which may be a direct result of the Project and which can be quantified or identified as part of the Project, rather than the broader Inland Rail Program. These are captured under two broad benefit streams: providing competitive freight transport and supporting regional and local business. These are summarised in Section 5.2 of the Executive Summary. The revised draft EIS also summarises the broader program benefits identified in the 2015 Investment Case in Section 5.1 of the Executive Summary.</p>	<p>Chapter 18: Economics Section 18.7</p>
193	193.0122		Economics		TOR 11.21 (f) has not been met, where employment opportunities have not been substantiated and will have a net negative impact to the region due to draw down on already significant labour shortages and loss of jobs due to impact to DA Hall business and operations.	nil.	<p>ARTC acknowledges the construction labour supply required for the Project includes technical and specialised skill sets such as engineering capability. The nature of these jobs is quite mobile, where professionals tend to travel to Project sites from major urban centres, interstate and internationally, where required. As such, labour market statistics for this supply group are summarised at a national and State level. More general labour market statistics are summarised in Chapter 16: Economics, Section 5.2 of the revised draft EIS.</p> <p>ARTC has recently updated the EIS economic modelling to reflect current labour market conditions. If labour market conditions at the national and State level remain in the recent range, the Project's Construction Works stage will be completed in the context of a relatively tight labour market, especially in the market for skilled labour relevant to the construction sector. However, the economic assessment indicates in Section 6.4 that there is some slack in the Darling Downs – Maranoa labour markets, which provides opportunities for recruiting, training and re-skilling available workforces in the region to supply a significant portion of the workforce requirements of the Project. The ability for the local economy to supply labour to the Project, depends on the specific location of works along the alignment. At the time of construction, local employment is dependent on a number of factors including labour market conditions, skills availability, and the existence of workforce training and participation programs to support local, Indigenous and youth employment.</p> <p>In response to public notification of the draft EIS, ARTC has refined the Project alignment which has changed the potential impacts for a number of agricultural enterprises. ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community including DA Hall business and operations including a reduction in adverse economic and social impacts by:</p> <ul style="list-style-type: none"> ➤ Creating greater separation between the DA Hall business infrastructure, thereby reducing potential impacts or risks associated with Inland Rail's operational noise, vibration, light emissions, and potential biosecurity risks ➤ Avoiding direct impacts to future planned infrastructure ➤ Avoiding potential loss of employees ➤ Avoiding future impacts to associated supply chains that support DA Hall business and related operations. <p>As outlined in the mitigation measures, ARTC will continue to work with impacted landowners and businesses regarding the changes in the draft EIS and will continue to consult with key stakeholders during the Detailed Design stage.</p>	<p>Chapter 18: Economics Section 18.4 Section 18.8.3 Section 18.9.1</p>
193	193.0123		Economics		The economic cost of impact to agriculture production does not include impact/loss to DA Hall piggery and poultry operations, nor considers the cost relating to land acquisition and compensation, agriculture operations, transport and property access, services, water resources, flood impacts, production loss, supply chain disruption.	Full assessment of economic impact and cost to agriculture: - Loss of agricultural land, acquisition of land and loss of production and value add- Acquisition of land used for intensive livestock operations and loss of production and value add- Temporary and permanent disruption to access and infrastructure- Temporary and permanent disruption to stock ad product movement- Improvements in supply chain efficiency and impacts to supply chain; and- Flood inundation of direct and indirectly impacted land use and supply chains, accounting for mitigation measures and cumulative impacts	<p>An assessment of the economic impacts (EIA) per lot and commodity is not in the scope of the Environmental Impact Statement (EIS) assessment process. The requirements for EIA is outlined in Section 5.1 and 11.141 of the Border to Gowrie final Terms of Reference (ToR). The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. Refer to Chapter 18: Economics and Appendix Y: Economic Impact Assessment. These outcomes have been summarised in the revised draft EIS.</p> <p>In response to public notification of the draft EIS, ARTC has refined the Project alignment which has changed the potential impacts for a number of agricultural enterprises including cattle feedlots, piggeries and poultry farms (Appendix B3: Changes to Reference Design since Draft EIS). ARTC notes the advantages with the proposed updated design and the positive outcomes for the local community being:</p> <ul style="list-style-type: none"> ➤ Removal of two active level crossings, increasing safety benefits for the community (for more information refer to Chapter 20: Traffic, Transport and Access Section 20.5). This is particularly important for: <ul style="list-style-type: none"> ➤ Community members travelling to the Millmerran Waste Management Facility. ➤ Workers travelling to the Millmerran Power Station, the piggery on Lindenmayer Road and landowners travelling within their community (home and local townships). ➤ Reducing the potential impacts on transport requirements for logistical operations required for the current and future farming operations. ➤ Rail alignment traverses less area impacted by the 1% AEP Condamine Floodplain event (for more information please refer to Section 14.8.1 of Chapter 14: Flooding and Geomorphology of the revised draft EIS) ➤ The new alignment indicates no changes to 1% AEP Condamine Floodplain impact objectives (i.e. afflux, velocities, inundation, and directional flows) on properties housing infrastructure for major regional employer's business infrastructure. ➤ Reduces the adverse economic and social impacts by: <ul style="list-style-type: none"> ➤ Creating greater separation between a major Millmerran regional employer's main business infrastructure, reducing potential impacts or risks associated with Inland Rail's operational noise, vibration, light emissions, and potential biosecurity risks. For more information refer to Chapter 17: Social and Chapter 16: Noise and Vibration of the revised draft EIS. ➤ Avoids direct impacts to future planned infrastructure. ➤ The access road for the piggery infrastructure (Lindenmayer Road) no longer requires a level crossing, eliminating any direct impacts to associated traffic for future operations. For more information refer to Chapter 18: Economics of the revised draft EIS. <p>The revised Economic Impact Assessment (EIA) in the revised draft EIS, included the calculation of potential loss for rural communities. Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential impacts to DA Hall and Co infrastructure and their piggery, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible. Refer to Appendix E: Consultation Report.</p> <p>As outlined in the mitigation measures, ARTC will continue to work with impacted landowners and businesses regarding this change from the draft EIS and will continue to consult with key stakeholders during the Detailed Design stage.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1</p> <p>Chapter 17: Social Chapter 18: Economics Section 18.3 Section 18.9.1</p> <p>Chapter 20: Traffic, Transport and Access Section 20.5</p> <p>Appendix B3: Changes to Reference Design since Draft EIS</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p> <p>Section 5.12</p> <p>Section 5.14</p> <p>Appendix Y: Economic Impact Assessment Section 5.5</p>
193	193.0124		Economics		Preliminary economic impact assessments, including employment impacts, have been conducted for DA Hall and known to ARTC, which have not been acknowledged in the draft EIS.	nil.	<p>In response to public consultation, ARTC has made a number of updates to the revised draft EIS, including updates to the Project alignment. This has resulted in a number of updates, including to the calculated potential loss for rural communities. Appendix Y: Economic Impact Assessment Section 5.5 outlines that overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in the Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>These alignment changes, such as the Millmerran alternative alignment, now avoid or minimise potential impacts on DA Hall and Co infrastructure and their piggery, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. Refer to Appendix E: Consultation Report for specific details. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> ➤ Direct impacts on properties (e.g. severance and loss of productive land) ➤ Impacts on property accesses and connectivity, including the location of level crossings on private roads ➤ Impacts on the movement of stock, water, produce and equipment. 	<p>Chapter 18: Economics Section 18.9.1</p> <p>Section 18.12</p> <p>Appendix E: Consultation Report</p> <p>Appendix Y: Economic Impact Assessment Section 5.5</p>
193	193.0125		Economics		Business case 2015: states that detailed designs are needed to better understand engineering, property and stakeholder requirements. This document states the benefit and cost estimates need to be refined, however remains the only economic assessment reference document since 2015. In 2009, the estimated cost was \$2.8 billion to build, the 2015 Base Case states \$9.9 billion, and an announcement in December 2020 the government will now invest \$14.5 billion to ARTC. By referring to the Base Case, the current cost estimates are not accounted for. As the detailed designs and mitigation measures are not yet completed, the projected cost is not substantiated. The Base Case also nominates the Port of Brisbane connection to cost and additional \$2.5 billion and is required to realise the project outcome.	nil.	<p>In response to public notification, ARTC has revised the Economic Impact Assessment. Details of the revised CAPEX costs can be found in Appendix C of Appendix Y: Economic Impact Assessment.</p> <p>Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with the Queensland Government, costs have not been included in Appendix Y: Impact Assessment.</p>	<p>Chapter 18: Economics Section 18.9</p> <p>Appendix Y: Economic Impact Assessment Appendix C</p>
193	193.0126		Economics		Given the lack of economic impact data and costs, it is difficult to conclude that an effective, full and transparent cost benefit analysis has been conducted as part of the route options analysis for Border to Gowrie.	The draft EIS should include a complete and updated cost benefit analysis of economic impact compared to other route alignment options, including cost to agriculture, land acquisition, impact to operations, mitigation measures and flooding.	<p>ARTC notes the purpose of the Investment Case (Inland Rail Program Business Case 2015) was to inform the Commonwealth's decision on whether or not to invest in the progression of the Inland Rail. It evaluated the benefit, cost and risk of alternative options and provided an evidence base to inform consideration of the preferred solution. Once the financial (i.e. investment) decision had been made to proceed with the Project, the statutory approval process commenced. Inland Rail, as a State Significant Project in Queensland, is required to respond to the Terms of Reference (ToR) with an Environmental Impact Assessment (EIS) as required under the <i>State Development and Public Organisation Act 1971</i> (Qld).</p> <p>The purpose of the EIS process is to inform decision-makers and the public of the environmental consequences of implementing a Project. The EIS identifies, predicts, and analyses impacts on the physical environment, as well as social, cultural, economic and health impacts during construction and operation of the Project. The economic analysis provided in the EIS response is tailored to consider these impacts during construction and operation with appropriate mitigation measures.</p> <p>Due to the nature of the incremental assessment approach adopted for this EIS, a Project-specific Cost Benefit Analysis (CBA) has not been undertaken as the results will not capture the full impact that is expected to be delivered upon completion of Inland Rail. Therefore, as agreed with Queensland Government costs have not been included in Appendix Y: Economic Impact Assessment.</p>	<p>Chapter 18: Economics Section 18.3 Section 18.7</p> <p>Appendix Y: Economic Impact Assessment Section 2.2</p>

194	194.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> ➤ The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. ➤ The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
194	194.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> ▶ The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. ▶ The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
194	194.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ▶ ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ▶ ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. ▶ The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ▶ ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ▶ ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. ▶ The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> ▶ Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. ▶ Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. ▶ The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. ▶ Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Participation Principles (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.1.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures Report have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ▶ ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ▶ ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. ▶ A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. ▶ Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> ▶ Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. ▶ In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ▶ ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> ▶ A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ▶ ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> ▶ As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Section 6.4</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
195	195.0001	Private	Flooding - Condamine River		The work of the Independent Panel of Experts for Flood Studies is directly related to the draft EIS and specifically the Condamine River floodplain Section of the proposed Border to Gowrie route. It is due until the end of 2021. In such circumstances, the draft EIS should be withdrawn.	<ol style="list-style-type: none"> 1. Ensure the Panel's advice on the extent, interpretation, assumptions and application of existing flood modelling, and best practice for design of waterway structures in a floodplain environment" is incorporated into the draft EIS for the Coordinator-General and stakeholders, including affected landowners on the Condamine River floodplain; to consider and comment. 2. The Coordinator-General should commit to awaiting the release of the Panel's advice before making a determination on the draft EIS, and prior to doing so invite stakeholder comment on the Panel's findings. 	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.6</p> <p>Section 8.6</p>
195	195.0002	Private	Flooding - Condamine River		The Senate Inquiry is not due to report until 13 May 2021, which is almost a month after the deadline for submissions on the draft EIS. As the Senate Committee's investigation is directly related to the draft EIS and specifically the Condamine River floodplain Section of the proposed Border to Gowrie route, as the Committee held hearings in Millmerran, the CG should ensure that the findings and recommendations are incorporated into the draft EIS.	<ol style="list-style-type: none"> 1. The Coordinator-General should invite ARTC to withdraw the draft EIS and ensure the Senate Committee's findings and recommendations are incorporated into the draft EIS for the Coordinator -General and stakeholders, including affected landowners on the Condamine River floodplain ; to consider and comment. 2. The Coordinator-General will extending the submission date on the draft EIS to beyond the reporting date of the Senate Committee (13 May) to allow stakeholders to consider that before making comments on the draft EIS. 3. The Coordinator-General should consider the Senate Committee's findings and recommendations, and the comments on it by stakeholders, as part of her assessment of the draft EIS. 	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.6</p> <p>Section 8.6</p>
195	195.0003	Private	Project scope		The Table 23.5 of Main Project Aspects To Be Developed from Chapter 23 of the EIS document demonstrates the incomplete nature of the EIS in its current form.	<p>The Coordinator-General should invite ARTC to withdraw the draft EIS and ensure that all necessary items under the terms of reference are incorporated into the draft EIS for the Coordinator -General and stakeholders, including affected landowners on the Condamine River floodplain; to consider and comment on Project footprint including areas to be acquired, final level crossing design, utilities, cross drain age configuration, signalling and communications, vertical alignment of the railway, bridge structure design, fencing strategy, impacts to QR assets, concrete facility, construction water, borrow pit locations, and non-resident workforce and accommodation.</p>	<p>As described in the revised draft Chapter 1: Introduction, Section 1.5, between 23 January 2021 and 4 May 2021, the draft EIS was made available for public comment under Section 33 of the SDPWO Act and public submissions were received. Terms of reference compliance has been updated for the revised draft EIS in Appendix A2: Terms of Reference - Cross Reference Table. On 4 January 2022 the Coordinator-General requested additional information under Section 34B(2) of the SDPWO Act. The Office of Coordinator-General additional information requirements and the proponent's (ARTC) responses to the public submissions received comprise the basis of assessment for the revised draft EIS.</p> <p>The revised draft EIS has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. In addition, changes have been made to the reference design that are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>The following steps in the coordinated Project process remain to be completed:</p> <ul style="list-style-type: none"> ▶ Once the Office of Coordinator-General has deemed that the additional information requirements have been satisfactorily addressed, the revised draft EIS will be made available for public comment. Submissions can be made to the Coordinator-General to be considered during evaluation of the revised draft EIS. ▶ The Coordinator-General will evaluate the revised draft EIS and may accept it as the final EIS. ▶ If accepted as final, the Coordinator-General prepares a report (i.e. Coordinator-General's evaluation report) on the final EIS consistent with the requirements of the SDPWO Act. <p>The EIS identifies and describes the environmental values that must be protected as specified in Section 9 of the Environmental Protection Act 1994 (Qld) (EP Act), the Environmental Protection Regulation 2019 (Qld), environmental protection policies, water resource plans, State Planning Policy, relevant guidelines and the EPBC Act. The relevant controlling provision for the Project is listed threatened species and communities (Sections 18 and 18A) (reference number EPBC 2017/7944). Refer Appendix O: Matters of National Environmental Significance Report for further detail.</p> <p>Chapter 3: Legislation and Project Approvals Process summarises the key Commonwealth and State legislation, and local government plans and policies and how they relate to approvals necessary for the planning, Construction Works and Operations stages of the Project. Chapter 3: Legislation and Project Approvals Process also tables the potential post-EIS approvals in Table 3-5, providing the triggers for each approval, the relevant administering authority and whether potential exemptions are available to the Project and ARTC. Approval and permit requirements may vary depending on the final design and construction methodology, and future changes in statutory requirements prior to the Project's implementation.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>As described in Chapter 25: Conclusions, Section 25.8, in recognition of the current status of design, the assessments completed for the revised draft EIS have adopted a conservative, worst-case approach, where possible, to identifying the potential impacts of the Project. This approach was adopted to ensure that future modifications and refinements to the revised reference design do not result in impacts greater than those predicted at this stage.</p> <p>It is expected that construction and operation of the Project will be within the parameters and scale of the impacts approved through the EIS. Changes to the Project that are beyond the assessment would need to progress through a request for Project change process.</p> <p>The revised draft EIS has been updated to address the Terms of Reference as outlined in Appendix A2: Terms of Reference Compliance Table.</p>	<p>Chapter 1: Introduction</p> <p>Section 1.5</p> <p>Chapter 3: Legislation and Project Approvals Process</p> <p>Table 3-5</p> <p>Chapter 5: Project Description</p> <p>Section 5.3.3</p> <p>Chapter 25: Conclusions</p> <p>Appendix A2: Terms of Reference - Cross Reference Table</p> <p>Appendix O: Matters of National Environmental Significance Report</p>
195	195.0004	Private	Outline EMP		The draft EIS submitted by ARTC does not comply with the Terms of Reference (TOR) set out by the Coordinator -General. Specifically, it does not sufficiently address detail around avoidance or mitigation measures as specified in Section 6.6 in the TOR.	nil.	<p>Chapter 23: Cumulative Impacts addressed TOR 6.6. Chapter 23: Cumulative Impacts includes an assessment of each environmental matter relevant to the EIS. This assessment includes the nature, magnitude and duration of the potential cumulative impacts of the Project and the proposed mitigation measures.</p> <p>Chapter 8 to Chapter 22 of the revised draft EIS address TOR 6.6 as these reports include assessment of the nature, magnitude and duration of the potential direct and indirect impacts of the Project and proposed mitigation measures.</p>	<p>Chapter 8 to Chapter 23</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
195	195.0005	Private	Noise and Vibration	Operational rail noise	All residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors. The noise and vibration from the rolling stock combined with additional signals from alarm bells and train horns will impact everyone. The Brookstead State School lies within 90 to 100 m from the proposed rail corridor. No alternative solutions have been discussed with the Brookstead community for a feasible alternative with less social impacts on the school day-to-day activities. There is potential for rail noise to affect the learning environments of the Brookstead and Yelarbon State Schools. ARTC have not informed the community of the noise and vibration details that will affect them.	nil.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Sleep disturbance impacts are also discussed in Section 6.1 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations. A range of feasible noise and vibration mitigations are provided in Chapter 16: Noise and Vibration, Section 16.10, and the associated technical reports Appendix V: Noise and Vibration Assessment: Construction and Road Traffic, Section 7, and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Chapter 16: Noise and Vibration and Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration and Appendix W: Noise and Vibration Assessment - Railway Operations. The development and implementation of such measures will be subject to further studies in the Detailed Design stage and verification of noise levels during initial operations.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p> <p>The railway noise assessment included a detailed calculation and prediction of noise levels at individual sensitive receptors, including the buildings and property at the Brookstead State School. The assessments identified that noise management and mitigation measures would be required to reduce and control the potential noise from the construction and operation of the Project and achieve the assessment criteria at the most affected sensitive receptors.</p> <p>The attenuation measures at Brookstead include the potential for railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6, Table 17-41 of Chapter 17: Social, outlines the detailed design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> ➤ Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. ➤ Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. ➤ Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. ➤ Confirm all relevant school bus services to enable consultation with the operators. ➤ Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> ➤ Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. ➤ Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. ➤ Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Table 17-41</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 6.1</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 11</p> <p>Section 17</p>
195	195.0007	Private	Stakeholder engagement		Very few residents from our local community in Brookstead participated in the survey as it was poorly advertised and promoted by ARTC. Many residents were unaware. the SIA survey does not represent views of the community members who may be impacted by the project.	SIA survey should be repeated until sufficient responses are received to represent community views.	<p>A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
195	195.0008	Private	Social Impact Assessment	Mitigation measures	No detail is provided about how negative social impacts will be minimised or mitigated and, as such, the draft EIS is incomplete according to TOR Condition 11.140.2. The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detailed design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed.	nil.	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
195	195.0009	Private	Stakeholder engagement		ARTC have failed to build trust, credibility, and visibility. The social impact of this poor engagement process by ARTC has been negative, and many representations to the Senate Inquiry into Management of Inland Rail project by ARTC and the Commonwealth government focused on concerns around poor consultation, individual and community stakeholder meetings have been requested to "suit" ARTC, rat her than community y needs. The majority of meetings have been requested or conducted during day-time working hours for the convenience of ARTC, and little consideration has been taken of stakeholder availability.	<ol style="list-style-type: none"> 1. The community consultation process needs to be undertaken again. An independent facilitator oversees the consultation process to ensure a fair process where community concerns are "heard, acknowledged, considered" and that the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication. 2. The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. 3. The detail of road and rail design will only be provided in the "Detailed Design phase" subsequent to the EIS, and this does not provide an opportunity to adequately respond to the EIS without sufficient information. This in itself is a failing of stakeholder engagement and the planning and communication process. On this basis, the draft EIS should be rejected based on the incomplete nature of information we need to effectively comment on environmental and social imp act 	<p>As outlined in Chapter 6: Stakeholder Engagement, Section and Appendix E: Consultation Report, Section 2 the consultation approach for the Project is guided by the International Association of Participation Principles (IAP2) engagement principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community engagement process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints.</p> <p>In reference to this submission, there has been ongoing consultation with the communities and local road users of the Brookstead and Pampas area during the development of the revised draft EIS, and changes to the reference design have been made in response to stakeholder input and feedback. ARTC hosted a community information sessions to discuss proposed changes to the Pampas and Brookstead road network design, which was developed in conjunction with DTMR and TRC. Community engagement has informed the reference design, with some key examples of these changes outlined in Chapter 6: Stakeholder Engagement, Section 6.5 and Section 6.6.Engagement with the communities directly impacted by the Project is ongoing, and will continue through detailed design, construction and operation.</p> <p>The reference design is an iterative process, and engagement about road and rail design is ongoing with stakeholders. As noted in Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.5</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 5.3</p> <p>Section 5.5</p>
196	196.0001	Private - Brookstead	Flora and Fauna	Koala	<ul style="list-style-type: none"> ➤ The submitter highlights that their family has owned Oak Park for 33 years and that there have always been koalas in the trees around the house, up in the scrub, along the roadside and that they have really been the koala's custodians. The submitter highlights that there have been occasions where their family have taken injured and sick koalas to vets and carers. ➤ The submitter highlights an occasion when going through the large area of remnant scrub to look for a koala, however sighted 14 koalas in the various trees; such as eucalypts and belahs, which provide a perfect habitat. ➤ The submitter expresses concern that the extent of the corridor and the gigantic structures that will be built adjacent to their property for Inland Rail, will destroy the environment, restrict koalas movements, prevent koalas from moving to and from their breeding grounds and possibly lead to extinction of Koalas in this area. •The submitter highlights that recent studies by experts and local people from movements like Landcare, have found that the Inland Rail corridor will dissect the Koala's habitat for approximately 100 km in the region; severely disturbing and possibly destroying their environment. ➤ The submitter states that the extensive development of Inland Rail, will destroy the ecosystem that has sustained a thriving Koala colony which has historically always existed in the Yarranlea/Murlaggan area. ➤ The submitter states that the predicted 11 trains through the day and 9 at night in 2026, will affect the movement of koalas as most of their movement occurs at night and if their movement is limited by the railway as we know their mating calls are most frequent at night, this is another threat to the continuity of the species. 	The submitter states that rerouting the Inland Rail to another part of Queensland where it will affect fewer animals and people should be considered by the Government.	<p>Appendix O: Matters of National Environmental Significance Report of the revised draft EIS, outlines the assessment undertaken to determine the degree of significance of impacts on koala populations, against the Commonwealth's EPBC Act 1999 referral guidelines for the vulnerable listed koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) and the Significant Impact Guidelines 1.1 - Matters of National Environmental Significance. In instances where uncertainty existed, a worst case scenario was adopted. It is noted that the Koala will be subject to significant residual impacts and offset for this species will be required in order to comply with commonwealth legislative requirements.</p> <p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development of Appendix M: Draft Koala Management Plan (DKMP).</p> <p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS. These include the following documents: Appendix M: Draft Koala Management Plan, Appendix N: Draft Fauna Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Section 5: Wildlife Crossing Structures and Other Treatments in Appendix P: Fauna Connectivity Strategy provides additional information on the management and mitigation measures to ensure fauna connectivity is maintained. The strategy looks at specific listed species and proposes tailored design strategies accordingly.</p> <p>The preferred location for the proposed Project rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ➤ Ability to enhance the Inland Rail service offering ➤ Construction and operating costs ➤ Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale, Section 2.8-2.10 of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to reference design since draft EIS to reflect the alignment maturity.</p> <p>In response to the draft EIS public notification, ARTC has refined the Project alignment. This has resulted in a number of updates made to the revised draft EIS, including to the calculated potential loss for rural communities. Section 5.5 of the revised Appendix Y: Economic Impact Assessment, outlines that overall, the permanent disturbance footprint will traverse 0.07 percent of the impact assessment area's productive agricultural land. This proportion can be used to estimate, at a high level, the potential loss of agricultural production resulting from the Project. In 2020-21, the gross value of agricultural production in Goondiwindi and Toowoomba LGAs was \$1.62 billion. Accordingly, it is estimated that the Project could result in a loss of \$1.13 million (value foregone) in gross agricultural production per year.</p> <p>The alignment changes, such as the Millmerran Alternative Alignment, now avoid or minimise potential impacts to DA Hall and Co infrastructure and their piggyery, poultry and egg farm operations, which are large local employers. In addition, the alignment avoids direct impacts to other intensive animal production operations such as feedlots. ARTC actively consulted with the owners of these operations to refine the Project alignment to minimise impacts on the feedlots' infrastructure and operations. As a result, impacts on employment opportunities associated with these businesses are expected to be negligible.</p> <p>As outlined in the mitigation measures, ARTC will continue to consult with farmers, graziers and owners of agricultural businesses which are directly affected or adjacent to the Project footprint during the Detailed Design stage to develop measures to mitigate impacts including:</p> <ul style="list-style-type: none"> ➤ Direct impacts on properties e.g. severance and loss of productive land ➤ Impacts on property accesses and connectivity, including the location of level crossings on private roads ➤ Impacts on the movement of stock, water, produce and equipment 	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Appendix B3: Changes to reference design since draft EIS</p> <p>Appendix E: Consultation Report</p> <p>Section 4.2</p> <p>Section 5.1</p> <p>Section 5.10</p> <p>Appendix O: Matters of National Environmental Significance Report</p> <p>Appendix M: Draft Koala Management Plan</p> <p>Appendix N: Draft Fauna Management Plan</p> <p>Appendix P: Fauna Connectivity Strategy</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
196	196.0002	Private - Brookstead	Flora and Fauna		The submitter states that the rural tranquility will be destroyed by the massive construction the Inland Rail will present and other forms of fauna like echidnas and the bearded earless dragon for example will find it difficult to exist in such a stressful environment and future generations will not have the same opportunities to enjoy the iconic Australian in this area	The submitter states that rerouting the Inland Rail to another part of Queensland where it will affect fewer animals and people should be considered by the Government.	<p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment as the preferred concept alignment for the Project. The Corridor Options Report, the preparation of which was overseen by a Project Reference Group appointed by the Australian Government and chaired by Mr Bruce Wilson AM, was made publicly available by the Australian Government on 21 September 2017. The estimate of quantities used in cost estimates contained in the report was subject to an independent review by RPS in August 2017, with no shortcomings identified.</p> <p>The base case via Wellcamp Charlton alignment formed the centrelaine of a two-kilometre-wide study area to be progressed through ARTC's phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. Section 2.8 and 2.9, Chapter 2: Project Rationale of the draft EIS describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">▶ ability to enhance the Inland Rail service offering▶ construction and operating costs▶ multi-criteria analysis (MCA). <p>As described in Section 2.8-2.10, Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.10 Appendix E: Consultation Report Section 5.1
196	196.0003	Private - Brookstead	Flooding		The submitter states that their family often discusses about the many ways the railway will create huge problems and disruption to not only themselves and the native animals, but to other farmers along the route, especially in times of flooding.	The submitter states that rerouting the Inland Rail to another part of Queensland where it will affect fewer animals and people should be considered by the Government.	<p>The EIS is focussed on the chosen alignment selected by the Australian Government.</p> <p>The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale, Section 2.8. Section 2.9.3 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail. gov. au/people-and-community/Border-to-Gowrie-route-assessment</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9.3
197	197.0001	Private - Brookstead	Social Impact Assessment	Modelling	<p>The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region.</p> <p>The SIA survey does not represent views of the community members who may be impacted by the project.</p>	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
197	197.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<p>The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase.</p> <p>The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'.</p>	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
197	197.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	<p>The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.</p>	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4
197	197.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none">▶ ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community.▶ ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners.▶ The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.▶ ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.▶ ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.▶ The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.	<ul style="list-style-type: none">▶ Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication.▶ Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses.▶ The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process.▶ Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact.	<p>The consultation approach for the Project is guided by the International Association of Participation Principles (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.3: Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.1.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none">▶ ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development.▶ ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts.▶ A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6.▶ Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none">▶ Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS.▶ In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022.▶ ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none">▶ A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope.▶ ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none">▶ As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 198	198.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Participation Principles (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.1.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Section 6.4</p>
199	199.0001	Private	Flooding	Increase in flows	The submitter thinks that there hasn't been enough discussions/investigations into the flow of water in all adjoining areas to the project line.	The submitter wants ARTC to speak to the older residences in the area to get accurate knowledge on the flow of water.	<p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Section 14.5 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.5</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.6</p> <p>Section 8.6</p>
199	199.0002	Private	General project opinion - negative		The submitter raises the issue that the existing rail line has served its purpose as its foundation does not move as a result of black soil. At the same time, the existing rail line has carted thousands of tons of wheat without going through prime agricultural land.	nil.	<p>Chapter 2: Project Rationale, Section 2.2 describes the justification of Inland Rail. Much of the infrastructure on the existing regional rail systems is old and has maintenance and renewal issues and, as such, has restrictions on axle loads and tonnages that can be transported. Poor maintenance of rail lines leads to network availability issues and speed constraints. When combined, these existing rail network constraints are resulting in an increasing reliance on freight transportation by road, thereby imposing additional maintenance and safety burdens on the affected road asset managers (Infrastructure Australia, 2015).</p>	Chapter 2: Project Rationale Section 2.2
200	200.0002	Private	General project opinion - positive		<ol style="list-style-type: none"> The rail will provide financial benefit from construction and long term benefit to enable Goondiwindi region to grow and develop new marketing opportunities and strategic freight lines. The rail will provide construction opportunities for Goondiwindi Region 	<ol style="list-style-type: none"> The contractors and subcontractors should favour local businesses in all purchasing decisions. Local labour should be hired. Goondiwindi has good training facilities that could deliver any training needed. 	<p>Appendix X: Social Impact Assessment Technical Report (Section 8.3) states "one of ARTC's primary aims is to maximise employment opportunities for residents within the SIA study area by:</p> <ul style="list-style-type: none"> Facilitating skills development opportunities to build regional capacity in construction and rail operation Building partnerships with training providers to strengthen workforce skills in the SIA study area and reduce the potential for cumulative impacts to draw labour and skills from other businesses Requiring the Contractor to employ locally, and to implement workforce training and diversity strategies". <p>Section 8.3.4 in Appendix X: Social Impact Assessment Technical Report also notes ""there is also potential for cumulative demands for construction personnel for Inland Rail and other projects to cause labour shortages for businesses in the SIA study area". Appendix X: Social Impact Assessment Technical Report Section 7.5.2 states "some of the types of trades required (e.g. welders, concreters) may be in demand by local business and residents, however other trades required (e.g. those required for major civil construction, flashbutt welding and sleeper laying) are specific to major infrastructure projects.</p> <p>ARTC has established the Inland Rail Skills Academy (Appendix X: Social Impact Assessment Technical Report, Section 8.3.2) to increase the skills and capacity of the local workforce to participate in construction employment.</p> <p>ARTC partnered with Goondiwindi Regional Council to support the development of a "Local Employment Roadmap" which aims to attract skilled workers to the region. Appendix X: Social Impact Assessment Technical Report Section 8.3.4 has been updated in this regard.</p> <p>If the Project is contributing to cumulative pressures on labour availability, ARTC will engage with the Contractor to refine the Project's recruitment and training strategies (Appendix X: Social Impact Assessment Technical Report, Section 8.3.7). * As noted in Appendix X: Social Impact Assessment Technical Report (Section 7.5.3) ARTC's Australian Industry Participation Plan and Sustainable Procurement Policy have a key focus on providing local and Indigenous businesses and social enterprises with full, fair and reasonable opportunity to participate in the supply of goods and services to Inland Rail.</p> <p>Inland Rail's tender assessment criteria includes local and Indigenous participation as a key element of all construction tender assessments.</p> <p>ARTC has also commenced delivery of business capability strategies; Appendix X: Social Impact Assessment Technical Report Section 6.2 has been updated in this regard.</p> <p>As outlined in Appendix X: Social Impact Assessment Technical Report Section 8.7.3 (Table 8.14), the Contractor will be required to monitor of the number of people from the SIA Study Area that are employed in construction and the number and value of contracts with businesses located in the Goondiwindi and Toowoomba LGAs in line with targets, and report on outcomes.</p>	<p>Appendix X: Social Impact Assessment Technical Report</p> <p>Section 6.2</p> <p>Section 7.5.2</p> <p>Section 7.5.3</p> <p>Section 8.3</p> <p>Section 8.3.4</p> <p>Section 8.3.7</p> <p>Section 8.7.3</p> <p>Table 8.14</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
201	201.0001	Private - Brookstead	Land Use and Tenure	Directly impacted landowner	The submitter highlights there are inaccuracies and omissions in the draft EIS with respect to Impacted Properties in Appendix F, Impacted Community Organisations, in the draft EIS, including Emergency and Medical services in Chapter 15. Submitter states that their family trust has an interest in seven properties within the rail corridor, and additional eleven properties within 5 km of the proposed IR line. The land use category assigned to five of the seven included land parcels (2RP71738, 2RP87457, 1RP87457, 3149A341582, 1RP803554) are incorrect in the draft EIS document (Appendix F, Table F.2) Lot2RP87457; is an irrigated farm of 310.96 ha in prime agricultural land and has been incorrectly indicated in the EIS as a property of other minimal use. The incorrect classification is an error in the preparation of the draft EIS as the land classification is designated as Cropping on QLUMP website (Attachment 1) Lot1 RP87457 is a residential property situated on 2.02 ha and has been incorrectly classified as a property of other minimal use in the EIS. This error is a result of missed verification on ARTCs behalf as it is listed as Other minimal use on the QLUMP website (Attachment 1). Lot 2 RP71738, is an irrigated farm located in Pampas as indicated on the QLUMP map (Attachment 1) and has been incorrectly listed as land parcel as Transport and Communication in Appendix F, Table F.2. Lot 3149 A341582 is an irrigated farm located in Pampas as indicated on the QLUMP map (Attachment 1) and has been incorrectly listed in the draft EIS as Transport and communication in Appendix F, Table F.2 Lot3 RP803554 is an irrigated farm located in Pampas as indicated on the QLUMP map (Attachment 1) and the draft EIS document incorrectly lists this land parcel as Transport and Communication in Appendix F, Table F.2.	Submitter states to check and correct predominant land use category for all assigned properties as these are not accurate records and therefore not indicative of the impact on agricultural land and residences. Address the impact of these erroneous land use classifications on information and decisions made in other sections of the draft EIS.	The revised draft EIS Chapter 8: Land Use and Tenure, Section 8.4, presents updated information on the Project with regards to land-use assessment, identification and mapping existing land uses.	Chapter 8: Land Use and Tenure Section 8.4
201	201.0002	Private - Brookstead	Land Use and Tenure	Modelling	Submitter states that the process of mapping and verifying land used by ARTC, based on the Queensland Land Use Mapping Program (QLUMP) was not undertaken thoroughly, if at all, as the verification process did not detect glaring errors of misclassification on a scale of 71% for the properties alone. A rate of less than 30% accuracy for land use classification, should not be sufficient to pass the EIS process.	Submitter states to check and correct predominant land use category for all assigned properties as these are not accurate records and therefore not indicative of the impact on agricultural land and residences. Address the impact of these erroneous land use classifications on information and decisions made in other sections of the draft EIS.	Land uses are accurate to QLUMP. QLUMP is used for consistency across Queensland and local/regional boundaries. The revised draft EIS Chapter 8: Land Use and Tenure, Section 8.4, presents updated information on the Project with regards to land-use assessment, identification and mapping existing land uses.	Chapter 8: Land Use and Tenure Section 8.4
201	201.0003	Private - Brookstead	Stakeholder engagement	Directly impacted landowner	Submitter highlights that they have had numerous meetings with ARTC representatives in their residence 1RP87457 however this has not been defined as such.	nil.	ARTC notes that ongoing engagement has been undertaken with this submitter, including meetings at their property and through the SDDCCC. ARTC is not referencing individual landowner meetings in the revised draft EIS. For further details on directly impacted landowner consultation refer to Appendix E: Consultation Report, Section 4.	Appendix E: Consultation Report Section 5
201	201.0004	Private - Brookstead	Land Use and Tenure	Directly impacted landowner	Submitter states that omissions in the draft EIS may appear minor, however have far reaching implications and raise the following questions: <ul style="list-style-type: none"> How many other affected land parcels have an incorrect classification, given the high percentage of interests we have highlighted that are misrepresented in the draft EIS These land use categories have been used as a comparative assessment criteria in route selections since 2016 and these classification errors may have perpetuated incorrect decisions, particularly as the 'best-route' was a close decision that was certainly not clear-cut in the multi-criteria assessment process (Figure 2.15, Section 2.8.6.2). 	Submitter states to check and correct predominant land use category for all assigned properties as these are not accurate records and therefore not indicative of the impact on agricultural land and residences. Address the impact of these erroneous land use classifications on information and decisions made in other sections of the draft EIS.	Land uses are accurate to QLUMP. QLUMP is used for consistency across Queensland and local/regional boundaries. The revised draft EIS Chapter 8: Land Use and Tenure, Section 8.4, presents updated information on the Project with regards to land-use assessment, identification and mapping existing land uses.	Chapter 8: Land Use and Tenure Section 8.4
201	201.0005	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> Submitter highlights that community groups and Emergency Services in the Pampas and Brookstead communities have been omitted from the list of impacted organisations, and excluded from the community consultation process. The following groups have been omitted; The Pampas Progress Association, The Pampas Rural Fire Brigade (RFB), Brookstead Rural Fire Brigade and Pampas Neighbourhood Watch Group. The submitter states that the impacts of this project on the small regional community are so significant, that they question whether they have been (deliberately) ignored and neglected by ARTC, as the conversations and stakeholder engagement process possess a significant challenge for ARTC to actually execute with little chance of positive and acceptable solutions. Additionally, the submitter highlights that there is an error in the Draft EIS with the respect to the listing of the Millmerran Medical Centre in Chapter 15, Table 15.10 that this medical centre has been closed since January 2020 and therefore is another example of the level of inaccuracy in the draft EIS, displaying lack of attention to detail and fact-checking in preparation of the document. These omissions highlight the lack of a comprehensive social impact assessments, as required by ToR 11.21 and an ineffective and incentive stakeholder engagement program (as ARTC indicated in their Appendix C, specifically Table 2.2 and required in ToR 7.7, 7.8, 7.9. 	<ul style="list-style-type: none"> The community consultation in the Pampas region needs to be completed to engage with all affected community groups to fully address social impact and complete stakeholder engagement The draft EIS needs to complete the detail around rail and bridge design in the village of Pampas, as well as road access changes and the impact on residences and local businesses so that the full extent of the environmental, social and economic impacts can be assessed. 	<p>As detailed in the revised draft EIS Chapter 5: Project Description, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Projects safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation facilities to likely construction sites for fatigue management purposes (maximum desirable commute of 30 mins) Land tenure, ownership, road access, and area of the site Proximity to supporting infrastructure and services, such as water and electricity Likelihood of social, environmental and heritage related impacts Potential for planned future developments. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project.</p> <p>In early 2023, it was determined that the Turallin site was a not a feasible location. BNTAC and Toowoomba Regional Council were advised in March 2023 and ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions. ARTC are committed to continued consultation with the relevant stakeholders. Further analysis will be undertaken on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Appendix E: Consultation Report Section 2.2
201	201.0006	Private - Brookstead	Stakeholder engagement	Road safety	<ul style="list-style-type: none"> Submitter raises concern with respect to a lack of detail in the draft EIS Chapter 23, Table 23.5 – making it difficult to respond to the draft EIS. Submitter highlights that their properties lie either side of the proposed rail line and they will need to transport large machinery across the line on a seasonal basis. Additionally, each of the four operators on their property cross the rail line, on average six times per day at Pampas, making a total of 24 crossings on a regular daily basis. Therefore, this will create huge operational and safety issues for their business plan and personnel and, as yet they have no detail of the road-rail crossing design in their small community, despite asking for these alignments numerous times. *For this reason the submitter states they cannot comment on details in the draft EIS as they are not yet available (Table 23.5), and they propose that impacts of the proposed corridor on their daily operations cannot be adequately assessed until this detail is known. 	nil.	As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
201	201.0007	Private - Brookstead	Stakeholder engagement	Directly impacted landowner	<ul style="list-style-type: none"> Stakeholder engagement with ARTC has been unprofessional, disregarding and insensitive, citing an example of the potential substantial impact to their shed, their infrastructure and business operations. Submitter states that they have been communicating with ARTC since the project formation sessions began in 2016 and more recently, it seemed likely to them that one of their major sheds central to their agricultural business would be impacted. However, despite questioning ARTC numerous about this potential impact, they were advised that it would not be affected. The submitter then highlights that they have been informed by ARTC post EIS of potential acquisition of their shed which is the business hub of their agricultural activities which contains a workshop, maintenance facility for the business vehicle fleet, agricultural machinery and operational infrastructure. The shed also houses fuel and chemical supply stations and filling points and the adjoining buildings contain an office space and storage, meeting room, toilet and shower block (adjacent) and water supply for agricultural and residential use. The submitter highlights that the acquisition of this shed will have a huge impact on their business operations and to be informed of this after the EIS is unacceptable. The submitter further expresses that when contacted by ARTC on 9 April 2021 about the impacts, they received an informal text message and ARTC down played the meeting to be low key. 	nil.	<p>As detailed in the revised draft EIS Chapter 5: Project Description, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for three non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Projects safe commutable distances requirements, with proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included:</p> <ul style="list-style-type: none"> The proximity of the accommodation facilities to likely construction sites for fatigue management purposes (maximum desirable commute of 30 mins) Land tenure, ownership, road access, and area of the site Proximity to supporting infrastructure and services, such as water and electricity Likelihood of social, environmental and heritage related impacts Potential for planned future developments. <p>Based on these criteria, properties in Yelarbon and Inglewood have been identified as suitable for the establishment of non-resident workforce accommodation facilities. The landowners of these properties have each been consulted and are receptive to having the accommodation being located on their properties. The third location in the Millmerran area is yet to be determined and non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the EIS and will be obtained prior to accommodation establishment works commencing.</p> <p>Community engagement has been undertaken with the community and key stakeholders during the selection process. In October 2021, an information session was held in each of the localities, and the ARTC team received feedback from the attendees for a strong preference for the non-resident workforce accommodation facility to be located within Millmerran township, and for further engagement from the Project.</p> <p>In early 2023, it was determined that the Turallin site was a not a feasible location. BNTAC and Toowoomba Regional Council were advised in March 2023 and ARTC commenced engagement with key stakeholders including and the community on potential preferences for a site in the Millmerran area. ARTC notes of community concerns received through the community engagement sessions in 2021 and 2023, and related EIS submissions. ARTC are committed to continued consultation with the relevant stakeholders. Further analysis was undertaken during 2023 on a preferred site location. Further details on how ARTC will be managing workforce accommodation is contained in Appendix X: Social Impact Assessment (Section 8.4).</p>	Appendix X: Social Impact Assessment Section 8.4 Appendix E: Consultation Report Section 4.5
201	201.0008	Private - Brookstead	Social Impact Assessment		<ul style="list-style-type: none"> Submitter highlights their concerns that approval of an incomplete EIS lacking detail in many aspects, would leave them with no recourse for action against unacceptable design decisions by ARTC after the event. Submitter claims that the draft EIS does not provide a comprehensive document on social and business impacts as the detail is not provided, and in many instances is not yet complete or available. It is apparent that the EIS process has been undertaken prematurely before the plans have been developed to a stage where the full economic, environmental, and social impacts can be assessed and responded to by the affected communities. 	nil.	The revised draft EIS was undertaken in compliance with the Terms of Reference set by the Office of Coordinator-General. It is not uncommon for an EIS to be undertaken before all of the finer details are finalised. Appendix X: Social Impact Assessment, Section 8 includes an updated Social Impact Management Plan (SIMP) and monitoring strategy to support adaptive management of social impacts and opportunities for the Project to benefit local communities. Appendix X: Social Impact Assessment, Section 8.2.2 also commits to an ongoing process of engagement with stakeholders to resolve issues as they arise.	Appendix X: Social Impact Assessment Section 8 Section 8.2.2
201	201.0009	Private - Brookstead	Land Use and Tenure	Land acquisition/com-pensation	<ul style="list-style-type: none"> Submitter claims that land acquisition requirements given in the EIS are currently incomplete and misleading, as the detail has not yet been determined, for the full extent of land acquisition, prior to submission of the EIS. This directly contravenes ToR 11.74 regarding tenure changes and timing of acquisitions. Submitter highlights that it is obvious from recent conversations with ARTC from April 2021, that the detail of land acquisition is not yet finalised. 	nil.	ARTC are currently consulting with affected landowners and negotiating acquisition of land where required.	Chapter 8: Land Use and Tenure Section 8.5.1 Table 8-51 Appendix E: Consultation Report
201	201.0010	Private - Brookstead	Stakeholder engagement	Directly impacted landowner	<ul style="list-style-type: none"> ARTC stakeholder engagement has failed to build trust, credibility and visibility, due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts. Submitter cited an example when family representatives attended a consultation meeting around the road and rail design at Pampas Hall in June 2019, to which the consultation process highlighted ARTC's intent to 'inform' landowners of impacts to their property and violate their 'promise to the community' to listen to input on impacts and concerns about possible alternative design. The process highlighted that avoiding an impact is not the highest priority but rather that mitigate seems to be an acceptable option to ARTC when alternatives for avoidance have not been discussed or considered, being a direct violation of TOR 10.10. "ARTC has been unprofessional when communicating with residents as there has been a lack of documentation of meetings held, a lack of follow up on action items and information provided. 	nil.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC notes it met with representatives of the landowner in June 2019 as part of a targeted community workshop around the Pampas road rail interface and local load design. This workshop was an information-gathering exercise and ARTC considered the feedback received in developing the design. Subsequent to the submission of the draft EIS, ARTC has undertaken further engagement with the Pampas community about the road/rail interface and made changes to the design.</p> <p>ARTC provided written notes of meetings to attendees when requested at the time of the meeting. Between, July 2019 and December 2022, Inland Rail contacted the submitter on several occasions, including in relation to his membership on the Southern Darling Down CCC. In February 2023, the submitter agreed to meet with ARTC face-to-face in March 2023. At this meeting, ARTC discussed and agreed to his request to transfer to the Inner Darling CCC and organising a time to meet with him on his property to discuss his concerns and the impacts of the Project to his property to seek his input into the process. The submitter agreed to a meeting in the future. This on-property meeting is yet to occur. ARTC is committed to regularly communicating to the submitter to organise a suitable to time to meet.</p>	Appendix E: Consultation Report Section 3
201	201.0013	Private - Brookstead	Stakeholder engagement		<p>Submitter states that ARTC have failed to 'build trust and credibility' in stakeholder engagement, failing the steps of 'consult and collaborate' with respect to flood modelling and impacts. Communication around flooding, flood model and impacts with ARTC have been dismissive and treated affected landowners with disregard and sometimes even contempt. Submitter cites the below examples:</p> <ul style="list-style-type: none"> Inaccurate information was presented by ARTC at the Sydney conference in 2019 regarding floodplain width of the Condamine River and when this was presented to the Toowoomba regional councillors on 3 September 2019, ARTC were reluctant to update the flood model to include extra water and would only acknowledge that the depth of water at this location in 2010 flood was 20cm when photographic evidence clearly indicated otherwise. Dr McIntosh presented findings of a review of the flood model to the community at Brookstead Hall and the community's follow up questions were not responded to for over three months. When Dr McIntosh did respond, it was suggested that 'the historic records may be inaccurate'. Senior employees of ARTC supplied misinformation to the Senate committee in April 2019, demonstrating a lack of consultation within ARTC from the ground up, as well as its dismissal of documentary flood evidence and concerns about the flood model conveyed to them by affected landowners. 	nil.	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.1.</p> <p>Chapter 6: Stakeholder Engagement, Section 6.6 and Appendix E: Consultation Report, Section 5.3 of the revised draft EIS details the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>ARTC provided technical information to Dr Macintosh for his independent review but was otherwise not involved in this process and is unable to comment on the review process. In 2020, ARTC also shared technical information with the Independent International Panel of Experts for Flood Studies, established by the Australian and Queensland Governments to provide advice on the flood models and structural designs developed by ARTC for Inland Rail in Queensland.</p> <p>The Panel released its draft report in March 2021. In April and November 2021, ARTC held open community meetings with the IDDCCC and the SDDCCC in Millmerran to provide an overview of their draft report. As part of additional assessment and studies conducted for this revised draft EIS, ARTC has assessed all local catchments against the new Flood Impact Objectives (FIOs), which determine the acceptable parameters within which the Project can change or increase the existing flood conditions. Additional consultation was undertaken in October 2022 with all landowners that were shown to have the highest exceedances to the FIOs, in order to discuss these potential impacts and allow ARTC to develop mitigations specific to each area or property.</p>	Chapter 6: Stakeholder Engagement Section 6.6 Appendix E: Consultation Report Section 5.3
201	201.0014	Private - Brookstead	Flooding - Condamine River		<p>Submitter highlights the concerns of the community, regarding potential dangers to lives, homes, rural infrastructure, prime agricultural land and the unique highly fertile black cracking clay (vertisol) soil resource and agriculture enterprises due to an unacceptable flood risk imposed by the Inland Rail design. Submitter claims that the current design will result in both short-term and long-term impacts that are irreversible due to changed water flow and velocity resulting from the proposed rail design. Submitter highlights that ARTC do not fully understand or acknowledge the potential flood impacts and the damage it will cause to the fragile vertisol soils and damage to the cropping systems and environment resource. Refer to pages 9-13 with respect to examples of concerns of the Inland Rail design, expected to have flood impacts</p>	nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for water flow velocities. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment. Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 4.2 Section 5-17
201	201.0015	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> Submitter highlights that as per Section 12.6.3.2, statement Figure 12.20b, it is obvious that the flood impacts of the current rail design objectives is happening at critical flood receptors, as well as across areas of agricultural land. Submitter highlights that three of the impacted receptors in Table 12.75 are located on their properties, and yet there has not been any communication from ARTC with respect to these findings 	nil.	ARTC has held numerous meeting with representatives of the owners of this group of properties to discuss in detail the predicted changes to flood levels at the properties. The engagement supporting the development of the Condamine floodplain crossing is detailed in Appendix E: Consultation Report, Section 5.4	Appendix E: Consultation Report Section 5.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
201	201.0016	Private - Brookstead	Flooding	Modelling	Submitter highlights that the revised flood impact objectives, allow for changes in peak heights of up to 200 mm on agricultural land, with up to 400 mm in localized areas. Submitter disputes the flood impact objectives stating that it is not acceptable for an increase of 200 to 400 mm over agricultural cropping land due to rail design. Submitter further highlights that most of their six parcels of land lying adjacent to the rail line on the Millmerran-Leyburn road have unacceptable flood height increases and they dispute that this is an acceptable flood design criterion. The submitter further notes that of these six land parcels, only two have been included as Impacted properties in Appendix F, Table F.2. Submitter highlights that most of their parcels of land in close proximity to the rail line in Pampas have unacceptable flood height increases and dispute that this is an acceptable flood design.	nil.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for changes in peak water levels. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.35 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>The updated flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 4.2 Section 5-17</p>
201	201.0017	Private - Brookstead	Flooding	Erosion	Submitter highlights concern around the risk of erosion from potential embankment failure, which is not addressed in the draft EIS, in violation of mandatory TOR 6.2. Submitter highlights that embankment failures have occurred on ARTC constructions and it is a fear that an embankment failure on the fragile soils of the Condamine floodplain would result in damage and soil loss that could never be repaired or retrieved. Submitter states that this is a totally unacceptable risk to soil management practices in these agricultural systems.	The Condamine Main Brand Bridge be extended 400 m to the South to join the Condamine South Brand Bridge. The Condamine South Branch Bridge be extended to Millmerran-Leyburn Road to ensure no erosion damage due to concentrated water flow through culverts in this area Request a bridge from the Millmerran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design in this area.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8.1 of the EIS Chapter 14: Flooding and Geomorphology and Section 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of the revised draft EIS, Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the revised draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.2a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk (Section 22.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised reference design.</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures will be reviewed and confirmed during Detailed Design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Figure 14-20a-e Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 7.5.3 Section 22.3 Appendix B</p>
201	201.0018	Private - Brookstead	Flooding	Modelling	Submitter highlights inaccuracies, bias, and poor calibration in relation to the flood modelling. Further detail on page 17-18 of submission.	Submitter states that they really do not know what the suggested solution is for Pampas, and the reality is that they will not know the impacts until the first major flood events. Submitter highlights that this is the frightening reality for residents in the concentrated region of housing on the Condamine floodplain. The state of the flood model gives little confidence in assessing the likely impacts as it currently under-predicts and has spatial bias around key receptors in the Pampas locality. The predicted changes in flood height for both agricultural land and residential properties is unacceptable and violates the flood impact objectives in the draft EIS. The submitter implores the CG to direct technical flood experts to genuinely work with the community of affected landowners in Pampas to devise an acceptable design solution in this area.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Sections 7.2 and 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 7.2 Section 7.2.3 Section 7.3</p>
201	201.0019	Private - Brookstead	Flooding	Mitigation measures	Submitter highlights concerns with respect to flood impacts in Pampas region and states that the draft EIS does not address alternative rail design that may mitigate these flood impacts; violating TOR 11.68, 11.69, 11.142 as it ignores the potential risks to people and property, that may be associated with the Project from flooding deeming the design as an acceptable risk. The submitter outlines 6 key reasons of concerns regarding flood impacts in Pampas region, refer to page 19-20 of the submission.	Submitter states that they really do not know what the suggested solution is for Pampas, and the reality is that they will not know the impacts until the first major flood events. Submitter highlights that this is the frightening reality for residents in the concentrated region of housing on the Condamine floodplain. The state of the flood model gives little confidence in assessing the likely impacts as it currently under-predicts and has spatial bias around key receptors in the Pampas locality. The predicted changes in flood height for both agricultural land and residential properties is unacceptable and violates the flood impact objectives in the draft EIS. The submitter implores the CG to direct technical flood experts to genuinely work with the community of affected landowners in Pampas to devise an acceptable design solution in this area.	<p>Operational flood impacts in the Condamine River floodplain have been described in Section 14.8.1 of the revised draft EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Sections 7.2 and 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Section 14.5 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.5 Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.2 Section 7.2.3 Section 7.3 Section 7.5.3</p>
201	201.0020	Private - Brookstead	Flooding		The submitter highlights that the work of the Independent Panel of Expert for flood studies directly relates to the draft EIS, specifically the Condamine River floodplain Section of the proposed B-G route: Therefore, the submitter states the CG should invite ARTC to withdraw the draft EIS, ensuring the Panels advice and best practice for design of waterway structures in a floodplain environment is incorporated into the draft EIS for the CG and stakeholders to consider and comment. The submitter requests the CG to commit to awaiting the release of the Panels advice before making a determination on the draft EIS, and prior to doing so invite stakeholders to comment on the Panel's findings.	<p>The submitter requests that the CG insist that the flood impact objectives listed in Table 12.8 be changed to specify:</p> <p>a. no flood height increases be allowed on sensitive housing and infrastructure receptors on the Condamine flood plain as it is felt that an allowance of an increase in 10 mm is an unacceptable objective given the uncertainty and inaccuracies around flood model for such a complex flood plain system.</p> <p>b. no increase in flood height be allowed due to rail design on agricultural cropping land. The submitter requests that the CG review the flood impact objectives in Table 12.8 and insist on no change in a. duration of flood inundation time, b. flood flow distribution and c. velocity.</p> <p>Submitter further highlights that there is no specific criteria around changes in these flooding parameters, as ARTC only need to justify acceptability of these changes. The submitter proposes that no change is acceptable under sound environmental management and in relation to TOR 6.2, 11.69, 11.142 (a)(ii).</p> <p>Submitter requests that the flood impact objectives must include a requirement to adhere to best management practices for agricultural farming systems and soil conservation on the Condamine flood plain. To simply adhere to best management practices for rail and bridge design and hydrology and hydraulic practices in total isolation and disconnect from best management practices on the environmental system on which the rail structure is built is unacceptable and ineffective and contravenes TOR 6.2. This disconnect cannot result in acceptable assessment of environment impacts. The submitter requests that the Coordinator-General reject the application of flood model outputs presented in the EIS as unacceptable. The Floodplain residents request to work with the international panel of experts to interpret the flood impact assessment and modify rail design to produce an acceptable environment outcome-that is, nil change to flooding risk.</p>	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
202	202.0001	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC's approach to community engagement and communication has been the opposite of informative, collaborative and transparent, highlighting shortcomings of ARTC to demonstrate the expected behaviours and communication principles depicted in Appendix C – Section 2.5, Figure 2.1. Additionally ARTC provides no acknowledgement or rationale for the omission of the empower principle (depicted in Figure 2.1), displaying another example of a lack of transparency and accountability in their public communication, consultation and engagement process. 	<ul style="list-style-type: none"> Submitter requests for the Coordinator-General remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of Inland Rail. The community consultation process needs to be undertaken by an independent facilitator who oversees the consultation to ensure a fair process where community concerns are 'heard, acknowledged, considered' and the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Section 2.5, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS (Chapter 23, Table 23.5), which does not provide an opportunity for impacted community members and landowners to adequately respond to the EIS as there is not sufficient information on road and rail design. The Social Impact survey presented in Appendix U must be undertaken again to provide valid representation on community views and responses. A stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on the success (or lack thereof) of ARTCs stakeholder engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact (Chapter 23, Table 23.5). 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p> <p>There has been ongoing engagement with the communities, businesses and local road users along the alignment during the development of the revised draft EIS, and changes to the reference design have been made in response to stakeholder input and feedback. Details of traffic and transport consultation outcomes are in Appendix E: Consultation Report, Section 5.5.</p> <p>The reference design is an iterative process, and stakeholder engagement is ongoing. As noted in Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 5.5</p> <p>Section 6</p>
202	202.0002	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. Submitter disputes the claims of ARTC managing social impacts in Section 8.2.3 – Partnership and Agreements in Appendix U (Table 8-5); are concerned that ARTC claims and responsibilities to undertake further stakeholder engagement (Section 8.2.5) with affected landowners through the detailed design phase and ongoing stakeholder engagement. 	<ul style="list-style-type: none"> Submitter requests for the Coordinator-General remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of Inland Rail. The community consultation process needs to be undertaken by an independent facilitator who oversees the consultation to ensure a fair process where community concerns are 'heard, acknowledged, considered' and the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Section 2.5, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS (Chapter 23, Table 23.5), which does not provide an opportunity for impacted community members and landowners to adequately respond to the EIS as there is not sufficient information on road and rail design. The Social Impact survey presented in Appendix U must be undertaken again to provide valid representation on community views and responses. A stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on the success (or lack thereof) of ARTCs stakeholder engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact (Chapter 23, Table 23.5). 	<p>ARTC provided written notes of meetings to attendees when requested at the time of the meeting. ARTC acknowledges that multiple Project representatives did attend some meetings; however, meeting attendees were selected for their knowledge on specialised issues to be discussed at a meeting (e.g. design, hydrology, property).</p> <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>An independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>As detailed in Appendix E: Consultation Report, Section 5.5, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road design refinements.</p> <p>ARTC notes that the community survey was only one element of the community engagement carried out to inform the SIA. Other elements are described in Appendix E: Consultation Report, Section 5.11, including a program of quarterly community surveys to gather feedback on communications and interactions.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 5.5</p> <p>Section 5.11</p>
202	202.0003	Private - Brookstead	Stakeholder engagement		<p>ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.</p>	<ul style="list-style-type: none"> Submitter requests for the Coordinator-General remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of Inland Rail. The community consultation process needs to be undertaken by an independent facilitator who oversees the consultation to ensure a fair process where community concerns are 'heard, acknowledged, considered' and the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Section 2.5, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS (Chapter 23, Table 23.5), which does not provide an opportunity for impacted community members and landowners to adequately respond to the EIS as there is not sufficient information on road and rail design. The Social Impact survey presented in Appendix U must be undertaken again to provide valid representation on community views and responses. A stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on the success (or lack thereof) of ARTCs stakeholder engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact (Chapter 23, Table 23.5). 	<p>Appendix E: Consultation Report, Section 5.3 details the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>Community engagement has influenced the development of the reference design. The Condamine floodplain crossing design has been updated to incorporate community feedback. Key design elements include:</p> <ul style="list-style-type: none"> building four bridges (6.2 km total bridge length) constructing approximately 600 reinforced concrete culvert cells (900 mm–2.1 m in diameter) at 83 locations extending the proposed bridge over the North Branch by approximately 250 m north moving the proposed Yandilla rail bridge further south and combining with the proposed Grasstree Creek bridge increasing the number of proposed culverts near the Yandilla grain silos to ensure the drainage channel to the south of the silos has enough culverts to convey flood water one-on-one consultation to discuss mitigation measures with landowners for impacted properties. <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>It further notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>As detailed in Appendix E: Consultation Report, Section 5.5, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road design.</p> <p>ARTC notes that the community survey was only one element of the community engagement carried out to inform the SIA. Other elements are described in Appendix E: Consultation Report, Section 5.11, including a program of quarterly community surveys to gather feedback on communications and interactions.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 5.5</p> <p>Section 5.11</p>
202	202.0004	Private - Brookstead	Stakeholder engagement		<p>ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p>	<ul style="list-style-type: none"> Submitter requests for the Coordinator-General remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of Inland Rail. The community consultation process needs to be undertaken by an independent facilitator who oversees the consultation to ensure a fair process where community concerns are 'heard, acknowledged, considered' and the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Section 2.5, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS (Chapter 23, Table 23.5), which does not provide an opportunity for impacted community members and landowners to adequately respond to the EIS as there is not sufficient information on road and rail design. The Social Impact survey presented in Appendix U must be undertaken again to provide valid representation on community views and responses. A stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on the success (or lack thereof) of ARTCs stakeholder engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact (Chapter 23, Table 23.5). 	<p>ARTC notes that this submission refers to a community engagement event held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016)and was managed by the Federal Department of Infrastructure and Regional Development.</p> <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>It further notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>As detailed in Appendix E: Consultation Report, Section 5.5 of the Stakeholder Engagement Report in the revised draft EIS, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road design.</p> <p>ARTC notes that the community survey was only one element of the community engagement carried out to inform the SIA. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
202	202.0005	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. A stakeholder satisfaction survey has not been undertaken, there is zero evidence to substantiate the claims surrounding the effectiveness or results of stakeholder engagement made in the EIS. Submitter states that this has been a deliberate omission and that this two-way feedback must be an essential component of the EIS there is also no accountability on behalf of ARTC to evaluate their own effectiveness in engagement, specifically with impacted landowners and this inability to address and detail the results of the implementation directly contravenes ToR 7.9. 	<ul style="list-style-type: none"> Submitter requests for the Coordinator-General remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of Inland Rail. The community consultation process needs to be undertaken by an independent facilitator who oversees the consultation to ensure a fair process where community concerns are heard, acknowledged, considered and the community is truly empowered in influencing the best possible outcome in their region of influence, according to the terms of reference for communication (Section 2.5, Figure 2.1). The consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS (Chapter 23, Table 23.5), which does not provide an opportunity for impacted community members and landowners to adequately respond to the EIS as there is not sufficient information on road and rail design. The Social Impact survey presented in Appendix U must be undertaken again to provide valid representation on community views and responses. A stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on the success (or lack thereof) of ARTCs stakeholder engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact (Chapter 23, Table 23.5). 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p> <p>There has been ongoing engagement with the communities, businesses and local road users along the alignment during the development of the revised draft EIS, and changes to the reference design have been made in response to stakeholder input and feedback. Details of traffic and transport consultation outcomes are in Appendix E: Consultation Report, Section 5.5.</p> <p>The reference design is an iterative process, and stakeholder engagement is ongoing. As noted in Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 5.5</p> <p>Section 6</p>
202	202.0006	Private - Brookstead	Flooding	Modelling	Issues raised with respect to flood modelling and hydrology which have not been fully resolved and validated. Submitter highlights that the EIS is incomplete as it does not consider: The ongoing investigation by the Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail project by ARTC and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021The ongoing assessment of the Independent Panel of Experts for Flood Studies, which states it expected to complete their work by the end of 2021	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 7.6</p>
202	202.0007	Private - Brookstead	Flooding - Condamine River	Modelling	Concerns raised with respect to the complexity and limitations of modelling the Condamine floodplain with sparse data: The flood model is calibrated on only two flood events (1991 and 2010) and it is to be questioned whether this is sufficient data to build a model for the complex nature of the Condamine floodplain. Both flood events of 1991 and 2010 fall below a 1 in 100 event, equal to an annual exceedance probability (AEP) of 1%. The 2010 flood event is shown as being a 1 in 20 year flood (5% AEP) at the Warwick gauge station, between a 1 in 20 year and a 1 in 50 year flood at the Tummaville gauge station (2-5% AEP) and between a 1-2%AEP at the Cecil Plain Weir. Therefore, predictions for the 2010 flood and allowances for these water heights do not meet the 1 in 100 event requirements for rail design. The model is limited, as the accuracy has not been assessed against a known even of this magnitude. Refer to submission, page 11 for further technical detail.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data and are utilised to determine the robustness of the flood model to predict flood impacts for design events. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Sections 7.2 and 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.2</p> <p>Section 7.2.3</p> <p>Section 7.3</p> <p>Section 7.6</p>
202	202.0008	Private - Brookstead	Flooding - Condamine River	Modelling	Issues raised with modelling the complexity of modelling the Condamine system. Concerns raised with respect to the data inputs for model calibration are not being used from Tummaville station. Submitter highlights understanding of the unreliability of this gauge station, but also understand the changes in the system between Warwick and Tummaville, and the associated tributaries that enter the system between these two gauging stations. Submitter questions, the importance of the discrepancy in the results in Table 9.15 and Table 9.16 (Appendix Q1), showing the differences between the flood frequency analysis and URBS model flows. Submitter states that surely the URBS model flows in Table 9.16 are a gross under-prediction of the flood frequency analysis peak discharges and requests that these results be more clearly explained and presented in the EIS document.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>URBS results were reconciled against Flood Frequency Analysis at an upstream pivot (Warwick) and a downstream pivot (Cecil Weir + Lone Pine, i.e. 'Outlet'). The match between URBS and FFA flows is not as strong at the 'outlet' compared to that at Warwick and is a result of the URBS model being insufficient for capturing the full floodplain behaviours (e.g. braided channels and large storage) downstream of Warwick, which must be resolved hydraulically. To clarify these uncertainties, in consultation with the Expert Flood Panel, the Condamine River hydraulic model has been extended past the Cecil Weir gauge to enable a joint calibration/validation with the URBS model for four well-recorded historical events (1991, 2010, 2013, 2021) (Section 7, Appendix T1: Hydrology and Flooding Technical Report - Volume 1). The joint calibration/validation found that the differences between modelled and recorded flood levels at Cecil Weir were between +60 mm (+0.6% difference in depth) and +250 mm (3.4% difference in depth) respectively. The current design hydrology and flood modelling approach are considered suitably robust and conservative for the purposes of the revised draft EIS.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 7</p>
202	202.0009	Private - Brookstead	Flooding	Modelling	Concerns raised with respect to the validation of the flood model Submitter highlights that with respect to the floodmarks, summarized in Table 9.28, that the validation exercise has eroded trust and credibility in the flood model, rather than increased confidence in the model as claimed in the draft EIS. Refer to page 13-14 for further technical detail.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>2010 floodmark validation has been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Updated floodmark validation results can be found in Table 7.31 of Section 7.3.7 in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 7.3.7</p> <p>Section 7.6</p> <p>Table 7.31</p>
202	202.0010	Private - Brookstead	Flooding	Modelling	Submitter highlights that ARTC representatives supplied misinformation to the Senate committee, demonstrating a lack of consultation within ARTC from the ground up as well as its dismissal of documentary flood evidence and concerns about the flood model convey to them by affected landowners.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 7.6</p>
202	202.0011	Private - Brookstead	Flooding	Modelling	Local floodplain residents have been attempting to work with ARTC for over three years around the accuracy of the flood model and the height and extent of water in the 2010 flood event. Additionally, request for further detail around the flood model has not been forthcoming to address concerns. The local floodplain residents have been continually assured that the flood model is 'fit for purpose however the residents are still very uncertain about its accuracy, validity and ability to predict future events. There has been little communication about modelled results on properties and increased flood impacts due to the IR rail design.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>Operational flood impacts in the Condamine River floodplain have been described in Section 14.8.1 of the revised draft EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Community and stakeholder consultation focused on flooding has been undertaken at key milestones since the early design development stages, in alignment with ARTC's Flood Study Engagement Framework (ARTC, 2020c). Community consultation was completed in the early stages of the Project through 2018 to 2020. Further consultation with potentially impacted landowners, accounting for revised impacts, was undertaken in October 2022, prior to the second public release of the EIS for consultation. This consultation process is documented in Section 14.5 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.5</p> <p>Section 14.8.1</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.5.3</p>
202	202.0012	Private - Brookstead	Flooding		ARTCs history of rail design failures where flood plains are involved, gives significant cause for concern. Examples cited from South Australia and Moreton Bay. Further technical detail provided on page 16 of submission.	Draft EIS document be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. Any further development and consultation regarding the flood model and flooding impacts be undertaken by an independent panel and not be undertaken by ARTC or FFJC, as the engineers for ARTC.	<p>The flood modelling methodology that has been followed is consistent with Australian guidelines and best practice, and outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Sections 7.2 and 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.2</p> <p>Section 7.2.3</p> <p>Section 7.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
202	202.0013	Private - Brookstead	Flooding		Local landowners are extremely concerned about potential dangers to lives, homes, rural infrastructure and prime agricultural land, the unique and highly fertile black cracking clay (vertosol) soil resource and agricultural enterprises due to an unacceptable flood risk imposed by the IR design. Concerns raised with respect to the current design, that it will result in both short-term and long-term impacts that are irreversible, due to changed water flow and velocity resulting from the proposed rail design. These changes directly contravene the mandatory ToR of 6.2 as the EIS does not acknowledge that these flooding impacts are likely to be irreversible. Refer to page 18 for further details about flooding impact concerns.	The Condamine Main Branch Bridge be extended 400 m to the South to join the Condamine South Branch Bridge The Condamine South Branch Bridge be extended to Millmerran-Leyburn Road to ensure no erosion damage to concentrated water flow through culverts in this area. The submitter requests a bridge from the Millmerran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design in this area.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for water flow velocities. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3</p> <p>Section 14.11 Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 4.2 Section 5-17</p>
202	202.0014	Private - Brookstead	Flooding		Submitter highlights that the inundation maps from Appendix Q2 at this location show unacceptable increased heights from minor to major flood events around the proposed rail structure. Refer to page 19 of submission for more detail. The impact of the rail design from Millmerran-Leyburn road to the Condamine River for more extreme events results in alarming increases in flood height of up to 0.5 m and, the submitter states that this flood impact is totally unacceptable The draft EIS does not address alternative rail design that may mitigate these flood impacts, and this violates ToR 11.68, 11.69, 11.142 as it ignores avoidance of the potential risks to people and property that may be associated with the project from flooding. Submitter disagrees with the assumptions made in Chapter 12 (P 12-166) of the draft EIS that the change in peak water levels due to design are acceptable. From this statement the submitter states that it is obvious that the impacts of the rail design result in unacceptable changes that violate the flood-impact objectives, and that this failure to meet design objectives is happening at critical flood receptors, as well as across areas of agricultural land. Submitter highlights a second major concern that the series of culverts (and bridge pylons) will increase the flow volumes and water velocity when water is channelled under and around these structures, increasing the erosion risk and causing long-term and irreversible damage to the farming system and soils (see ToR 6.2). Submitter highlights that long-term and irreversible environment impacts associated with this obstruction to the natural water flow in flood events is unacceptable. The current design must be further modified to remove the obstruction and inadequate drainage resulting from the use of culverts in the design.	The Condamine Main Branch Bridge be extended 400 m to the South to join the Condamine South Branch Bridge The Condamine South Branch Bridge be extended to Millmerran-Leyburn Road to ensure no erosion damage to concentrated water flow through culverts in this area. The submitter requests a bridge from the Millmerran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design in this area.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Hydrology and Flooding of the revised draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8.1 of the EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3</p> <p>Section 14.8.1 Table 14-4 Figure 14.20a-e</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 7.5.3</p>
202	202.0015	Private - Brookstead	Flooding		Submitter raises concern regarding increased risk of Soil Erosion with irreparable and irreversible Impacts. Local landowners have tried to collaborate with ARTC and FFJV on numerous occasions to discuss the consequences of erosion both adjacent to and downstream from the proposed rail design, due to increased velocity by impeding water flow across an 18 km floodplain to a cross-sectional area of 7.5 km of bridging and culverts, under an elevated wall of up to 3 m high. Refer to pages 20-22 for further information.	The Condamine Main Branch Bridge be extended 400 m to the South to join the Condamine South Branch Bridge The Condamine South Branch Bridge be extended to Millmerran-Leyburn Road to ensure no erosion damage to concentrated water flow through culverts in this area. The submitter requests a bridge from the Millmerran-Leyburn Road to the Condamine River, with no sections of culverts in the drainage design in this area.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8.1 of Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk.</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design (Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised Reference Design.</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures will be reviewed and confirmed during Detailed Design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available (Section 22.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3</p> <p>Section 14.8.1 Table 14-4 Figure 14-20a-e</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 4.2 Section 7.5.3 Section 22.4 Appendix B</p>
202	202.0016	Private - Brookstead	Flooding		The submitter raises concerns with the flood impact objectives and disputes EIS claims around rail design. The Submitter questions the flood impact objectives and proposes that it is not acceptable for an increase of 200 to 400 mm over agricultural cropping land due to rail design. Refer to pages 21-22 of submission for further details.	nil.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for land, with further FIO requirements that relate to land usage, impacted area, etc. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 of Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p> <p>Further design refinement, mitigation, and consultation will continue through the Detailed Design stage of the Project.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3</p> <p>Section 14.11</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 4.2 Section 5-17</p>
202	202.0017	Private - Brookstead	Flooding		The submitter highlights that the work of the Independent Panel of Expert for flood studies directly relates to the draft EIS, specifically the Condamine River floodplain Section of the proposed B-G route. Therefore, the submitter states the CG should invite ARTC to withdraw the draft EIS, ensuring the Panels advice and best practice for design of waterway structures in a floodplain environment is incorporated into the draft EIS for the CG and stakeholders to consider and comment. The submitter requests the CG to commit to awaiting the release of the Panels advice before making a determination on the draft EIS, and prior to doing so invite stakeholders to comment on the Panel's findings. The submitter further requests that the CG insist that the flood impact objectives listed in Table 12.8 be changed as per indication in point 1. on page 23 of the submission. The submitter further requests that the CG review the flood impact objectives in Table 12.8 and insist no change as per indication in point 2. on page 23 of the submission. The submitter proposes that no change is acceptable under sound environmental management and in relation to ToR 6.2, 11.69, 11.142 (a) (ii)The submitter requests that the flood impact objectives must include a requirement to adhere to best management practices for agricultural farming systems and soil conservation on the Condamine flood plain. Refer to further detail provided on page 24 of submission. The submitter requests that the CG reject the application of flood model outputs presented in the EIS as unacceptable. Refer to further detail provide on page 24 of submission.	nil.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted FIOs to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS. ARTC has incorporated the revised quantitative Flood Impact Objectives (FIOs) developed in consultation with Expert Flood Panel, into the revised draft EIS impact assessment. The FIOs have been applied to Flood Sensitive Receptors, State-Controlled Roads, Local Public Roads, Existing Rail Infrastructure and Private Property. Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.10.1</p> <p>Table 14-117</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 5-17</p>
202	202.0018	Private - Brookstead	Flooding	Modelling	The submitter raises concerns with respect to the flood modelling and climate change impacts, stating that the rail design fails to meet flood impact objectives for seasonal variations and the likely impact of climate change into the near future, where these extreme events will be of greater intensity and occur at more frequent intervals. The submitter highlights that whilst the EIS addresses the flood immunity of the current rail design, it makes no consideration of the impacts on agricultural land, or detailed assessment of sensitive flood receptors under this climate change scenario and this is a failure to meet the mandatory requirements of ToR 6.2 and 6.3, as well as ToR 11.48 and 11.54	nil.	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Climate change and the selected Representative Concentration Pathway are discussed throughout Chapter 14: Flooding and Geomorphology and Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS (within the climate change assessment of each catchment area in Sections 5 to 17). For the avoidance of doubt the RCP 8.5 (2090 horizon) climate change scenario has been adopted for the Project.</p>	<p>Chapter 14: Flooding and Geomorphology Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Sections 5 - 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
202	202.0019	Private - Brookstead	Flooding	Modelling	<p>Submitter states that the draft EIS fails to address uncertainty in the hydrologic and hydraulic models presented, and that results are presented in a deterministic way. Submitter states that given the complex nature of the Condamine flood plain system and the associated difficulties in flood modelling, it is imperative that a full analysis of uncertainty surrounding the predicted peak heights, flow velocities and inundation times are assessed. The submitter highlights that these omissions in the current draft of the EIS document violate the mandatory requirements of ToR 6.3.</p>	<p>Draft EIS submitted by ARTC should be rejected on the grounds that: It does not comply with the Terms of Reference set by the Coordinator-General on 16 November 2018. The draft EIS is incomplete due to the omission of an assessment of uncertainty surrounding the flood model outputs including predictions of peak height, flow velocity and inundation time for flood events. The draft EIS also fails to address the detail of the flood impact on the Condamine floodplain as indicated in Table 23.5. The flood impact on the Condamine floodplain cannot be determined until the details of the project footprint, level crossing design, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As with all of our prior interactions with ARTC, the detail is scant and is 'not yet available.</p>	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the reference design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River and Back Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Chapter 14: Flooding and Geomorphology Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 7.6</p> <p>Section 8.6</p>
203	203.0001	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility, and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', which has been the opposite of informative, collaborative and transparent. The social Impact of the poor communication and engagement process on ARTC's behalf has been negative; leading to increased anxiety frustration and mistrust, as information provided by ARTC has consistently been lacking detail, contradictory in nature or not forthcoming. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach 	<ul style="list-style-type: none"> The shortcomings of ARTC's communication and engagement process, as well as their consultation program with impacted landowners be addressed before it would even be possible for ARTC to address the subsequent (and significant) issues within their impact assessment process. Given the failure of past stakeholder engagement and the subsequent damage to affected communities caused by ARTC's approach, the submitter request's that the CG remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of inland rail. Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence of ARTC's stakeholder Engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC notes that this submission refers to a community engagement event held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016)and was managed by the Federal Department of Infrastructure and Regional Development.</p> <p>As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>It further notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road design.</p> <p>Consultation in Brookstead: ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead.</p> <p>Consultation in Pampas: ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing.</p> <p>Subsequent to the submission of the draft EIS, ARTC has implemented a program of quarterly community surveys to gather feedback on communications and interactions. An addition survey Living in Place was conducted in 2022 to inform the Social Impact Assessment.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Appendix E: Consultation Report</p> <p>Section 2</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
203	203.0002	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> There has been no documentation of meetings, limited to no follow-up undertaken on any requested action items and a paucity of communication about the influence public opinion has had on project development. The failure to provide accurate information to the affected community, combined with the organization representatives' lack of effective interpersonal and communication skills when interacting with vulnerable community members, has created a power and authority imbalance, which is disempowering to the local community. 	<ul style="list-style-type: none"> The shortcomings of ARTC's communication and engagement process, as well as their consultation program with impacted landowners be addressed before it would even be possible for ARTC to address the subsequent (and significant) issues within their impact assessment process. Given the failure of past stakeholder engagement and the subsequent damage to affected communities caused by ARTC's approach, the submitter request's that the CG remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of inland rail. Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence of ARTC's stakeholder Engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC notes that this submission refers to a community engagement event held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016)and was managed by the Federal Department of Infrastructure and Regional Development.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. An addition survey Living in Place was conducted in 2022 to inform the Social Impact Assessment.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
203	203.0003	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC have fallen short at demonstrating the expected behaviours and communication principles outlined within the four steps of inform, consult, involve and collaborate, in the engagement process (depicted in Figure 2.1) whilst not providing any rationale for omitting the empower step from their public consultation approach. The EIS provides much documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board, what the action items are and whether/how these have been addressed and how the outcome assessment of how action items have been addressed, including the quality of the work in addressing action items (as opposed to arbitrarily 'ticking the box'). As no stakeholder satisfaction survey has been undertaken, there is zero evidence to substantiate the claims surrounding the effectiveness or results of Stakeholder engagement made in the EIS. The submitter states this is a deliberate omission and that two-way feedback must be an essential component of the EIS document. The lack of outcome measurements not only means we have no data on how effective the stakeholder engagement process has been, but more importantly, that there is no accountability on the behalf of ARTC to evaluate their own effectiveness in engagement, specifically with impacted landowners. This inability to address and detail the results of the implementation directly contravenes TOR 7.9 	<ul style="list-style-type: none"> The shortcomings of ARTC's communication and engagement process, as well as their consultation program with impacted landowners be addressed before it would even be possible for ARTC to address the subsequent (and significant) issues within their impact assessment process. Given the failure of past stakeholder engagement and the subsequent damage to affected communities caused by ARTC's approach, the submitter request's that the CG remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of inland rail. Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence of ARTC's stakeholder Engagement process. The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC notes that this submission refers to a community engagement event held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016)and was managed by the Federal Department of Infrastructure and Regional Development.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>It further notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road design.</p> <p>Consultation in Brookstead: ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead.</p> <p>Consultation in Pampas: ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing.</p> <p>Subsequent to the submission of the draft EIS, ARTC has implemented a program of quarterly community surveys to gather feedback on communications and interactions. An addition survey Living in Place was conducted in 2022 to inform the Social Impact Assessment.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 6.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
203	203.0004	Private - Brookstead	Stakeholder engagement		The submitter states their concerns around ARTC claims and responsibilities to undertake further stakeholder engagement with affected landowners through the detailed design phase and ongoing stakeholder engagement.	<ul style="list-style-type: none"> ▶ The shortcomings of ARTC's communication and engagement process, as well as their consultation program with impacted landowners be addressed before it would even be possible for ARTC to address the subsequent (and significant) issues within their impact assessment process. ▶ Given the failure of past stakeholder engagement and the subsequent damage to affected communities caused by ARTC's approach, the submitter request's that the CG remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of inland rail. ▶ Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. ▶ Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. ▶ Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. ▶ Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence of ARTC's stakeholder Engagement process. ▶ The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p> <p>There has been ongoing engagement with the communities, businesses and local road users along the alignment during the development of the revised draft EIS, and changes to the reference design have been made in response to stakeholder input and feedback. Details of traffic and transport consultation outcomes are in Appendix E: Consultation Report, Section 5.5.</p> <p>The reference design is an iterative process, and stakeholder engagement is ongoing. Chapter 24: Draft Outline Environmental Management Plan, an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.3</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 5.5</p> <p>Section 6</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
203	203.0005	Private - Brookstead	Stakeholder engagement		ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.	<ul style="list-style-type: none"> ▶ The shortcomings of ARTC's communication and engagement process, as well as their consultation program with impacted landowners be addressed before it would even be possible for ARTC to address the subsequent (and significant) issues within their impact assessment process. ▶ Given the failure of past stakeholder engagement and the subsequent damage to affected communities caused by ARTC's approach, the submitter request's that the CG remove the responsibility from ARTC for ongoing stakeholder engagement through the detailed design process and the operation phase of inland rail. ▶ Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. ▶ Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. ▶ Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. ▶ Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence of ARTC's stakeholder Engagement process. ▶ The EIS should be rejected based on the incomplete and inconclusive nature of information that stakeholders need to effectively comment on the environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC notes that this submission refers to a community engagement event held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016)and was managed by the Federal Department of Infrastructure and Regional Development.</p> <p>As detailed in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required.</p> <p>It further notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks.</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road design.</p> <p>Consultation in Brookstead: ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead.</p> <p>Consultation in Pampas: ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. 204	204.0004	Private - Brookstead	Social Impact Assessment	Property Devaluation	<ul style="list-style-type: none"> ▶ Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. ▶ Families with young children living on the northern side of the town will be impacted by real estate devaluation. 	Review the entire alignment, this route is not suitable.	The EIS is required to assess the Project alignment as detailed throughout the revised draft EIS Chapter 5: Project Description.	Chapter 5: Project Description
204	204.0004	Private - Brookstead	Social Impact Assessment	Property Devaluation	<ul style="list-style-type: none"> ▶ Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. ▶ Families with young children living on the northern side of the town will be impacted by real estate devaluation. 	Review the entire alignment, this route is not suitable.	The EIS is required to assess the Project alignment as detailed throughout the revised draft EIS Chapter 5: Project Description.	Chapter 5: Project Description
204	204.0005	Private - Brookstead	Stakeholder engagement		ARTC have failed to engage with residents and inform them of the impacts of the train noise and vibration.	<p>The true noise and vibration impact on the community cannot be determined until all details of the Project footprint have been completed. ARTC provide scant details that fail to identify the true impact this Project will have on urban areas like Pittsworth.</p>	<p>Stakeholder engagement regarding noise and vibration is ongoing as ARTC continues to progress noise modelling, noise impact assessments and baseline monitoring as part of developing the revised draft EIS and design for the Project.</p> <p>In October 2019, ARTC held targeted engagement across the alignment on the draft reference design which included noise impacts of the Project. The engagement campaign delivered nine community information sessions attended by 193 stakeholders, individualised letters and phone calls to all identified sensitive receptors, a factsheet and an eNews story. The Project has also presented at both the IDDCCC and SDDCCCs regarding noise, responding to all questions from the floor.</p> <p>Updated noise modelling has been undertaken as part of the updates for the revised draft EIS. This updated modelling will be supported by an engagement plan delivered in mid-2023 and will include the delivery of updated noise modelling information to all sensitive receptors, interactive online noise map (hosted on ARTC Inland Rail's website) which allows landowners surrounding the Project to understand potential noise impact levels, one on one meetings with sensitive receptors as required.</p> <p>This engagement will enable stakeholders to better understand the noise levels at their specific location, and ask questions about mitigation measures which will be further developed during detailed design.</p> <p>A summary of these tools is detailed in Appendix E: Consultation Report, Section 5.6. ARTC will continue to develop and refine the construction methodology to minimise noise and vibration impacts to sensitive receptors. The results of refined construction noise and vibration modelling will be communicated to potentially affected residents and occupants (sensitive receptors) where noise criteria is exceeded.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.6</p>
205	205.0000	205.0008	Private - Brookstead	Noise and Vibration	Lack of detail and certainty in the mitigation options and activities in Section 23.4.9.2 which demonstrates that the detail around noise mitigation has not been developed. The lack of detail and project planning does not sufficiently address criteria 11.124 and 11.125 in the ToR.	<p>The draft EIS submitted by the proponent should be rejected on the grounds that: Noncompliance with TOR set by CG 16.11.2018 The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design stage. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. If this project is to proceed, there must be a night time curfew put in place to protect communities from sleep disturbance and also to mitigate risk around house and land devaluation and property development.</p>	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>The revised draft EIS provides new and updated predictions of worst-case noise levels associated with the construction and operation of the Project based on the current designs and expected activities. The assessments are comprehensive and assess impacts for individual receptors within an area substantially larger than normally applied on transport infrastructure Projects, which usually only consider an area large enough to capture the closest receptors. The details of all predictions is provided in the technical reports accompanying the EIS; Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Appendix W: Noise and Vibration Assessment – Railway Operations.</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>Noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration, Section 7 of Appendix V: Noise and Vibration Assessment – Construction and Road Traffic, and Section 16 of Appendix W: Noise and Vibration Assessment – Railway Operations. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined and other mitigation solutions developed during detailed design.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment – Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment – Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 16</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
205	205.0001	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. •ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4 and 6.2.5. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.1.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. <p>ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Border to Gowrie design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.4</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 7</p>
205	205.0002	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kaganu Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
205	205.0005	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and, as such, the draft EIS is incomplete according to TOR Condition 11.140.	<ul style="list-style-type: none"> The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. The true social impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 8</p> <p>Section 8.5.6</p>
205	205.0006	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'. If this project is to proceed, there must be a night time curfew put in place to protect communities from sleep disturbance and also to mitigate risk around house and land devaluation and property development.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>
206	206.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents due to the on-going noise and vibration from the rolling stock combined with additional signals from alarm bells and train horns, resulting in daytime disruptions and night-time sleep disturbance. The height of structures over the Oakley to Pittsworth Road and Lochaber Road will mean that Operational Noise will be disturbingly audible to more residents than have been identified in the Noise Abatement Section of the EIS Appendix T 15.4.4. The 5 laybys of varying area to be located in close proximity to the township, will result in considerable machinery movements, another source of noise and dust and a potential impediment to the movement of local traffic. Vibration of a train of the length and tonnage has not been quantified. Vibration and noise that will affect the entire town population, during the driving of piles to the required depth.	Review the entire alignment, this route is not suitable. The true noise and vibration impact on the community cannot be determined until all details of the project footprint have been completed. ARTC provide scant details that fail to identify the true impact this project will have on urban areas like Pittsworth.	<p>ARTC acknowledge the concerns of the Pittsworth community regarding the potential for noise and vibration to impact lifestyle and amenity during the Construction Works stage. As noted in the Strategic Options Assessment within Section 2.8 of Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to the community, stakeholders and properties. Regarding the proposed solution, the preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community.</p> <p>The construction noise and vibration impacts provided in the revised draft EIS are conservative predictions of unmitigated worst-case construction noise and vibration levels based on a preliminary construction methodology. Reasonable and practicable measures to minimise construction impacts will be implemented based on community consultation and a detailed assessment of construction noise and vibration impacts during the Detailed Design stage of the Project. Mitigation has been included in the revised draft EIS. Construction impacts are temporary in nature and will subside as construction activities progress away from the area.</p> <p>The noise assessment criteria, adopted from the DTMRs Codes of Practice, are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance. In accordance with DTMR's CoP Vol 2, reasonable and practical noise mitigation and management measures have been presented in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment – Railway Operations, Section 17.This includes examples of at-property noise treatments and noise barrier mitigation which includes measures specifically to reduce noise impacts at residential properties. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and Construction Works stages of the Project.</p> <p>ARTC acknowledges that active level crossings can be a source of railway noise, such as train horns and audible alarms signals. DTMR's Interim Guideline Operational Railway Noise and Vibration excludes level crossings from the noise assessments and mitigation of noise on the grounds they are safety warning devices that use sound as a critical function to maintain safety for road users and pedestrians. However, ARTC has assessed noise impacts from active level crossing and reported this separately in the revised draft EIS. The revised draft EIS discusses further noise mitigation measures, including options to control noise from alarm bells and train horns. See Section 16.8 and Section 16.10 within Chapter 16: Noise and Vibration, Railway Noise Assessment.</p> <p>Ground borne vibration is assessed in Appendix W: Noise and Vibration Assessment – Railway Operations, Section 11.It is identified that any receivers with 12 m from the alignment has potential to exceed the human comfort criteria. Further assessment of these impact is recommended during the Detailed Design stage to verify the screening assessment outcomes.</p> <p>ARTC acknowledges that during the EIS phase may have caused stress and anxiety for some stakeholders, due to concerns about property acquisitions, amenity impacts, property values or environmental changes including noise impacts. To minimise potential impacts to the community, in particular, community health and well-being, ARTC has partnered with various private health networks and other community organisations to provide additional and ongoing assistance. For specific details refer to the Project Social Impact Management Plan within Chapter 17: Social.</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 13</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
206	206.0004	Private - Brookstead	Social Impact Assessment	Property Devaluation	<ul style="list-style-type: none"> Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. Families with young children living on the northern side of the town will be impacted by real estate devaluation. 	Review the entire alignment, this route is not suitable.	The EIS is required to assess the Project alignment as detailed throughout the revised draft EIS Chapter 5: Project Description.	Chapter 5: Project Description
206	206.0005	Private - Brookstead	Stakeholder engagement		ARTC have failed to engage with residents and inform them of the impacts of the train noise and vibration	The true noise and vibration impact on the community cannot be determined until all details of the project footprint have been completed. ARTC provide scant details that fail to identify the true impact this project will have on urban areas like Pittsworth.	<p>ARTC acknowledges the concern from the community that some sensitive receptors were potentially missed during the initial stage of the noise and vibration modelling for the draft EIS. ARTC is now confident that all sensitive receptors have been identified for use in the revised draft EIS modelling. The revised draft EIS has been updated to address potential impacts from both construction and operational rail noise and vibration to sensitive receptors along the Border to Gowrie alignment. ARTC has used the latest building data aerial imagery to identify sensitive receptors within the revised draft EIS study area in accordance with the Department of Transport and Main Roads guidelines.</p> <p>Construction noise and vibration sensitive receptors (as defined by the Department of Transport and Main Roads Transport Noise Management Code of Practice Volume 2: Construction Noise and Vibration) have been identified based on a combination of property data and aerial imagery. No missing construction receptors near Brookstead and Pampas have been identified. More detail on the identification and categorisation of sensitive receptors is in revised draft EIS in Section 16.4 of Chapter 16: Noise and Vibration, Existing Noise Environment and in Section 5 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, Existing Noise Environment.</p> <p>Operational noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads Interim Guideline – Operational Railway Noise and Vibration (March 2019), with the results being presented in the revised draft EIS. Sensitive receptors and related land uses were identified in accordance with the Interim Guideline (2019). Refer to Section 16.4 of Chapter 16: Noise and Vibration, Existing Environment and Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations, Existing Environment.</p> <p>The revised draft EIS has identified the potential for sensitive receptors to be impacted from both construction and operational noise and vibration impacts in exceedance of the nominated criteria. During detailed design, further detailed engineering, and acoustic assessments, including noise modelling, will be undertaken and will consider sensitive receptors in the vicinity of the Project. Specific and reasonable mitigation measures will be developed and implemented following this detailed assessment.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Sections 16.4</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 5</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 5</p>
207	207.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	The inland rail route extends along the entire northern boundary of Pittsworth; it will severely impact on all residents due to the on-going noise and vibration from the rolling stock combined with additional signals from alarm bells and train horns, resulting in daytime disruptions and night-time sleep disturbance. The height of structures over the Oakey to Pittsworth Road and Lochaber Road will mean that Operational Noise will be disturbingly audible to more residents than have been identified in the Noise Abatement Section of the EIS Appendix T 15.4.4. The 5 laybys of varying area to be located in close proximity to the township, will result in considerable machinery movements, another source of noise and dust and a potential impediment to the movement of local traffic. Vibration of a train of the length and tonnage has not been quantified. Vibration and noise that will affect the entire town population, during the driving of piles to the required depth. 207	207.0004	Private - Brookstead	Social Impact Assessment	Property Devaluation	<ul style="list-style-type: none"> Due to retirees lifestyle and well-being impacted, their relocation to an aged-care facility will see the family home value for which they have relied on for future funding, dramatically reduced or unsaleable. Families with young children living on the northern side of the town will be impacted by real estate devaluation. 	Review the entire alignment, this route is not suitable.	The EIS is required to assess the Project alignment as detailed throughout the revised draft EIS Chapter 5: Project Description.	Chapter 5: Project Description
207	207.0005	Private - Brookstead	Stakeholder engagement		ARTC have failed to engage with residents and inform them of the impacts of the train noise and vibration.	The true noise and vibration impact on the community cannot be determined until all details of the project footprint have been completed. ARTC provide scant details that fail to identify the true impact this project will have on urban areas like Pittsworth.	<p>Stakeholder engagement regarding noise and vibration is ongoing as ARTC continues to progress noise modelling, noise impact assessments and baseline monitoring as part of developing the revised draft EIS and design for the Project.</p> <p>In October 2019, ARTC held targeted engagement across the alignment on the draft reference design which included noise impacts of the Project. The engagement campaign delivered nine community information sessions attended by 193 stakeholders, individualised letters and phone calls to all identified sensitive receptors, a factsheet and an ENews story. The Project has also presented at both the IDCCCC and SDOCCCs regarding noise, responding to all questions from the floor.</p> <p>Updated noise modelling has been undertaken as part of the updates for the revised draft EIS. This updated modelling will be supported by an engagement plan delivered in mid-2023 and will include the delivery of updated noise modelling information to all sensitive receptors, interactive online noise map (hosted on ARTC Inland Rail's website) which allows landowners surrounding the Project to understand potential noise impact levels, and one-on-one meetings with sensitive receptors as required.</p> <p>This engagement will enable stakeholders to better understand the noise levels at their specific location, and ask questions about mitigation measures which will be further developed during detailed design.</p> <p>A summary of these tools is detailed in Appendix E: Consultation Report, Section 5.6. As noted in Appendix T1: Hydrology and Flooding, ARTC will continue to develop and refine the construction methodology to minimise noise and vibration impacts to sensitive receptors. The results of refined construction noise and vibration modelling will be communicated to potentially affected residents and occupants (sensitive receptors) where noise criteria is exceeded.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5.6</p>
208	208.0001	Private - Brookstead	Noise and Vibration	Operational rail noise	Residences in Brookstead will suffer from daytime disruption and night-time sleep disturbance factors; Section 11.4 (from the rolling stock combined with additional signals from alarm bells and train horns). Chapter 14 states that there is potential for noise (from construction activities and/or project traffic) near the Brookstead, Southbrook and Yelarbon State Schools to impact on the learning environment of the schools. Lack of detailed information provided by the proponent surrounding the impacts of the train noise and vibration on the Brookstead community. Feasible alternatives for noise and vibration solutions to move the rail further from the residences in Brookstead has not been considered by the proponent and is in violation of Section 6.7 of the TOR.	The draft EIS submitted by the proponent should be rejected on the grounds that: Non-compliance with TOR set by CG 16.11.2018. The draft EIS is incomplete due to the omission of noise minimisation and/or mitigation measures that will not be developed until the detailed design phase. The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the community of Brookstead cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>ARTC acknowledges that the community has concerns regarding potential noise and vibration impacts to property, lifestyle and day-to-day activities during both Construction Works and Operations stages, and associated mitigation measures. The revised draft EIS has been updated to address potential impacts from both construction and operational noise and vibration to sensitive receptors, including schools along the Project alignment.</p> <p>Construction noise impacts have been modelled in accordance with the Department of Transport and Main Roads' Transport Noise Management Code of Practice: Volume 2 - Construction Noise and Vibration. Construction noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 7 of Appendix V: Noise and Vibration Assessment - Constructions and Road Traffic. The development and implementation of such measures will be subject to further review and assessment by the construction contractor.</p> <p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.The railway noise assessment (Section 16.8 of Chapter 16: Noise and Vibration) included a detailed calculation and prediction of noise levels at individual sensitive receptors, including residences and non-residential receivers such as the buildings and property at the Brookstead and Yelarbon State Schools. Potential sleep disturbance impacts have also been assessed using a criteria based on the Australian Government's Department of Health publication, The Health Effects of Environmental Noise, 2018 ('enHEALTH 2018'), further discussed in Section 11 of Appendix W: Noise and Vibration Assessment - Railway Operations.</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment - Railway Operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. All noise mitigation will be in place prior to the commencement of Inland Rail operations. Mitigation measures were identified as potentially being required for two buildings at Brookstead State School. The proposed attenuation measures at Brookstead includes railway noise barriers to screen the noise from future railway operations. The predicted railway noise levels with the concept noise barriers show a substantial reduction in noise could be achieved, including at Brookstead State School. The revised draft EIS discusses a range of additional reasonable and practicable mitigation measures to reduce and control noise where these predictions identify relevant noise level criteria are unlikely to otherwise be met and noise related impacts could be experienced.</p> <p>The Project's Social Impact Assessment SIMP within Section 17.6 of Chapter 17: Social, outlines the Detailed Design commitments. ARTC and/or the construction Contractor will consult with Department of Education and Yelarbon, Brookstead and Southbrook Central State Schools to:</p> <ul style="list-style-type: none"> Confirm the location of the rail alignment, road-realignments and associated laydown areas and access tracks. Describe the construction schedule and the nature of road-rail interface treatments, temporary disruptions to traffic, any disruptions to school bus routes and traffic management measures e.g., supervised crossings, traffic flow and speed control measures or relocation of pedestrian pathways. Conduct an audit of the affected schools to determine in-corridor or at-property treatments to mitigate operational rail noise impacts, e.g., façade treatments, fence treatments or air conditioning. Confirm all relevant school bus services to enable consultation with the operators. Identify any specific considerations (e.g., off-campus sports or activities) that should be considered in the Project's RUMP and Traffic Management Plan. <p>Agree the communication process between ARTC and school communities during the Construction Works stage. The construction Contractor will:</p> <ul style="list-style-type: none"> Commence implementation of management measures relating to schools as agreed during the Detailed Design stage. Ensure that all schools and community facilities in the potentially impacted communities are aware of the construction program and are provided with regular updates about road closures and roadworks. Engage with schools in response to any complaints regarding construction impacts on amenity (e.g., dust), and work with them to find satisfactory solutions. <p>ARTC has engaged with Department of Education (Qld) and has confirmed an approach to audit and identify appropriate mitigation measures specific to each school's requirements. ARTC will continue to work with the Department during the Detailed Design stage to confirm appropriate noise mitigation measures based on an audit of each affected schools' site layout, to determine the applicability of in-corridor or at-property noise treatments. Information about consultation with the Department can be found in Appendix E: Consultation Report, Section 5.6. ARTC will monitor noise levels through construction and operation of this Section of the Project, as well as ongoing engagement with residents and the school to manage noise and vibration in impacts through Brookstead.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Chapter 17: Social</p> <p>Section 17.6</p> <p>Appendix E: Consultation Report</p> <p>Section 5.6</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic</p> <p>Section 7</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 11</p> <p>Section 17</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
208	208.0004	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ration between ARTC representatives to landowners. The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation in the Brookstead and Pampas region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local business. The draft EIS should be rejected based on the incomplete nature of information needed to effectively comment on environmental and social impact (Chapter 23, Table 23.5). Detail of road and rail design will only be provided in the 'Detailed Design phase' subsequent to the EIS which does not provide an opportunity to adequately respond to the EIS. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4 and 6.2.5. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.1.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Border to Gowrie design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <ul style="list-style-type: none"> As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below: <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p> <p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Section 6.4</p>
209	209.0001	Private - Brookstead	Flooding - Condamine River		The submitter's property starts 300 m from the existing rail line and extend further east. The submitter highlights the huge potential for a river in a floodplain to change its course as a result of minor changes to the actual watercourse as well as the likely development of new gullies caused by increasing water velocity behind, around and through culverts. The draft EIS does not acknowledge that the flooding impacts are likely to be irreversible. Therefore the EIS is not acceptable and additional instances of this are highlighted and discussed in the following submission.	nil.	<p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8.1 of the EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p> <p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6.3</p> <p>Section 14.8.1</p> <p>Table 14-4</p> <p>Figure 14.20a-e</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 7.5.3</p>
209	209.0002	Private - Brookstead	Surface Water		The issues of flood modelling and hydrology have not been fully resolved and validated. The draft EIS is incomplete as it does not consider the ongoing investigation by the Senate Rural and Regional Affairs and Transport References Committee into the Management of the Inland Rail project by the Australian Rail Track Corporation and the Commonwealth Government, which is not due to release its findings and recommendations until 13 May 2021. Also, the EIS should take into account the assessment of the Independent Panel of Experts for Flood Studies, which states it expected to complete their work by the end of 2021.	nil.	<p>Chapter 13: Surface Water, Section 13.26 states that the revised reference design will minimise the changes to flow and potential impact to downstream surface water users. A flooding and hydrology study has been undertaken detailing potential impacts to flow. Whilst change to hydraulic regimes may occur (due to new infrastructure) at 1% AEP conditions, changes to base-flow and low-flow conditions are not expected (refer Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2) and will not significantly impede current surface water resource use.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Chapter 13: Surface Water</p> <p>Section 13.26</p> <p>Appendix T1: Hydrology and Flooding Technical Report Volume 1</p> <p>Section 1.4</p> <p>Section 7.2</p> <p>Section 7.6</p> <p>Appendix T2: Hydrology and Flooding Technical Report Volume 2</p>
209	209.0003	Private - Brookstead	Surface Water	Modelling	The flood model is calibrated on only two flood events (1991 and 2010) and we question whether this is sufficient data to build a model for the complex nature of the Condamine floodplain. Additionally, neither of these flood events is a 1-in-100 frequency event so the requirement to design for a 1%AEP flood and assess the impacts of more extreme events is questionable, and lacking precision under these limited data inputs. Also, local flood records provided by landowners have been ignored in the calibration process. Historic flood records provided by local landowners have been used from 47 stations (plus 3 gauging stations) as a validation of the flood model. These records show a bias in under-prediction of modelled flood heights, as 37 out of 46 historic flood records(excluding 4 outliers) are under-predicted by the flood model, whereas only 9 are over predicted. Additionally, there appears to be spatial bias and greater errors in calibration for historic events around Pampas.	nil.	<p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data and are utilised to determine the robustness of the flood model to predict flood impacts for design events. Further details on event selection for calibration of the Condamine River hydrologic model is provided in Section 7.2.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Further sensitivity analysis to 'stress-test' the Condamine River models was carried out at the request of the Expert Flood Panel, and documented in Sections 7.2 and 7.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>2010 floodmark validation and 2013/2021 flood photo verification has been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Updated floodmark validation results can be found in Table 7.31 of Section 7.3.7 in Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in Detailed Design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 7.2</p> <p>Section 7.2.3</p> <p>Section 7.3.7</p> <p>Section 7.6</p> <p>Table 7.31</p>
209	209.0004	Private - Brookstead	Flooding - Condamine River	Modelling	ARTC and FFJV representatives have been asked for but have failed to provide estimated errors or measures of uncertainty in the predicted flood heights at key infrastructure locations for local landowners. This clearly violates Mandatory TOR 6.3 to include estimates of uncertainty in the flood model.	nil.	<p>Calibration of the Condamine River hydrologic and hydraulic models has been completed against two events, 1991 and 2010, with validation performed against the 2013 and more recent December 2021 events. The calibration events have been selected based on available information with selection governed by reliable and accurate data and are utilised to determine the robustness of the flood model to predict flood impacts for design events. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
209	209.0005	Private - Brookstead	Flooding	Modelling	The impact of climate change has not been considered in predicted flood heights for locally impacted buildings and infrastructure. It is only presented briefly in Appendix Q2 to indicate a flood height increase of 0. Sm with no impact on the rail design. This violates Mandatory TOR 6.2 to consider unknown and unpredictable future events, and also TOR 11.54 as it does not allow for design modifications and recognise flooding impacts on surrounding agricultural practices and infrastructure in these future increasingly likely events. The current rail design on the Condamine floodplain has been devised against a flawed flood model, and the resulting inundation maps showing the impact of the rail design have been suggested in the draft EIS as acceptable. The submitter claims that the demonstrated changes in the inundation maps against the rail design are unacceptable for our farming systems and do not meet best-practice agricultural management on the floodplain.	nil.	Climate Change sensitivities have been described in Section 14.7.7 of the EIS Chapter 14: Flooding and Geomorphology and the 'Sensitivity Analysis' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Chapter 14: Flooding and Geomorphology Section 14.7.7 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 5-17
209	209.0006	Private - Brookstead	Stakeholder engagement		Submitter lacking trust in the information provided during stakeholder engagement. The Southern Darling Downs Community Consultative Committee (SDDCCC) engaged Water Solutions, through Dr John Macintosh, to provide an independent expert review of the FFJV flood model. The results from this review were presented to the community at a meeting at the Brookstead Hall on 9 April, 2019. This presentation was the first general meeting sharing the levels of under-prediction bias from the flood model, and caused concern about the errors against known data, showing the accuracy range that the submitter was dealing with in flood model formulation. Additional information was collected and questions were submitted to Dr Macintosh on 2 June 2019. He replied after 3 months stating that he was unable to provide the detail we requested around errors in predicted flood heights from the model. His response to the concerns raised was that recorded flood records (that is, those provided by the landowners) could be inaccurate for many reasons.	nil.	ARTC provided technical information to Dr Macintosh for his independent review but was otherwise not involved in this process and is thus unable to comment. ARTC notes that it also cooperated and shared technical information with the Independent Flood Panel and a flooding expert appointed by local landowners.	Appendix E: Consultation Report Section 5.3
209	209.0007	Private - Brookstead	Stakeholder engagement		Submitter states that misinformation was given to the Senate Estimates Committee by ARTC regarding details of flood modelling. The submitter also confirms the frustration felt by residents on the floodplain, due to the dismissive, disregarding and arrogant behaviour of ARTC representatives. This misinformation supplied to the Senate committee by senior employees of ARTC clearly demonstrates the lack of consultation within ARTC from the ground up, as well as its dismissal of documentary flood evidence and concerns about the flood model conveyed to them by affected landowners.	nil.	ARTC appreciates there was some misunderstanding at this point in time. Since the submission, additional engagement has been undertaken to inform the Condamine River Floodplain crossing design, and Appendix E: Consultation Report, Section 5.3 details this engagement. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.	Appendix E: Consultation Report Section 5.3
209	209.0008	Private - Brookstead	Flooding - Condamine River	Modelling	The flood heights for the 1 in 100 year event predicted from the flood model are actually lower than the recorded flood heights from the 2010 flood (which is less than a 1 in 100 flood; being somewhere between a 1 in 20 and 1 in 50 flood). This contradiction clearly indicates that there is a gross under-prediction of modelled flood heights for a 1 in 100 year event, and downward bias in the flood model.	nil.	The AEP estimate of a flood depends on the at-site historical flood record, which can vary significantly in both space and time. The 2010 event is estimated to be around 2.6% AEP at Warwick about 50 km upstream of the hydraulic model domain (3rd largest event behind 1976 and 2011) and at 0.8% AEP at Cecil Weir at the downstream end of the hydraulic model (flood of record) (Section 7 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). From a hydraulic modelling perspective, the 2010 event is considered a rarer than 1% AEP event as it produced slightly higher peak flows than the 1% AEP design event. The main 2010 event was also preceded by multiple secondary rainfall bursts resulting in highly saturated catchment conditions, whereas the initial and continuing losses for the design 1% AEP event were derived from statistical observations rather than from a single event. These differences in storm volume and antecedent conditions further contribute to water level variations on the floodplain. The flood modelling conducted for the Project has also been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Appendix T1: Hydrology and Flooding Technical Report Section 1.4 Section 7
209	209.0009	Private - Brookstead	Flooding - Condamine River	Baseline/background sampling	From the beginning of this project, June 2016, ARTC and FFJV have referred to the Condamine Floodplain as being 12.5 km wide, ending at the west bank of Grasstree Creek, and the first inundation maps presented to us by ARTC and FFJV showed this extent. The Toowoomba Regional Council (TRC) also defined the floodplain as being 12.5 km wide. Local landowners have always insisted that floodwaters extend across a width of (at least) 18 km, including the water from Back Creek in Millmerran to past the North Branch of the Condamine, near Brookstead, and we have photographs from the 2010 flood event as evidence of water depths up to 0.7m in a connected water flow outside of the 12.5 km extent of the floodplain. Landowners presented photographic evidence showing the 18 km extent of the floodplain in the 2010 flood.	nil.	In order to clarify the statement made by ARTC, it should be noted that the width of the Border to Gowrie Condamine Floodplain mentioned as 12.5 km specifically refers to the portion of the rail alignment that traverses through the 1% Annual Exceedance Probability (AEP) flood zone area. However, it is important to recognize that the actual width of the floodplain varies and extends beyond the stated 12.5 km, as observed along the Gore Highway as an example. When discussing the precise width of the Condamine Floodplain, it is essential to establish a reference frame for measurement. To validate and verify ARTC's statement, this can be done using the interactive mapping platform Plan Engage, which offers mapping and comprehensive data on the floodplain's dimensions. All of the catchments along the Inland Rail route have been modelled and assessed as part of the revised draft EIS. The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice. ARTC have actioned the Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River and Back Creek hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 and 8.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.	Appendix E: Consultation Report Appendix T1: Flooding and Hydrology Technical Report - Volume 1 Section 7.6 Section 8.6
209	209.0010	Private - Brookstead	Stakeholder engagement		As stakeholder engagement by ARTC has failed in the past, the submitter is extremely concerned that the EIS document states that there will be further model refinement and consultation with landowners outside of the EIS process. It has been his past experience that ARTC have ignored community concerns and discounted their records and local knowledge. For this reason, ARTC have no credibility or trust within the Condamine floodplain community, as they have not engaged with stakeholders in a consultative and collaborative manner in the past.	1. The draft EIS document should be rejected for the Condamine flood plain model, until the independent panel of experts have completed the model review. 2. Any further development and consultation regarding the flood impacts be undertaken by an independent panel and not by ARTC or FFJV, as the engineers for ARTC.	The flood modelling conducted for the Project was reviewed by the Independent International Expert Panel for Flood Studies, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Expert Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment. As part of additional assessment and studies conducted for the revised draft EIS, ARTC assessed all local catchments against the new Flood Impact Objectives (FIOs), which determine the acceptable parameters within which the Project can change or increase the existing flood conditions, including afflux, time of inundation, velocity, hazard and flow directions. In October 2022, ARTC undertook consultation with all landowners that were shown to have the highest exceedances to the FIOs, in order to discuss these potential impacts and allow ARTC to develop mitigations specific to each area or property. As per ARTC's flood model engagement framework, ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures. Property specific impacts were identified during the consultation sessions in 2022, with the potentially impacted landowners (e.g. access, property specific observations and constraints) and the results recorded for incorporation when mitigations are applied in detailed design along with FIO application.	Appendix E: Consultation Report Section 5.3
209	209.0011	Private - Brookstead	Flooding - Condamine River		Concerned about rail design plan and EIS claims - The design proposes to raise an embankment up to 3 m high across the length of the floodplain, so water will no longer be able to over-top this structure during a flood. The design also proposes to reduce the free-flowing extent of water over the top of the current embankment (for 18 km), to approximately 6 km of bridging and 1.5 km of culverts. This will concentrate the flow of water under this new IR structure and reduce the free-flowing cross Section of the flood plain by more than one-half, or approximately 7.5 km. This restriction will impact on current water flows and directly contravene TOR 11.64, as there have been insufficient design considerations to minimise impact.	nil.	Flood impacts have been quantified through flood modelling, and assessed in accordance with the Terms of Reference (ToR) and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised reference design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of the revised draft EIS (1% AEP change in peak velocities). The flood modelling conducted for the Project has also been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Chapter 14: Flooding and Geomorphology Table 14-4 Figure 14.2-a-e
209	209.0012	Private - Brookstead	Flooding - Condamine River	Increase in peak water levels	Unacceptable increase in flood heights due to the proposed rail design - The submitter disagrees with the assumptions made in Chapter 12 (p 12-166) of the draft EIS that the change in peak water levels due to design are acceptable. A series of culverts (and bridge pylons) will increase the flow volumes and water velocity when water is channelled under and around these structures, increasing the erosion risk and causing long-term and irreversible damage to our farming system and soils (see TOR 6.2).	nil.	The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities). Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS. During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable. Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8.1 of the EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office. The flood modelling conducted for the Project has also been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7.5.3
209	209.0013	Private - Brookstead	Flooding - Condamine River	Erosion	Increased risk of soil erosion with unrepairable and irreversible impacts (photographic evidence given)Local landowners have tried to collaborate with ARTC and FFJV on numerous occasions to discuss the consequences of erosion both adjacent to and downstream from the proposed rail design, due to increased velocity by impeding water flow across an 18 km floodplain to a cross-sectional area of 7.5 km of bridging and culverts, under an elevated wall of up to 3 m high.	The submitter requests for an extension of bridge length across the Condamine floodplain. The bridging length be extended to join the South Bridge with the main Condamine bridge. The submitter also states that this bridge must have unimpeded flow extend from the Millmerran-Leyburn Road to the Condamine River, so that water can flow freely under the rail construction, rather than being dammed by a 3 m high embankment and restricted to flow under culverts in some sections.	The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14.20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities). Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIOs, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk. An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised reference design (Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised Reference Design. Scour protection requirements are reported in Appendix B of Appendix T1: Flooding & Hydrology Technical Report - Volume 1 of the revised draft EIS. Scour and erosion protection measures will be reviewed and confirmed during Detailed Design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available (Section 22.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
209	209.0014	Private - Brookstead	Flooding - Condamine River	Increase in peak water levels	The submitter notes that the flood impact objectives listed in draft EIS in Table 12.8 (Chapter 12, p1218) allow for changes in peak height of up to 200 mm on agricultural land, with up to 400 mm in localised areas. The submitter finds this not acceptable for an increase of 200 to 400 mm over agricultural cropping land due to rail design. In the most recent flood event in March 2021, there were large areas of sorghum and cotton crops on property adjacent to the rail line that were inundated by flood water. An increase in flood height of 300 mm, which is allowable under the design objectives, would have resulted in the total loss of large proportions of this crop along the rail alignment, where such losses equate to an estimated value of over\$3 m.	nil.	<p>Updated Flood Impact Objectives (FIO) have been agreed with the Independent International Expert Flood Panel, including targets for land, with further FIO requirements that relate to land usage, impacted area, etc. The updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.5.1 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. As the FIOs have been determined in association with the Expert Flood Panel, additional consultation with TMR/LGAs is required to discuss road impacts, agree the approach for each FIO exceedance and identify appropriate mitigation measures.</p> <p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>Flood modelling results were assessed and where FIO exceedances above the FIO targets are recorded, summary tables have been provided in the 'Flood Impact Objective outcome' Section of each catchment Section Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.11 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 4.2 Section 5-17</p>
209	209.0015	Private - Brookstead	Flooding - Condamine River		The work of the Independent Panel of Experts for Flood Studies is expected to be completed by the end of 2021	<ol style="list-style-type: none"> 1. CG invites ARTC to withdraw the EIS. 2. the CG should wait for the flood panel report before making determination on draft EIS. 3. CG should invite stakeholders' comments on panel findings. 	<p>The flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC have actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Within the Condamine River hydrologic and hydraulic models, any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in Section 7.6 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 7.6</p>
210	210.0001	Private	General project opinion - positive		The Goondiwindi Chamber of Commerce (GCC) represents the businesses of Goondiwindi and Ingleswood and views the Inland Rail project as potentially providing major benefits to the towns and region. The benefits GCC recognises from the Inland Rail project are in two parts. Firstly, a financial benefit from the construction and then a potential long-term opportunity to enable the Goondiwindi region to grow and develop new economic opportunities. Secondly long term major benefits to towns and region.	The submitter expects maximum involvement of local people and businesses in the construction and future operation of the rail line. They want minimal disruption to local businesses and lifestyle, and if disruption does occur fair compensation must be made.	<p>ARTC acknowledge the Goondiwindi Chamber Of Commerce's support of the Project and the benefits for the Goondiwindi region.</p> <p>Section 8 of Appendix X: Social Impact Assessment Technical Report provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>As noted in Appendix X: Social Impact Assessment Technical Report (Section 7.5.3) ARTC's Australian Industry Participation Plan and Sustainable Procurement Policy have a key focus on providing local and Indigenous businesses and social enterprises with full, fair and reasonable opportunity to participate in the supply of goods and services to Inland Rail.</p> <p>The Project will underpin its planning with the minimum participation targets set by related Commonwealth and Queensland policy, and will drive outcomes toward aspirational or incentivised targets with Contractors to exceed these minimum benchmarks. The Project's contractual negotiations will remain commercial in confidence.</p> <p>Inland Rail's tender assessment criteria includes local and first nations participation as a key element of all construction tender assessments.</p> <p>There is no relevant target for local procurement from within an area such as the SIA study area. ARTC's planning will be guided by an aspirational target of 15 per cent of the value of Project procurement to be spent with businesses that are located within the SIA study area.</p> <p>Appendix X: Social Impact Assessment Technical Report Section 7.5.2 notes that when the Project's Detailed Design is confirmed, ARTC will consult with tourism-related businesses located within 10 km of the Project and will develop a strategy, working with local Chambers of Commerce, tourist information centres and the Goondiwindi and Toowoomba Regional Councils, to ensure that any potential impacts on tourism visitation are mitigated, which could include support for tourism marketing campaigns targeting potentially impacted communities.</p> <p>ARTC are committed to continued consultation with the community, local businesses and key stakeholders through detailed design and construction works to minimise impacts and develop mitigation measures as required.</p>	<p>Appendix X: Social Impact Assessment Section 7.5.2 Section 7.5.3 Section 8</p>
210	210.0002	Private	Flooding		ARTC state in their EIS that Inland Rail will only affect any future flood levels in Goondiwindi by no more than 10 mm. The 2011 flood event required the town levy bank to be sand-bagged in places so there was absolutely no margin for error, but the volume of water that went past Goondiwindi in 2011 was less than what was recorded in both 1976 and 1996. So, the third biggest volume of water in the last 45 years nearly flooded the town. GCC does not have the technological skills and resources to challenge or endorse the ARTC hydrological modelling but we are concerned that the third biggest volume of water in 45 years could threaten to inundate the town. The independent panel's draft report identifies five major catchments containing thirteen regional catchments - the Macintyre River is the only one of these regional catchments that the panel does not review as ARTC are presently revising their model. This causes concern for the submitter as they were looking forward to suggested amendments of the proposal from the experts.	nil.	<p>The revised draft EIS includes additional hydrologic and hydraulic modelling work that was conducted as part of the North Star to NSW/QLD border Project at the request of NSW DPIE. The Macintyre River sections of the revised draft EIS has been updated, refer to Section 17 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 17</p>
210	210.0004	Private	Social Impact Assessment	Workforce and employment	The submitter requests that as often as possible local people are employed for the program, and if it is found that locals don't have sufficient skills, training be made available to them.	Where labour camps need to be established, they should be done in such a way as to fit in with the community rather than be a totally separate enclave. They should obviously source their supplies from the local region.	<p>The employment of local people is a key goal for the Project so the benefits of wages and skills development will extend to local and non-local residents. ARTC has established the Inland Rail Skills Academy (revised draft EIS Appendix X: Social Impact Assessment, Section 8.3.2) to increase the skills and capacity of the local workforce to participate in construction employment.</p> <p>The Project's management of accommodation facilities is addressed at Appendix X: Social Impact Assessment, Section 8.4 and will include:</p> <ul style="list-style-type: none"> ▶ Management of workforce behaviour to avoid impacts on local community values such as family friendly communities and courteous driving behaviour ▶ Noise, air quality and odour management with respect to the amenity of surrounding properties ▶ Enabling local businesses to tender for supply of good and/or services to the non-resident workforce accommodation facilities. ▶ Employment of local residents in non-resident workforce accommodation facilities. 	<p>Appendix X: Social Impact Assessment Section 8.3.2 Section 8.4</p>
211	211.0001	Private	Surface Water	Modelling	The submitter raises the issue about the Condamine River Flood Plain between Millmerran and Brookstead. He highlights that the results and accuracy of the flood modelling has been widely challenged by local farmers. Also, the potential for an embankment with culverts to cause widespread gulying of the Condamine floodplain has been ignored both in the EIS and in its TOR. There is a long history of gully erosion in this area on cracking clay soil floodplains invariably caused by concentration of overland flows and often associated with culverts. Flow through culverts under flood conditions is concentrated and its energy gradient is higher than the slope of the land, as water is ponded on the upstream side. The end result is that flow through a culvert has increased velocity and flow tractive force, and has greater potential to directly detach and remove soil.	nil.	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing revised Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14-20a-e of Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Flood impacts have been quantified through flood modelling, and assessed in accordance with the ToR and the Flood Impact Objectives (FIOs) (refer to Table 14-4 of Chapter 14: Flooding and Geomorphology of the revised draft EIS). During the Reference Design development process ARTC have considered community feedback on design proposals by making design modifications (e.g. longer bridges, more culverts etc.) to minimise flood impacts as far as practicable.</p> <p>Flood impacts associated with the Condamine River floodplain have been reviewed as part of the revised draft EIS which incorporates updates to the Condamine River hydraulic model based on feedback and comments from the Expert Flood Panel. Impacts have been described in Section 14.8.1 of the EIS Chapter 14: Flooding and Geomorphology and Sections 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1. Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. As per standard industry guidelines, the impact of the Inland Rail Project on the existing flood regime was quantified and compared against Flood Impact Objectives for the 1% AEP (as discussed in Section 14.6.3 of Chapter 14: Flooding and Geomorphology). Residual flood impacts that exceed the FIO limits are reported in the draft EIS for further consideration by landowners and the Coordinator-General's office.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Table 14-4 Figure 14-20a-e Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 7.5.3</p>
211	211.0002	Private	Flooding - Condamine River		The submitter outlines that adequate risk considerations have not been taken into consideration by the proponent. <ol style="list-style-type: none"> 1. The EIS contains no assessment of geomorphic risk. 2. There is no plan B. If, as widely anticipated by highly experienced local professionals, the current design causes extensive erosion of high value cropping land, there is no possibility of changing the design to reduce that risk. 3. Effectively, once constructed, there will be zero opportunity to re-build sections of the line, and the farming community will be left with a festering problem that may well also compromise the functionality of rail line itself. 	nil.	<p>A Geomorphology assessment has been carried out in accordance with the requirements outlined in RF1 312. The outcomes of the Geomorphology assessment are reported in Appendix H: Geomorphology Technical Report and Chapter 14: Flooding and Geomorphology of the revised draft EIS.</p> <p>Scour protection requirements for culverts during the revised reference design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIO's, as endorsed by the Independent International Expert Flood Panel. As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk (Section 22.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1).</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised reference design. A representative and conservative average bare soil ETV value of 0.5 m/s was adopted for the purposes of this impact assessment. In addition to initial scour protection requirements identified during the revised Reference Design, areas immediately downstream of culvert outlets that may experience FIO velocity exceedances were also identified, and additional scour protection allowed for within the revised Reference Design (refer to Section 5.1 of Appendix H: Geomorphology Assessment).</p> <p>Scour protection requirements are reported in Appendix B of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p> <p>Scour and erosion protection measures will be reviewed and confirmed during detailed design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available.</p>	<p>Chapter 14: Flooding and Geomorphology Appendix H: Geomorphology Assessment Section 5.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 22.4 Appendix B</p>
211	211.0003	Private	Flooding - Condamine River		The EIS (page 12-170) notes that scour protection has been designed in accordance with the Guide to Road Design Part 5B: Drainage (Austroads, 2013b). However, that document specifically considers established flow paths. It does not consider stabilisation of structures on a vertosol floodplain with no established gullies.	nil.	<p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. Any potential change in flood conditions (including flood depth, velocity, duration, and hazard) is carefully managed through application of the Project FIO's, as endorsed by the Independent International Expert Flood Panel (the updated FIOs are summarised in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1). As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures, including measures focused on mitigating scour and erosion risk.</p> <p>An impact assessment was undertaken against the FIOs using the Existing Case and Development Case hydraulic modelling results to define velocity exceedances on properties external to the Inland Rail permanent Project footprint, based on the revised Reference Design. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
211	211.0004	Private	Flooding - Condamine River		The submitter opposes culverts in the Condamine floodplain.	<p>The preferred and most reliable option for the inland rail crossing of the entire Condamine floodplain is a viaduct. That would cause no diversion or concentration of flood flows, and has quite limited potential to cause increases in flooding, diversion of flows, or erosion damage to cropping land. It is the most reliable option to address the floodplain crossing. If largely due to cost concerns, a design incorporating culverts is adopted, then at the very minimum:</p> <ol style="list-style-type: none"> Box culverts should be used and not pipe culverts. A maximum outlet velocity of 0.5 m/s should be set for flow at the point where it exits the sealed or protected surface at the downstream end of culvert. Given the high probability that culverts will cause severe erosion damage to adjoining agricultural lands, a requirement should be included in the conditions for the project that such damage will be repaired to a suitable and acceptable standard at the expense of the authority responsible for the management and maintenance of the rail line 	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). The Condamine Floodplain crossing Reference Design aims to maintain existing flood levels and velocities. Due to the significant number and lengths of bridges and culverts allowed for in the design to maintain the existing flow of flood water, there are only minor changes in velocities within the floodplain, as indicated by Figure 14-20a-e of the revised draft EIS Chapter 14: Flooding and Geomorphology (1% AEP change in peak velocities).</p> <p>Scour protection requirements for culverts during the revised Reference Design were calculated based on the velocities predicted from the hydraulic modelling. 211	211.0005	Private	Land Use and Tenure	Severance of agricultural land	Considering solely a 75 metre wide alignment, the proposed rail line would alienate some 217 hectares of high-value cropping land across this 29 kilometre stretch. However, construction of the rail line will disrupt farming operations on both sides of the rail line (enormously in some cases) adding to production costs and/or losses, causing effective loss of significantly more than 217 ha of high-value land. There is also the potential for gullying to impact on and damage land adjoining a proportion of that 29 km corridor.	<p>The preferred and lowest risk option for the inland rail crossing of the Condamine floodplain is a viaduct.</p>	<p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of good quality agricultural land that cannot be avoided.</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>A combination of geographical and bio-physical factors contribute to land being of high agricultural value. New agricultural land is unable to be developed on the basis of these over-arching factors therefore like-for-like replacement for loss of agricultural land in a location that would benefit the impacted landowner is not feasible. Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption.</p> <p>ARTC will continue to work with directly affected landowners to develop and implement property-specific measures to mitigate impacts on properties that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. <p>This will inform development of the detailed design and Construction Environmental Management Plan.</p> <p>As described in Section 2.8 and Section 2.9 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>Where changes to surface water and hydrology are identified, nominated Flood Impact Objectives (FIO) have been developed to provide guidance and consideration to indirect impacts on particular land uses (Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 13: Surface Water).</p> <p>The FIOs applied to assess the Project impacts are presented in Chapter 14: Flooding and Geomorphology, Section 14.6.3, Table 14-4. The Project will target achieving the FIOs for events up to and including the 1% AEP for land, receptors, and/or infrastructure, and where the FIOs are met, it is reasonable to assume there will be no adverse impacts from flooding on the use of land.</p> <p>Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case by case basis, including through consultation with stakeholders and landowners. This is also further discussed in the revised draft EIS, Chapter 8: Land Use and Tenure, Section 8.5.1.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.5.4</p> <p>Section 8.6.2</p> <p>Table 8-46</p> <p>Chapter 13: Surface Water</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6.3</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
211	211.0006	Private	Project alignment		Problems with the proposed route The route selection process did not consider the erosion risks associated with crossing the Condamine floodplain. Consequently, it did not consider the potential additional construction costs that may be required to deliver an acceptable (non-erosive) design. (Additional length of viaduct has already been added, and stakeholders are calling for a much greater distance of viaduct, which would greatly increase construction costs.) Nor did the selection process (and the EIS) consider the potential high management costs that may be required to address continuing issues with instability of cross-corridor drainage on such erodible soils. It also did not consider the impact on the local koala population as a result of the proposed route. Finally there are quite significant construction challenges associated with placement of a rail line on the expanse of highly reactive (swelling and shrinking) deep clay soils when crossing the floodplain from Millmerran to Yarranlea.	<p>To overcome the issue of clay soil and construction challenges it is likely that construction will need to either:1. Excavate a significant (possibly in the order of 1 metre) depth of reactive clay and replace it with a non-reactive foundation material; or2. Treat the foundation soil (probably to a depth close to 1 metre) with lime (quicklime or hydrated lime) to stabilise the soil and render it non-reactive. Lime application rates in the order of 2 - 6% by weight are commonly reported. The submitter also mentions that making these changes could come at a significant cost increase.</p>	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8-2.10, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes: - environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>Chapter 14: Flooding and Geomorphology, Section 14.9.1 states that stakeholder concerns regarding the dispersive nature of soils in floodplains were addressed in the revised reference design by incorporating scour and erosion protection measures into the revised reference design in areas determined to be at risk, such as around culvert headwalls, drainage discharge pathways and bridge abutments. A preliminary erosive threshold velocity assessment was undertaken to inform the scour and erosion protection strategy (Section 14.6.5). Section 14.9.1 describes the proposed additional mitigation measures during future Project stages.</p> </p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Section 2.10</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6.5</p> <p>Section 14.9.1</p> <p>Appendix E: Consultation Report</p>
212	212.0001	Private	Stakeholder engagement		Despite direct impact of the proposed inland rail on Vary Agricultural Services (submitter), they were not engaged to participate in the consultation processes.	<ol style="list-style-type: none"> Not approve the draft EIS Ask ARTC to consult Vary Agricultural Services. Release additional information from ARTC in a revised EIS and give the submitter the right to provide future comment. 	<p>Since this submission, Inland Rail have met with Vary Agricultural Services to better understand concerns held regarding potential impacts to their business due to noise, vibration and dust. A commitment has been made to assess potential vibration impacts on the business's sensitive weigh bridge once plans for the weigh bridge are provided. Inland Rail have provided ongoing assistance in trying to locate weigh bridge plans. Engagement with this submitter is ongoing.</p>	<p>Appendix E: Consultation Report</p>
212	212.0002	Private	Hazard and Risk		The Vary Agricultural Services office building and the chemical shed are not on the map. The office was built in 2015 and chemical shed built in 2017. These structures should be on the map which shows the Inland Rail is using outdated maps. Subsequently sensitive receptors for the office are not noted and impact to the business are not acknowledged. The laydown area and cement batching plant for Inland Rail are located directly next to the submitter's office premise. This close proximity of cement batching plant presents contamination risks to food products and fertiliser products. It will be hazardous for the consumers' health given this risk.	nil.	<p>Section 21.2 of Chapter 21: Hazard and Risk outlines the commitment of ARTC's Safety Policy which provides the basis for effective management of employee, contractor and public health for the Project.</p> <p>Section 8.6.3 of Chapter 8: Land Use and Tenure outlines the commitment of ARTC to continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This has included the identification of:</p> <ul style="list-style-type: none"> Landowners' needs regarding access to the properties and the closure of private roads Property infrastructure such as fences and dams which would be affected and need to be addressed as part of compensation arrangements with the Acquiring Authority The potential for changes to groundwater access. 	<p>Appendix E: Consultation Report</p> <p>Section 4.6</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.6.3</p>
212	212.0003	Private	Traffic and Transport	Operational traffic	The design element of the road crossing of the Inland Rail is difficult for trucks. Trucks stopped at a rail crossing can't easily go from a standstill to an immediate incline over elevated rail. This will be dangerous for entry roads that go over inland rail and turn onto the Gore Highway. The case in Brookstead is an example where trucks will go from a standstill over inland rail and then directly enter Gore Highway where traffic will be travelling at speed. Safety for trucks and trains are raised by the submitter.	nil.	<p>Appendix AA: Traffic Impact Assessment Section 1.1.2 details the legislation, policy and guidelines used within the assessment. The list includes Austroads Guide to Road Design and Guide to Traffic Management. Road design standards have been developed to achieve service level objectives of the specific road. This means that the updated road geometry will accommodate a B-double vehicle (or as agreed with road manager) with corresponding compliant grades. ARTC notes submitters concerns around acceleration of trucks from standing start and this will be provided for within the use of design standards.</p> <p>The road safety assessment presented within Appendix AA: Traffic Impact Assessment has been undertaken as per the framework laid out in GTIA Part C Section 9. This framework relies on the principle that a road's safety is not significantly worsened as a result of the Project and that any pre-existing or Project -introduced unacceptable safety risk is addressed.</p> <p>The GTIA acknowledges that safety is not readily quantifiable and may require scoring based on expert opinion on the changes to likelihood and/or consequence of a risk being realised. This road safety impact assessment has the following aims in accordance with the Project's TIA – Road Safety Methodology Technical Memo which was agreed with DTMR in November 2022 (Appendix BS).</p> <p>A safety risk assessment based on existing crash history has been undertaken along the Project construction traffic routes and road-rail interface locations for the following scenarios:</p> <ul style="list-style-type: none"> 'Without' Project 'With' Project 'With' Project and with mitigation measures (required only if the score in the Project situation is higher than in the without Project situation, or if the without Project score is in the 'high' category). <p>Appendix AA: Traffic Impact Assessment Section 5.2.2 provides whole of Project mitigation measures suggested for the Detailed Design and Construction Works stages, which include items such as construction traffic management plans, road use management plans, and non-infrastructure based mitigation measures.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.2 provides a summary of the intersections, road links and road-rail interfaces requiring mitigation as per the GTIA Part C Section 9 framework. The detailed road safety assessments are contained in Appendix AN, AO AP and AQ of Appendix AA: Traffic Impact Assessment for intersections, road links, road-rail interfaces (construction), and road-rail interfaces (operation) respectively.</p> <p>Section 5.9 of Appendix AA: Traffic Impact Assessment details level crossing impact assessment and mitigation - operation, which includes assessment of vehicle wait times. Table 5.112 summarises the road-rail interface mitigation measures.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 1.1.2</p> <p>Section 5.2</p> <p>Section 5.9</p> <p>Table5.112</p> <p>Appendix AN</p> <p>Appendix AO</p> <p>Appendix AP</p> <p>Appendix AQ</p> <p>Appendix BS</p> <p>Appendix E: Consultation Report</p> <p>Section 5.3</p>
212	212.0004	Private	Traffic and Transport	Operational traffic	Diversion of traffic through Brookstead while working on the overpass on eastern end of Brookstead, and noise and risk problems from increased traffic. It raises the possibility of vehicles and trucks interacting on the highway and local roads. It poses a huge road safety risk for motorists. This means that access to the submitter's Vary Agricultural Business will be compromised. As a truck freighting business, they generate multiple trips both to and from our business and the Inland Rail will be a generator of additional trucking movements throughout the construction stage. They highlight the lack of consultation with them in this matter.	nil.	<p>In Appendix AA: Traffic Impact Assessment Section 5.9.4 a detailed assessment has been undertaken at each of these diversion locations, to summarise the:</p> <ul style="list-style-type: none"> Existing situation, including the road network and active and public transport provisions Required site distance length Traffic information and rerouting assumptions Capacity (SIDRA) and turn warrants assessment without and with Project Recommendations. <p>The Ware Street diversion is an exception to above, as this diversion location has had a separate traffic impact assessment undertaken. As such, this has been summarised within this report, with the full assessment included in Appendix BM of Appendix AA: Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.9.4</p> <p>Appendix BM</p> <p>Appendix E: Consultation Report</p> <p>Section 5.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
212	212.0005		Economics		The Draft EIS claimed that at the end of this process the project would produce 10-15 FTE jobs. This project is a major disruption to Brookstead with a poor full-time job return and no guarantee that these would be local jobs. There is a real concern for local businesses that this may mean displacement i.e. local firms may lose employees who would leave for construction jobs. Additionally, the submitter highlights that EIS draws on an economic report that is 6 years out of date, given the recent Covid border restrictions, drought and bushfire that have caused shortages in labour market.	A new and detailed economic study relevant to today's condition should be undertaken.	<p>ARTC has recently updated the EIS economic modelling to reflect current labour market conditions. If labour market conditions at the national and state level remain in the recent range, the Project's Construction Works stage will be completed in the context of a relatively tight labour market, especially in the market for skilled labour relevant to the construction sector. However, the economic assessment, in Section 6.4 of Appendix Y: Economic Impact Assessment, indicates that there is some slack in the Darling Downs – Maranoa labour markets, which provides opportunities for recruiting, training and re-skilling available workforces in the region to supply a significant portion of the workforce requirements of the Project. The ability for the local economy to supply labour to the Project, depends on the specific location of works along the alignment. At the time of construction, local employment is dependent on a number of factors including labour market conditions, skills availability, and the existence of workforce training and participation programs to support local, Indigenous and youth employment.</p> <p>ARTC will implement mitigation measures to ensure impacts to the availability of the local workforce is reduced. These include:</p> <ul style="list-style-type: none"> ▶ Establishing the Inland Rail Skills Academy training and capacity building initiatives to increase the labour pool ▶ Monitoring labour draw in consultation with key stakeholders ▶ Corrective actions if required (e.g. updating recruitment or training strategies). 	Appendix Y: Economic Impact Assessment Section 6.4
212	212.0007	Private	Groundwater		Vary Agricultural Services do not have access to town water and have a bore in operation. The business cannot operate without water access. Any impact to the current bore in use on the premises, including loss of resource, pressure or quality, will impact the business operation.	nil.	<p>Groundwater drawdown is predicted to be isolated and limited in extent around the vicinity of deep cuts (>10 m). Vary Agricultural Services is located 24.2 km from the nearest cut at chainage 176.35 km and therefore is not likely to be impacted by groundwater drawdown as a result of the Project (drawdown extent from cut is predicted to be 43 m. Further, impact to groundwater quality is not anticipated as a result of the Project (Chapter 15: Groundwater, Section 15.6.2).</p> <p>Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset for comparative purposes to assess any potential deterioration of water quality resulting from the Project (Chapter 15: Groundwater, Section 15.4.4). The baseline groundwater dataset, in addition to regular groundwater monitoring (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project (refer Chapter 15: Groundwater, Section 15.7.3 and Appendix U: Groundwater Technical Report, Section 8.3.1).</p>	Chapter 15: Groundwater Section 15.4.4 Section 15.6.2 Section 15.7.3 Appendix U: Groundwater Technical Report Section 8.3.1
212	212.0008		Economics		<p>The submitter, Vary Agricultural Services, outlines the following economic impacts for their business as a result of the Inland Rail.</p> <ol style="list-style-type: none"> 1. Loss of business from customers not being able to access the business with ease during construction of the project, as the Gore Highway at Brookstead will be closed for an extended period, forcing all highway traffic past the business entrance, making it hard to access and time delays and convenience may force customers to Millmerran or Pittsworth as they can also use other back tracks to avoid the construction areas. 2. The ability to easily enter and exit the premises due to the significance increase in highway traffic on Ware Street will be made difficult, increasing time and costs. 3. Economic loss in the event of a weed seed contamination 4. Economic loss due to contamination of food product and fertiliser product from cement dust from the Inland Rail5. Economic loss due to structural integrity of buildings compromised - sheds and office building6. Significant economic loss in the event of weighbridge not operating, periodically or perpetually. Significant risk to the business if weights are not correct, loss of contracts and direct penalties. 	nil.	<p>An assessment of the economic impacts per lot, business or commodity is not in the scope of the EIS as per Section 5.1 and 11.141 of the final Terms of Reference (ToR), as approved by the Qld Coordinator-General. The economic assessment undertaken seeks to identify potential economic benefits and impacts on affected local and regional communities and businesses and has been drawn from local community consultation and industry engagement, public available information, the outputs from the Social Impact Assessment and Land Use and Tenure Assessment. These outcomes have been summarised in the revised draft EIS.</p> <p>Regarding site access, ARTC note the concerns of Vary Agricultural Services Pty Ltd. However, the Gore Highway is not proposed to be closed for extended periods of time with traffic diverted through Brookstead. Instead, the Project is proposing to build a temporary side road that will maintain existing traffic flows on the Gore Highway during the construction period of the road over rail grade separation. ARTC does not anticipate any issues with customers or workers entering or exiting the Vary Agricultural Service facility. Refer to assessment in Section 20.5 and 20.6 of Chapter 20: Traffic, Transport and Access.</p> <p>Biosecurity matters and proposed mitigation measures (e.g., the spread of declared weed plant material and the potential for contaminating agricultural products), has been included in Chapter 21: Hazard and Risk in the revised draft EIS and in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>Potential impacts from the operation of the temporary concrete batching facility located at the laydown area (B2G-LDN0152) and its potential for dust to contaminate food and agricultural products has been updated in the revised draft EIS. Refer to Chapter 12: Air Quality. Impacts are expected to be within statutory requirements given the proposed separation distances to the Vary Agricultural Services and the additional mitigation measures as outlined in Chapter 24: Draft Outline Environmental Management Plan.</p> <p>In relation to structural integrity of buildings and potential impacts to the operation of the weighbridge, the revised draft EIS has been updated to address potential noise and vibration impacts for the revised reference design. In terms of road traffic noise, the assessment has been undertaken in accordance with DTMR's Transport Noise Management Code of Practice, Volume 1—Road Traffic Noise (CoP Vol 1) (DTMR, 2013a). The CoP Vol 1 is a standard under the Transport Infrastructure Act 1994 (Qld) (TI Act) and provides guidance and instruction for assessing and managing the impact of road traffic noise, where the Project has delivered new and upgraded roads. Construction noise and vibration has been assessed in accordance with DTMR's Transport Noise Management Code of Practice: Volume 2—Construction Noise and Vibration (CoP Vol 2) (DTMR, 2016). The CoP Vol 2 is gazetted under the Environmental Protection Act 1994 and provides the framework for the assessment and management of construction noise and vibration on public amenity and safety.</p> <p>For vibration impacts associated with railway operations, ARTC has assessed noise and vibration impacts in accordance with DTMR's Interim Guideline—Operational Railway Noise and Vibration: Government Supported Transport Infrastructure (DTMR, 2019a). The Interim Guideline provides the framework for the assessment of noise and vibration emissions generated by the operation of rolling stock on railways and railway infrastructure. Refer to Chapter 16: Noise and Vibration and Appendix V: Noise and Vibration Assessment – Construction and Road Traffic and Appendix W: Noise and Vibration Assessment – Railway Operations. Prior to construction commencing, ARTC will undertake building condition or dilapidation surveys prior to assess the structural integrity of buildings along the alignment in accordance with the assessment criteria outlined in Table 16-39. The results from the noise and vibration modelling for both construction and operational activities, are not anticipated to cause structural impacts to adjacent site infrastructure or interfere with the current and future operations of the existing weighbridge at Vary Agricultural Services.</p> <p>As outlined in Section 17.6 of Chapter 17: Social, ARTC will continue to work with all directly impacted landowners to ensure the Project impacts are minimised or mitigated where possible.</p>	Chapter 12: Air Quality Chapter 16: Noise and Vibration Section 16.6 Section 16.8 Section 16.10 Chapter 17: Social Section 17.6 Chapter 18: Economics Section 18.3 Section 18.9 Chapter 20: Traffic, Transport and Access Section 20.5 Section 20.6 Chapter 21: Hazard and Risk Chapter 24: Draft Outline Environmental Management Plan Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Section 6.0 Section 7.0 Appendix W: Noise and Vibration Assessment – Railway Operations Section 9.0 Section 12.0 Table 16-39
212	212.0009	Private	Flora and Fauna	Contaminated land	The proximity of the laydown area and construction of the Inland Rail presents risk of weed contamination to Vary Agricultural Service products stored at the premises. It will impact customer contract obligations and business reputation. Contamination to fertiliser product which goes on farm is also of major concern, where unknown weed seed contamination will spread weeds to farms, costing in treatment and contamination potential of product and market rejection	No approval should be granted until this is fully assessed.	<p>Chapter 24: Draft Outline Environmental Management Plan states a Biosecurity Management Plan will be developed as a component of the CEMP which will provide adequate management measures as a result of continued stakeholder engagement.</p> <p>The Biosecurity Management Plan will include weed surveillance and treatment during construction and rehabilitation activities such as:</p> <ul style="list-style-type: none"> ▶ Vehicle and plant washdown requirements for fleet moving from low-risk areas to high-risk areas ▶ Weed certification requirements for vehicles, plant and materials arriving onto the construction site. 	Chapter 24: Draft Outline Environmental Management Plan
212	212.0010	Private	Land Resources		The Laydown area directly next to the business premises will present potential erosion and land use issues. The drainage associated with the new Inland Rail infrastructure along Ware Street will potentially create erosion problems for the road and adjoining land use.	nil.	<p>During the Construction Works stage of the Project, the reference design will be in varying stages of construction, involve temporary works and be susceptible to flooding without specific mitigation measures being implemented. As such during this stage of works, additional mitigation measures may be required to minimise the impact to property, infrastructure, and Flood Sensitive Receptors. The following mitigation measures may be implemented during the Construction Works stage to mitigate Flood Impact Objective (FIO) exceedances as outlined in Section 14.9.1 of Chapter 14: Flooding and Geomorphology:</p> <ul style="list-style-type: none"> ▶ Establishment of a baseline of the surrounding land and environment via detailed survey ▶ Completion of Flood Impact Assessments (including compliance with the FIOs), for any temporary works located within floodplains via a secondary approvals process, as required ▶ Implementation of Erosion and Sediment Control measures (as per the Construction Environmental Management Plan) to adequately manage scour and sedimentation on surrounding lands ▶ Stabilisation of disturbed land to reduce potential scour impact and minimise velocity increases ▶ Maintaining conveyance through existing drainage lines, where possible, to minimise diversion of flows to adjacent land. <p>Scour and erosion protection measures (including the need for flow spreaders and/or dissipaters) will be reviewed and confirmed during detailed design, when detailed soil mapping becomes available, and in light of specialist Geotechnical and Soil Conservation advice provided during the Detailed Design stage, when detailed site-specific data is available.</p>	Chapter 14: Flooding and Geomorphology Section 14.9.1
212	212.0011	Private	Land Use and Tenure		Vary Agricultural Services business premises is for commercial purposes, it is located directly adjacent the Inland Rail alignment and within the project footprint. The Inland Rail infrastructure, construction and operation will create new and unacceptable impacts to the business and its operation. Vary Agricultural Services intend to maintain our right to claim compensation for impacts as a direct and perpetual result of the Inland Rail during construction and operation. For example, the laydown area and cement batching plant for Inland Rail construction stage are located directly next to the Vary Agricultural Services premises. The close proximity of the cement batching plant presents contamination risk to food products and fertiliser products from cement dust.	Compensation for direct and indirect economic loss to the submitter's business.	<p>Where the Project requires the permanent acquisition of properties, this will be undertaken in accordance with the requirements of the Acquisition of Land Act 1967 (Qld).</p> <p>Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance. Refer to the revised draft EIS Chapter 8: Land Use and Tenure, Section 8.6 for further details.</p> <p>Costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> ▶ Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation ▶ Costs related to the purchase of replacement comparable land ▶ Storage and removal costs ▶ Other reasonable financial costs incurred that are a direct consequence of the resumption of the land 	Chapter 8: Land Use and Tenure Section 8.6
212	212.0012		Economics		As a bulk grain and cotton carting company, Vary Agricultural Services, outlines the reasons why truck freight is favoured by consumers and not rail. The submitter outlines that product can be picked up directly from the farm at any and various locations and delivered direct to the end user and market. There is no double handling or loss of time. On the other hand, Queensland Rail does not run consistent and regular scheduled service. The Grain Depot may hold product for a while until there is sufficient bulk to run services. The farmer loses time and ability to meet contracts to market. The opening of the Toowoomba Range Crossing increased the capacity of road freight to meet time, cost and logistics savings for delivering product from farm to port, and all other regional and interstate freight services to Brisbane. The Business Case 2015 does not represent this freight capacity for the B2G Section and the Inland Rail benefit claims are not valid.	nil.	<p>Potential impacts from the operation of the temporary concrete batching facility located at the laydown area (B2G-LDN0152) and its potential for dust to contaminate food and agricultural products has been updated in the revised draft EIS (Chapter 12: Air Quality, Section 12.51). Impacts are expected to be within statutory requirements given the proposed separation distances to the Vary Agricultural Services and the additional mitigation measures as outlined in Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 12: Air Quality Section 12.51 Chapter 24: Draft Outline Environmental Management Plan
214	214.0001	Private	General project opinion - positive		Wagner Corporation is wholly supportive of Inland Rail and particularly the B2G Section as presently outlined. We believe Inland Rail and the B2G Section will provide enormous benefits to the State of Queensland and particularly the Toowoomba Region.	nil.	ARTC acknowledge the Wagner Corporation's support of the Project and the benefits for the Toowoomba Region.	N/A
214	214.0002	Private	Approvals/conditions/recommendations		Proposed Development: The draft EIS does not consider or detail in any way the proposed rail terminal planned for the Wellcamp Business park adjoining the Toowoomba Wellcamp Airport.	Wagner Corporation requests that the OCG impose a condition that the proponent is required to consult with Wagner Corporation and to make plans and/or accommodations for the proposed rail terminal to be located at adjacent to the Toowoomba Wellcamp Airport.	This issue is noted. Submission to be considered by The Office of the Coordinator-General.	N/A
214	214.0003	Private	Traffic and Transport		Cecil Plains Road: The draft EIS does not consider or provide sufficient detail regarding the need to maintain future access to heavy road traffic (including oversize loads etc.) at the crossing located at Cecil Plains Road.	Wagner Corporation requests that the OCG impose a condition that The proponent is required to ensure 2 lanes in each direction and the construction of that bridge include upgrading the associated road in both easterly and westerly directions	ARTC is consulting on technical requirements for Toowoomba Cecil Plains road with the road manager (TMR) including requirements for any futureproofing elements relating to this interface. This includes requirements for any futureproofing elements relating to this interface. Consultation on the final agreed solution remains ongoing and will be agreed in Detailed Design stage prior to constructions. Assessment for Cecil Plains road has been undertaken within Appendix AA: Traffic Impact Assessment).	Appendix AA: Traffic Impact Assessment

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
215	215.0001	Private	Land Use and Tenure	Directly impacted landowner	The main issues affecting the submitter's property is the proposed Inland Rail route which is dissecting and flooding and causing further issues and disruptions to farming operations and logistics. In particular, the proposed route will dissect a paddock which is critical for sheep grazing operations and logistics. The issue of dissection in this part of our property presents additional logistical issues mainly relating to movement of stock and machinery across the rail line. They have thousands of sheep grazing together at one time and must rotate their stock around to different paddocks. Moving sheep, heavy machinery such as trucks, tractors (pulling various implements), headers, will also become difficult with the frequent passing of trains.	nil.	<p>The revised reference design for the Project includes changes to the alignment in the vicinity of the submitter's property. Chapter 2: Project Rationale, Section 2.10.9 outlines the revised reference design options assessment, including the Millmerran Alternative Alignment which has been based upon ongoing consultation with local business and community, and the content of public submissions.</p> <p>As outlined in Chapter 8: Land Use and Tenure, Section 8.6, ARTC will continue to consult with potentially impacted landowners through the Detailed Design and Pre-Construction Activities and Early Works stages to develop and implement property-specific measures to avoid or minimise impacts that could affect agricultural enterprises. This will include the identification of:</p> <ul style="list-style-type: none"> ▶ Landowners' needs regarding access to the properties and the closure of private roads ▶ Property infrastructure such as fences, water storages, groundwater bores and irrigation infrastructure that would be affected and need to be considered in compensation arrangements for the property ▶ The potential for changes in access to natural resources, such as groundwater and overland flow. <p>As outlined in Chapter 8: Land Use and Tenure, Section 8.5.1, where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance.</p> <p>Where changes to flooding and geomorphology are identified, nominated Flood Impact Objectives (FIO) have been developed to provide guidance and consideration to indirect impacts on particular land uses (Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 14: Flooding and Geomorphology). The FIOs applied to assess the Project impacts including erosion and scouring potentials are presented in Chapter 14: Flooding and Geomorphology Section 14.6.3, Table 14-4. The Project will target achieving the FIOs for events up to and including the 1% AEP for land, receptors, and/or infrastructure, and where the FIOs are met, it is reasonable to assume there will be no adverse impacts from flooding on the use of land.</p> <p>Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case by case basis, including through consultation with stakeholders and landowners. This is also further discussed in the revised draft EIS, Chapter 8: Land Use and Tenure, Section 8.5.1.</p>	<p>Chapter 2: Project Rationale Section 2.10.9 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2 Chapter 14: Flooding and Geomorphology Section 14.6.3 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
215	215.0002	Private	Land Use and Tenure	Property Devaluation	Based on ARTC's latest design, they are proposing to build an additional passing loop with the main line through the submitter's property, which will only add to the impacts on their property. The market value of their property will drop significantly due to the Inland Rail route because such a large portion of their property will be affected by the infrastructure, causing large losses in overall equity and profitability as a business.	nil.	<p>The revised reference design for the Project includes changes to the alignment in the vicinity of the submitter's property. Chapter 2: Project Rationale, Section 2.10.9 outlines the revised reference design options assessment, including the Millmerran Alternative Alignment which has been based upon ongoing consultation with local business and community, and the content of public submissions.</p> <p>As outlined in Chapter 8: Land Use and Tenure, Section 8.5.1, where the permanent disturbance footprint is unable to avoid the severance of agricultural land, the Project will require the acquisition of agricultural land, which may affect the operations of agricultural enterprises and grazing properties. Where land is to be acquired by the compulsory acquisition process in accordance with the Acquisition of Land Act 1967 (Qld), compensation will be assessed on an individual basis based on the market value of the land as at the date of resumption.</p> <p>Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance (Chapter 8: Land Use and Tenure, Section 8.6.2).</p>	<p>Chapter 2: Project Rationale Section 2.10.9 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6.2</p>
215	215.0003	Private	Flooding	Baseline/backgr ound sampling	There are also concerns with ARTC's floodwater estimations and computer modelling systems used to demonstrate that the floodwater depths around the Gore Highway are somewhat minimal. Using computer modelling and TRC (Toowoomba Regional Council) flood studies, ARTC's model flood water depth through the submitter's property and over the Gore Highway was claimed to be only 200 mm. The submitter provides photographic evidence of their property where 1200 posts were completely submerged. There are significant errors in ARTC's flood water predictions in this area as they have not accurately accounted for realistic flood water depths in their modelling.	nil.	<p>Construction and operations flood impacts on land in the Condamine River floodplain have been described in Chapter 14: Flood and Geomorphology Section 14.8.1 and Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 7.5.3.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 2 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>In addition, the Expert Flood Panel discussed within their Draft Report that some consideration should be given to reviewing the currently adopted Flood Impact Objectives (FIOs) to be more consistent with those adopted along the Narrabri to North Star alignment. Subsequently, ARTC have undertaken a review of the current FIOs, in consultation with the Expert Flood Panel, to consider the Quantitative Design Limits (QDLs) adopted on the NSW portions of Inland Rail, for inclusion in the revised draft EIS.</p> <p>This mapping has been included within the revised draft EIS to provide more granularity around potential flood impacts on land during operation, along with updated modelling results and further discussion of results. Mapping can be found in Appendix T2: Hydrology and Flooding Technical Report - Volume 2 and the online digital platform.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 1.4 Section 2 Section 7.5.3 Appendix T2: Hydrology and Flooding Technical Report - Volume 2</p>
215	215.0003	Private	Stakeholder engagement		Members of the community including the submitter were not officially notified about this meeting which was being held to show landowners how their properties would be affected by the Inland Rail project. Flyers and letters about the drop-in session were received up to one week after the session had already taken place. Despite a strong media presence at the meeting (both Channel 7 and Channel 9), the media crews weren't allowed to show the ARTC employees faces and only film from the waist down. ARTC's preferred method of consultation is also flawed and micromanaged. Instead of holding open and honest large community meetings; their preferred method is conducting one on one drop in sessions. The CCC process was also very frustrating to landowners because people gave up their valuable time to attend, only to sit and listen to ARTC ramble on without any substance.	nil.	<p>ARTC notes that this submission refers to a community engagement event held in June 2016. The community engagement associated with the development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and subsequent corridor selection process was managed by the Federal Department of Infrastructure and Regional Development.</p> <p>Targeted engagement has been undertaken in the development of the revised draft EIS, and this is documented in Appendix E: Consultation Report. The consultation approach is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on the consultation approach is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC established the two CCC's for the Project in December 2017 to facilitate broader community involvement in the Project. The purpose of a CCC is to:</p> <ul style="list-style-type: none"> ▶ seek community feedback and input to Project outcomes ▶ increase awareness and understanding for the Project by providing communities with 'one-point of call' for Project information ▶ act as a conduit between the Project team and the community by providing information or addressing issues and concerns. <p>While the committees are not decision-making bodies, the input and feedback they receive will help the Project to better address community issues and concerns during planning and design. The CCC meetings are chaired by an independent chair and that committee members are given the opportunity to nominate topics for the agenda. Details of the CCC process is outlined in Appendix E: Consultation Report, Section 4.</p>	<p>Appendix E: Consultation Report Section 4</p>
215	215.0004	Private	Land Use and Tenure	Baseline/backgr ound sampling	The submitter highlights the flaws in conducting a multi criteria analysis to select the best route out of 4 proposed alternative. The results of the MCA were also flawed as there wasn't enough emphasis on critical issues e.g. flooding, high quality agricultural land. He also highlights that no detail costings had been done across the Condamine floodplain.	Look for viable alternative router forestry route	<p>As described in Section 2.8 and Section 2.9 of Chapter 2: Project Rationale of the revised draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works.</p> <p>ARTC has considered a balanced approach to determining the Inland Rail alignment, considering operational, environmental, economic and social factors. ARTC are committed to minimising loss of agricultural land as far as is reasonably practicable by co-locating with existing rail or road where possible or aligning with property boundaries as much as possible. However it is acknowledged that there will be a loss of good quality agricultural land that cannot be avoided (Chapter 8: Land Use and Tenure, Section 8.6.1).</p> <p>Where loss of agricultural land was unable to be avoided, refinement of the horizontal alignment considered (among other environmental, social, cultural, economic and technical constraints), placement of the rail corridor such that it traverses around, or as close as possible to, property boundaries to reduce potential fragmentation and sterilisation of Class A land, Class B land and land within an IAA (Chapter 8: Land Use and Tenure, Table 8-46 and Section 8.5.4). Intensive livestock operations, including feedlots and poultry farms, have also been avoided where possible.</p> <p>Where the permanent disturbance footprint is unable to avoid the severance of agricultural land and enterprises due to the partial acquisition of a property, acquisition will be investigated in consultation with landowners. The consideration of partial or full acquisition of these properties will be determined on a case-by-case basis during detailed design, in accordance with the Acquisition of Land Act 1967 (Qld). Ongoing consultation with individual landowners will occur to determine if the agricultural enterprise can remain viable (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Where changes to flooding and geomorphology are identified, nominated Flood Impact Objectives (FIO) have been developed to provide guidance and consideration to indirect impacts on particular land uses (Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 14: Flooding and Geomorphology). The FIOs applied to assess the Project impacts including erosion and scouring potentials are presented in Chapter 14: Flooding and Geomorphology, Table 14-4, Section 14.6.3. The Project will target achieving the FIOs for events up to and including the 1% AEP for land, receptors, and/or infrastructure, and where the FIOs are met, it is reasonable to assume there will be no adverse impacts from flooding on the use of land.</p> <p>Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case by case basis, including through consultation with stakeholders and landowners. This is also further discussed in the revised draft EIS, Chapter 8: Land Use and Tenure, Section 8.5.1.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.1 Section 8.6.2 Table 8-46 Chapter 14: Flooding and Geomorphology Section 14.6.3 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
216	216.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> ▶ The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondiwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. ▶ The SIA survey does not represent views of the community members who may be impacted by the project. 	The SIA Survey should be repeated.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	<p>Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2</p>
216	216.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	<ul style="list-style-type: none"> ▶ The draft EIS is incomplete due to the omission of a Community Wellbeing Plan that will not be completed until the detail design phase. ▶ The true social impact on the communities of Millmerran, Pampas, Brookstead, Pittsworth and Southbrook cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. The detail is scant and is 'not yet available'. 	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during Detailed Design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6</p>
216	216.0004	Private - Brookstead	Noise and Vibration	Operational rail noise	ARTC have not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As will all of prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway Operations. There will be engineering and further acoustic assessment works (including noise modelling) undertaken during the Detailed Design and Construction Works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
216	216.0006	Private - Brookstead	Stakeholder engagement		<ul style="list-style-type: none"> ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer'; resulting in negative social impacts on the community. ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landowners. The EIS provides alot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board. ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records. ARTC has failed to build visibility in the community as the majority of affected landowners did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach. The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness. 	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTCs stakeholder engagement process. Draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.2.1.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the Detailed Design and Construction Works methodology. Individual property treatments will be developed in consultation with landowners/occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <ul style="list-style-type: none"> As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below: ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	<p>Chapter 6: Stakeholder Engagement</p> <p>Section 6.2.4</p> <p>Section 6.2.5</p> <p>Section 6.6</p> <p>Table 6.11</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p> <p>Section 2.1</p> <p>Section 4.1</p> <p>Section 5.3</p> <p>Section 5.5</p> <p>Section 6</p> <p>Section 6.4</p> <p>Appendix X: Social Impact Assessment</p> <p>Section 4.3</p> <p>Section 6.2</p> <p>Section 6.2.2</p>
217	217.0001	Private	Flooding		The submitter voices her opposition to the project going through the township of Brookstand and Pittsworth. It is a rich agricultural area which has the potential of severe flooding. The submitters wants ARTC to consider alternative route for this area. She proposes Inglewood as it has large trees and grass which are not prone to flooding as much as the current proposed route. The submitter also states that some wealthy influential and powerful people may have personal gains from the proposed route.	Reroute through Inglewood	<p>The EIS is focussed on the chosen alignment selected by the Australian Government.</p> <p>The chosen rail alignment has been supported by several technical reports and reviews between 2006 and 2020, which are detailed in Chapter 2: Project Rationale. Section 2.8 and Section 2.9 details the corridor and alignment options considered for the Section of the Project between Yelarbon and Gowrie. A copy of the Inland Rail B2G Alternative Route Comparison Review is available at: inlandrail. gov. au/people-and-community/Border-to-Gowrie-route-assessment</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p>
218	218.0001	Local Government	Project scope		Commencement of construction works prior to the end of 2021	Council has concerns regarding this timeframe and requires that construction works not commence prior to the finalisation of the Independent Internal Panel of Experts for Flood Studies of Inland Rail in Queensland and approvals of the EIS.	<p>A revised schedule has been provided in the revised draft EIS at Chapter 5: Project Description, Section 5.3.6. Pre-construction activities and early works are undertaken prior to full mobilisation of the contractor. These works may be undertaken under a separate contract but will not commence until the Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) has been approved by the Coordinator-General and the Australian Government Minister for the Environment, and the relevant early works Construction Environmental Management Plan (CEMP) has been endorsed by the Environmental Monitor.</p> <p>The anticipated timing of stages for the Project are shown in Table 5-3.</p> <p>The Independent International Panel of Experts for Flood Studies (the Panel) has submitted a final report, dated 6 September 2022. The report has been made available and is publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr. qld. gov. au).</p> <p>The report presents the outcomes of the Panel's review of the flood models and reference designs developed by ARTC for the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Project sections.</p> <p>The Queensland and Australian governments have accepted the Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has undertaken a substantial amount of work to identify existing flooding characteristics and to assess and mitigate potential impacts associated with the four Project sections. This work includes responding to the issues raised by the Panel in its respective draft reports. ARTC has responded to all issues raised in the draft reports, including:</p> <ul style="list-style-type: none"> providing additional information which addressed the queries raised completing additional work to address issues and committing to incorporating the revised results in future documentation (specifically revised draft EIS documentation) committing to undertake additional works to address the Panel's comments and incorporating the results in future documentation (specifically revised draft EIS documentation) recommending that some issues raised are dealt with at Detailed Design stage. <p>A detailed summary of these issues and ARTC's responses are presented in the Issues Management Register (IMR) in Appendix A to Appendix D in the final report.</p> <p>Next Steps</p> <ul style="list-style-type: none"> ARTC have committed to implement the Panel's six recommendations outlined in the Final Report. ARTC's flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event. Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project Approvals and Corridor Acquisition, Detailed Design, Construction Works, Operations). A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions. Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.3.6</p> <p>Table 5-3</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.4</p> <p>Appendix T1: Hydrology and Flooding Technical Report</p> <p>Appendix A</p> <p>Appendix B</p>
218	218.0002	Local Government	Project scope		Council's technical review of the draft EIS is that it does not meet the requirements of the Terms of Reference. He Draft EIS consistently does not provide sufficient detail or evidence regarding the potential and possibly significant environmental, infrastructure, water resource, cultural, social and economic impacts of the proposed project or identify and commit to appropriate mitigation measures.	Council strongly recommends that the OCG require the draft EIS to be updated to address these matters to ensure it meets the full requirements of the TOR as this is a statutory obligation of the proponent under the SDPWO Act.	<p>As described in the revised draft EIS at Chapter 1: Introduction, Section 1.5, between 23 January 2021 and 4 May 2021, the draft EIS was made available for public comment under Section 33 of the SDPWO Act and public submissions were received. Terms of reference compliance has been updated for the revised draft EIS in Appendix A2: Terms of Reference - Cross Reference Table. On 4 January 2022 the Coordinator-General requested additional information under Section 34B(2) of the SDPWO Act. The Office of Coordinator-General additional information requirements and the proponent's (ARTC) responses to the public submissions received comprise the basis of assessment for the revised draft EIS.</p> <p>The revised draft EIS has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. In addition, changes have been made to the reference design that are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>The following steps in the coordinated Project process remain to be completed:</p> <ul style="list-style-type: none"> Once the Office of Coordinator-General has deemed that the additional information requirements have been satisfactorily addressed, the revised draft EIS will be made available for public comment. Submissions can be made to the Coordinator-General to be considered during evaluation of the revised draft EIS. The Coordinator-General will evaluate the revised draft EIS and may accept it as the final EIS. If accepted as final, the Coordinator-General prepares a report (i.e. Coordinator-General's evaluation report) on the final EIS consistent with the requirements of the SDPWO Act. <p>The EIS identifies and describes the environmental values that must be protected as specified in Section 9 of the Environmental Protection Act 1994 (Qld) (EP Act), the Environmental Protection Regulation 2019 (Qld), environmental protection policies, water resource plans, State Planning Policy, relevant guidelines and the EPBC Act. The relevant controlling provision for the Project is listed threatened species and communities (Sections 18 and 18A) (reference number EPBC 2017/7944). Refer Appendix O: Matters of National Environmental Significance Report for further detail.</p> <p>Chapter 3: Legislation and Project Approvals Process summarises the key Commonwealth and State legislation, and local government plans and policies and how they relate to approvals necessary for the planning, Construction Works and Operations stages of the Project. Chapter 3: Legislation and Project Approvals Process also tables the potential post-EIS approvals (Table 3-5), providing the triggers for each approval, the relevant administering authority and whether potential exemptions are available to the Project and ARTC. Approval and permit requirements may vary depending on the final design and construction methodology, and future changes in statutory requirements prior to the Project's implementation.</p> <p>The revised draft EIS compliance with the terms of reference is documented in Appendix A2: Terms of Reference - Cross Reference Table.</p>	<p>Chapter 1: Introduction</p> <p>Section 1.5</p> <p>Chapter 3: Legislation and Project Approvals</p> <p>Table 3-5</p> <p>Chapter 5: Project Description</p> <p>Section 5.3.3</p> <p>Appendix A2: Terms of Reference - Cross Reference Table</p> <p>Appendix O: Matters of National Environmental Significance Report</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0003	Local Government	General project opinion - negative		Overarching key issues of concern regarding the Draft EIS	<p>Overarching issues of concern:</p> <ul style="list-style-type: none"> ▶ Conflicting, dated and irrelevant information and statements throughout the document (between the executive summary, main document, and the appendices, as well as between different sections). ▶ Gaps, inconsistencies, and deficiencies in technical studies, including a lack of commitment to the application of industry standard best practice and guidance. ▶ Potential impacts that are inadequately or inconsistently identified, assessed, and mitigated to ensure no significant residual impacts by the proposal. ▶ Lack of consideration of the broader impacts of the proposal on existing land uses and land users. ▶ Limited or no evidence of how significant issues previously and consistently raised by TRC directly with the proponent have been considered in the Draft EIS and how those issues are proposed to be managed (an example includes use of TRC water resources). <p>Attached is the full Table of issues, comments and recommendations that Council is of a view needs to be addressed prior to the final approval by the Coordinator General. Council recommends the Coordinator General seek additional information given the potential nature, scale and duration of the impacts of the B2G project on the environment (be it natural, built, cultural, social or economic).</p>	ARTC acknowledge TRC's concerns. Significant additional assessments and field surveys have been conducted since submission of the draft EIS. These assessments have been used to update the revised draft EIS chapters and supporting documents to meet the terms of requirement (see Appendix A2: Terms of Reference Compliance Table), stakeholder concerns, and to remove inconsistencies and deficiencies in research, modelling, assessment of impacts and mitigations. The revised draft EIS replaces in full the draft EIS.	Appendix A2: Terms of Reference Compliance Table
218	218.0004	Local Government	Surface Water	Construction water supply	<p>Availability of water in the Perseverance and Cooby dams</p>	<p>Construction Water The draft EIS identifies that Perseverance and Cooby dams may be sources of water for construction purposes. Council officers have consistently advised that these sources are not available, and we request that this reference be removed.</p> <p>Council reiterates this and further determined that Council's response is that all water sources under its control including raw, potable, surface and bore water used to supply all Toowoomba Communities will not be available for construction of the Inland rail works by the proponent or its contractors.</p> <p>Council's priority for water supply will always be for urban supply over construction works and the proposal to use these water sources for construction purposes is considered inappropriate. Given the significance of water in the region, the proponent should clearly outline its proposed approach to construction water management, which does not include TRC water resources.</p>	<p>The construction water strategy for the Project has been updated to reflect amendments to the reference design, stakeholder feedback received during consultation and from submissions on the draft EIS, as well as advances made in planning for construction of the project. Revised details are provided in Section 5.6.24 of Chapter 5: Project description regarding:</p> <ul style="list-style-type: none"> ▶ Estimated volumes required, by activity ▶ The quality of water required for various tasks ▶ The sourcing of water, including reliability and access considerations ▶ Monitoring of the take and usage of water. <p>In revising the construction water strategy, ARTC has recognised TRC's position of prohibiting access to Council's water sources for the project. Consequently, there is no intention to obtain water from TRC-managed sources in the revised construction water strategy. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	<p>Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements</p>
218	218.0005	Local Government	Traffic and Transport	Level crossing	<p>Impact on local government road network</p>	<p>Impact on LGA road network The Draft EIS and reference design identifies 36 local road-rail interfaces and proposes to create 10 new passive level crossings; 5 new active level crossings; 6 grade separated crossings, with no crossings or consolidations, diversions or closures of local roads proposed at the remaining 15 locations.</p> <p>TRC does not support the use of passive level crossings at any new road-rail interfaces or any re-purposed existing road-rail interfaces, whether supported by Australian Level Crossing Assessment Model (ALCAM) outputs or not. TRC has not, at the time of making this submission, agreed in-principle or otherwise, with any of the proposed road-rail interfaces, or any of the consolidations, diversions or closures of local roads proposed in the Draft EIS.</p> <p>The Draft EIS requires updating to commit to appropriate consultation with the landowners where private land is proposed to be used for laydown areas as a matter of priority. Laydown areas should also be appropriately identified on a map.</p>	<p>ARTC note that in the revised draft EIS all passive level crossings have been eliminated within the Toowoomba Region based on the latest ALCAM inputs agreed with the road managers.</p> <p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT of Appendix AA: Traffic Impact Assessment. This overview provides Office of Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p>	<p>Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Appendix BT</p>
218	218.0006	Local Government	Project scope		<p>Recognised standards and practices. Results of technical studies must be known prior to commencement of construction and approvals</p>	<p>Recognised Standards and Practices Councils position is that the proponent should be required to maintain the recognised standards and practices as stated in the Terms of Reference and that it be required to achieve these standards and practices in the information responding to the Coordinator General. Construction and approvals should not commence prior to the results and finalisation of the technical studies including but not limited to the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland.</p>	<p>The revised draft EIS compliance with the terms of reference is documented in Appendix A2: Terms of Reference - Cross Reference Table.</p> <p>Chapter 3: Legislation and Project Approvals Process summarises the Commonwealth Government and Queensland Government legislation relevant to the Inland Rail Border to Gowrie Project (the Project) and identifies the approvals, permits, licences and authorities necessary for the Detailed Design, Construction Works and Operations stages of the Project. Figure 3-1 provides a schematic explanation of the interaction of the Coordinated Project process (under the State Development and Public Works Organisation Act 1971 (Qld) (SDPWO Act)) with the Planning Act 2016 (Qld) (Planning Act) while Figure 3-2 sets out the steps in the process, including remaining steps. Further explanation of the approval processes for prescribed environmentally relevant activities under the Environmental Protection Act 1994 (Qld) and Planning Act are shown in Figure 3-3. Table 3-1 details key approvals sought through the EIS. Table 3-5 details potential post-environmental impact statement approvals for the project.</p> <p>The revised draft EIS has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. In addition, changes have been made to the reference design that are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>This includes the outcomes of the final report of the Independent International Panel of Experts for Flood Studies (the Panel), dated 6 September 2022. The report has been made available and is publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au).</p> <p>The Queensland and Australian governments have accepted the Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>The final report presents the outcomes of the Panel's review of the flood models and reference designs developed by ARTC for the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Project sections.</p> <p>ARTC has undertaken a substantial amount of work to identify existing flooding characteristics and to assess and mitigate potential impacts associated with the 4 Project sections. This work includes responding to the issues raised by the Panel in its respective draft reports. ARTC has responded to all issues raised in the draft reports, including:</p> <ul style="list-style-type: none"> ▶ providing additional information which addressed the queries raised ▶ completing additional work to address issues and committing to incorporating the revised results in future documentation (specifically revised draft EIS documentation) ▶ committing to undertake additional works to address the Panel's comments and incorporating the results in future documentation (specifically revised draft EIS documentation) ▶ recommending that some issues raised are dealt with at Detailed Design stage. <p>A detailed summary of these issues and ARTC's responses are presented in the Issues Management Register (IMR) in Appendix A to Appendix D in the final report.</p> <p>Next Steps</p> <ul style="list-style-type: none"> ▶ ARTC have committed to implement the Panel's six recommendations outlined in the Final Report. ▶ ARTC's flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event. ▶ Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project Approvals and Corridor Acquisition, Detailed Design, Construction Works, Operations). ▶ A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions. ▶ Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p>	<p>Chapter 3: Legislation and Project Approvals Process Figure 3-1 Figure 3-2 Figure 3-3 Table 3-1 Table 3-5 Chapter 5: Project Description Section 5.3.3 Chapter 14: Flooding and Geomorphology Section 14.4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Appendix A to D</p>
218	218.0007	Local Government	Social Impact Assessment	Workforce and employment	<p>No focus or commitment in providing real jobs and opportunities to members and businesses of the local community</p>	<p>nil.</p>	<p>Appendix X: Social Impact Assessment, Section 8.3.1 notes that to boost local workforce numbers, the Project's procurement process for the construction contract enables competitive bidding for local employment targets and procurement targets, incentivising the contractors to maximise local benefits.</p> <p>Appendix X: Social Impact Assessment, Section 8.3 notes that "employment opportunities will be available for professional staff and supervisors, trade workers and plant operators, earthworks crews, bridge structure teams, capping and track-works crews, safety and signalling systems installation crews, fencers and labourers," and that "one of ARTC's primary aims is to maximise employment opportunities for residents within the SIA study area".</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 has been updated to provide examples of and commentary regarding minimum and aspirational targets relevant to local and Indigenous procurement and workforce participation.</p> <p>Businesses which trade from a street address within the SIA study area or Region (as defined above) are considered "local". Appendix X: Social Impact Assessment, Section 8.6.3. has been updated in this regard. This is consistent with the reporting framework for other Inland Rail Projects and ARTC is unable to adopt additional Project-specific definitions.</p>	<p>Appendix X: Social Impact Assessment Section 8.3 Section 8.3.1 Section 8.6.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0008	Local Government	Project scope	Increase in flows	Hydrology - principle of no actionable nuisance in relation to any changes in drainage flows and/or flow paths.	<p>Hydrology The draft EIS addresses only technical engineering design criteria and fails to address the common law principle of no actionable nuisance in relation to any changes in drainage flows and/or flow paths. All direct and indirect impacts on local drainage flows and/or flow paths should be identified and mitigation measures provided. Construction and approvals should not commence prior to the results and finalisation of the technical studies including but not limited to the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland.</p> <p>The reference design indicates that the proposed project will intercept, divert and concentrate upstream overland flows to higher locations in each catchment and may even potentially divert flow between catchments. These changes have the potential to adversely affect TRC road and drainage infrastructure and private property owners.</p> <p>The draft EIS should be amended to address groundwater levels and quality. The proponent should propose appropriate mitigation measures to ensure risks to levels and quality are properly managed (ALARP).</p>	<p>The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). Flood flow distribution has been assessed and is discussed in Section 14.9.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.</p> <p>Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.5.1 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.10.1 (Table 14-117),11 of Chapter 14: Flooding and Geomorphology.</p> <p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.</p> <p>As per ARTC's Mitigation Framework, ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6.3</p> <p>Section 14.8.1</p> <p>Section 14.11</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 4.2</p> <p>Section 5-17</p> <p>Section 18.2</p> <p>Appendix T2: Flooding and Hydrology Technical Report - Volume 2</p>
218	218.0009	Local Government	Cultural Heritage	Indigenous cultural heritage	Cultural Significance - areas have not been adequately highlighted or protected	<p>Cultural Significance Areas of Cultural Significance have not been adequately highlighted or protected within the draft EIS. These areas are required to be identified with potential impacts highlighted. Mitigation measures are required to minimise impacts on these Areas of Cultural Significance. Impacts to areas of aboriginal cultural heritage and historical rail lines are proposed, however the Draft EIS did not include copies of Cultural Heritage Management Plans (CHMP) or other measures to demonstrate how these impacts would be mitigated.</p>	<p>As outlined in Chapter 19: Cultural Heritage , Section 19.5 and 19.6, impacts to Indigenous cultural heritage will be identified and managed in accordance with the Cultural Heritage Management Plans developed between ARTC and Bigambul People, Western Wakka Wakka people and the Endorsed Aboriginal Parties for the unclaimed area in 2018. Cultural Heritage Management Plans are confidential documents and cannot be made publicly available.</p> <p>The identification of Indigenous cultural heritage and assessment of potential impacts is occurring in consultation with the relevant Aboriginal Parties and in accordance with the approved CHMPs for the Project which forms the basis for tangible and intangible Indigenous heritage considerations. CHMPs for the Project are confidential and do not allow details on their content to be disclosed without following due consideration to the relevant Aboriginal Parties. The broad activity types defined in the Aboriginal Cultural Heritage Act Duty of Care Guidelines provides general guidance on the potential for harm to be caused to Aboriginal cultural heritage.</p> <p>The Duty of Care Guidelines recognise that it is unlikely that Indigenous cultural heritage will be harmed where:</p> <ul style="list-style-type: none"> ▶ The proposed activity is on an area previously subject to significant ground disturbance and the activity will impact only on the area subject to the previous disturbance; or ▶ The impact of the proposed activity is unlikely to cause any additional harm to Indigenous cultural heritage than that which has already occurred. 	<p>Chapter 19: Cultural Heritage</p> <p>Section 19.5</p> <p>Section 19.6</p>
218	218.0010	Local Government	Flora and Fauna	Mitigation measures	Flora and fauna - avoidance of impacts	<p>Flora and Fauna The Draft EIS requires amendment to further outline and clarify a commitment to the avoidance of potential impacts on native flora and fauna. Further surveys, including on ground assessments, are required to assist in the identification of core fauna and flora habitats. Minimising or mitigating options are secondary options to be employed after all avenues of avoidance have been exhausted.</p> <p>The Draft EIS should demonstrate how impacts to environmentally sensitive areas have been avoided and minimised. The proponent should commit to a more comprehensive assessment of ecological impacts and mitigation measures that align with standard industry practice.</p>	<p>Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project alignment. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction activities and early works stage, construction works and Operations stages.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, provides further context and the framework for implementation of these proposed mitigation and management measures.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5</p> <p>Section 11.6</p> <p>Section 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
218	218.0012	Local Government	Cultural Heritage	Non-Indigenous cultural heritage	Protection of Mt Kent Observatory	<p>The Draft EIS should recognise the international significance of the Mount Kent Observatory, and provide mitigation measures to ensure that the astronomical observational capabilities of the Observatory (protection of the night sky) are not adversely impacted to the satisfaction of the University of Southern Queensland and its astronomical partners.</p>	<p>An obtrusive lighting assessment has been conducted and is documented as part of the Landscape and Visual Impact Assessment for the Project (Chapter 10: Landscape and Visual Impact Assessment, Section 10.3 3.3 and 10.5.5 and Appendix K: Landscape and Visual Impact Assessment Section 4.11 and Section 9.2 (Appendix 3)). The obtrusive lighting assessment concludes that there will be no impact to the observational capabilities of the Mount Kent Observatory. Due to the distance of Mt Kent observatory 21km southeast of the alignment, there are no concerns regarding lighting impacts associated with the Project. The lighting proposed is essential for safety and the current mitigation measures incorporated in the report include to keep this to the minimum required standards. An obtrusive lighting consultant met with Mt Kent observatory and they noted satisfaction with the assessments to date. The Project remains committed to continue to engage with Mount Kent Observatory as it progresses into detailed design.</p>	<p>Chapter 10: Landscape and Visual Impact Assessment</p> <p>Section 10.3.3.3</p> <p>Section 10.5.5</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.11</p> <p>Section 9.2</p> <p>Appendix 3</p>
218	218.0013	Local Government	Editorial		<p>Inconsistencies between executive summary and Draft EIS: Term of Reference (TOR) 8.1 requires that the executive summary should describe the project and convey the most important and preferred aspects and environmental management options relating to the project in a concise and readable form. It should use plain English, avoid jargon, be written as a stand-alone document, and be structured to follow the EIS. It should be easy to reproduce and distribute on request to those who may not wish to read or purchase the whole EIS.</p> <p>Technical review of the Draft EIS by Toowoomba Regional Council (TRC) has revealed that there are many inconsistencies between the executive summary and the Draft EIS including, but not limited to, incorrect data, errors in sourcing references and inconsistencies in proposed project timeframes. The executive summary cannot be relied upon as a standalone document. As such, the document does not meet the requirements of TOR 8.1.</p>	<p>The Draft EIS requires updating to ensure it is consistent, accurate and appropriate and that the executive summary accurately reflects the detail provided in the main document and its associated appendices as required by TOR 8.1.</p>	<p>Substantial revisions have been made to the revised draft EIS, capturing the outcomes of on-going investigations and ensuring a document that is more consistent, accurate and appropriate.</p> <p>The Executive Summary and Conclusions (Chapter 25: Conclusions) have also been reworked and in so doing reflects the revisions that have been made to the body of the EIS.</p> <p>The Executive Summary has been developed to address the requirements of the Terms of Reference, Section 8.As such it describes the Project and conveys the most important and preferred aspects and environmental management options relating to the Project. Key aspects and relevant information has been extracted from the revised draft EIS, to achieve consistency across the EIS and with the Executive Summary, include several chapters but in particular:</p> <ul style="list-style-type: none"> ▶ Chapter 2: Project Rationale ▶ Chapter 5: Project Description <p>The Executive Summary has been developed to be a stand-alone document, structured to mirror the contents of the revised draft EIS. This document is intended to provide a clear summary of the Project (including aspects, environmental management options) to stakeholders, potentially impacted landowners and the greater public who wish to review each report presented in the revised draft EIS.</p>	<p>Executive Summary</p> <p>Chapter 2: Project Rationale</p> <p>Chapter 5: Project Description</p> <p>Chapter 25: Conclusions</p>

218	218.0014	Local Government	Stakeholder engagement		<p>Consultation: TOR 7.8 requires the EIS to 'describe the consultation that has taken place and how the responses from the community and agencies have been incorporated into the design and outcomes of the project. '</p> <p>TOR 7.9 requires the inclusion of a public consultation report (as an appendix) 'detailing how the public consultation plan was implemented and the results of the implementation.</p> <p>TRC have met with the proponent's project team on multiple occasions in relation to concerns TRC have regarding the proposed adverse impacts relating directly to the proposed project. However, the details of commitments made by the proponent during consultation with TRC have not been adequately addressed or included as commitments in the Draft EIS, including issues relating to:</p> <ul style="list-style-type: none">▸ Construction water sources;▸ The proposed management of road/rail crossing interfaces do not meet the desired outcome of the Federal Rail Safety Guidelines);▸ Local road and traffic requirements;▸ The appropriate management of flood mitigation in the Condamine Floodplain;▸ The current and significant accommodation shortages in the TRC region; and▸ The appropriate management of providing regional job opportunities for the local community. Consultation: TOR 7.8 requires the EIS to 'describe the consultation that has taken place and how the responses from the community and agencies have been incorporated into the design and outcomes of the project. <p>TOR 7.9 requires the inclusion of a public consultation report (as an appendix) 'detailing how the public consultation plan was implemented and the results of the implementation.</p> <p>TRC have met with the proponent's project team on multiple occasions in relation to concerns TRC have regarding the proposed adverse impacts relating directly to the proposed project. However, the details of commitments made by the proponent during consultation with TRC have not been adequately addressed or included as commitments in the Draft EIS, including issues relating to:</p> <ul style="list-style-type: none">▸ Construction water sources;▸ The proposed management of road/rail crossing interfaces do not meet the desired outcome of the Federal Rail Safety Guidelines);▸ Local road and traffic requirements;▸ The appropriate management of flood mitigation in the Condamine Floodplain;▸ The current and significant accommodation shortages in the TRC region; and▸ The appropriate management of providing regional job opportunities for the local community. Consultation: TOR 7.8 requires the EIS to 'describe the consultation that has taken place and how the responses from the community and agencies have been incorporated into the design and outcomes of the project. ' <p>TOR 7.9 requires the inclusion of a public consultation report (as an appendix) 'detailing how the public consultation plan was implemented and the results of the implementation.</p> <p>TRC have met with the proponent's project team on multiple occasions in relation to concerns TRC have regarding the proposed adverse impacts relating directly to the proposed project. However, the details of commitments made by the proponent during consultation with TRC have not been adequately addressed or included as commitments in the Draft EIS, including issues relating to:</p> <ul style="list-style-type: none">▸ Construction water sources;▸ The proposed management of road/rail crossing interfaces do not meet the desired outcome of the Federal Rail Safety Guidelines);▸ Local road and traffic requirements;▸ The appropriate management of flood mitigation in the Condamine Floodplain;▸ The current and significant accommodation shortages in the TRC region; and▸ The appropriate management of providing regional job opportunities for the local community. <p>Consultation: TOR 7.8 requires the EIS to 'describe the consultation that has taken place and how the responses from the community and agencies have been incorporated into the design and outcomes of the project.</p> <p>TOR 7.9 requires the inclusion of a public consultation report (as an appendix) 'detailing how the public consultation plan was implemented and the results of the implementation.</p> <p>TRC have met with the proponent's project team on multiple occasions in relation to concerns TRC have regarding the proposed adverse impacts relating directly to the proposed project. However, the details of commitments made by the proponent during consultation with TRC have not been adequately addressed or included as commitments in the Draft EIS, including issues relating to:</p> <ul style="list-style-type: none">▸ Construction water sources;▸ The proposed management of road/rail crossing interfaces do not meet the desired outcome of the Federal Rail Safety Guidelines);▸ Local road and traffic requirements;▸ The appropriate management of flood mitigation in the Condamine Floodplain;▸ The current and significant accommodation shortages in the TRC region; and▸ The appropriate management of providing regional job opportunities for the local community.	<p>The requirements of TOR 7.8 have not been met by the Draft EIS and as such, the Draft EIS requires updating to include real and appropriate commitments including, but not limited to, those already made by the proponent to TRC during consultation sessions to meet the requirements of TOR 7.8 and 7.9.</p>	<p>Appendix E: Consultation Report has been updated to include consultation that has been undertaken to inform the revised draft EIS. This includes extensive consultation with TRC in Appendix E: Consultation Report, Section 4.ARTC understands that TRC is one of the key stakeholder critical to the success of the Inland Rail Project. As such, ARTC maintains regular, scheduled engagement with TRC at multiple levels to ensure this stakeholder has clear opportunities for input and consultation. ARTC notes the key areas of concern, as outlined in TRC's submission to the draft EIS, and has been working with the submitter to address concerns.</p> <p>ARTC understands the working relationship with TRC is well established and constructively collaborative. A formal schedule of meetings has been consistent since 2017, as an established means to communicate updates, resolve concerns and identify development opportunities.</p> <p>Engagement with TRC comprises interactions on four levels:</p> <ol style="list-style-type: none">1. Mayor and councillor briefings, both formal and informal2. Management working group3. Technical working group4. Officer level working groups focusing on key issues, including social impact, offsets, agreements, etc. <p>ARTC meets quarterly with TRC to discuss matters relevant to the SIA and consider feedback on community concerns. Consultation outcomes are detailed in Appendix X: Social impact assessment. Key outcomes from consultation have included:</p> <ul style="list-style-type: none">▸ upgrade of all proposed level crossings in the TRC region from passive level crossings to active level crossing▸ changes to the local road network in Pampas and Brookstead▸ changes to the Athol School Rd and Purcell Rd▸ widening of road reserves to allow for upgraded infrastructure and future proofing▸ advice about engaging with communities in the TRC region, including complaints grievance procedures▸ key input into legacy planning for the region, such as telecommunications connectivity, visual amenity.	Appendix E: Consultation Report Section 4

218	218.0015	Local Government	Editorial		<p>Inconsistencies and issues with main document and its appendices: There are numerous inconsistencies and issues with the Draft EIS that occur throughout the document, including, but not necessarily limited to:</p> <ul style="list-style-type: none">As mentioned in Comment 1, the executive summary is inconsistent with the main document (technical chapters and appendices), is too long (128 pages) and should be condensed further to ensure the key considerations, issues and outcomes are highlighted.Chainage is introduced early in the Draft EIS (Chapter 1, Section 1.2.2.2), providing the reader with horizontal distances and locations along the alignment. However, the use of chainage is not consistent throughout the Draft EIS and is specifically not referred to in any useful way in many of the technical chapters, including Chapter 9 (uses GIS references for identifying the location of viewpoints, and chainage for discussing mitigation); and Chapter 10 (chainage is only mentioned when discussing the wild dog check fence and bridge locations (sections which have been copied from elsewhere in the document). This inconsistent use of chainage throughout the document results in the reader being unable to easily identify the cumulative impact the proposed project may have on the surrounding environment.Geocentric Datum of Australia 1994 (GDA94) is used throughout the Draft EIS. While this is the current standard, GDA2020 is the current system and provides a more robust and accurate datum.The Draft EIS fails to address the potential impact to existing utilities as a result of the proposed project.Certain Chapters and Appendices of the Draft EIS consistently refers to NSW issues (including, but not limited to, legislation and community consultation, processes, and requirements) at times in some detail. This level of detail is not reflected in the same information when it directly relates to Queensland. The proposed project is located in Queensland.Chapter 2, Section 2.1, Table 2.1 (alternative routes), Forestry route, via Cecil Plains. The route option cross-reference not provided. There are numerous other formatting/referencing errors (e.g., repetitive paragraphs) throughout the document which indicate a lack of final review.Technical review has revealed data, State and Federal guidelines, standards etc used to inform some technical studies are not industry best practice, fit for purpose, or considered to be technically appropriate or current.	<p>It is recommended that the Draft EIS be rewritten to remove inconsistencies and confusion raised through missing, potentially misleading, or inaccurate information, including, but not necessarily limited to:</p> <ul style="list-style-type: none">Executive Summary needs to be consistent with the main document and summarised further to meet the requirements of TOR 8.1.The Draft EIS should reference chainage consistently in order to ensure that the actual impact the proposed project will have on the surrounding environment may be easily identified and understood by the reader, including the ability to identify cumulative impact.The Draft EIS should reflect GDA2020 to align with TRC systems and achieve best practice.The Draft EIS requires update to adequately address potential impacts to existing utilities.The Draft EIS should reflect the fact that the project is located in Queensland, not NSW. This is particularly relevant when discussing matters relating to topics such as stakeholder and community consultation.Table 2.1 requires updating to provide a correct cross-reference. It is recommended a final review of the document to correct formatting and referencing errors be completed.Technical Chapters and Appendices require updating to ensure relevance to proposed project and the surrounding environment (further detail provided in comments following).Technical studies to be reviewed and updated to ensure that they accord with the requirements of the TOR and current Queensland and Federal regulatory requirements, industry guidance and best practice.	<p>Substantial revisions have been made to the revised draft EIS, capturing the outcomes of ongoing investigations and ensuring a document that is more consistent, accurate and appropriate.</p> <p>Revisions include:</p> <ul style="list-style-type: none">A complete review and update of the chapters and technical studies including addressing the request by the Coordinator-General for additional informationChapter 8: Land Use and Tenure revised to include additional information on potential impacts on utilities; Table 8-43 summarises the potential impacted utilities; Appendix B4: Utilities illustrates all utilities potentially impacted by the Project.Changes have been made to chainages to reflect revisions to the reference design; the revised chainages have been mapped to enable impacts to be more easily identified and understood.More complete, accurate and consistent cross-referencing. <p>Mapping Projection used for the EIS is in accordance with the ToR 7.5 and in Geocentric Datum of Australia 1994 (GDA94)</p> <p>The Executive Summary and Conclusions (Chapter 25: Conclusions) have been reworked and in so doing reflects the revisions that have been made to the body of the revised draft EIS. The Executive Summary has been developed to address the requirements of the Terms of Reference, Section 8.As such it describes the Project and conveys the most important and preferred aspects and environmental management options relating to the Project. Key aspects and relevant information has been extracted from the revised draft EIS, to achieve consistency across the EIS and with the Executive Summary, include several chapters but in particular:</p> <ul style="list-style-type: none">Chapter 2: Project RationaleChapter 5: Project DescriptionChapter 2: Project Rationale, Section 2.9.3 and Table 2-2, makes reference to sections of rail through Cecil Plains that are no longer required.	<p>Executive Summary</p> <p>Chapter 2: Project Rationale</p> <p>Section 2.9.3</p> <p>Table 2-2</p> <p>Chapter 5: Project Description</p> <p>Chapter 8: Land Use and Tenure</p> <p>Table 8-43</p> <p>Chapter 25: Conclusions</p> <p>Appendix B4: Utilities</p> <p>Appendix E: Consultation Report</p> <p>Section 5.15</p>
218	218.0016	Local Government	Project scope	Survey effort/field investigation data	<p>Inappropriate technical assessments: The Draft EIS collected and assessed existing information on groundwater, surface water, water quality, land use, land use tenure and most other environmental values relevant to the surrounding environment. However, the potential impacts of the proposed project are discussed in very general terms, with few exceptions (e.g., Chapter 8 provides specific mitigation measures). The potential adverse impacts the surrounding environment will experience as a result of the proposed project need to be addressed appropriately in order for the Draft EIS to meet TOR 5.1 (all relevant environmental, social and economic impacts. Are identified and assessed and to recommend mitigation measures to avoid or minimise adverse impacts) The potential impacts of the proposed project they have direct consequences for the community in terms of adverse environmental, social and economic impacts and as such, appropriate technical assessments and the development of mitigation measures should have been included in the Draft EIS.</p> <p>In general, most technical chapters fail to identify and commit to specific and appropriate mitigation measures required as a result of adverse impacts from the proposed project. The majority of the mitigation measures provided are in very general terms such as makes good or state that the issue will be addressed during the detailed design phase. This is not considered sufficient to meet the requirements of TOR 5.1.</p>	<p>The Draft EIS requires update to appropriately identify all potential impacts (including cumulative impacts) to environmental, social and economic aspects and propose and commit to adopting appropriate and real mitigation measures.</p> <p>The update of the Draft EIS should include, but not be limited to, committing to the development of appropriate monitoring locations and baselines for all measurable and proposed adverse environmental, social and economic impacts resulting from proposed project activities and the development of associated and appropriate monitoring programs for the operational phase.</p>	<p>The revised draft EIS has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. In addition, changes have been made to the reference design that are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>As described in the revised draft EIS at Chapter 1: Introduction, Section 1.5, between 23 January 2021 and 4 May 2021, the draft EIS was made available for public comment under Section 33 of the SDPWO Act and public submissions were received. Terms of reference compliance has been updated for the revised draft EIS in Appendix A2: Terms of Reference - Cross Reference Table. On 4 January 2022 the Coordinator-General requested additional information under Section 34B(2) of the SDPWO Act. The Office of Coordinator-General additional information requirements and the proponent's (ARTC) responses to the public submissions received comprise the basis of assessment for the revised draft EIS.</p> <p>Chapter 3: Legislation and Project Approvals Process, Section 3.21 states that an EIS provides the Coordinator-General with a framework to ensure appropriate environmental management and monitoring programs to avoid, minimise, mitigate or offset any adverse impacts.</p> <p>Chapter 4: Assessment Methodology, Section 4.1 states that the assessment methodology has been established to provide a structured and objective approach to identifying environmental, social and economic impacts and opportunities, develop effective mitigation and management measures, and maximise the benefits of the Project.</p> <p>The approach for each specific matter addressed in Chapters 8 to 22 is provided in Chapter 4: Assessment Methodology, Section 4.2 and included:</p> <ul style="list-style-type: none">Fieldwork was undertaken to identify and/or ground truth existing environmental conditions and sensitive receptorsPotential impacts and opportunities were identified in accordance with the selected impact assessment method and assessed using criteria set out in legislation, statutes, guidelines or policies. Where such criteria do not exist, the assessment was based on industry standards and professional judgement.Mitigation and management measures were documented in Chapter 8 to Chapter 22 and consolidated in Chapter 24: Draft Outline Environmental Management Plan in accordance with Chapter 4: Assessment Methodology, Section 4.6. <p>Impact Assessment methods are provided in Section 4.4 of Chapter 4: Assessment Methodology. This includes discussion of general Project or targeted monitoring programs.</p> <p>The revised draft EIS compliance with the terms of reference is documented in Appendix A2: Terms of Reference - Cross Reference Table.</p>	<p>Chapter 1: Introduction</p> <p>Section 1.5</p> <p>Chapter 3: Legislation and Project Approvals Process</p> <p>Section 3.21</p> <p>Chapter 4: Assessment Methodology</p> <p>Section 4.1</p> <p>Section 4.2</p> <p>Section 4.4</p> <p>Section 4.6</p> <p>Chapter 5: Project Description</p> <p>Section 5.3.3</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix A2: Terms of Reference - Cross Reference Table</p>
218	218.0017	Local Government	Project scope		<p>Project timing: The Draft EIS was issued for public consultation in February 2021 with responses due by 19 April 2021. In relation to the required Inland Flood Study, the OCGs website states that the findings of the Expert Panel Inland Flood Study Group will be finalised by the end of 2021. The Draft EIS suggests that design will be completed by Q2 2021, with construction commencing in Q4 2021, which would be prior to the finalisation of the Study Group findings.</p> <p>The Draft EIS does not address how construction can commence when the Flood Study findings have not been received or incorporated into proposed project activities. Further, given the period of time which will be required to appropriately address Draft EIS submissions, complete any further investigations and reviews that might be required, gain subsequent regulatory approvals and finalise design in accordance with those approvals, the timeline provided in the Draft EIS is not considered to be realistic. Given this, the Draft EIS does not adequately describe the proposed timing of the works (as required by TOR 10.1(k)).</p>	<p>The Draft EIS should be revised to meet the requirements of TOR 10.1(k) and provide realistic timing for the proposed project, and to appropriately consider the findings of the flood panel and any further studies that are required to finalise the EIS and accurately assess the potential impacts and mitigation requirements for the project.</p> <p>Construction and approvals should not commence prior to the finalisation of all required technical studies including but not limited to the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Review. Construction timeframes require reassessment to be appropriate to regulatory requirements and timeframes.</p>	<p>A revised schedule has been provided in the revised draft EIS at Chapter 5: Project Description, Section 5.3.6. Pre-construction activities and early works are undertaken prior to full mobilisation of the contractor. These works may be undertaken under a separate contract but will not commence until the Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) has been approved by the Coordinator-General and the Australian Government Minister for the Environment, and the relevant early works Construction Environmental Management Plan (CEMP) has been endorsed by the Environmental Monitor.</p> <p>The anticipated timing of stages for the Project are shown in Table 5-3.</p> <p>The Independent International Panel of Experts for Flood Studies (the Panel) has submitted a final report, dated 6 September 2022. The report has been made available and is publicly available here: Independent panel of experts for flood studies in Queensland Department of Transport and Main Roads (tmr.qld.gov.au).</p> <p>The report presents the outcomes of the Panel's review of the flood models and reference designs developed by ARTC for the Border to Gowrie, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Project sections.</p> <p>The Queensland and Australian governments have accepted the Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practice; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has undertaken a substantial amount of work to identify existing flooding characteristics and to assess and mitigate potential impacts associated with the four Project sections. This work includes responding to the issues raised by the Panel in its respective draft reports. ARTC has responded to all issues raised in the draft reports, including:</p> <ul style="list-style-type: none">providing additional information which addressed the queries raisedcompleting additional work to address issues and committing to incorporating the revised results in future documentation (specifically revised draft EIS documentation)committing toundertake additional works to address the Panel's comments and incorporating the results in future documentation (specifically revised draft EIS documentation)recommending that some issues raised are dealt with at Detailed Design stage. <p>A detailed summary of these issues and ARTC's responses are presented in the Issues Management Register (IMR) in Appendix A to Appendix D in the final report.</p> <p>Next Steps</p> <ul style="list-style-type: none">ARTC have committed to implement the Panel's six recommendations outlined in the Final Report.ARTC's flood models will be updated to meet the Panel's requirements including consideration of the 2022 flood event.Compliance and assurance against the Flood Panel's recommendations will be undertaken by ARTC, with Independent Verification process and continued peer reviews, at all stages of the Project (Project Approvals and Corridor Acquisition, Detailed Design, Construction Works, Operations).A Panel member is proposed to be engaged by the State to provide ongoing independent advice and assurance in relation to implementation of the Flood Panel's recommendations and actions.Community and stakeholder consultation will be scheduled upon the release of each Project section's revised Environmental Impact Statements. <p>(Extracts from tmr.qld.gov.au/projects/inland-rail/independent-panel-of-experts-for-flood-studies-in-queensland)</p> <p>Chapter 14: Flooding and Geomorphology, Section 14.4 states that a detailed summary of the Project-related issues and ARTC's responses are presented in the Issues Management Register in the final Expert Flood Panel Report (Appendix B). The Issues Management Register has been replicated in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Appendix A) with the location where each comment has been addressed and response documented in the revised draft EIS identified.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.3.6</p> <p>Table 5.3</p> <p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Appendix A to D</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0018	Local Government	Traffic and Transport		<p>Network connectivity and legal access to properties: The Draft EIS does not consider all locations where the proposed rail alignment crosses the public road reserve network. Further, the Draft EIS states that where a road-rail interface is unable to be provided, an alternative access route has been proposed. However, no alternatives have been provided to ensure the continuity of the existing public road reserve network (including, where roads are not currently constructed) or to ensure legal access to properties is maintained.</p> <p>This may require the provision of new road reserves to maintain connectivity of the existing public road network.</p> <p>The Draft EIS does not adequately address any cumulative impacts on the wider transport network and therefore does not meet the requirements of TOR 11.109.</p>	nil.	<p>Where the Project crosses the public road network, impacts to the diversion of traffic, and the local road network, have been assessed in Appendix AA: Traffic Impact Assessment, Section 5.9. This sections explores all cases where the Project alignment results in a change to the road alignment, network and the proposed impacts and solutions. Where deemed feasible, this includes new road realignments and reserves in order to maintain connectivity and mitigate the impacts of the Project.</p> <p>A qualitative and quantitative assessment of the cumulative impacts has been included in Appendix AA: Traffic Impact Assessment, Section 5.11.</p> <p>The qualitative cumulative impact assessment includes determining the relevance, impact significance of the identified projects and suggested mitigation measures. During detailed design, once the construction method (including material sources and quantities) and the finalised construction routes have been determined, the traffic impact assessments will be updated and include other developments and activities in the region that may contribute to background traffic volumes over the construction period for the Project. These will be identified and confirmed in consultation with Goondiwindi and Toowoomba Regional Councils as well as DTMR.</p> <p>The quantitative cumulative impact assessment has been undertaken considering the complete Inland Rail construction from North Star to Border to Kagaru to Acacia Ridge/Bromelton. The study area considers the overlap of other Inland Rail packages with the proposed the Project construction routes across the complete construction timeframe over the 6 packages. Key assessments influenced by volumes have been reassessed as part of the cumulative impact assessment, including the:</p> <ul style="list-style-type: none"> ➤ Road safety assessment ➤ Intersection assessment ➤ Road link capacity assessment ➤ Pavement assessment <p>For the safety, intersection, and road link capacity assessments, analysis was undertaken where peak hour volumes experienced a change. All road links and intersections with no volume change are considered to be assessed in the 'Project only' assessment covered in the previous sections of Appendix AA: Traffic Impact Assessment. This was considered appropriate as without a change in peak hour volumes between 'Project only' and the cumulative assessment, the intersections and road links impacts are considered identical.</p> <p>For the pavement assessment, analysis was undertaken for all road links. This was undertaken as the pavement assessment considers the total yearly impact of HVs on the pavement. With regard to the road alignment changes and diversions:</p> <p>Where the Project crosses the public road network, impacts to the diversion of traffic, and the local road network, have been assessed in Appendix AA: Traffic Impact Assessment, Section 5.9. This sections explores all cases where the Project alignment results in a change to the road alignment, network and the proposed impacts and solutions. Where deemed feasible, this includes new road realignments and reserves in order to maintain connectivity and mitigate the impacts of the Project.</p> <p>A qualitative and quantitative assessment of the cumulative impacts has been included in Appendix AA: Traffic Impact Assessment, Section 5.11.</p> <p>The qualitative cumulative impact assessment includes determining the relevance, impact significance of the identified projects and suggested mitigation measures. During detailed design, once the construction method (including material sources and quantities) and the finalised construction routes have been determined, the traffic impact assessments will be updated and include other developments and activities in the region that may contribute to background traffic volumes over the construction period for the Project. These will be identified and confirmed in consultation with Goondiwindi and Toowoomba Regional Councils as well as DTMR.</p> <p>The quantitative cumulative impact assessment has been undertaken considering the complete Inland Rail construction from North Star to Border to Kagaru to Acacia Ridge/Bromelton. The study area considers the overlap of other Inland Rail packages with the proposed the Project construction routes across the complete construction timeframe over the 6 packages. This was undertaken as the pavement assessment considers the total yearly impact of HVs on the pavement.</p>	Appendix AA: Traffic Impact Assessment Section 5.9 Section 5.11
218	218.0019	Local Government	Traffic and Transport	Road safety	<p>Road-over-rail bridges pedestrian access: The Draft EIS states that no public pedestrian access is proposed to be provided on road-over-rail bridges yet it shows protection screening on diagrams depicting typical road-over-rail bridges.</p> <p>The Draft EIS traffic impact assessment does not assess pedestrian needs, other than by stating that these may be co-located with local roads and including notations that no provision for pedestrians is proposed (other than the roads themselves).</p> <p>TRC requires separate public pedestrian access for all road-over-rail bridges in order to ensure the safe movement of pedestrians and non-vehicular traffic in its regional areas.</p> <p>The Draft EIS has not appropriately addressed active transport or prepared mitigation strategies in close consultation with the relevant local government (TRC). Therefore the Draft EIS has not met the requirements of TOR 11.112 or 11.116.</p>	<p>The Draft EIS should commit to delivering separated public pedestrian and non-vehicular access on all road-over-rail bridges.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to reach written agreement with TRC regarding the provision of separate pedestrian access on all proposed road-over-rail bridges at least six months prior to the commencement of any construction activities.</p>	<p>The submission references the Project Description 'road over rail bridge' detail with protection screens. ARTC notes that this diagram is indicative only and does not represent all possible grade separation design scenarios. In developing the design further with Council, ARTC refers to a more suitable clause within the Guide to Road Design Part 6A: Paths for Walking and Cycling that states: "the need for pedestrian paths should also be related to the pedestrian network functional requirements. For example, the presence of pedestrians on many rural roads is a rare event and the provision of paths is not economically justified. In this situation the provision of shoulders will provide space for a pedestrian who happens to use the road."</p> <p>The advice suggests that using road shoulders as an acceptable measure is rare but can be considered. Additionally, the need for pedestrian paths should be determined based on the functional requirements of the pedestrian network. In the case of rural roads, where the presence of pedestrians is infrequent and is not part of the formal planning network, the provision of dedicated paths is not economically justified. This will be further agreed within technical forums as part of third party agreement discussions (Appendix AA: Traffic Impact Assessment).</p>	Appendix AA: Traffic Impact Assessment
218	218.0020	Local Government	Project alignment	Blasting	<p>Impacts to existing rail corridors disconnected sections: The reference design illustrates several locations where the existing South Western System alignment will be taken over or intercepted by the proposed rail alignment, with or without interconnections provided (generally between Millmerran and Pittsworth).</p> <p>The Draft EIS contains no information as to what will happen with disconnected sections of existing QR rail line. And as a result, has not adequately addressed how the proposed project will affect the existing rail (as required by TOR 11.112).</p>	<p>The Draft EIS should be updated to adequately discuss how the proposed project will affect existing rail systems such as the South Western Line and the Millmerran Branch Line to meet the requirements of TOR 11.112.</p>	<p>The issue with the "disconnected sections" of rail corridor is noted.</p> <p>Any outstanding issues with the existing network will be resolved during detailed design. ARTC are expecting significant involvement and engagement from QR in the future. It is further contemplated that QR and ARTC will enter into formal Interface Agreements (as required by Rail Safety National Law) to ensure the safe design, construction and operation of both networks in accordance with their respective Notices of Accreditation underwritten by their approved Safety Management Systems (Chapter 3: Legislation and Project Approvals, Section 3.425).</p> <p>As part of ARTC's ongoing engagement with QR and DTMR, the roles and responsibilities regarding the Rail Infrastructure Manager (RIM) during Detailed Design, Construction Works and Operations will be clarified.</p> <p>ARTC anticipate the roles and responsibilities in relation to RIM status will be resolved prior to construction through a signed agreement. However, agreement in principle is expected to be known significantly earlier, which would enable appropriate discussions during Safety in Design (SiD) workshops during detailed design.</p>	Chapter 3: Legislation and Project Approvals Process Section 3.425
218	218.0021	Local Government	Traffic and Transport	Infrastructure crossings/ interaction	<p>Road-Rail Intersections proposed road-rail interfaces not acceptable to TRC: The Draft EIS and reference design identifies 36 local road-rail interfaces, and proposes to create 10 new passive level crossings, 5 new active level crossings and 6 grade separated crossings, with no crossings or consolidations, diversions or closures of local roads proposed at the remaining 15 locations.</p> <p>The number of proposed new passive and proposed new active level crossings is inconsistent with the Office of the National Rail Safety Regulator's (ONRSR) Level Crossings Policy, as follows: Section 9.1 of the ONRSR Policy (No new level crossings) states, in part, that ONRSR does not support the construction of new level crossings and strongly encourages governments and industry to commit to a firm policy of no new level crossings.</p> <ul style="list-style-type: none"> ➤ Section 9.2 of the ONRSR Policy (Expectations for infrastructure planning) states, in part, that ONRSR expects that projects in either greenfield (new) or brownfield (existing) locations do not propose the construction of new level crossings. Brownfield projects should also include assessment of the potential to close any existing level crossings and, if they are to remain, demonstrate that safety will be ensured SFAIRP. (Note: in the policy, SFAIRP means so far as is reasonably practicable.)The Queensland Level Crossing Safety Strategy 2012-2021 (Strategy 9) states the clear objective of adding no further open level crossings to the rail network. The Office of the National Rail Safety Regulator has a Level Crossing Policy. <p>TRC does not support the use of passive level crossings at any new road-rail interfaces or any re-purposed existing road-rail interfaces, whether supported by Australian Level Crossing Assessment Model (ALCAM) outputs or not.</p> <p>TRC has not, at the time of making this submission, agreed in-principle, or otherwise, with any of the proposed road-rail interfaces, or any of the consolidations, diversions or closures of local roads proposed in the Draft EIS.</p> <p>The Draft EIS has not adequately addressed:</p> <ul style="list-style-type: none"> ➤ The impacts of the Project on individual road/rail crossings and any cumulative impacts on the wider transport network, as required by TOR 11.109. ➤ Mitigated impacts proposed to be created by new railway level crossings in close consultation with relevant local governments (in this submission, TRC), as required by TOR 11.115 and 11.116. 	<p>The Draft EIS should be amended to align with the desired outcomes of the Federal Rail Safety Guidelines, the Queensland Level Crossing Safety Strategy 2012-2021 and ONRSR's Level Crossings Policy 2019 through the inclusion of a commitment to maximise the number of grade-separated road-rail interfaces and to provide active level crossings (as an absolute minimum) at all proposed new at-grade road-rail interfaces.</p> <p>Further, the proponent should continue to develop the design of local road-rail interfaces in close consultation with TRC and reach agreement with TRC in relation to all new road-rail interfaces and all consolidations, diversions or closures of local roads at least six months prior to the commencement of construction.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to develop the design of local road-rail interfaces in close consultation with TRC, and to reach written agreement with TRC in relation to all new road-rail interfaces, all consolidations, all diversions and all closures of local roads at least six months prior to the commencement of any construction activities.</p> <p>TRC requests that at-grade separate crossings the height and width of both oversize vehicles and agricultural vehicles are catered for.</p>	<p>ARTC recognises the complex decision-making process surrounding public road rail interfaces. ARTC also note the submission references to the key level crossing policies in Queensland:</p> <ul style="list-style-type: none"> ➤ The Office of the National Rail Safety Regulator's (ONRSR) Level Crossing policy (ONRSR, 2019) ➤ Queensland Level Crossing Safety Strategy 2012-2021 <p>Section 3.6 and Section 3.7 of Appendix AA: Traffic Impact Assessment discusses proposed road-rail interface locations and the approach used regarding ensuring consistent safety-based risk approach to determine crossing treatments.</p> <p>The approach completes an Australian Level Crossing Assessment Model (ALCAM) assessment for all level crossings, and this becomes as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. An overview of the process followed in the assessment of road-rail interfaces across the Project and the methodology followed in the development of road-rail interface treatments is outlined in Appendix BT. This overview provides Office of Coordinator-General, DTMR and the Community with further transparency on the design process undertaken and understanding that all designs and ALCAM inputs have been reviewed by the appropriate road manager at all public road rail interface locations throughout Project. Many road rail interfaces do not meet a topography-based grade separation, nor any criteria triggering an automatic grade separation detailed Public Level Crossing Treatment methodology.</p> <p>In January 2023 ONRSR undertook an audit of the Inland Rail Road-Rail Crossing Strategy in Queensland, specifically focussing on the public level crossings in the Border to Gowrie section. The key findings included that ARTC Inland Rail demonstrated that a consistent, systematic, and comprehensive process for the assessment of level crossings is applied to determine adequate conforming treatments, and that the stakeholder engagement process has fed into the updated designs.</p> <p>Section 5.8 of Appendix AA: Traffic Impact Assessment discusses proposed level crossing impact assessment and mitigation for construction traffic volumes.</p> <p>Similarly, Section 5.9 reports on road-rail interfaces performance under operational traffic conditions. This includes queue analysis for short stacking condition assessment, and road diversion assessment.</p> <p>ARTC will continue to work collaboratively with TRC, GRC and DTMR as detailed design progresses regarding the proposed level crossing design solution. For more information, please also refer to IR level Crossing Factsheet inlandrail.artc.com.au/level-crossings-fact-sheet.</p>	Appendix AA: Traffic Impact Assessment Section 3.6 Section 3.7 Section 5.8 Section 5.9 Appendix BT

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0022	Local Government	Traffic and Transport	Infrastructure crossings/ interaction	<p>Bridge Clearances not adequately addressed: The Draft EIS identifies that rail-over-road bridges will have a minimum vertical clearance as required by the road asset owner, and that bridge clearances have been established in consultation with the owners of existing assets over which the bridge structures span.</p> <p>However, the Draft EIS and reference design does not adequately address horizontal clearances at rail-over-road bridge structures.</p> <ul style="list-style-type: none"> TRC's position is that road reserves should not be encumbered, horizontally, in any way, by proposed bridge structures, and that vertical clearances should not compromise over-size or overmass (OSOM) vehicle movements where reasonable alternative routes are not available. <p>TRC has not, at the time of making this submission, agreed to or approved in-principle, any of the proposed vertical clearances at any of the proposed bridges shown in the reference design.</p> <p>In addition, all proposed bridge structures and associated componentry should be delivered containing the maximum reasonable amount of empty service ducts to allow for, without limitation, future utility infrastructure such power cabling, telecommunications networks infrastructure, water and sewerage network infrastructure.</p> <p>The Draft EIS has not adequately outlined mitigation strategies in close consultation with relevant local governments (TRC) (as required by TOR 11.116).</p>	<p>The proponent should continue consulting with TRC regarding inclusive of currently operational and disused lines including horizontal and vertical bridge clearances and commit to addressing these impacts to TRCs satisfaction. The proponent should include allowance in all bridge structures for utilities.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to consult with TRC regarding horizontal and vertical bridge clearances and to reach written agreement with TRC in relation to bridge clearances at least six months prior to the commencement of any construction activities.</p>	<p>Development of the revised reference design for the Project has progressed in parallel with the impact assessment process. As a result, design solutions for avoiding, minimising or mitigating impacts have been incorporated into the revised reference design as appropriate and where possible.</p> <p>ARTC has continued to engage with Council to further develop the technical criteria around bridge clearances in the vertical and horizontal plane around road rail interfaces. This will continue through the future design stages to achieve the road manager approval.</p> <p>Mitigation measures and controls that have been factored into the design, or otherwise implemented during the revised reference design stage for the Project, are summarised in Section 20.6.1 Table 20.50 of Chapter 20: Traffic, Transport and Access. This documents that Bridge clearances have been established in consultation with the owners of existing assets over which the bridge structures span (i.e. DTMR, local councils and private landowners).</p> <p>Once the construction routes have been confirmed at the next stage of the project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor. Key relevant commitments include:</p> <ul style="list-style-type: none"> ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	<p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.6.1</p> <p>Table 20.50</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 6.2</p>
218	218.0023	Local Government	Traffic and Transport	Infrastructure crossings/ interaction	<p>Rail Network Infrastructure interfaces with existing QR network and removal of obsolete level crossings. The Draft EIS states that the proposed project will utilise 46.8 km of the existing South Western Line and 24.4 km of the Millmerran Branch Line (approximately). The document does not however clarify which sections of the remaining South Western Line and Millmerran Branch Line will remain operational or consider all rail lines whether they be disused, what will happen with the sections of rail line that become disconnected and non-operational, or who is considered responsible for removing obsolete level crossings. TRC should not be considered responsible for the costs of removing infrastructure at QR road-rail interfaces made obsolete by the proposed project. The lack of clarification over this topic is unacceptable to TRC.</p> <p>Given this, the Draft EIS has not adequately assessed the impacts of the proposed project on the wider transport network or ensured that mitigation strategies will be prepared in close consultation with relevant local governments (TRC) and therefore does not meet the requirements of TOR 11.109 and 11.116.</p>	<p>The Draft EIS requires amendment to define all corridors and local road-rail interfaces and commit to providing sufficient project footprint to accommodate local utility and road requirements to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition: The proponent is required to consult with TRC regarding utility interfaces at all road-rail interfaces and to reach written agreement with TRC in relation to providing sufficient project footprint to accommodate local utility and road requirements at least six months prior to the commencement of any construction activities.</p>	<p>Appendix AA: Traffic Impact Assessment Section 3.23 discusses the Projects interface with existing Queensland Rail Infrastructure. As part of ARTCs ongoing engagement with QR and DTMR, roles and responsibilities regarding the Rail Infrastructure Manager (RIM) obligations during Detailed Design, Construction and Operation will be clarified. Any necessary interface agreements with QR will also be in place prior to the commencement of construction.</p> <p>Appendix AA: Traffic Impact Assessment, Section 4.2.1 explains routes have been identified for the diversion of materials which would otherwise be transported by rail, however, will be restricted in train movements during the construction of the Project. The following assumptions have been considered by ARTC for the construction of the rail line:</p> <ol style="list-style-type: none"> If the Project utilises the option of road freight for grain and other domestic products during the construction of the QR lines, then the track will be closed between certain sections for the length of construction period. Sections of QR track that would be closed: <ol style="list-style-type: none"> South Western Line: Whetstone to Thallon Millmerran Branch Line: Millmerran to Pittsworth Alternatively, the Project may elect to construct offline (physically separated from the existing track) through the brownfield corridors, under track closures and possessions. In doing so, the Project would not require the use of road freight for the transportation of grain and/or other domestic commodities. <p>For the purpose of the TIA, it has been conservatively assumed that the Project will require complete closure of the QR lines at the locations specified in Option 1, above. This option requires redirection of all items which would otherwise be travelling via rail, increasing the traffic movements on the road possibly substantially, particularly during peak harvest season.</p> <p>Appendix AA: Traffic Impact Assessment Section 3.2 reiterates the assumption for temporary possession of the existing rail corridors for the duration of construction and ARTCs ongoing engagement with QR and DTMR.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 3.23</p> <p>Section 4.2.1</p>
218	218.0024	Local Government	Project alignment	Infrastructure crossings/ interaction	<p>Utilities provision of adequate road reserve: The Draft EIS identifies that there are 656 utility interfaces located within the footprint of the proposed project (utilities are commonly located in road reserves).</p> <p>The Draft EIS does not however identify how utility interfaces will be addressed at road-rail interfaces, or whether the proposed project footprint provides sufficient road reserve at road-rail interfaces to accommodate utility requirements without adversely impacting the utility or imposing additional cost on TRCs ability to construct or upgrade utilities or roads in the future.</p> <p>As a result, the Draft EIS has not adequately assessed the impacts of the project on individual road-rail crossings (required by TOR 11.109).</p>	<p>The Draft EIS should be amended to identify utility interfaces at all local road-rail interfaces and commit to providing sufficient project footprint to accommodate local utility and road requirements to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition: The proponent is required to consult with TRC regarding utility interfaces at all road-rail interfaces and to reach written agreement with TRC in relation to providing sufficient project footprint to accommodate local utility and road requirements at least six months prior to the commencement of any construction activities.</p>	<p>ARTC have adopted a 5 m allowance on each side of the formed road for all impacted road corridors to ensure there is sufficient width to accommodate utility requirements.</p> <p>As described in Section 5.4.8 in Chapter 5: Project Description, general likely utility interface treatment types are; protection, relocation/realignment or no treatment where the revised reference design can be configured to avoid direct impacts to the utility. These proposed utility interface treatment types are also applicable to road rail interfaces.</p> <p>All utility owners have been consulted by ARTC during the reference design process to establish potential interface impacts and to identify design solutions. Details of consultation are outlined in Appendix E: Consultation Report.</p> <p>Prior to construction commencing, the relevant land owners (i.e. easements, road corridor, private property) including Councils, DTMR and utility owners are required to endorse/approve all proposed utility treatments/designs within land under their management and control.</p> <p>This includes for temporary roads, haul roads etc as well as permanent roads.</p> <p>ARTC will continue consultation with key stakeholders including Councils, DTMR into the Detailed Design stage.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.8</p> <p>Appendix E: Consultation Report</p>
218	218.0026		Project scope		<p>Rail design standards Reference design: The Draft EIS identifies that the reference design is generally based on the General alignment standards (grades of 1:100 target, 1:80 maximum) but that Medium speed alignment standards (grade of 1:50 maximum) may be applied in mountainous terrain. The reference design is based on the General alignment standards, with no instances of Medium speed alignment standards and contains numbers of locations where changes to the vertical grade and/or relaxation of the maximum vertical grades has the potential to significantly change:</p> <ul style="list-style-type: none"> The nature and location of road-rail interfaces (between grade-separated, at-grade, consolidations, diversions or closures); Land acquisition requirements; Drainage requirements; Noise impacts; and Other matters. <p>It is therefore considered unlikely that the reference design will be maintained through the design and construction phases of the proposed project, as contractors will endeavour to deliver value for money outcomes through changes to the proposed vertical alignment.</p> <p>The reference design cannot therefore be relied upon to assess the impacts of the project on individual road-rail crossings or any cumulative impacts on the wider transport network and as a result, the Draft EIS does not meet the requirements of TOR 11.109 (assess the impacts of the project on individual road/rail crossings and any cumulative impacts on the wider transport network).</p>	<p>The Draft EIS should be updated to refine and finalise the vertical alignment of its reference design and reissue the reference design for further public consultation and engagement.</p> <p>The Draft EIS should also demonstrate how project contractors will be managed to ensure that the delivery of the proposed project will be according to the finalised reference design.</p>	<p>Since the reference design was developed, the rail vertical alignment has been reviewed to utilise more 1:80 grades as part of a value engineering exercise to improve Project outcomes such as road/rail interfaces and earthworks volumes. Although 1:50 grades for mountainous terrain was referenced in EIS documentation, these are not preferred by Inland Rail and may only be considered under extraordinary circumstances and subject to ARTC engineering review and approval. Chapter 5: Project Description, Section 5.3.3 provides a summary of changes to the reference design since the draft EIS and the basis of design.</p> <p>ARTC has consulted with TRC extensively on these proposed changes, all of which have been endorsed in technical officer forums. The updated EIS will also incorporate these changes within the updated documentation.</p> <p>Further improvement of the vertical alignment may be conducted during detailed design and within Inland Rail engineering standards, which will require further consultation with stakeholders and EIS change management processes where necessary.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.3.3</p>
218	218.0026		Project scope		<p>Rail design standards Reference design: The Draft EIS identifies that the reference design is generally based on the General alignment standards (grades of 1:100 target, 1:80 maximum) but that Medium speed alignment standards (grade of 1:50 maximum) may be applied in mountainous terrain.</p> <p>The reference design is based on the General alignment standards, with no instances of Medium speed alignment standards and contains numbers of locations where changes to the vertical grade and/or relaxation of the maximum vertical grades has the potential to significantly change:</p> <ul style="list-style-type: none"> The nature and location of road-rail interfaces (between grade-separated, at-grade, consolidations, diversions or closures); Land acquisition requirements; Drainage requirements; Noise impacts; and Other matters. <p>It is therefore considered unlikely that the reference design will be maintained through the design and construction phases of the proposed project, as contractors will endeavour to deliver value for money outcomes through changes to the proposed vertical alignment.</p> <p>The reference design cannot therefore be relied upon to assess the impacts of the project on individual road-rail crossings or any cumulative impacts on the wider transport network and as a result, the Draft EIS does not meet the requirements of TOR 11.109 (assess the impacts of the project on individual road/rail crossings and any cumulative impacts on the wider transport network).</p>	<p>The Draft EIS should be updated to refine and finalise the vertical alignment of its reference design and reissue the reference design for further public consultation and engagement.</p> <p>The Draft EIS should also demonstrate how project contractors will be managed to ensure that the delivery of the proposed project will be according to the finalised reference design.</p>	<p>Since the reference design was developed, the rail vertical alignment has been reviewed to utilise more 1:80 grades as part of a value engineering exercise to improve Project outcomes such as road/rail interfaces and earthworks volumes. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0027	Local Government	Waste and Resource Management	Spoil management	Permanent stockpiles location: The Draft EIS proposes to temporarily stockpile excess material along the rail corridor and then form these stockpiles into permanent spoil mounds which are spread out to minimise height. The Draft EIS does not identify where permanent spoil mounds will be located or state that enough rail corridor is proposed to adequately accommodate and minimise the height of these spoil mounds. Further, while the document notes that all temporary laydown areas have the potential to be used for temporary stockpiling if required, it does not identify any area for the proposed permanent stockpiling of spoil material. The proposed rail corridor illustrated on the reference design is relatively narrow compared to the volumes of unusable cut material being excavated and proposed to be stockpiled. As a result, it is considered that the Draft EIS does not adequately address the rehabilitation of affected areas after construction as required by TOR 10.10(p) and 11.87.	The Draft EIS should be updated to identify all locations where permanent spoil mounds will be located and to demonstrate that enough rail corridor will be provided to adequately accommodate and minimise the height of these mounds.	Spoil storage areas are discussed in Section 22.5.2.2 of Chapter 22: Waste and Resource Management. Excess spoil will be directly transported to a point of immediate reuse within the Project footprint to avoid stockpiling and double handling. In the event that immediate transportation and local reuse is not possible, the material will be temporarily stockpiled along the Project right of way established for construction or within designated laydown areas. Laydown areas have been pre-determined in Table 2.7 of Appendix AB: Earthworks Strategy and Draft Soil Management Plan.	Chapter 22: Waste and Resource Management Section 22.5.2.2 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Table 2.7
218	218.0028	Local Government	Editorial		Construction activities: Section 6.3.1 of the executive summary needs to be updated to be consistent with the construction schedule provided in Section 5.4.2 of the Draft EIS.	The Draft EIS requires updating to meet the requirements of TOR 5.1 and to ensure there is consistency between the construction schedules in the executive summary and Section 5.4.2.	Construction schedule in Executive Summary and Chapter 5: Project Description, Section 5.3 have been revised and made consistent.	Executive Summary Chapter 5: Project description Section 5.3
218	218.0030	Local Government	Traffic and Transport	Construction traffic	Precast concrete use of local roads: The Draft EIS identifies four concrete suppliers, three pre-cast suppliers, and two potential pre-cast yard (one either side of the Condamine Floodplain) locations within the TRC region. One of the precast suppliers nominated in Toowoomba (Rocla) closed over ten years ago and has now ceased supplying precast pipes and culverts across Australia creating a national shortage of these products. Being potential or assumed locations only, the Draft EIS cannot be relied upon as to whether precast piles, girders and other bridge components will be manufactured on-site, or whether these elements will be transported from suppliers in Brisbane or elsewhere. The current building boom and shortfall in pre-cast concrete products has meant these products have been transported to Queensland from as far as Victoria and Western Australia. The Draft EIS has nominated details of existing precast concrete suppliers that are out of date (for example, Rocla closed years ago) and the remaining existing precast supplier (Humes now being owned by Holcim) only produces precast culverts and pipes. Further, the Draft EIS provides no information regarding where precast bridge girders and other precast structural elements could be sourced.	The Draft EIS should be amended in order to identify all locations where precast bridge girders and other precast structural elements could be sourced, along with details of how the elements will be transported and lifted into position, what local roads will be used for transport and crane access, and to propose mitigation measures that are acceptable to TRC. TRC requests that the OCG impose the following condition: The proponent is required to consult with TRC regarding the structural elements of bridges and the transportation of same to site, and to reach written agreement with TRC in relation to these issues at least six months prior to the commencement of any construction activities.	As mentioned in the submission, two locations have been identified for the temporary siting of a precast concrete facility and concrete batch plant for the Project (Appendix AA: Traffic Impact Assessment). Whilst two locations have been nominated, only one plant is expected to be necessary to supplement the supply of concrete from established plants. The proposed locations are immediately north and south of the Condamine River floodplain outside the 1% AEP flood line. For the TIA, it has been assumed that all precast bridge girders required for bridges along the Project alignment will be delivered from the proposed Precast Concrete Facility and Batch Plant North (approximate Ch 150.5 km, near Brookstead). Routes are based on roads most likely to be used for the transportation of precast concrete considering input from the NHVR journey planner which provides guidance in identifying suitable roads for HVs. For the transportation of some of the larger precast concrete bridge girders, it is expected that police escort will be required. To reduce traffic impact, transportation will most likely have to occur outside busy daytime hours. Further discussion on the use of OSOM vehicles for the delivery of precast concrete bridge girders is provided in Appendix AA: Traffic Impact Assessment Section 5.7.3 and will require continued engagement with the road authorities. Appendix AA: Traffic Impact Assessment Section 3.5 discusses laydown area details including that at bridge locations there will be a dedicated laydown/work area that may include crane pads for the lifting of bridge members.	Appendix AA: Traffic Impact Assessment Section 3.5 Section 5.7.3
218	218.0031	Local Government	Traffic and Transport	Construction traffic	Construction water and sourcing use of local roads: While it is acknowledged that construction water will be sourced by the construction contractor, the Draft EIS contains only generalised statements regarding the process of sourcing construction water and does not adequately identify which TRC roads will be used for transporting this water to site. As a result, the document has not adequately identified how project transport will affect existing transport infrastructure at the local level as required by TOR 11.113. The proponent is required to ensure that the construction contractor consult with TRC regarding the sourcing and transport of construction water and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities.	The Draft EIS should be amended to meet the requirements of TOR 11.113 and include the location of proposed construction water sources, which TRC roads will most likely be used for the transport construction water, and to propose mitigations measures that are acceptable to TRC. TRC requests that the OCG impose the following condition: The proponent is required to ensure that the construction contractor consult with TRC regarding the sourcing and transport of construction water and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities.	Revised draft EIS Appendix AA: Traffic Impact Assessment Section 4.2.2 discusses water sources and routes: ARTC recognises water sourcing and availability is critical to supporting the construction program for the Project. Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process detailed water demand planning will be undertaken, including detailed contingency options in the event that protracted dry seasonal conditions prevail and water supply options become unavailable. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements. The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan and be dependent on: <ul style="list-style-type: none"> ► Climatic conditions in the lead up to construction ► Confirmation of private water sources made available to the Project by landowners under private agreement ► Confirmation of access agreements with local governments for sourcing of mains water. Options for the sourcing of construction water, subject to availability, are anticipated to be as follows: <ul style="list-style-type: none"> ► Commercial, licenced water supplies where capacity exists ► Public surface water storages, i.e., dams and weirs ► Permanently (perennial) flowing watercourses ► Privately held water storages, i.e., dams or ring tanks, under private agreement ► Existing registered and licenced bores ► Treated water, e.g., from wastewater treatment plants ► New bores established to service the Project under appropriate water licence or entitlement (least preferred option). An assessment of the suitability of each source will need to be made for each construction activity requiring water, based on the following considerations: <ul style="list-style-type: none"> ► Legal access ► Volumetric requirement for the activity ► Water quality requirement for the activity, e.g., facilities will need potable water ► Source location relative to the location of need. Construction water will be supplied to various points along the alignment by water trucks (Austroads Class 7 vehicles) for activities including earthworks, haul road maintenance, dust suppression, track works and concrete batching. For the purpose of incorporating the delivery of water into the TIA, the assessment has considered the supply of water from public water storages (dams and weirs). This logic will need to be revised once the construction water strategy for the Project is confirmed during detailed design. Appendix AA: Traffic Impact Assessment Table 4.4 provides an overview of water truck movements per year on each of the road links, while the proposed construction transport routes for water are illustrated in Appendix AC: Water Construction Routes of the revised draft EIS Appendix AA: Traffic Impact Assessment. For the purpose of this TIA, water has been considered in a uniform delivery schedule.	Appendix AA: Traffic Impact Assessment Section 4.2.2 Table 4.4 Appendix AC Appendix B5: Construction Water Requirements
218	218.0032	Local Government	Traffic and Transport	Construction traffic	Mass haulage and borrow material use of local roads: While the Draft EIS identifies that local roads will only be used where essential it also states that haul distances greater than 5 km will require the use of either road trains on gazetted roads and/or the use of dump trucks (where direct access to the rail corridor is available). Further, the Draft EIS identifies only 148,905 m3 of unusable cut (without treatment) of a total of 12,525,037 m3. If all unusable cut is able to be treated for re-use, then the total deficit for the proposed project will still be a significant 822,332 m3. The fill deficit is proposed to be met through the importation of appropriate material type from operational licensed quarries or from borrow pits (the only borrow pits shown being south of Millmerran). The Draft EIS identifies approximately 450,000 movements for materials (cut to fill, cut to spoil, general fill) and seven geographic areas within which material will be delivered to other areas, cut to spoil or imported. The Draft EIS does not otherwise identify how many of these movements are proposed for the rail corridor or which movements are proposed to be made on state and/or local roads. While some sections of the proposed rail corridor may be permitted by TMR to have direct access from State-controlled roads, most of the length can only be accessed in a first-mile last-mile sense by using local roads which are generally not gazetted for road trains and in many cases are not constructed to a suitable standard for the potential numbers of dump truck movements indicated by the mass haulage quantities provided. The Draft EIS does not identify what mitigation measures are proposed to address the mass haulage use of local roads. As a result, the document is not considered to have adequately addressed the impacts of the proposed project on the wider transport network, including how existing transport infrastructure will be affected by project transport at the local level or committing to ensuring mitigation strategies are prepared in close consultation with relevant local governments as required by TOR 11.109, 11.113 and 11.116.	The Draft EIS should be amended to meet the requirements of TOR 11.109, 11.113 and 11.116, to identify all local roads that are proposed most likely to be used for the mass haulage of materials for the proposed project, and to provide mitigation measures which are acceptable to TRC. Further, the document should include commitments to conduct road dilapidation surveys prior to the commencement of construction, an appropriate maintenance program and rehabilitation to original condition after construction activities have ceased. TRC requests that the OCG impose the following condition: The proponent is required to ensure that the construction contractor consult with TRC regarding the use of local roads for the mass haulage of construction material (including, but not limited to, commitments to conduct road dilapidation surveys prior to the commencement of construction, an appropriate maintenance program during construction, and rehabilitation to original condition or better after construction activities have ceased). and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities.	As stated in Appendix AA: Traffic Impact Assessment Section 5.12.1, Table 5.148 The horizontal and vertical alignment has been established to optimise the earthworks required and achieve as close to a net-balance as is possible. By minimising the material deficit for construction of the Project, the volume of material required to be imported has been reduced. Less imported material equates to fewer construction truck movements on public roads. Appendix AA: Traffic Impact Assessment Table 4.1 provides the cut to fill and cut to spoil break down while the management of spoil and number of trips are provided in Table 4.2. Appendix AB: Earthworks Strategy and Draft Soil Management Plan of the revised draft EIS further detail spoil management for the Project. The mass haul quantities of fill and spoil have been estimated based on excavated volume of material, overlaid spatially and temporally across the Project. To generate a conservative number of heavy vehicle trips on the road network, a minimum of 10% of material excavated from each earthworks area has been allocated as spoil that cannot be reused and will need to be disposed of. A detailed assessment of material movement will form part of the mass haul assessment which will be carried out in the Detailed Design stage of the Project to determine the need for and viability of opportunities for material reuse. Any proposed mitigations identified within Appendix AA: Traffic Impact Assessment are the baseline mitigation measures for the Project. The appointed construction contractor will further develop the alignment design, determine their construction methodology and construction routes are finalised, specific mitigation measures on top of these baseline mitigations will be required to be developed and applied to the Project. A Traffic Management Plan (TMP) and Road Use Management Plan (RUMP) will be prepared for the Project in accordance with the GTIA to support works to the existing road network. This will be developed in consultation with DTMR, local councils and emergency service providers and will be finalised prior to the commencement of construction. Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority. Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include: <ul style="list-style-type: none"> ► ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ► Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ► ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. The agreed arrangements to deal with impacted pavements as a result of construction will exist between the Road Manager and ARTC. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0033	Local Government	Land Use and Tenure		<p>Stock Routes continuation of stock movements: The Draft EIS has identified four stock routes within the TRC region which may potentially be impacted by the proposed project and has proposed measures (use of one passive level crossing and three rail-over-road bridges) to allow the continuation of stock movements along the roads at each location.</p> <p>However, it is not made clear whether the continuation of stock movements will be clear of the trafficked roads, and one measure (use of a passive level crossing) indicates that stock would actually use the road. As a result, the Draft EIS has not adequately addressed impacts on stock routes (as required by TOR 11.78).</p>	<p>The Draft EIS should be amended to meet the requirements of TOR 11.78 through committing to providing sufficient width at all stock route crossings to ensure that stock movements can be maintained clear of the trafficked road.</p>	<p>The Project interfaces with the State stock route network, which consists of stock routes and reserves, in 11 locations. In each instance, the reference design has been developed to provide continued connectivity along each stock route. The stock route interface treatments that have been included in the reference design are summarised in Chapter 8 Land Use and Tenure, Section 8.5.1 (Table 8-35). ARTC will continue to consult with DoR, GRC and TRC through the detailed design process to ensure that the proposed stock route interface treatments are suitable for future useability purposes.</p> <p>Consultation has taken place between ARTC, DoR, TRC and GRC with respect to redesign and management of stock routes following the construction of the Project. Refer to Appendix E: Consultation Report. Where the existing stock route crossings are impacted by the Project, at-grade, then level crossings will be provided. All level crossings will be designed to meet the current Australian, ARTC and road managers standards. Design features include, minimum 7.3 m stock crossing width, compliant sighting distances, crossing panels, warning signage, fencing and gates across the road approaches, but not across the tracks. Where the alignment is proposing to run linearly through an existing stock route, allowances have been made to widen the remaining route appropriately to ensure a corridor that is fit for the purpose of transport livestock.</p> <p>The revised reference design for the Project has endeavoured to maintain the integrity (connectivity and functionality) of the stock route network. In circumstances where the Project has the potential to impact on existing stock routes, ARTC has consulted with DoR, GRC and TRC to identify potential solutions for the treatment of rail and stock route interfaces. Outcomes of the several engagements have been summarised in Appendix E: Consultation Report and Appendix B2: Stock Routes.</p> <p>In the event that private stock routes are identified through consultation with landowners, a means of continued stock movement connectivity will be included in the detailed design. Where disruption to private stock movements may occur during construction, appropriate temporary connectivity solutions will be agreed in advance with the relevant landowner (Chapter 8: Land Use and Tenure, Table 8-51).</p> <p>Several risk workshops have been conducted to support the development of shared use level crossing designs for greenfield projects. Although the risk is low, we understand that the community is concerned about the potential for stock to access the railway corridor at a level crossing and then potentially getting hit by a train.</p> <p>To seek to address stakeholder concerns, ARTC is trailing a STRAIL grid system. ARTC has engaged a university to run the trail to assess the effectiveness of STRAIL grid in preventing stock from entering the rail corridor. STRAIL grid is a spiked matting system that can be installed across the surface of the track and does not present an obstruction risk to trains. ARTC welcome any involvement or further information on the trial that DoR would like. Should this trial be successful ARTC will include these at TSR crossings where they are required based on consultation with DOR and council. ARTC will continue to work collaboratively with DoR and council on the design solution for these locations during detailed design.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Table 8-35</p> <p>Table 8-51</p> <p>Appendix B2: Stock Routes</p> <p>Figures 1 - 26</p> <p>Appendix E: Consultation Report</p> <p>Section 5.5.3</p>
218	218.0034	Local Government	Land Use and Tenure	Severance of agricultural land	<p>Acquisition: TOR 5.1 states that the objectives of the EIS are to ensure that all relevant environmental, social and economic impacts of the project are identified and assessed</p> <p>The Draft EIS does not meet TOR 5.1 as it is inconsistent when providing the number of properties to be acquired, and how many properties will be directly impacted by the proposed project:</p> <ul style="list-style-type: none"> Section 7.1.1 of the Executive Summary and Table 7.2.4 (Section 7.6.1) states that 368 freehold properties will likely be acquired. Section 3.5.2 of the Draft EIS states that the permanent footprint for the proposed project will directly impact approximately 440 properties and the temporary footprint approximately 542. Chapter 15, Section 15.8.3.3 states assuming up to 20 households need to relocate The Stakeholder Engagement Report, Section 4.1.4 quotes 220 private landowners whose properties have been identified as being directly impacted by the Project <p>Further to this, the proponent stated on 23 February 2021 during an Information Session with TRC that they have already begun acquiring properties for the project.</p>	<p>The Draft EIS should clearly identify how many of these potentially impacted properties(either permanent or temporary) will actually be affected, and which of those will be acquired under the Acquisition of Land Act 1967 (AL Act) to meet the requirements of TOR 5.1. The proponent should ensure all data provided which relates directly to affected persons and properties is accurate and consistent throughout the Draft EIS.</p> <p>Further, if the proponent is indeed already in the process of acquiring properties for the proposed project, this raises concerns for TRC in relation to the current proposed alignment and the issues relating to the Condamine River Floodplain and Class A and B agricultural land. The Draft EIS should state how and why properties may be acquired prior to completion of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland and acquiring all necessary regulatory approvals for the project.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>Upon completion of construction activities and in a progressive manner, the proponent is required to return any acquired land back to Class A and/or Class B agricultural land that is surplus to the project need.</p>	<p>ARTC are currently consulting with affected landowners and negotiating acquisition of land where required.</p> <p>EIS to be updated with latest acquisition details, noting that the Project is progressing through detailed design and minor changes may be required. Specific detail cannot be provided however as this information is commercial in confidence.</p> <p>The revised draft EIS Chapter 8: Land Use and Tenure, Section 8.5.1 has been updated and states that the rail alignment has been intentionally located to use the existing South Western Line and Millmerran Branch Line rail corridors, where possible, minimising the extent of 'new' properties to be acquired. Of the 495 properties within the permanent footprint, 47 are within the existing South Western Line and Millmerran Branch Line rail corridors (Table 8-36). Additional properties may also be acquired where certain impacts cannot be avoided or appropriately mitigated and/or acquisition is agreed upon in consultation with affected landowners.</p> <p>Ongoing consultation with affected landowners, and the wider communities, will be undertaken in accordance with ARTC's consultation plan, as discussed in Chapter 6: Stakeholder Engagement. Negotiation of land acquisition will be undertaken in accordance with the Acquisition of Land Act 1967 (Qld), which includes the process for the resumption of land by a constructing authority (Department of Transport and Main Roads) and compensation. A summary of land within the permanent footprint that will potentially be subject to full or partial acquisition is provided in Table 8-36 of Chapter 8: Land Use and Tenure and a detailed record of all impacted properties is in Appendix F: Impacted Properties. The extent of land acquisition will be confirmed following completion of the detailed design.</p> <p>Assessment of compensation is undertaken in accordance with Section 20 of the Acquisition of Land Act 1967 (Qld). Compensation is based upon the value of land taken at the date of the resumption, plus damage caused by severance and/or injurious affection to other land, and costs attributable to disturbance. Compensation is assessed on an individual basis, based on the highest and best use market value of the land taken at the date of resumption. In assessing the compensation paid, regard is given to the value of the land taken, severance, injurious affection and disturbance (Chapter 8: Land Use and Tenure, Section 8.6.2).</p> <p>Costs attributable to Compensation for disturbance caused by the resumption may include:</p> <ul style="list-style-type: none"> Reasonable legal costs, valuation or other professional fees for preparing and filing a claim for compensation Costs related to the purchase of replacement comparable land Storage and removal costs Other reasonable financial costs incurred that are a direct consequence of the resumption of the land. <p>During construction, land will be acquired temporarily in accordance with the Acquisition of Land Act 1967 (Qld). Purchasing or leasing arrangements for these properties will be investigated in consultation with relevant landowners.</p> <p>With regards to flooding, where changes to surface water and hydrology are identified, nominated Flood Impact Objectives (FIO) have been developed to provide guidance and consideration to indirect impacts on particular land uses (Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Chapter 13: Surface Water). The Project will target achieving the FIOs for events up to and including the 1% AEP for land, receptors, and/or infrastructure, and where the FIOs are met, it is reasonable to assume there will be no adverse impacts from flooding on the use of land.</p> <p>Where it is not practicable or feasible to achieve the FIOs at flood sensitive receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case by case basis, including through consultation with stakeholders and landowners.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Section 8.6.2</p> <p>Table 8-36</p> <p>Chapter 13: Surface Water</p> <p>Appendix F: Impacted Properties</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p>
218	218.0035	Local Government	Editorial		<p>Inconsistency in Draft EIS: TOR 5.1 states that the objectives of the EIS are to ensure that all relevant environmental, social and economic impacts of the project are identified and assessed.</p> <p>Section 7.1.1 of the Executive Summary states that one third of the proposed project will involve the upgrade of the existing rail corridor with the balance to be co-located with existing road infrastructure or will be established on land that, by and large, has been subject to previous disturbances for agricultural purposes. This wording is misleading and gives the reader the impression that the greenfield Section of the proposed project will be primarily constructed within existing road infrastructure, which is not the case.</p> <p>Table 14 (Tenure within the impact assessment area) provides the following data:</p> <ul style="list-style-type: none"> Freehold land - 70.8% permanent and 72.6% temporary impact. Road type parcels (existing road infrastructure) 16.3% permanent and 22.1% temporary impact. <p>Figures provided in Chapter 3, Section 3.5.2.2, Table 3.3 (Tenure within the project footprint) and Chapter 7, Section 7.5.1 (Land tenure), Table 7.4 cites different figures (72.6% for freehold land and 22.1% for road type parcels), inconsistent with Table 14 of the Executive Summary.</p> <p>The Draft EIS does not acknowledge the fact that the majority of the proposed greenfield alignment will actually be predominantly located in freehold land, that is Class A and B agricultural land. The document also fails to address impacts to agricultural land use such as the creation of fragmented farmland resulting in reduced efficiencies for farming practices as a result of the current proposed alignment, including, but not limited to, impacts such as:</p> <ul style="list-style-type: none"> Significantly increased water flows across farmland during severe storm/flood events; Increased and changed sedimentation and erosion events; Changes to land management practices and the use of equipment etc. <p>In addition, while the agricultural land in question has been previously disturbed, it still has high value from a primary production perspective. Chapter 7, Section 7.5.2 (Land use), Table 7.9 (existing land use within the project footprint (based on QLUMP data)) states that transport and communication (road and other infrastructure reserves) will comprise 1.3% of the permanent footprint and 3.2% of temporary, while agricultural uses (grazing, cropping, irrigated cropping) total 86.8% of the permanent, and 85.3% of the temporary footprint. This Table indicates that there is a substantial difference between the two land uses (agriculture and transport). This should be highlighted when referring to the current proposed alignment of the rail corridor and existing land use.</p> <p>Further, the Draft EIS notes (in Table 7.9s footnote) that the dataset was not modified where localised inaccuracies occur. This gives the reader the impression that inaccuracies exist and may be significant, without explicitly stating that this is the case.</p> <p>between the two land uses (agriculture and transport). This should be highlighted when referring to the current proposed alignment of the rail corridor and existing land use.</p> <p>Further, the Draft EIS notes (in Table 7.9s footnote) that the dataset was not modified where localised inaccuracies occur. This gives the reader the impression that inaccuracies exist and may be significant, without explicitly stating that this is the case.</p>	<p>The Draft EIS does not meet the requirements of TOR 5.1 given the inconsistency between figures quotes for impacted properties. The Draft EIS should be amended to ensure:</p> <ul style="list-style-type: none"> Information provided in the Executive Summary is consistent with that provided in the main document, and appendices. The uncertainty regarding affected properties is removed and the proposed projects current proposed greenfield alignment is clearly identified as being primarily located in Class A and Class B Agricultural Land, which is primarily freehold land. Data should be made consistent throughout the Draft EIS and wording should accurately reflect what the data tells the reader. The Draft EIS should be amended appropriately to either consider the inaccuracies referred to in Table 7.9s footnote or provide information which clearly illustrates to the reader that the inaccuracies referred to are minimal rather than simply inferring that inaccuracies exist without providing firm data to back the statement up. Sections of the proposed project which cross freehold land which is Class A and B agricultural land should be realigned in consultation with landholder requirements. The proponent should consider adopting the widening of road corridors where appropriate to reduce the amount of freehold land which is Class A and B agricultural land in order to reduce adverse impacts to landowners as a result of the proposed current alignment. 	<p>Revisions and updates to the executive summary have been undertaken to ensure consistency between the content of the Executive Summary and the body of the EIS.</p> <p>Chapter 8: Land Use and Tenure, Section 8.4.2 and 8.5.1 include information on the number of lots and easements (Permanent and Temporary). Appendix F Impacted Properties is consistent.495 properties are permanently impacted along with 33 easements. When combined with temporarily impacted properties, the numbers increase by 48 lots to 543 and easements increase by 9 to 42.</p> <p>With respect to the Agricultural land, Table 8-10 and 8-11 of Chapter 8: Land Use and Tenure are relevant as they demonstrate the area and percentage of the Project footprint (permanently and temporarily impacted) for both the mapped Land Class A and B for the total area as well as for the areas that are currently available for cropping (which is land outside of the existing road and rail reserves in which the Project is located).</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Section 8.4.2</p> <p>Section 8.5.1</p> <p>Table 8-10</p> <p>Table 8-11</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0036	Local Government	Traffic and Transport	Operational traffic	Impacts to Property Access TRC consultation required: The Draft EIS states the proposed project will: <ul style="list-style-type: none"> Result in the severance of driveways and private access to individual properties; Design each property solution on a case-by-case basis; and Include typical treatments such as diversions to an adjacent public road. <p>The Draft EIS does not propose to consult with TRC to ensure that proposed property solutions involving TRC managed public roads are also acceptable to Council. As a result, the document has not adequately addressed the impacts of the proposed project on the wider transport network or ensured that mitigation strategies will be prepared in close consultation with relevant local governments (as required by TOR 11.109 and 11.116).</p>	The Draft EIS requires update to commit to consulting with TRC in relation to any proposed change to private access from public roads.	Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include: <ul style="list-style-type: none"> ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. <p>Severance and fragmentation of rural properties are considered in Chapter 8: Land Use and Tenure, and the results are summarised in Section 8.5.1 and 8.5.4 of the EIS. It is identified that property severance could affect the configuration of a property, affecting efficiency, productivity and viability, for example as a result of changes in access arrangement for the movement of farm machinery or stock to different areas of a property. Other identified property impacts include impeded access and changes to internal roads.</p> <p>ARTC acknowledges this issue, which will continue to be addressed as the design and construction planning progress. In accordance with mitigation measures in Section 8.6.2 and 8.6.3 of Chapter 8: Land Use and Tenure, the design and construction planning would continue to be refined to minimise potential impacts on land uses and properties as far as reasonably practicable. Consultation with landowners will be ongoing during detailed design to identify feasible and reasonable measures and opportunities to minimise impacts on their operations/properties. Where the proposal affects internal property access arrangements, input has been and will continue to be sought from relevant landowners prior to finalising the detailed design. Where changes to internal property access arrangements are required, ARTC will consult with relevant property owners/occupants regarding alternative access arrangements, where feasible alternatives are available, ARTC will identify feasible and reasonable measures to minimise impacts on existing operational arrangements/properties.</p>	Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.5.4 Section 8.6.2 Section 8.6.3 Appendix AA: Traffic Impact Assessment Section 6.2
218	218.0037		Traffic and Transport	Construction traffic	Land Tenure temporary footprint may not be sufficient: The Draft EIS states that the temporary footprint will provide for the roadworks associated with the construction of new roads.	TRC does not support the full closure of any road to traffic during construction. The Draft EIS should be revised to provide sufficient temporary footprint at all road/rail interfaces to accommodate side-tracks during construction and to commit to no road closures during construction activities.	Whilst a significant amount of work has been completed to assess the potential road impacts as outline in the Traffic Impact Assessment in Appendix AA: Traffic Impact Assessment of the revised draft EIS, the Principal Contractor is not on board the Project until detailed design and as such the construction routes are not finalised by the Contractor. As a result, a complete RUMP cannot be delivered until that time. This is normal process for construction projects, and is in line with Workplace Health and Safety legislation requirements. This is because many assumptions during the previous stages that will impact on road use management strategies, are not confirmed until detailed design progresses, or construction scheduling allows full visibility of the impact of construction vehicles.	Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 6.2
					Elsewhere, the Draft EIS states that during construction, land will be required temporarily and purchasing or leasing arrangements will be investigated in consultation with relevant landowners.		Requirements for roads upgrades to be finalised during Detailed Design stage as well as updating during the Construction Works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MTRS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.	
					The Design drawings do not adequately identify whether there is sufficient temporary footprint available at relevant local road/rail interfaces to accommodate side-tracks for the proposed permanent construction works.		Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan.	
					As a result, the Draft EIS has not adequately identified all tenure required for the proposed project to proceed and therefore does not meet the requirements of TOR 11.74.		Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include: <ul style="list-style-type: none"> ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	
218	218.0038	Local Government	Social Impact Assessment	Construction traffic	School Bus Routes – impacts not adequately addressed: The Draft EIS acknowledges that stakeholders are concerned about the potential for Project traffic to use school bus routes, which will in turn lead to safety issues for school children and the public in general.	TRC's position is that there should be no movement of construction traffic (other than light vehicles) on school bus routes during construction of the project, and to provide mitigation measures to address these impacts to TRC's and TransLink's satisfaction.	The disruption to bus routes located near the alignment are likely to be during construction of the Project.	Appendix AA: Traffic Impact Assessment Section 5.2.2 Section 5.12.3 Section 5.10.4 Table 5.114
					The Draft EIS identifies that across the proposed project area, 164 existing school bus services will share elements of the proposed construction routes including 11 new or upgraded intersections, and notes impacts of longer journey times, with essential movements proposed during pick-up and set-down times.	The Draft EIS should be amended to provide detailed information as to how the proposed project will impact school bus routes during construction of the project, and to provide mitigation measures to address these impacts to TRC's and TransLink's satisfaction.	Construction traffic on known school bus routes, or routes with significant cyclist or pedestrian activity will be restricted during pick-up and set-down times on school days, or peak active transport periods.	
					The Draft EIS does not quantify that these longer journey time impacts, and the use of the term 'essential movements' could be interpreted as being all construction traffic associated with the proposed project.	TRC requests that the OCG impose the following condition: <ul style="list-style-type: none"> The proponent is required to consult with TRC and TransLink regarding the potential and adverse impacts of construction traffic on school routes and to reach written agreement with TRC and TransLink in relation to this issue at least six months prior to the commencement of any construction activities.' 	Further measures may include measures such as signage or protection on construction routes with a high proportion of cyclists or pedestrians, employing contractor driver briefings on safe driving to avoid active transport users and community notifications.	
					Further, the Draft EIS does not adequately describe how the proposed road-rail interface works will be constructed, including what detours, road closures or other impacts may arise during construction, simply noting in most cases that vehicular movements are expected to be 'unimpeded once construction works are operational'.		Once a construction contractor is appointed, construction routes and vehicle numbers are finalised, specific measures to mitigate impacts to active transport users will be required to be developed for the construction routes on a case-by-case basis. This is to minimise construction vehicles through areas of higher pedestrian or cyclists' activity, such as schools or town centres, in peak periods will reduce the impact and potential safety issues (Section 5.2.2, Appendix AA: Traffic Impact Assessment).	
					The Draft EIS does not adequately describe how the impacts to school bus routes will be mitigated during the construction phase of the proposed project, nor does it provide sufficient information to allow an independent assessment of how existing transport infrastructure will be affected by proposed project transport at the local level or developed mitigation strategies in close consultation with relevant local governments (TRC), and as such has not meet the requirements of TOR 11.113 and 11.116.		In addition to identifying impact mitigation measures in Appendix AA: Traffic Impact Assessment for all applications, major developments must generally submit a road-use management plan (RUMP). The purpose of the RUMP is to detail how road impacts of Project traffic, particularly from HV use, will be avoided or managed during the life of the Project using road-use management strategies that are verifiable. The RUMP is detailed further in Section 5.12.3 of Appendix AA: Traffic Impact Assessment. The Contractor will use DTMR Guideline for Preparing a Road Use Management Plan and the Traffic and Road Use Management Manual for guidance and as a source of reference for preparing a RUMP. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing, to ensure management measures to minimise the potential impacts on the transport network are implements and mechanisms are in place to manage these impacts into the future.	
							Given that the school bus routes summarised in Table 5.114 (of Section 5.10.4) do not tend to have designated bus stops, apart from the termini, prior to the Construction Works stage of the Project, suitable mitigation measures for all of the affected services, including the location of bus stops, should be identified in consultation with bus operators, local councils, impacted schools, Department of Education and the local community and be documented in the TMP to ensure school bus safety and understand any impacts to journey times, if any.	
							It is expected that school bus services would not be substantially impacted from an operational and service reliability perspective as a result of the Project generated traffic during the Project construction. However, the construction contractor should avoid school bus services and school zones, with school zones and routes considered in the preparation of the CEMP, as discussed in Section 5.12.3 of Appendix AA: Traffic Impact Assessment.	
218	218.0039		Surface Water	Increase in flows	Hydraulic Design Criteria, Flood Impact Objectives, Assessment Methodology and Mitigation Measures no actionable nuisance to be created by the Project: The Draft EIS addresses only technical engineering design criteria and fails to address the common law legal principle of no actionable nuisance in relation to any changes in drainage flows and/or flow paths.	The Draft EIS should be amended to meet the requirements of TOR 11.53 and 11.54(c) and identify and mitigate all direct and indirect impacts of the proposed project on local drainage flows and/or flow paths, and to provide mitigation measures which will address these impacts to TRCs satisfaction and to ensure that there is no actionable nuisance affecting either TRC road and drainage infrastructure or private property owners.	The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). Flood flow distribution has been assessed and is discussed in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Section 14.11 Table 14-4
					The reference design indicates that the proposed project will intercept, divert and concentrate upstream overland flows to higher locations in each catchment and may even potentially divert flow between catchments. These changes have the potential to affect TRC road and drainage infrastructure and private property owners adversely.	TRC requests that the OCG impose the following condition: <ul style="list-style-type: none"> The proponent must implement all recommendations of the Independent International Panel of Experts for Flood Studies of Inland rail in Queensland review and be required to consult with TRC regarding the mitigation of all direct and indirect impacts from the proposed project on local drainage flows and/or flow paths and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 4.2 Section 18
					The Draft EIS contains brief commentary about point-source discharges of water, embankment drains, catch drains and discharges of water from the proposed rail corridor, and states these will pass into a local water system with negligible impacts. Appendix Q states that calculations for minor catchments have been undertaken however these calculations are not provided in the Draft EIS. Further, no mitigation measures have been proposed to address these concerns.		Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.	Appendix T2: Hydrology and Flooding Technical Report - Volume 2
					As a result, the Draft EIS has not adequately addressed the proposed project's direct and indirect impacts at the local scale, and therefore does not meet the requirements of (TOR 11.53 and 11.54).		As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	
218	218.0039	Local Government	Surface Water	Increase in flows	Hydraulic Design Criteria, Flood Impact Objectives, Assessment Methodology and Mitigation Measures no actionable nuisance to be created by the Project: The Draft EIS addresses only technical engineering design criteria and fails to address the common law legal principle of no actionable nuisance in relation to any changes in drainage flows and/or flow paths.	The Draft EIS should be amended to meet the requirements of TOR 11.53 and 11.54(c) and identify and mitigate all direct and indirect impacts of the proposed project on local drainage flows and/or flow paths, and to provide mitigation measures which will address these impacts to TRCs satisfaction and to ensure that there is no actionable nuisance affecting either TRC road and drainage infrastructure or private property owners.	The Inland Rail Project has been designed to maintain existing water flow paths by incorporating sufficiently sized cross drainage structures (i.e. bridges and culverts). Flood flow distribution has been assessed and is discussed in Section 14.8.1 of the revised draft EIS, Chapter 14: Flooding and Geomorphology.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Section 14.8.1 Section 14.11 Table 14-4
					The reference design indicates that the proposed project will intercept, divert and concentrate upstream overland flows to higher locations in each catchment and may even potentially divert flow between catchments. These changes have the potential to affect TRC road and drainage infrastructure and private property owners adversely.	TRC requests that the OCG impose the following condition: <ul style="list-style-type: none"> The proponent must implement all recommendations of the Independent International Panel of Experts for Flood Studies of Inland rail in Queensland review and be required to consult with TRC regarding the mitigation of all direct and indirect impacts from the proposed project on local drainage flows and/or flow paths and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.	Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 2 Section 4.2 Section 5-17 Section 18.2
					The Draft EIS contains brief commentary about point-source discharges of water, embankment drains, catch drains and discharges of water from the proposed rail corridor, and states these will pass into a local water system with negligible impacts. Appendix Q states that calculations for minor catchments have been undertaken however these calculations are not provided in the Draft EIS. Further, no mitigation measures have been proposed to address these concerns.		Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.	Appendix T2: Flooding and Hydrology Technical Report - Volume 2
					As a result, the Draft EIS has not adequately addressed the proposed projects direct and indirect impacts at the local scale, and therefore does not meet the requirements of (TOR 11.53 and 11.54).		As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.	

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0040	Local Government	Surface Water	Overland flow/diversion	<p>Watercourses and waterways, and mitigation measures impacts on local roads: The Draft EIS states that the reference design includes 66 minor waterways, however flood modelling has not been completed at many of these minor waterways to inform the document. According to the reference design, a number of these waterways involve rail-over-road diversions of local roads.</p> <p>Further to this, a detailed hydrology assessment to develop enough hydrological models for the project is required to allow TRC to appropriately assess the impacts of diversions or interceptions of overland flow or the placement of diverted roads adjacent to creeks under rail-over-road bridges.</p> <p>Such impacts could adversely impact private property owners and the safety and flood resilience of TRCs road network (through changes to the depth, velocity and increased duration of inundation). Given this, the Draft EIS does not adequately address the projects direct and indirect impacts at the local scale and therefore does not meet the requirements of TOR 11.53 and 11.54(c).</p>	<p>The proponent should develop hydrologic and hydraulic models for all locations where overland or other flows are intercepted and diverted by the proposed project, particularly where the project proposes to place diverted roads adjacent to creeks or flow paths under rail-over-road bridges, and to provide mitigation measures to address these impacts to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent must implement all recommendations of the Independent International Panel of Experts for Flood Studies of Inland rail in Queensland review and be required to consult with TRC regarding diverted roads adjacent to creeks or flow paths under rail-over-road bridges to develop appropriate mitigation measures and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	<p>Hydrologic and hydraulic modelling has been carried out for local catchments as well as regional (floodplain) catchments. Local and floodplain catchments have been reported in detail in Appendices T1 and T2: Hydrology and Flooding Technical - Volume 1 and 2 Report of the revised draft EIS. The methodology that was followed to assess local catchments, and to place and size cross drainage provisions (bridges and culverts) for local catchment drainage paths is described in Section 18.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the draft EIS.</p> <p>Flood Impact Objectives (FIO) have been revised, and agreed, with the Expert Flood Panel with the FIO targets located in Section 4.2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.6.3 (Table 14-4) of Chapter 14: Flooding and Geomorphology of the revised draft EIS. An impact assessment against these FIOs has been completed with a summary of this assessment provided within the 'Flood impact objectives outcomes' Section of each catchment Chapter in Appendix T1: Hydrology and Flooding Technical Report - Volume 1 (Sections 5 to 17). Justification and mitigation measures have been provided against each FIO exceedance within the summary tables provided. A summary of FIO exceedances is provided in Section 14.11 of Chapter 14: Flooding and Geomorphology.</p> <p>As per ARTC's Mitigation Framework ARTC will continue to work with affected landowners and asset owners where Flood Impact Objectives cannot be met (or are otherwise justified) to agree appropriate mitigation measures.</p>	<p>Chapter 14: Flooding and Geomorphology</p> <p>Section 14.6.3</p> <p>Section 14.11</p> <p>Table 14-4</p> <p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 4.2</p> <p>Section 5-17</p> <p>Section 18.2</p>
218	218.0041	Local Government	Traffic and Transport	Road safety	<p>Road Safety is not adequately addressed: The Draft EIS states that as a minimum, road safety audits will be undertaken for all public level crossings included in the detailed design and that consultation will provide stakeholders with details of the relevant construction management plans and Traffic Management Sub-plan.</p> <p>The Draft EIS contains no commitment to undertake road safety audits on all local roads (including detour roads) impacted by the proposed project, nor any commitment (other than consideration in detailed design and construction methodology) to address the safety concerns and issues identified by these audits.</p> <p>The Draft EIS has therefore not provided enough information to allow an independent assessment of how existing transport infrastructure will be affected by project transport at the local level or how identified impacts will be mitigated (as required by TOR 11.113 and 11.116).</p> <p>ARTC Response: As stated within the revised TIA, a safety assessment of the detail design and proposed construction traffic routes will be required, in accordance with the GTIA, once detail design is completed. The safety assessment will determine the locations where road safety audits are required.</p> <p>As the dEIS and revised TIA have outlined the proposed level crossings for the Project, these have been noted as requiring a road safety audit during the detailed design phase. As a minimum, road safety audits will be undertaken for all public level crossings included in the detail design.</p> <p>Regarding Proposed Solution: The revised EIS states within Section 9.2.2 that as a minimum, road safety audits will be undertaken for all public level crossings included in the detail design. Furthermore, all road safety audits will be undertaken by an accredited road safety auditor, in accordance with the Austroads Guide to Road Safety Part 6A: Implementing Road Safety Audits (Austroads, 2019c).</p> <p>Further details will be added to Section 9.2 detailing that consultation between ARTC, the construction contractor, local councils and TMR will be required regarding the provision of road impact assessments and road safety audits for all impacted LGR and SCR.</p> <p>ARTC Response: As stated within the revised TIA, a safety assessment of the detail design and proposed construction traffic routes will be required, in accordance with the GTIA, once detail design is completed. The safety assessment will determine the locations where road safety audits are required.</p> <p>As the dEIS and revised TIA have outlined the proposed level crossings for the Project, these have been noted as requiring a road safety audit during the detailed design phase. As a minimum, road safety audits will be undertaken for all public level crossings included in the detail design.</p> <p>Regarding Proposed Solution: The revised EIS states within Section 9.2.2 that as a minimum, road safety audits will be undertaken for all public level crossings included in the detail design. Furthermore, all road safety audits will be undertaken by an accredited road safety auditor, in accordance with the Austroads Guide to Road Safety Part 6A: Implementing Road Safety Audits (Austroads, 2019c).</p> <p>Further details will be added to Section 9.2 detailing that consultation between ARTC, the construction contractor, local councils and TMR will be required regarding the provision of road impact assessments and road safety audits for all impacted LGR and SCR.</p>	<p>nil.</p>	<p>The road safety assessment presented within the TIA has been undertaken as per the framework laid out in GTIA Part C Section 9.This framework relies on the principle that a road's safety is not significantly worsened as a result of the Project and that any pre-existing or Project -introduced unacceptable safety risk is addressed.</p> <p>The GTIA acknowledges that safety is not readily quantifiable and may require scoring based on expert opinion on the changes to likelihood and/or consequence of a risk being realised. This road safety impact assessment has the following aims in accordance with the Project's TIA – Road Safety Methodology Technical Memo which was agreed with DTMR in November 2022 (Appendix BS).</p> <p>A safety risk assessment based on existing crash history has been undertaken along the Project construction traffic routes and road-rail interface locations for the following scenarios:</p> <ul style="list-style-type: none"> ▶ 'Without' Project ▶ 'With' Project ▶ 'With' Project and with mitigation measures (required only if the score in the Project situation is higher than in the without Project situation, or if the without Project score is in the 'high' category). <p>Appendix AA: Traffic Impact Assessment Section 5.2.2 provides whole of Project mitigation measures suggested for the Detailed Design and Construction Works stages, which include items such as construction traffic management plans, road use management plans, and non-infrastructure based mitigation measures.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.2 provides a summary of the intersections, road links and road-rail interfaces requiring mitigation as per the GTIA Part C Section 9 framework. The detailed road safety assessments are contained in Appendix AN, AO AP and AQ for intersections, road links, road-rail interfaces (construction), and road-rail interfaces (operation) respectively.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.9 details level crossing impact assessment and mitigation - operation, which includes assessment of vehicle wait times. Table 5.112 summarises the road-rail interface mitigation measures.</p> <p>Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are considered.</p> <p>Any roads or existing structures located along construction routes that may warrant upgrades to cater for the Project's construction vehicles will be required to be assessed in consultation with the asset owner, the road controlling authority, local councils, ARTC and the construction contractor to determine if the upgrade is warranted as a part of the Project. For further detail see Section 5.7 of Appendix AA: Traffic Impact Assessment.</p> <p>Requirements for roads upgrades to be finalised during Detailed Design stage as well as updating during the Construction Works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p> <p>Section 5.9</p> <p>Table 5.112</p> <p>Appendix AN</p> <p>Appendix AO</p> <p>Appendix AP</p> <p>Appendix AQ</p>
218	218.0042	Local Government	Traffic and Transport	Mitigation measures	<p>Traffic Management not adequately addressed: The Draft EIS proposes that construction and construction traffic can be managed through a Traffic Management Sub-plan, to be prepared prior to the commencement of construction as a joint effort once preferred routes are confirmed, the purpose of which is to document only the scope of the construction transport task and specify management measures and controls to minimise impacts.</p> <p>The Draft EIS does not recognise that many of the proposed road-rail interfaces may only practicably be constructed under full closure of the road to all traffic, nor are there any mitigation measures described that adequately address the matters of side-tracks and/or detours with potentially multiple adjacent road-rail interfaces affected by construction at the same time, on lower order local roads.</p> <p>As a result, the Draft EIS has not provided enough information to allow an independent assessment of how existing transport infrastructure will be affected by project transport at the local level or how identified impacts will be mitigated in close consultation with the relevant local governments and as such does not meet the requirements of TOR 11.113 and 11.116.</p>	<p>In addition to confirming preferred routes for construction traffic, the Draft EIS should be updated to identify all proposed side-tracks and/or detours required for the proposed construction of all local road-rail interfaces, and to provide mitigation measures to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to consult with TRC regarding proposed construction traffic routes (including all proposed side-tracks and/or detours) and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	<p>Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are considered.</p> <p>Any roads or existing structures located along construction routes that may warrant upgrades to cater for the Project's construction vehicles will be required to be assessed in consultation with the asset owner, the road controlling authority, local councils, ARTC and the construction contractor to determine if the upgrade is warranted as a part of the Project. For further detail see Section 5.7 of Appendix AA: Traffic Impact Assessment.</p> <p>Requirements for roads upgrades to be finalised during Detailed Design stage as well as updating during the Construction Works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification 'MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.</p> <p>Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p> <p>Section 5.7</p> <p>Section 6.2</p>
218	218.0043		Approvals/ conditions/ recommend-ations	Operational traffic	<p>Traffic Management Plans and Traffic Control Plans approvals not adequately addressed: The Draft EIS identifies that the proponent will prepare a Road Use Management Plan (RUMP), Traffic Control Plans and Traffic Guidance Schemes for the proposed project activities.</p> <p>The Draft EIS does not however recognise that TRC has statutory powers as a road authority under the Local Government Act 2009 to approve Traffic Management Plans and Traffic Control Plans on local roads and it does not provide sufficient information to enable approval conditions to be developed in relation to later approvals under relevant legislation. As a result, the Draft EIS does not meet the requirements of TOR 7.1 and 7.2.</p>	<p>The Draft EIS requires amendment to recognise the requirements of the Local Government Act 2009 and TRCs statutory powers to issue approvals for Traffic Management Plans for all project works on all local roads.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to apply for and pay all fees and charges in relation to obtaining works on road permits at least one month prior to the commencement of any proposed construction activities on local roads. 	<p>The revised draft EIS addresses the traffic, transport and access impacts of the Project on the surrounding transport infrastructure in accordance with the Guidelines for Traffic Impact Assessment (GTIA) (see Appendix AA: Traffic Impact Assessment, Section 5.7). Mitigation measures have been proposed that recognises the role of DTMR in:</p> <ul style="list-style-type: none"> ▶ The provision of road impact assessments and road safety audits ▶ The preparation of Transport Management Plans ▶ Approving traffic management arrangements for construction sites, laydown areas or non-resident workforce accommodation requiring with access with a State controlled roads ▶ The preparation of temporary road works, including diversion and signage to be undertaken in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads (DTMR 2019a) and the Traffic and Road Use Management Manual: Volume 7 Road Works (DTMR 2012) ▶ The preparation of the Road Use Management Plan (RUMP) in accordance with the GTIA <p>The role of the DTMR through the provisions of the Local Government Act 2009, in particular Part 3, s.60 and the Transport Operations (Road Use Management) Act 1995, are noted.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.7</p>

They may also provide recommendations for other approvals required by the Project.</p>	N/A
218	218.0044		Traffic and Transport	Operational traffic	<p>Traffic Data Sources and Scope of Traffic Impact Analysis false assumptions and conclusion: In instances where existing traffic data was not available, the Draft EIS makes assumptions. Of the 65 Toowoomba Region local road sections listed in Appendix X Table 4.6, traffic counts have been assumed for 26 road sections which is 40% of the road sections assessed.</p> <p>In these 26 cases, the assumed traffic volumes are much greater than the likely traffic volumes (indicatively 400% to 2000% greater), leading to the percentage impact of construction traffic on these roads being correspondingly low. These incorrect traffic count assumptions have resulted in many roads which require assessment being dismissed.</p> <p>The Draft EIS therefore has failed to provide sufficient information to allow an independent assessment of how existing transport infrastructure will be affected by project transport at the local and regional level and as such, does not meet the requirements of TOR 11.114.</p>	<p>The Draft EIS requires amendment to meet the requirements of TOR 11.114 and provide accurate traffic count data for all TRC local roads where traffic count assumptions have been made.</p> <p>For local roads incorrectly not considered in the Draft EIS, the proponent should commit to completing the necessary additional traffic impact assessments which will provide sufficient information to allow TRC to assess how local roads and local road intersections with TMR roads will be affected by the project transport.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to complete additional traffic impact assessments to allow TRC to appropriately assess impacts to local roads from proposed construction activities and provide to TRC for approval at least six months prior to the commencement of any construction activities. 	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA to indicate performance thresholds for assessment of traffic impact were developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a), GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017). This includes the 5% threshold provided from the GTIA and other acceptable LOS values provided in the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a) and DTMR Guidelines for Assessment of Road Impacts of Development (2017).</p> <p>Section 2.4.1 of Appendix AA: Traffic Impact Assessment provides an overview of the traffic data collected and used for the purpose of determining intersection volumes (used for the turn warrants assessment) at SCR intersections and outlines the existing volumes for all intersections. As part of the traffic data collection task, traffic volumes have been collected along the Project construction routes over the recent years including:</p> <ul style="list-style-type: none"> ▶ SCR census-based traffic volumes ▶ Local Government databases ▶ Traffic signal data (from DTMR STREAMS software) ▶ Link-based traffic volumes tube counts conducted in: <ul style="list-style-type: none"> ▶ September 2019 ▶ September/October 2020 ▶ March 2021 ▶ March 2022. ▶ Intersection turning counts conducted in: <ul style="list-style-type: none"> ▶ March 2021, around Brookstead ▶ March 2022, for the wider network ▶ May 2022, for diversion locations. <p>In instances where traffic data was not available from road controlling authorities or traffic surveys conducted, conservative turning volume assumptions have been adopted using the available road link volumes. This methodology has been outlined in a technical memo to TMR which is provided in Appendix BP of Appendix AA: Traffic Impact Assessment. For the intersections where base traffic turning volumes were not available, the intersection assessment will be first undertaken by comparing two "Base Traffic Scenarios" and then the 'worst case' scenario is considered for delay impacts.</p> <p>During detailed design, once the construction routes are finalised with a construction contractor, it is recommended that traffic counts be obtained for updating the traffic analysis where recent data (i.e. previous 5 years) is not available to accurately determine impacts of final Project alignment, construction program, methodology, routes and vehicle volumes.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 2.4.1</p> <p>Appendix BP</p>
218	218.0045	Local Government	Traffic and Transport	Construction traffic	<p>Traffic Impact Assessment impacts on local roads not adequately identified: The Draft EIS identifies 38 TRC local roads which will be expected to experience construction traffic that exceeds 5% of the background traffic.</p> <p>The Draft EIS goes on to conclude that based on the Level of Service (LOS) comparison, the proposed project would not generate the need to upgrade the road network for such a short duration of impact. The LOS methodology adopted is not appropriate to adequately identify impacts on lower order local roads that are not constructed to TMR standards.</p> <p>Most of the local roads which are proposed to be used for first-mile last-mile access for the delivery of materials and equipment to the proposed project's bridge sites and laydown areas, are of minimal pavement strength and construction standard and are not suitable for project traffic without significant upgrading.</p> <p>Further, the Draft EIS:</p> <ul style="list-style-type: none"> ▶ Identifies 26 locations within TRC where the addition of construction traffic warrants additional turning treatments in order to maintain safety, but then proposes that given the short duration of construction-related traffic, traffic management strategies may be introduced as an alternative measure. ▶ Considers the delivery of materials to the proposed project but does not provide any information regarding equipment used in the installation of materials such as large cranes and pile-driving rigs. <p>While the proponent considers the duration of construction to be short, the Draft EIS identifies construction durations on roads in the TRC region of generally between 3 and 6 years, which does not support the proposed use of traffic management strategies in lieu of upgrade.</p> <p>The Draft EIS has therefore failed to provide sufficient information to allow an independent assessment of how existing transport infrastructure will be affected by project transport at the local level or to prepare mitigation strategies in close consultation with relevant local governments (as required by TOR 11.114 and 11.116).</p>	<p>"The Draft EIS requires updating to provide sufficient information for TRC to fully assess the impacts of the proposed project traffic on local roads and intersections of local roads with TMR roads, irrespective of the LOS comparison, and to provide appropriate mitigation measures to address these impacts to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to consult with TRC regarding proposed construction traffic routes (including all proposed side-tracks and/or detours), to propose appropriate mitigation measures and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	<p>Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA to indicate performance thresholds for assessment of traffic impact were developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a), GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017). This includes the 5% threshold provided from the GTIA and other acceptable LOS values provided in the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a) and DTMR Guidelines for Assessment of Road Impacts of Development (2017).</p> <p>Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. <p>The agreed arrangements to deal with impacted pavements as a result of construction will be agreed between the Road Manager and ARTC.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 6.2</p>
218	218.0046	Local Government	Traffic and Transport	Construction traffic	<p>Construction Routes unconstructed roads: The Draft EIS states that construction traffic will use 61 roads within the TRC region however 9 of these roads (15%) are not-constructed roads.</p> <p>The Draft EIS has not proposed any mitigation measures in relation to these unconstructed roads and has therefore failed to provide sufficient information to allow an independent assessment of how existing transport infrastructure will be affected by project transport at the local level or provide appropriate mitigation strategies in close consultation with relevant local governments. As a result, the Draft EIS does not meet the requirements of TOR 11.114 and 11.116.</p>	<p>"The Draft EIS requires amending to provide sufficient information to allow TRC to assess how construction traffic would use unconstructed roads, and to provide mitigation measures to address these impacts to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to reach written agreement with TRC in relation to the issue of construction traffic on unconstructed roads (including, but not limited to, committing to appropriate mitigation measures) at least six months prior to the commencement of any construction activities, 	<p>Once the Contractor is appointed and the final construction routes are determined, all construction routes will be further assessed and ground-truthed prior to use by construction vehicles. This includes obtaining all necessary permits and ensuring roads meet appropriate performance standards and any road upgrades that may be required are considered.</p> <p>Requirements for roads upgrades to be finalised during Detailed Design stage as well as updating during the Construction Works stage and as per contract required risk assessments when preparing appropriate TMPs and TGS in accordance with the Manual of Uniform Traffic Control Devices: Part 3 - Works on Roads and DTMR's specification "MRTS02 - Provision for traffic requirements. Further detail on proposed road work mitigations is discussed in Section 5.2.2 of Appendix AA: Traffic Impact Assessment.</p> <p>Appendix AA, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. <p>The agreed arrangements to deal with impacted pavements as a result of construction will exist between the Road Manager and ARTC.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p> <p>Section 6.2</p>
218	218.0047	Local Government	Traffic and Transport	Mitigation measures	<p>Pavement Impacts local roads not adequately addressed: The Draft EIS describes preliminary desktop pavement impacts on all potentially affected State-controlled roads but provides no pavement impact assessment on TRCs local roads.</p> <p>Further, the Draft EIS proposes that condition assessments be undertaken on both sealed and unsealed local roads but does not propose any actual measures which would address impacts on local road pavements. Local roads are generally not constructed to a pavement standard that is sufficient to accommodate the proposed projects transport task.</p> <p>The Draft EIS has therefore not provided sufficient information to allow an independent assessment of how existing transport infrastructure will be affected by project transport at the local level or prepared mitigation strategies in close consultation with relevant local governments (as required by TOR 11.113 and 11.116).</p>	<p>"The Draft EIS should be amended to meet the requirements of TOR 11.113 and 11.116 and commit to providing pavement impact assessments on all potentially affected TRC local roads, and to provide mitigation measures to address these impacts to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to ensure that they and all construction contractors consult with TRC regarding pavement impacts from construction activities (including, but not limited to, commitments to conduct pavement assessment surveys prior to the commencement of construction, an appropriate maintenance program during construction, and rehabilitation to original condition or better after construction activities have ceased) and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	<p>Appendix AA: Traffic Impact Assessment, Section 5.6 discusses pavement impacts with Section 5.6.4 highlighting mitigation measures for pavement damages to local government roads.</p> <p>The pavement impact assessment was undertaken to identify the likely magnitude of pavement impacts on the road network due to the additional heavy vehicles movements generated by the Project during construction. Where the pavement loadings of the additional Project related traffic equals or exceeds 5 per cent of the background loadings, the pavement is considered to be significantly impacted.</p> <p>Further, ARTC has committed that the current condition of the pavements will be classified based on Section 4 of Austroads Guide to Pavement Technology, Part 5 (2019), whereby the degradation of the pavements will be based on international roughness index values or NAAASRA roughness counts. The degradation of the pavements based on NAAASRA roughness count will be calculated, enabling the impact of construction traffic and the works required to restore the pavement to the pre-construction condition to be quantified. Where the level of roughness measured prior to construction exceeds the maximum desirable level for the class of road, the road has already exceeded its design life. In these cases, the intervention required will be agreed on a case-by-case basis with the road controlling authority.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.6</p> <p>Section 5.6.4</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0048	Local Government	Hazard and Risk	Infrastructure crossings/ interaction	<p>Hazard and residual risk at level crossings: The revised draft EIS states that proposed risk management policies and procedures will consistently and effectively reduce most of the risks associated with the proposed project to low-to-medium levels.</p> <p>The safety risk assessment reported in the revised draft EIS how's that the risk rating of road-rail interfaces on all impacted TRC local roads is proposed to be increased from either nil or medium, to High as a consequence of the proposed project.</p> <p>TRC has not at this time, agreed in-principle or otherwise with any of the road-rail interfaces or any of the consolidations, diversions or closures of local roads proposed by the revised draft EIS.</p> <p>The revised draft EIS does not adequately assess the impacts of the proposed project on individual road/rail crossings and/or any cumulative impacts on the wider transport network and therefore cannot meet the requirements of TOR 11.109.</p> <p>Further, the draft EIS does not adequately address or mitigate impacts proposed to be created by new railway level crossings in close consultation with relevant local governments (as required by TOR 11.115 and 11.116).</p>	<p>The revised draft EIS should maximise the number of grade-separated road-rail interfaces and provide active level crossings as an absolute minimum at all proposed new at-grade road-rail interfaces for the proposed project.</p> <p>TRC requests 'Additional information requests from OCG' impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to continue to develop the design of local road-rail interfaces in close consultation with TRC and to reach written agreement with the Council in relation to all proposed new road-rail interfaces and consolidations, diversions or closures of local roads at least six months prior to the commencement of construction activities. 	<p>ARTC engagement with stakeholders has continued including with TRC since public consultation of the revised draft EIS regarding all matters that have potential to affect Council, its community and assets. The design solutions for rail-road interfaces within the Toowoomba local government area has been a consistent theme through these discussions. In response to these consultations, the reference design has been revised as follows:</p> <ul style="list-style-type: none"> ▶ Passive level crossings of TRC roads reduced from 12 in the reference design to 1 in the revised reference design. This one passive level crossing is of a stock route along an unformed road. ▶ Grade separated crossings that involve TRC roads have been increased from 7 in the reference design to 12 in the revised reference design. <p>A summary of changes to the reference design since the revised draft EIS is presented in Section 5.3.3 of Chapter 5: Project Description. The revised rail crossing assessment is presented in Section 20.5 of Chapter 20: Traffic, Transport and Access in the revised draft EIS.</p>	<p>Chapter 5: Project Description Section 5.3.3</p> <p>Chapter 20: Traffic, Transport and Access Section 20.5</p>
218	218.0049	Local Government	Traffic and Transport	Mitigation measures	<p>Cycle routes, high pedestrian activity areas and schools impacts not adequately identified or addressed: The Draft EIS identifies there are 10 cycle routes, towns (including Toowoomba, Pittsworth, Millmerran) that have volumes of pedestrian activity and two primary schools (Brookstead and Southbrook) in TRC that have the potential to be adversely impacted by construction traffic.</p> <p>While the Draft EIS does note one mitigation measure in relation to the schools, the Draft EIS concludes that most of these cycle and pedestrian routes currently facilitate a high proportion of heavy vehicle movements, and the addition of construction traffic is unlikely to result in a significant increase in risk.</p> <p>The Draft EIS has not adequately assessed active transport impacts, nor provided sufficient information as to how existing transport infrastructure will be affected by project transport at the local level, neither has it included mitigation strategies in close consultation with relevant local governments (as required by TOR 11.112, 11.113 and 11.116).</p>	nil.	<p>In developing the Construction Traffic Management Plan, it will be required to take into consideration areas of significant pedestrian and cyclist activity. When construction activities are within these areas, where there is potential for higher pedestrian volumes, specific pedestrian management measures should be put in place. These will be subject to site specific planning and reflect the nature of the works underway and the impacts on the existing pedestrian and cycle network.</p> <p>Prior to construction traffic utilising these routes, consultation and agreement between ARTC, the construction contractor and the local council will be required, including agreement upon appropriate mitigation measures to ensure the safety of pedestrians, cyclists and schools impacted by the construction related traffic.</p> <p>Appendix AA: Traffic Impact Assessment Section 4.2 has identified roads within the PCNP, and the town centres, that are proposed for use by construction vehicles, and indicated that as these areas have increased numbers of active transport users, further mitigation measures may be required to be developed within the CTMP once a construction contractor is appointed.</p> <p>Appendix AA: Traffic Impact Assessment Section 6.1 includes further detail on proposed mitigation measures that may be implemented by the construction contractor on roads with increased pedestrian activity, near schools or significant cyclist activity. These measures may include things such as appropriate signage or protection from construction vehicles for active transport users.</p>	<p>Appendix AA: Traffic Impact Assessment Section 4.2 Section 6.1</p>
218	218.0050	Local Government	Traffic and Transport	Operational traffic	<p>Operational condition of road networks road safety: The Draft EIS states that rail operational traffic volumes are likely to be negligible, with no envisaged impact to the operational conditions of the surrounding road networks This statement is based on a numerical LOS parameter which does not reflect the major change in the road-rail safety environment that the proposed project represents.</p> <p>The Draft EIS identifies that each level crossing will disrupt traffic operations from 14 to 25 times per day with initial wait times of over 3 minutes (for up to 1.8 km trains). Compared to the current seasonal (only) and low-speed rail movements, the proposed project represents a substantial increase in the disruptive impacts of rail movements upon traffic operations on local roads. It also increases safety concerns arising from the proposed frequency of level crossing operations combined with high speed freight train operations.</p> <p>The Draft EIS has not adequately assessed the impacts of the proposed project on individual road/rail crossings as defined in TOR 11.109.</p>	<p>The Draft EIS should be updated to meet the requirements of TOR 11.109 and to recognise the significant change in the nature of and safety of road-rail interactions arising from the proposed project in terms of local road operations, and to propose mitigation measures which address this matter to TRCs satisfaction.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to consult with TRC regarding the proposed and significant change in the nature and safety of road/rail interactions as a result of the proposed project and in relation to local road operations, and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities. 	<p>Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA to indicate performance thresholds for assessment of traffic impact were developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a), GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017). This includes the 5% threshold provided from the GTIA and other acceptable LOS values provided in the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a) and DTMR Guidelines for Assessment of Road Impacts of Development (2017).</p> <p>During the Operations stage of the Project, it is anticipated that occasional access to and from the corridor will be required to conduct routine inspection and maintenance works. The existing road network will be used by maintenance crews to travel to the rail corridor. Once in the rail corridor, the RMAR incorporated into the design of the Project will be used in preference to the existing road network for Project maintenance activities. These activities are likely to be infrequent and the related traffic volumes are likely to be minimal with no envisaged impact to operational conditions of the surrounding road network. These traffic volumes are envisaged not to exceed 5 per cent of base conditions. Therefore, a detailed analysis was not considered necessary as part of Appendix AA: Traffic Impact Assessment.</p> <p>Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none"> ▶ ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing. ▶ Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing intersections and road links are not worsened. ▶ ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. 	<p>Appendix AA: Traffic Impact Assessment Section 6.2</p>
218	218.0051		Traffic and Transport	Cumulative impacts	<p>Cumulative Impacts within the wider road network not quantified: The Draft EIS states that there is a potential for this and other concurrent projects (including the proposed Gowrie to Helidon Inland Rail project) to result in cumulative impacts to accessibility within the wider road network.</p> <p>The Draft EIS further states that both Inland Rail projects are expected to be reliant on use of roads north of the Warrego Highway for a large portion of the construction period but provides no information as to the magnitude or intensity of these proposed impacts.</p> <p>Table 7.41 addresses cumulative impacts on accessibility to the wider road network, but not within the wider road network.</p> <p>The methodology proposed by the Draft EIS to address this issue is to facilitate communication between the principal contractors of the adjoining Inland Rail packages in order to ensure that construction methodologies and scheduling are compatible and do not exacerbate the potential impacts of a single project.</p> <p>While the Draft EIS also proposes to consult with TRC during the construction planning and construction phase to identify newly occurring issues/risks to the road network by project traffic, the document provides no clarity as to what the proposed impacts on accessibility within the wider road network would be or provide a surety as to how these impacts would be managed to TRCs satisfaction.</p> <p>As a result, the Draft EIS has not adequately addressed the impacts of the proposed project on the wider transport network or prepared adequate mitigation measures in close consultation with relevant local governments, as required by TOR 11.109 and 11.116.</p>	<p>The Draft EIS should be updated to meet the requirements of TOR 11.109 and TOR 11.116 including an assessment of the cumulative impacts of this and other concurrent projects (including the proposed Gowrie to Helidon Inland Rail project) on accessibility within the wider road network and to provide appropriate mitigation measures to effectively address these impacts.</p>	<p>Appendix AA: Traffic Impact Assessment has updated to address cumulative impacts of the Project (with concurrent projects including Gowrie to Helidon and North Star to Border project) on the wider network in Section 3.3.</p> <p>Appendix AA: Traffic Impact Assessment Section 3.3 details, to support the cumulative impact assessment for the revised draft EIS, anticipated timing of Construction for all Queensland and adjacent Inland Rail Projects is summarised in Table 3.7.</p> <p>Appendix AA: Traffic Impact Assessment Section 5.11 'Cumulative impact assessment and mitigations' addresses cumulative impacts of the Project with concurrent projects including the North Star to Border, Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru, Kagaru to Acacia Ridge/Bromelton projects. Detailed quantitative cumulative impact assessment and mitigations is discussed in Section 5.11.</p>	<p>Appendix AA: Traffic Impact Assessment Section 2.8 Section 3.3 Section 5.11 Table 3.7</p>
218	218.0052	Local Government	Project scope		<p>Proposed project footprint: TOR 5.3 states the detail at which the EIS deals with matters relevant to the project should be proportional to the scale of the impacts on environmental values</p> <p>Chapter 1, Table 1.1 states that the rail corridor would extend out to a maximum of 230 m. Wider sections of corridor are required to accommodate earthworks, drainage structures, rail infrastructure, access tracks and fencing. It is unclear to the reader whether this is 230 m to one side, or 230 m incorporating the proposed rail alignment.</p> <p>Chapter 7, Section 7.4.1 does not provide or discuss the maximum construction or operation footprint for the proposed project.</p> <p>The lack of maximum construction and operation footprint sizes raises concerns regarding technical study areas. Specifically, whether or not the proposed project footprint (including temporary and permanent footprint areas) has been adequately addressed by all the various technical studies (i.e., have all studies assessed a consistent and accurate project footprint?).</p>	<p>The Draft EIS requires amendment to meet the requirements of TOR 5.3 as it does not provide maximum construction or operation footprint sizes.</p> <p>It is recommended that all technical studies be reviewed to ensure that the proposed project footprint (including temporary and permanent footprint areas) has been accurately assessed.</p> <p>The Draft EIS should state whether the 230 m is total width or 230 m to either side of the corridor and provide clear information relating directly to where these maximums occur on the proposed alignment.</p> <p>The maximum width needs to be considered when calculating maximum footprints for construction and operation. These figures need to be included throughout the Draft EIS, and particularly in Chapter 7, Section 7.4.1.</p>	<p>The starting point for the EIS investigations and the definition of the permanent and temporary Project footprints was the two-kilometre-wide study area as determined by the Australian Government and as referenced in Section 2.8 of Chapter 2: Project Rationale of the revised draft EIS. This study area was an outcome of the Corridor Options Report for Border to Gowrie that was completed in 2017.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation for each subject matter and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>This is described in Chapter 8: Land Use and Tenure, Section 8.3 and is depicted on Figure 8.1a-w.</p>	<p>Chapter 2: Project Rationale Section 2.8</p> <p>Chapter 8: Land Use and Tenure Section 8.3 Figure 8.1a-w</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0053	Local Government	Flora and Fauna	Infrastructure crossings/interaction	<p>Crossing loops in environmentally sensitive areas: Section 1.2.3 notes there will be five crossing loops constructed at a minimum length of 2200 m and turnouts constructed to connect crossing loops and existing Lines/sidings. Figures 1.3a to 1.3k do not indicate where these crossing loops and turnouts will be located.</p> <p>Figures 1.3a to 1.3k do include a red shaded marking labelled 'permanent disturbance footprint' however many of the wider areas of the permanent disturbance footprint are located within environmentally sensitive areas. For example:</p> <ul style="list-style-type: none"> Ch 45 to 53; Ch 55 to 66; Ch 73 to 77; Ch 84 to 96; Ch 155 to 118; Ch 164 to 169; Ch 170 to 176; and Ch 203 to 207. 	<p>Figures 1.3a to 1.3k of the Draft EIS require amendment to include the locations of crossing loops, sidings and turnouts. Further, the Draft EIS requires amendment to justify why proposed crossing loops, sidings and turnouts have to be located in areas which are environmentally sensitive areas.</p> <p>The Draft EIS should demonstrate how impacts to environmentally sensitive areas has been avoided and minimised as areas of sensitive environmental values should have a minimum footprint of disturbance as a priority. The Draft EIS should justify why the increased widths at the changes noted are not minimised to achieve no significant residual impact through environmentally sensitive areas and should consider amending the proposed locations of these areas outside environmentally sensitive areas.</p>	<p>The Project alignment has changed since submission of the draft EIS.</p> <p>The Project includes five crossing loops which will be constructed as Sections of track roughly parallel to the main track (Section 5.4.3, Chapter 5: Project Description). The selection of crossing loop locations was informed by operational modelling for the Inland Rail Program and has taken into consideration proximity to sensitive receptors, interferences with existing infrastructure and flexibility for future extension. The locations of the crossing loops are:</p> <ul style="list-style-type: none"> Loop 1—Yelarbon Loop 2—Inglewood Loop 3—Kooroongarra Loop 4—Yandilla Loop 5—Broxburn <p>Chapter 11: Flora and Fauna, Section 11.6 of the revised draft EIS outlines the proposed mitigation measures across Detailed Design, Pre-Construction Activities and Early Works stage, Construction Works and Operations stages. Section 11.6 provides comprehensive details for mitigation and management measures according to the aspect of the Project including biodiversity, aquatic fauna, water quality, fauna fencing and movement.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.3</p> <p>Chapter 11: Flora and Fauna</p> <p>Section 11.6</p>
218	218.0054		Hazard and Risk	Mitigation measures	<p>Proponent environmental record: Section 1.5 notes that the proponent has incurred penalties for the discharge of sediment-laden water and sediment and erosion issues in NSW.</p>	<p>In light of the proponents pre-existing environmental penalties, it is considered that the revised draft EIS should robustly commit to communicating clearly how the proponent intends to ensure such events do not occur again, given that both the unauthorised release of sediment laden water, and events relating to the creation of sediment erosion issues may be considered to be directly related to TRC and community concerns regarding the Condamine River Floodplain.</p>	<p>A Concept Erosion and Sediment Control Plan (ESCP) will be developed as a component of the Construction Environmental Management Plan and will guide development of area-specific ESCPs and include detailed erosion hazard assessments and erosion and sediment control structure designs. Each of these be regularly updated and maintained during construction. The erosion and sediment control measures will be developed by a certified practitioner in erosion and sediment control, in accordance with the Best Practice Erosion and Sediment Control (IECA, 2008) and with reference to Soil Conservation Guidelines for Queensland (DSITI, 2015) and will be implemented during construction of the Project.</p> <p>A draft Soil Management Plan is provided in Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Part B (Section 3). Commitments to developing and implementing ESCPs are provided in Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan</p> <p>Section 3</p>
218	218.0055	Local Government	Project scope		<p>Proponents environmental record: Section 1.5 notes the proponent has previously entered into a Voluntary Enforceable Undertaking with the Department of Sustainability, Environment, Water, Population and Communities (now the Department of Agriculture, Water and the Environment (DAWE)) under the EPBC Act in 2011.</p>	<p>It is considered that given TRC and community concerns regarding all catchments and in particular the Condamine River Floodplain, the Draft EIS should include detail regarding this agreement in order to provide the reader with confidence in the proponent and the delivery of the proposed project.</p>	<p>Once ARTC had met the requirements of the Voluntary Enforceable Undertaking (VEU), including implementation of 48 months of the weed management plan, ARTC provided DSEWPac (now DCCEEW) formal advice which confirmed completion of the requirements of the VEU on 12 January 2015.</p> <p>To enable the effective management of environmental compliance across the Inland Rail Program, ARTC has implemented an EMIS, SAI360. SAI360 is utilised as a management tool to monitor, review and manage environmental requirements and obligations. This system has been configured to support ARTC fulfil its environmental management requirements associated with the Projects. The Contractor will be required to provide environmental data/information to enable the population of SAI360 platform as part of their obligations in the contract. ARTC will remain as the proponent for ARTC approvals and will track and monitor compliance with these obligations utilising SAI360.</p> <p>All staff and contractors will be required to report any environmental incidents (including complaints) or breaches of any approval conditions in accordance with the requirements and timeframes set out in the CEMP, Operation EMP and any statutory requirements through SAI360. Project-specific Incident Management Procedures will also be developed to detail the process and resources required to respond to and manage incidents and emergencies during construction, commissioning and operation, including meeting regulatory reporting requirements.</p> <p>ARTC also manages an asset management system, 'Ellipse' during the Operations stage that records and tracks performance and compliance of assets against environment management obligations, and schedules maintenance and monitoring requirements, as prescribed by the relevant administrative authority, refer Chapter 24: Draft Outline Environmental Management Plan.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>
218	218.0056	Local Government	Land Resources		<p>Access to Millmerran landfill: The area circled on the Figure 1.3h (below) is Millmerran landfill. Access via Owens Scrub Road at Ch130 may be impacted.</p>	<p>The Draft EIS requires amendment to commit to ensuring traffic access to the landfill is maintained at all times for commercial waste contractors, domestic self-haul customers and construction traffic.</p>	<p>In response to community feedback, the revised reference design presented in the revised draft EIS includes a grade separated crossing (road over rail) on Owen Scrub Road (see Appendix E: Consultation Report, Section 4 and Section 5).</p> <p>Any temporary road closures proposed during the Construction Works stage will be reviewed and approved by the relevant road authority as part of the Contractors Traffic Management Plan. As Owen Scrub Road is a local Council road, the relevant Traffic Management Plan and any proposed closures will need to be reviewed and approved by Toowoomba Regional Council. It is expected that the Owen Scrub Road will generally remain open during daytime working hours. Side tracking of this road or short term, partial closures may be required at suitable times to enable construction works to be completed safely. Chapter 20: Traffic, Transport and Access, Section 20.5 and Section 20.6 discusses potential impacts to the local road network and proposed mitigation measures.</p> <p>ARTC will ensue traffic access to the Millmerran landfill is maintained for commercial waste contractors, domestic self-haul customers and construction traffic.</p>	<p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.5</p> <p>Section 20.6</p> <p>Appendix E: Consultation Report</p> <p>Section 4</p> <p>Section 5</p>
218	218.0057		Social Impact Assessment		<p>Local matters, local project: TOR 5.1 requires that 'the objectives of the EIS are to ensure that all relevant environmental, social and economic impacts of the project are identified and assessed...'</p> <p>The Draft EIS does not meet the requirements of TOR 5.1 as, in its current form, most of Chapter 2, including key responses such as the potential community benefits, has a heavy focus on capital cities that are at such a distance to the proposed project that any discussion of the benefits these cities may garner from the proposed project should be brief at best. Specifically:</p> <ul style="list-style-type: none"> Section 2.2 of the Draft EIS refers to issues in capital cities, including 'competition from passenger trains, commute times and increased trucking movements on metropolitan roads.' The text goes on to further highlight population growth issues in capital cities and how the proposed project will benefit capital cities. Section 2.3 and 2.4 are much the same providing no reference to benefits for, or consideration of, local government areas (LGAs). Section 2.5 does include some discussion in relation to this, however the focus of the Chapter 2 remains on the benefits that capital cities will garner from the proposed project. 	<p>It is acknowledged that the proposed project is part of the larger Inland Rail Project and this should be discussed. However, it is considered that to respond appropriately to the COG's TOR requirements, the Draft EIS should discuss aspects such as perceived benefits as they relate to the proposed alignment for the proposed project, and not just the broader benefits from Inland Rail in capital cities.</p> <p>To be compliant with TOR 5.1, the Draft EIS should discuss all relevant environmental, social and economic impacts as they relate directly to the proposed B2G alignment (i.e., TRC and Goondwindi Regional Council (GRC) areas).</p> <p>The proponent should consider that while the proposed project is a component of Inland Rail, the Draft EIS and its assessment process relates directly to the B2G Section of Inland Rail and should therefore focus on providing a discussion on any perceived benefits for the LGAs which the proposed alignment traverses. Section 2.3 for example, should provide a detailed discussion regarding the perceived benefits to the LGAs, rather than simply referring to benefits for Melbourne, Sydney and Brisbane.</p>	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 7.2.3 describes the benefits of training and employment to local residents. Appendix X: Social Impact Assessment, Section 7.4.9 describes the potential legacy benefits that would eventuate in the Project region, and has been further detailed in response to submissions.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 7.2.3</p> <p>Section 7.4.9</p>
218	218.0058		Editorial		<p>Multicriteria analysis: This Figure shows a summary of 4 corridor options with several decision criteria weighted as favourable through to highly unfavourable. Why isn't the Multicriteria Analysis shown in Figure 2.5 used as the decision criteria for Figure 2.15?</p>	<p>Prepare a new Figure 2.9 and Figure 2.15 using the Multicriteria Analysis shown in Figure 2.5 as the decision criteria being responded to and update text accordingly.</p>	<p>While the multicriteria analysis (MCA) tool provided an important means of establishing a preference of one possible alignments over others, route selection was the result of previous locational and feasibility studies and the outcomes of ongoing consultation.</p> <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it became evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016 with the route being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson Corridor 2: Base Case (Modified) with a deviation to Wellcamp and Charlton Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case would be via Wellcamp Charlton was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.8) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the MCA. <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Appendix E: Consultation Report</p>

The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs the outcomes of the MCA. <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the MCA outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works (refer to Section 2.9.1 of Chapter 2: Project Rationale). The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Section 2.9.1 Figure 2.14 Figure 2.15 Appendix E: Consultation Report
218	218.0059	Local Government	Approvals/ conditions/ recommend-ations		Water Supply (Safety and Reliability) Act 2008: Section 3.5.34.2 states that this legislation is not relevant to the proposed project as the proponent will not be acting as a service provider. The proponent will however be required to locate community infrastructure (such as water and sewer services) and as a result, this legislation requires consideration.	The Draft EIS requires update to correctly include the legislative requirements relating to the required relocation of community infrastructure as a direct result of the proposed project.	As outlined in Chapter 3: Legislation and Project Approvals Process, Section 3.47 and 3.4.8, electricity infrastructure upgrades and relocations will be subject to separate assessments, with all necessary approvals obtained prior to the relevant works commencing. The Project will comply with requirements of the Electricity Act 1994 and Electrical Safety Act 2002.	Chapter 3: Legislation and Project Approvals Process Section 3.47 Section 3.48
218	218.0060		Approvals/ conditions/ recommend-ations		<p>Legislation and approvals: The OCGs TOR (6.8) requires the Draft EIS assess the extent to which the construction and operation of the project meets all statutory and regulatory requirements of the State and that the intended outcomes are consistent with current state policies and guidelines:</p> <p>Chapter 3, Section 3.1 states that this Chapter summarises the key legislation and statutory instruments, including supporting plans and policies that are relevant to the project, and the approvals necessary for the construction and operation of the project. This statement is incorrect as many approvals, and particularly state policies and guidelines, are not provided in Chapter 3, rather they have been included in the technical chapters. Further, this is not mentioned or referenced in Chapter 3.</p> <p>In addition, technical review of the EIS has identified that some data, guidelines and standards which were used to inform technical assessments have been identified as out of date or inappropriate to the proposed project. Further comment in relation to this issue is provided in detail in relevant comments below.</p>	<p>The Draft EIS states that the approvals required for the project are consolidated in Chapter 3. However, Chapter 3 only provides a discussion regarding Commonwealth and State Legislation and touches on Local Government Approvals. It does not include more detailed information regarding legislation, which is provided in the technical chapters along with relevant state policies and guidelines appropriate to each individual assessment. This means the reader is required to constantly refer to individual technical chapters to identify all regulatory requirements for the proposed project.</p> <p>The Draft EIS should summarise all regulatory requirements in one location, rather than relying on the technical chapters to provide legislative information (and cause confusion for the reader) so that the EIS adequately and easily illustrates whether the proposed project can and will meet all regulatory requirements. Technical chapters should summarise the application of previously discussed statutory and regulatory requirements as they apply to that specific technical assessment.</p> <p>Additionally, Chapter 3 should only reference legislation and provide high-level insight into its application to the proposed project. This Chapter should not contain detailed descriptions of potential requirements or propose mitigation measures.</p>	<p>The intent of Chapter 3: Legislation and Project Approvals Process is to summarise the Commonwealth Government and Queensland Government legislation relevant to the Project and identify the approvals, permits, licences and authorities necessary for the Detailed Design, Construction Works and Operations stages of the Project.</p> <p>It has been deemed appropriate for Chapter summaries that have been derived from the technical reports to further summarise legislation specific to a technical discipline. This allows Chapter 3: Legislation and Project Approvals Process to capture a high level summary on information relevant to legislation and approvals processes.</p>	Chapter 3: Legislation and Project Approvals Process
218	218.0061	Local Government	Approvals/ conditions/ recommend-ations		<p>Local Government Act: The Draft EIS does not generally recognise the Local Government Act 2009 and TRCs statutory powers as a road authority under that Act.</p> <p>Section 3.6.2 includes a statement that commits the proposed project to adhere to and be carried out in accordance with relevant local laws where applicable. However, there is no detail provided regarding which local laws are applicable, or which assessment criteria issues like noise impacts are assessed against. As a result, the Draft EIS is essentially dismissing local law requirements.</p> <p>The Draft EIS does not otherwise recognise TRCs local laws or acknowledge any proposed approvals or mitigation measures which may be required by TRC.</p> <p>Given this, the Draft EIS does not meet all statutory and regulatory requirements provided in TOR 6.8.</p> <p>TRC Planning Scheme and Planning Scheme Policies: The Draft EIS does not recognise the Toowoomba Region Planning Scheme or planning scheme policies including Engineering Standards for Transport and Drainage.</p> <p>As a result, the requirements of TOR 10.9 have not been met as the Draft EIS has not adequately described the planning schemes for the proposed alignment.</p> <p>Professional Engineers Act: The Draft EIS does not recognise the Professional Engineers Act 2002 which governs the provision of engineering services in Queensland. Given this, the Draft EIS has not met all statutory and regulatory requirements of the State (as required by TOR 6.8).</p> <p>Water requirements: The Draft EIS provides limited discussion regarding the requirements of the Water Act 2000 and Water Supply Safety and Reliability Act 2008 to consider impacts on existing licence holders, particularly in terms of extraction from storages beyond what is stated in the legislation.</p>	<p>The Draft EIS requires amendment to recognise the Local Government Act 2009 and TRCs statutory powers under that Act, the Toowoomba Region Planning Scheme (including PSP%232 Engineering Standards for Transport and Drainage) and provide sufficient information in relation to proposed mitigation measures which will enable appropriate approval conditions to be developed in relation to TRCs requirements.</p> <p>This should include, but not be limited to:</p> <ul style="list-style-type: none"> Defining which local laws are applicable to the proposed project and providing a statement of intended compliance. Clearly identify which impacts will be managed by local laws and investigate approval requirements for both construction and operation. Justify these decisions by referencing applicable legislation. Commit to the responsibility of managing complaints from sensitive receptors with regards to noise, lighting and all other impacts during both construction and operational phases of the project. The Draft EIS should be amended to recognise the Professional Engineers Act 2002 and to ensure that all engineering services associated with the proposed Project in Queensland are provided in accordance with the Act. <p>These requirements must be adhered to (before, during and after) including ongoing operations and maintenance phase.</p> <p>TRC request that the OCG impose the following condition:</p> <p>The proponent is required to adhere to the requirements of the Toowoomba Region Planning Scheme (including, but not limited to, PSP Engineering Standards for Transport and Drainage) before, during, and after construction, operation and maintenance activities resulting from the proposed project. Further, the proponent is required to consult with TRC and to provide TRC with sufficient information in relation to proposed mitigation measures which will enable appropriate approval conditions to be developed in accordance with TRCs requirements at least six months prior to the commencement of any construction activities.</p> <p>The Draft EIS requires amendment to include a discussion on the process to be adopted to identify potential impacts on existing licensed water users as a result of proposed project activities and how these impacts will be mitigated to ensure that there is no significant residual impact from the proposed project.</p>	<p>The revised draft EIS is not seeking approval or stated conditions associated with any approval or permit associated with the <i>Local Government Act 2009</i> (Section 3.5.1, Chapter 3: Legislation and Project Approvals Process). Preparation of application material will occur prior to the relevant works and in consultation with the regulator. Information requirements will be addressed and collated during the Detailed Design and Construction Works stage.</p> <p>The Coordinator-General may impose stated conditions that must be incorporated into subsequent development approvals. They may also provide recommendations for other approvals required by the Project (Chapter 3: Legislation and Project Approvals, Section 3.21).</p>	Chapter 3: Legislation and Project Approvals Process Section 3.21 Section 3.5.1

218	218.0062	Local Government	Approvals/ conditions/ recommendations		Water requirements: The Draft EIS provides limited discussion regarding the requirements of the Water Act 2000 and Water Supply Safety and Reliability Act 2008 to consider impacts on existing licence holders, particularly in terms of extraction from storages beyond what is stated in the legislation.	The Draft EIS requires amendment to include a discussion on the process to be adopted to identify potential impacts on existing licensed water users as a result of proposed project activities and how these impacts will be mitigated to ensure that there is no significant residual impact from the proposed project.	<p>Chapter 13: Surface Water, Chapter 15: Groundwater and Chapter 8: Land Use and Tenure have been updated following completion of construction water studies. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>The revised draft EIS includes a description of the process/es adopted to identify potential impacts on the existing environment (including licenced water users). This is a ToR, a specific objective of the EIS from the proposed Project. Section 15.3.2 of revised draft EIS Chapter 15: Groundwater discusses the adopted methodology, including predictive modelling, to identify potential impacts on groundwater as a result of the proposed Project. Table 15-7 details the water entitlements/licences in the groundwater study area by Water Plan (developed under the Water Act 2000, see Section 15.2 of Chapter 15: Groundwater). Chapter 15: Groundwater, Section 15.7 presents mitigation measures that may be adopted to avoid/minimise the potential impacts identified in Section 15.6, throughout the various Project stages.</p> <p>Specific mitigation measures that ARTC have committed to in order to minimise the identified impacts include ongoing investigations, a bore survey, and refinement of the modelling with the outputs of the ongoing investigations to better understand the extent and duration of potential impacts. The Project footprint (temporary footprint required to enable the Project and permanent footprint that remains after construction) is wholly contained within the groundwater impact assessment area (1 km radius from rail centreline). Section 15.5.4 details the breakdown for registered and unregistered bores within the impact assessment area, and how that information was utilised to develop the revised draft EIS. The predictive modelling does not indicate impact to any bores (registered or not) from predicted Project groundwater impacts. Project-specific monitoring bores were installed, as detailed in Section 15.4.A total of 48 Project bores comprise the revised groundwater monitoring network and can form the basis of the groundwater management and monitoring plan (GMMP) (Table 15-21). Any water entitlements attached to these bores warrant discussion between ARTC and the landholder to identify the most appropriate solution for that landholder.</p> <p>The Water Supply Safety and Reliability Act 2008 provides framework for water service providers and their customers and is not considered relevant for groundwater users in this context.</p>	<p>Chapter 8: Land Use and Tenure</p> <p>Chapter 13: Surface Water</p> <p>Chapter 15: Groundwater</p> <p>Section 15.2</p> <p>Section 15.3.2</p> <p>Section 15.4</p> <p>Section 15.5.4</p> <p>Section 15.6</p> <p>Section 15.7</p> <p>Table 15-7</p> <p>Table 15-21</p> <p>Appendix B5: Construction Water Requirements</p>
218	218.0063		Project scope	Survey effort/field investigation data	<p>Assessment methodology: Table 4.3 describes the not significant consequence for environment as contained environmental damage fully recoverable, no cost to ARTC or action required.</p> <p>As the lowest risk consequence criteria available, this is a vague, unqualified benchmark that provides little to no confidence for minimising any proposed environmental impact to ensure that there is no significant residual impact from the proposed project. Further, TRC do not consider contained environmental damage fully recoverable, no cost or ARTC action required an appropriate commitment for mitigating environmental impacts from the proposed project as it completely dismisses the best practice standard of no environmental impact. Furthermore, no reference is made in the environment consequence criteria to levels of environmental harm that are described in Chapter 1 of the Environmental Protection Act 1994.</p>	<p>The Draft EIS should be revised to define what is meant by contained environmental damage. This statement sends a message that contained environmental damage is acceptable environmental damage. The document requires further information such as:</p> <ul style="list-style-type: none"> Environment consequence criteria should refer to levels of environmental harm that are described in Chapter 1 of the Environmental Protection Act 1994. How environmental damage will be contained. Details of the actual impacts and risks associated with this containment. Include ARTC action required against the four higher-consequence levels. Higher consequences should require the proponent to remediate impacts. Describe the difference between contained and isolated environmental damage. Explain why the document fails to identify no environmental impact as the best outcome for determining risk. 	<p>Chapters 8-22 of the revised draft EIS describe in detail the potential impacts of the Project on environmental factors. The risk assessment method was applied to specific matters that might be impacted by the Project where impacts could not be quantified. This includes unknown or unpredictable impacts from land resources, transport and access, hazard and risk, and waste management. In these instances, potential impacts are assessed in terms of how likely they are to occur, and the consequences if they do occur. Likelihood and consequence criteria, and the resulting risk matrix are set out in Chapter 4: Assessment Methodology Table 4.3, Table 4.4 and Table 4.5. These criteria have been established to be consistent with the intent of AS ISO 31000:2018 Risk Management—Guidelines (Standards Australia, 2018b). Risk assessments have been documented in tabular form in the relevant EIS chapters. Once risk is determined for a potential impact, appropriate mitigations measures to reduce risk are described and the residual risk after application specified.</p>	<p>Chapter 4: Assessment Methodology</p> <p>Table 4.3</p> <p>Table 4.4</p> <p>Table 4.5</p>
218	218.0063		Project scope	Survey effort/field investigation data	<p>Assessment methodology: Table 4.3 describes the not significant consequence for environment as contained environmental damage fully recoverable, no cost to ARTC or action required.</p> <p>As the lowest risk consequence criteria available, this is a vague, unqualified benchmark that provides little to no confidence for minimising any proposed environmental impact to ensure that there is no significant residual impact from the proposed project. 218	218.0064	Local Government	Flora and Fauna		<p>The Draft EIS requires amendment to include a discussion regarding MLES, MSES and MNES and a rationale regarding the proposed 'moderate' MLES sensitivity classification. The Draft EIS should also discuss and map predicted flood impacts against known areas of local, state and federal environmental significance and further, describe how proposed impacts to any environmentally significant area will be avoided.</p>	<p>MLES, MSES, MNES and TECs: The Major and High sensitivity criteria provided in the Draft EIS appear to ignore matters of local environmental significance (MLES). Flora or fauna species which are common throughout the state may be locally rare or the last remaining local population at the boundary of its normal distribution/habitat range and therefore should be considered in an appropriate way.</p> <p>Section 10.4.2 notes that the impact assessment for flora and fauna only focused on sensitive environmental receptors as defined by Section 5 of the Environmental Offsets Regulation 2014. No MLES are included in this regulation.</p> <p>Tables 10.32, 10.33, 10.34 and 10.35 do not discuss MLES, while Section 10.9.14 notes that flooding 'should not' impact habitat for Matters of National Environmental Significance (MNE-S) species or Threatened Ecological Communities (TECs) in more than a minor or transient manner. There is no discussion provided for impacts on MLES or MSES.</p> <p>The Draft EIS fails to appropriately address TOR 11.95(a) as MLES, MSES and MNES are barely addressed.</p>	<p>Chapter 11: Flora and Fauna has been updated to include MLES, MSES and MNES species in site investigations and is outlined within the details of Field Methodology.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5</p> <p>Section 11.6</p> <p>Section 11.7</p>
218	218.0065	Local Government	Flora and Fauna	Increase in flows	<p>It is accepted that the presence of fencing across floodplains creates issues relating to flooding events and water flow and has the potential to present hazard and risk issues and should be managed in an appropriate way, including finding alternatives where appropriate. However, it is also considered that the lack of fencing or other barriers to prevent access to the rail corridor presents a significant safety risk to the local community, fauna and/or livestock.</p> <p>The Draft EIS should include a discussion on how the 'guideposts or other alternative means of protection' mentioned in Section 5.2.10.1 will minimise risk to the local community, native fauna and/or livestock, including providing specific detail regarding 'the alternate means of protection'. The draft EIS should be amended to provide detail relating to fencing across floodplains and reference design, including, but not limited to, how and where fences will terminate prior to the rail corridor crossing a floodplain, and how this will be achieved while at the same time preventing access to the rail corridor by the community, fauna and/or livestock.</p> <p>In relation to fencing across small waterways, the Draft EIS should consider the potential hazard and risk presented by flooding events in these waterways and how this relates to the floodplain impacts and the rationale the Draft EIS provides regarding not fencing across floodplains.</p> <p>This is required for the draft EIS to meet Section 10.10 of the Coordinator General's Terms of Reference, which requires the proponent to 'Describe the following information about the proposed project: (d) the location, design, capacity and management of all required infrastructure...'. </p> <p>The Draft EIS should be amended to address areas across the floodplains where landowners will no longer be able to access their own land for the purpose of running livestock because there will be no fencing in place.</p> <p>Given the issues regarding fencing or other works across the floodplain, it is also recommended that any proposed measures to manage access to the rail corridor are considered as part of Expert Panel Inland Flood Study Group and the Draft EIS.</p>	<p>Fencing across floodplains and waterways: TOR 5.1 requires that 'the objectives of the EIS are to ensure that all relevant environmental, social and economic impacts of the project are identified and assessed...'</p> <p>Section 5.2.10.1 of the Draft EIS acknowledges that there may be issues with fencing across floodplains and references community concerns in relation to same. It specifically mentions the Condamine River Floodplain, and cites community concerns regarding:</p> <ul style="list-style-type: none"> Fencing increasing 'the risk of debris being trapped on the fence and causing blockage, potentially exacerbating the risk of flooding impacts and resulting in ongoing maintenance issues'; and Fencing 'can be washed away in flood events, causing issues to downstream properties and infrastructure, and requires reinstatement'. <p>The Draft EIS further states that fencing across floodplains has not been included in the reference design, stating that 'guideposts or other alternative means of protection' will be installed to demarcate the rail corridor and prevent people, fauna and/or livestock accessing the corridor.</p> <p>The Draft EIS also states that 'fencing across small waterways will be designed to avoid storm damage and to retain effective stock control,' but does not mention flooding. Further, the document fails to address areas if there are areas where landowners will no longer be able to access their own property for the purpose of running livestock as there will be no fencing in place.</p>	<p>To limit access to the Project's rail alignment, fencing will be provided for the majority of the rail corridor. Fencing will act to protect adjoining lands from trespass and to prevent livestock from gaining access to the railway. Fencing is to extend between the corridor and private lots or property adjoining the railway. Property or land use specific fencing considerations will be discussed with relevant landowners as part of the Detailed Design stage. Refer to Section 5.4.12, within Chapter 5: Project Description.</p> <p>As the Project comprises substantial greenfield works in rural agricultural and grazing areas, standard rural fencing will typically be provided according to ARTC fencing procedure, Boundary Fencing ETM-17-02 (available on the ARTC Extranet: extranet.artc.com.au). Where ARTC propose to construct within the Queensland Rail corridor for all returned works (South Western Line and Millmerran Branch Line), ARTC shall comply with Queensland Rail standards; this includes new and replacement fencing. All existing fencing is proposed to be removed and replaced. Where ARTC are proposing to construction new railway corridor that coincides with road manager or landowner fencing, this will be replaced typically with ARTC fencing procedure, Boundary Fencing ETM-17-02. Where superior fencing is required (for example where tracks are in close proximity to roads and/or communities, or where trespass is anticipated to occur) a 1.8 m chain link boundary fence may be provided.</p> <p>Feedback from adjacent landowners indicates that fencing on the Condamine River floodplain:</p> <ul style="list-style-type: none"> Increases the risk of debris being trapped on the fence and causing blockage, potentially exacerbating the risk of flooding impacts and resulting in ongoing maintenance issues Can be washed away in flood events, causing issues to downstream properties and infrastructure and subsequently requires re-instatement. <p>Maintaining effective fauna movement across the rail corridor has been an important design consideration for the Project. A preliminary fauna movement provision and fencing strategy has been prepared for the Project and is included in Appendix P: Fauna Connectivity Strategy. The purpose of this strategy is to provide an overview of connectivity impacts across the landscape (pre and post the Construction) relating to particular species or species guilds and propose connectivity structures and fencing strategies to mitigate the loss of connectivity and reduce wildlife mortality.</p> <p>The opportunity to provide fauna exclusion fencing in association with the above-mentioned fauna crossings has been identified. This fencing would guide animals towards the preferred fauna crossing structure or passage, while reducing their potential to be struck by vehicles or trains. Where practical, the strategy provides recommendations for conceptual fauna crossing design types and associated fencing with consideration of the ARTC Fauna Design Guidelines (ARTC, 2021) and Fauna Sensitive Road Design—Volume 2 (DTMR, 2000).</p> <p>The feasibility of the proposed connectivity structures/opportunities and fencing strategies will then be determined during the Detailed Design stage of the Project.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.12</p> <p>Appendix P: Fauna Connectivity Strategy</p>
218	218.0066	Local Government	Stakeholder engagement		<p>Utility provider management: Section 5.3.6 states that the required utility realignment will be 'undertaken by the utility provider'.</p> <p>TRC is yet to make a written agreement with the proponent regarding who will be responsible for realigning utilities requiring relocation as a result of the proposed project. Discussions with the Inland Rail Utility Group are currently ongoing however agreed upon terms and conditions regarding utility relocations have not been included as commitments in the Draft EIS and as such, the requirements of TOR 7.8 have not been met.</p>	<p>The Draft EIS requires updating to provide accurate information regarding consultation with TRC to date and to discuss issues such as who is responsible for relocating utilities which require removal in order to accommodate the proposed project.</p>	<p>ARTC has successfully engaged with all utility owners impacted by the Project and have collaborated on solutions for all identified impacts on infrastructure, based on the revised reference design. ARTC notes that Chapter 6: Stakeholder Engagement and Appendix F: Impacted Properties of the revised draft EIS has been updated to include details of recent engagement with utilities and infrastructure owners, including TRC.</p> <p>Consultation with Department of Transport and Main Roads is likely to require ARTC to consult with, and either secure the consent of the Utility Authorities (including local councils) on how their infrastructure assets will be treated under the Project and to use best endeavours to obtain their consent before commencing construction that would affect infrastruture managed by a Public Utility Provider.</p>	<p>Appendix E: Consultation Report</p> <p>Section 5</p>

218	218.0067	Local Government	Land Resources		Soil stabilisation: Section 5.4 does not include reference to the likely significant volumes of lime and gypsum which will be required for soil stabilisation along the proposed alignment, or more importantly, where lime or gypsum may be sourced (in close proximity to the proposed project).	The Draft EIS (Section 5.4 and Chapter 8) requires an update to include a discussion regarding the significant volumes of lime and gypsum required for the proposed project and where it will be sourced from, transport routes etc. The Draft EIS should take into consideration and refer directly to the geomorphology requirements from the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Review when updating this section.	Sources of material for any soil stabilisation needed will be determined by the Contractor during detailed design when construction methods have been determined and soil trials have been completed. The sourcing of materials which may be needed for any soil stabilisation requirements will be undertaken in accordance with necessary approvals requirements. Appropriate risk mitigation and safety measures will be implemented to ensure stabilisation materials including but not limited to lime and gypsum, are safely transported to and stored onsite to avoid spillage and minimise associated dust. The placement and treatment of the stabilisers during construction will also be planned and executed to avoid spillage and minimise associated dust.	N/A
218	218.0068		Editorial		Hours of work: Section 5.4.4 defines proposed hours of work as generally between 6.30am to 6pm Monday to Friday and 6.30am to 1pm on Saturdays. However, based on other sections of the Inland Rail project and similar infrastructure projects of this scale, general construction hours are more likely to be 6.30am to 6pm Monday to Saturday and 6.30am to 6pm on Sundays and public holidays when there is likely no/minimal impact on sensitive receivers.	The Draft EIS requires updating to meet the requirements of TOR 5.1 and to: update working hours to be more reflective of the likely construction hours. Construction contractors are unlikely to want to have short days and days with no work. Associated impacts with any changes to construction working hours (e.g., amenity impacts on local communities) must also be reviewed to determine any additional adverse impacts and any further mitigation measures	Chapter 5: Project Description, Section 5.6.2 describes the construction hours of work. This Section has been updated to include non-standard construction hours where works comply with relevant construction noise criteria - aligning with DTMR Noise Code of Practice.	Chapter 5: Project Description Section 5.6.2
218	218.0068		Editorial		Hours of work: Section 5.4.4 defines proposed hours of work as generally between 6.30am to 6pm Monday to Friday and 6.30am to 1pm on Saturdays. 218	218.0069	Local Government	Editorial		Inappropriate location of sediment basins: The Draft EIS identifies 17 sedimentation basins (in Table 5.27) will be required for the proposed project. However, the majority of these sediment basins are proposed to be located in areas of environmental significance, namely: <ul style="list-style-type: none"> SB 1 - chainage 48.5 km; SB 3 - chainage 52.7 km; SB 4 - chainage 55.5 km; SB 5 - chainage 60.4 km; SB 6 - chainage 61.5 km; SB 7 - chainage 63.1 km; SB 8 - chainage 73.6 km; SB 2 - chainage 73.7 km; SB 10 - chainage 170.6 km - koala habitat; and SB 12 - chainage 179.9 km - koala habitat. 	The Draft EIS requires amendment to adequately address the location of sediment basins in areas of environmental significance including: <ul style="list-style-type: none"> Re-ordering Table 5.27 by ascending chainage reference, rather than the current haphazard list. Explaining the extent of additional clearing and environmental impacts created by the proposed footprint of these sedimentation basins. Identifying whether any of these proposed basins meet the criteria for referable dams (dam wall height, volume, downstream populations). Whether dam failure analysis will be completed for any of these basins. Whether the basins will be left on site permanently. Describe how basins will be rehabilitated when they are no longer required. Detail regarding the reasoning behind why SB 2 is located so close to SB 8. Why the proponent is proposing to locate sediment basins in known koala habitat areas which will result in a reduction in habitat for this vulnerable species. - Incorporate the key principles of ecological impact management (i.e., avoid and minimise) into the selection of sediment basin locations. 	The revised reference design for the Project includes 20 sediment basins within the Project footprint. These sediment basins are described, by ascending chainage, in Chapter 5: Project Description, Table 5-33. Chapter 14: Flooding and Geomorphology, Section 14.9.1 states that the number of sediment basins required for the final earthworks design will be confirmed during detailed design. <p>Sediment controls, including basins, are located within planned drainage lines within the construction footprint of the Project to reduce flow rates, the capture of sediment-laden water and to facilitate further capture via settlement of sediment, thereby reducing the potential for environmental impacts downstream. The controls are a mitigation tool to reduce impacts to sensitive aquatic receptors as well as minimise other impacts on the surrounding ecosystems. For example, scour and erosion, by slowing water flow velocities and preventing sediment being deposited in adjoining environments.</p> <p>Sediment basins are anticipated to be in place for the duration of the Construction Works stage until such time that the risk is minimised. The sediment basins are expected to be small in size to allow for regular maintenance and maintain capacity and are therefore, not expected to be referable under water plans. Once the risk of erosion and sedimentation has been sufficiently reduced through the construction program and permanent works are in place, the redundant temporary work areas will be stabilised and treated in accordance with the Project's landscape and rehabilitation management plan.</p> <p>Ongoing detailed design of drainage and water quality treatment for the Operations stage will continue and include identification of permanent water quality treatment locations. If detention basins, permanent drainage lines (or similar) are required, efforts will be undertaken to align with the temporary Construction Works stage controls to minimise vegetation disturbance and operational footprint.</p>	Chapter 5: Project Description Table 5-33 Chapter 14: Flooding and Geomorphology Section 14.9.1
218	218.0070		Project scope		Over-requirement of laydown areas: The Draft EIS proposes 74 laydown areas along 216 km of proposed rail alignment. This equates to 1 laydown area for every 2.9 km of track or carting material a distance to either side of a laydown area of only 1.45 km. This is an excessive number of laydown areas resulting in unnecessary environmental disturbance. At least 17 of the proposed laydown areas are located within the Bringally State Forest (sensitive environmental area) which is unacceptable to TRC as there appears to be no consideration of the key principles of ecological impact management (i.e., avoid and minimise). <p>This excessive number of proposed laydown areas fails to meet the requirements of TOR 5.1, particularly to recommend mitigation measures to avoid or minimise adverse impacts as mitigation should always consider minimising footprint size as far as possible to ensure that there is no significant residual impact from the proposed project, which the current arbitrary allocation of laydown areas fails to do.</p>	The Draft EIS requires amendment to meet the requirements of TOR 5.1 and to amend the currently excessively large number of laydown areas to a more reasonable number and to provide an estimate of the size of each pad (length and width and total surface area). <p>The Draft EIS should also aim to avoid and minimise locating laydown areas in environmentally sensitive areas. Where this is not achievable, the number and size of laydown areas must be minimised as far as possible to ensure that there is no significant residual impact from the proposed project. The Draft EIS should include a clear commitment to appropriately mitigating disturbances as a result of the proposed project.</p>	Laydown areas have been strategically located for the Project to enable robust construction methodologies and are described and located in Section 5.6.7 of Chapter 5: Project Description. Laydown areas have been positioned to avoid or minimise potential impacts to environmental and social receptors. <p>Land that is temporarily disturbed in support of construction activities, including laydowns, will be rehabilitated at the end of its use, unless otherwise agreed with the relevant landowner. It is also noted that construction will occur progressively along the Project alignment and, as such, the need (duration) for the temporary laydown areas has been minimised at each location.</p> <p>The revised draft EIS has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. In addition, changes have been made to the reference design that are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>In the draft EIS there was only one lay down area located in Bringally State forest, this laydown area has since been relocated to a location that is not within the State forest.</p> <p>ARTC is committed to ongoing consultations with impacted landowners through the Detailed Design and Construction Works stages with the contractor. This will enable the Project to further develop and implement property-specific mitigation measures to avoid or minimise impacts.</p>	Chapter 5: Project Description Section 5.3.3 Section 5.6.7
218	218.0070		Project scope		Over-requirement of laydown areas: The Draft EIS proposes 74 laydown areas along 216 km of proposed rail alignment. This equates to 1 laydown area for every 2.9 km of track or carting material a distance to either side of a laydown area of only 1.45 km. This is an excessive number of laydown areas resulting in unnecessary environmental disturbance. At least 17 of the proposed laydown areas are located within the Bringally State Forest (sensitive environmental area) which is unacceptable to TRC as there appears to be no consideration of the key principles of ecological impact management (i.e., avoid and minimise). <p>This excessive number of proposed laydown areas fails to meet the requirements of TOR 5.1, particularly to recommend mitigation measures to avoid or minimise adverse impacts as mitigation should always consider minimising footprint size as far as possible to ensure that there is no significant residual impact from the proposed project, which the current arbitrary allocation of laydown areas fails to do.</p>	The Draft EIS requires amendment to meet the requirements of TOR 5.1 and to amend the currently excessively large number of laydown areas to a more reasonable number and to provide an estimate of the size of each pad (length and width and total surface area). <p>The Draft EIS should also aim to avoid and minimise locating laydown areas in environmentally sensitive areas. Where this is not achievable, the number and size of laydown areas must be minimised as far as possible to ensure that there is no significant residual impact from the proposed project. The Draft EIS should include a clear commitment to appropriately mitigating disturbances as a result of the proposed project.</p>	Laydown areas have been strategically located for the Project to enable robust construction methodologies and are described and located in Section 5.6.7 of Chapter 5: Project Description. Laydown areas have been positioned to avoid or minimise potential impacts to environmental and social receptors. <p>Land that is temporarily disturbed in support of construction activities, including laydowns, will be rehabilitated at the end of its use, unless otherwise agreed with the relevant landowner. It is also noted that construction will occur progressively along the Project alignment and, as such, the need (duration) for the temporary laydown areas has been minimised at each location.</p> <p>The revised draft EIS has been updated with consideration of feedback received across multiple forums with key stakeholders, impacted landowners and the broader community, and additional information request submitted by the Office of the Coordinator-General. In addition, changes have been made to the reference design that are summarised in Chapter 5: Project Description, Section 5.3.3. Ongoing consultation will continue during all future stages of the Project.</p> <p>In the draft EIS there was only 1 lay down area located in Bringally State forest, this laydown area has since been relocated to a location that is not within the State forest.</p> <p>ARTC is committed to ongoing consultations with impacted landowners through the Detailed Design and Construction Works planning process with the contractor. This will enable the Project to further develop and implement property-specific mitigation measures to avoid or minimise impacts.</p>	Chapter 5: Project Description Section 5.3.3 Section 5.6.7
218	218.0071	Local Government	Stakeholder engagement		Laydown areas: Section 5.4.7 Table 5.28 identifies a number of laydown areas for construction of the proposed project however the locations of these sites have not been included on a corresponding Figure (map). In addition, it appears that the majority of these sites are located on private property. From review of Chapter 15 (Social), it is not apparent that any consultation has occurred with private owners of land where the Draft EIS proposes to construct laydown areas. Such consultation could result in a number of sites becoming unavailable or possibly shifted to a different location. Further, this lack of consultation in relation to laydown areas on private property ensures the Draft EIS fails to meet the requirements of TOR 5.1 '... ensure that all relevant environmental, social and economic impacts of the project are identified and assessed...'.	nil.	All landowners who are potentially impacted by the Project have been offered a meeting on property acquisition and compensation with DTMR. They have also been provided with property impact maps which include the location of temporary impacts such as laydowns. Landowners have been informed that the final determination of laydowns will be in consultation with the contractor. <p>Engagement with directly impacted landowners is detailed in Appendix E: Consultation Report, Section 4.</p>	Appendix E: Consultation Report Section 4
218	218.0072	Local Government	Project scope	Water quantity	Project-specific Construction Water Plan: The Draft EIS notes that water demand for the proposed project will be greatest during the construction phase where water will be required for earthworks, concrete batching, track works and non-resident workforce accommodations. <p>Chapter 5 Section 5.4.20.2 notes that water supply is critical for the project and TOR 11.55 to 11.57 requires the proponent to provide details on water requirements and sources for the project.</p> <p>Chapter 5, Section 5.4.20.2 and Appendix Z refer to the later preparation of a Project-specific Construction Water Plan during detailed design which will include the details of water demand, sources and contingencies. However, TOR 11.55 to 11.57 requires this information to be supplied in the Draft EIS and not later.</p> <p>Proposed water use and sources are of significant concern to TRC and the community. A true and accurate assessment of the impacts of the project on the regions water supplies cannot be made based on the information supplied by the proponent in the Draft EIS.</p> <p>The Draft EIS does not meet TOR 11.55 to 11.57 as the required level of detail regarding water demand and sources has not been supplied in the Draft EIS.</p>	The Draft EIS should be amended to meet the requirements of TOR 11.55 to 11.57 to allow for a true and accurate assessment of the impacts of the project on the regions water supplies. <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to consult with TRC regarding all aspects of water supply and use for the project and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities.</p> <p>Further to this, it is Toowoomba Regional Councils declared stance that all water sources raw, potable, surface and bore water, used to supply Toowoomba Communities are not available for construction of the Inland rail works by ARTC.</p> <p>Priority for water supply will always be for town water supply over any proposed project and the proposal to use any of these water sources for construction purposes is not considered an appropriate use of this resource by TRC.</p>	Chapter 5: Project Description, Section 5.6.24 provides estimated construction water volumes based on the revised reference design. <p>Section 5.6.24 states that both Toowoomba Regional Council (TRC) and Goondiwindi Regional Council (GRC) maintain a network of smart (automated) standpipes for potable water across their respective LGAs. However, both councils have advised that potable water from their networks is not available for use by the Project. Consequently, there is no intention to obtain Potable water from TRC or GRC sources.</p> <p>Section 5.6.24 identifies that the ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan.</p> <p>Chapter 5: Project Description, Section 5.8.10 states the Project's operational water requirements are anticipated to be minor, relative to the Construction Works stage requirements. Water may be required to support localised maintenance activities, such as high-pressure cleaning of culverts. An assessment will be made during stages of the Project to identify possible sources of water and their suitability for maintenance activities. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	Chapter 5: Project Description Section 5.6.24 Section 5.8.10 Appendix B5: Construction Water Requirements

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0073	Local Government	Project scope	Construction water supply	Construction water: Section 5.4.20 estimates a total of 2,536 ml of water will be required for earthworks during construction which equates to 11.7 ml/km. This appears to be a significant over estimation as experience on similar projects in similar climates with similar soil properties show an actual construction water use of somewhere between 2.5 and 3.5 ml/km.	It is recommended that the construction water estimates are reviewed during detailed design and against other Inland Rail projects such as Parkes to Narromine and Narrabri to North Star and a more realistic estimate developed.	<p>Noted. Construction water estimates will be reviewed during detailed design and be used in the preparation of the Construction Water Plan, as described in Section 5.6.24. Detailed discussion of ARTC's construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>However, it should be noted that direct comparisons between rail projects in terms of ml/km can be misleading, as project-specific complexities can be over-looked. The water requirement for the Project has been estimated with consideration for the volume of earthworks required to construct rail and non-rail components of the project. A 'ml/km' value does not give full consideration to all dimensions of railway construction.</p> <p>When calculating water estimates, conservative rates of application have been adopted to ensure that volumes are not underestimated and that contingency for variables (e.g. climatic conditions) is factored into the sourcing strategy.</p>	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements
218	218.0074	Local Government	Land Resources	Construction water supply	<p>Sourcing of mains water: TRCs bulk water supply is not available for project use. As a result, the Draft EIS is not considered to have sufficiently identified local water sources which may be able to provide sufficient water for the proposed project construction without impacting current water users.</p>	<p>Given that TRC have no water available for the construction of the proposed project, the Draft EIS requires amendment to further consider the appropriate sourcing of water that excludes TRCs water resources. It is recommended that the proponent consider that water may also be available from:</p> <ul style="list-style-type: none"> Stormwater runoff captured in sediment basins (this has been noted in Table 12.57, but not detailed as an option). Runoff from deep cuttings (especially if there is up to 3.3L/s flowing as stated in Chapter 12). Treated effluent from the Pittsworth and Millmerran towns (effluent could also be treated to a higher quality for additional purposes). <p>Further to this, it is Toowoomba Regional Councils declared stance that all water sources raw, potable, surface and bore water, used to supply Toowoomba Communities are not available for construction of the Inland rail works by ARTC.</p> <p>Priority for water supply will always be for town water supply over any proposed project and the proposal to use any of these water sources for construction purposes is not considered an appropriate use of this resource by TRC.</p>	<p>The construction water strategy outlined in Chapter 5: Project Description Section 5.6.24 for the Project has been updated to reflect amendments to the reference design, stakeholder feedback received during consultation and from submissions on the draft EIS, as well as advances made in planning for construction of the Project. Revised details are provided in the revised draft EIS regarding:</p> <ul style="list-style-type: none"> Estimated volumes required, by activity The quality of water required for various tasks The sourcing of water, including reliability and access considerations Monitoring of the take and usage of water. <p>The sourcing of water will vary and be dependent on the location of need and the intend purpose of use. In each instance, construction water will be purchased from existing licenced sources that have capacity within the limits of the current licenced entitlement/allocation (Chapter 5: Project Description Section 5.6.24).</p> <p>Both Toowoomba Regional Council and Goondiwindi Regional Council have advised through consultation and feedback on the draft EIS that potable water from their networks is not available for use by the Project. Consequently, there is no intention to obtain potable water from Toowoomba Regional Council and Goondiwindi Regional Council sources. Instead, Potable water for accommodation facilities and concrete batching will be obtained from potable networks within other LGAs, commercial bulk suppliers or from non-potable sources and subjected to treatment.</p> <p>Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS) (Chapter 5: Project Description Section 5.6.24). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>The ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan. Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	Chapter 5: Project Description Section 5.6.24 Appendix B5: Construction Water Requirements
218	218.0075	Local Government	Waste and Resource Management		Transport and treatment of sewage: Section 5.4.21 does not provide enough information regarding the transport and treatment of sewage or consider locations where reuse could be undertaken.	<p>The Draft EIS requires update to include details of discussions with local authorities (including TRC) if planning to dispose sewage at municipal treatment facilities in order to identify suitable locations and other requirements.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to consult with TRC regarding all aspects of the transport and treatment of sewage generated by the project and to reach written agreement with TRC in relation to this issue at least six months prior to the commencement of any construction activities.</p>	<p>Project wastewater is discussed in Chapter 13: Surface Water, Section 13.25.1. Proposed mitigation measures to manage workforce accommodation wastewater has been outlined in surface water and waste management tables of Chapter 24: Draft Outline Environmental Management Plan.</p> <p>As outlined in Chapter 24: Draft Outline Environmental Management Plan, further engagement is to be undertaken by the contractor with owners and operators of licenced waste disposal facilities and licenced waste carriers. Inland Rail will continue to engage closely with Toowoomba Regional Council through the Detailed Design and Construction Works stages regarding transport and treatment of sewage generated by the Project.</p>	Chapter 13: Surface Water Section 13.25.1 Chapter 24: Draft Outline Environmental Management Plan
218	218.0076	Local Government	Project scope	Construction water supply	<p>Construction water supply: Chapter 5, Figure 5.48 and Table 5.37 and all Sections referenced in this comment nominate Cooby and Perseverance dams as potential sources of supply for construction water, despite TRC advising the proponent on many occasions that this is town water which is currently inadequate to provide water for the TRC community, let alone supply water for the proposed project.</p> <p>Figure 5.47 provides a graph showing construction water usage over time. The graphs current format may not provide an accurate representation of figures and should be updated to an alternative format to display figures in a clear and easily understood way.</p> <p>Further to this, many of the weirs and dams proposed for construction water use are located in drought affected areas. The use of this water for construction purposes for the proposed project is ill-advised and will create severe shortages for the community.</p> <p>Concrete batching: Areas nominated for batching plants do not have access to mains water supply. Water is not available for construction purposes from Brookstead (as proposed in the Draft EIS) as the system is already struggling. Water from Millmerran's water supply for may be considered by TRC for construction purposes, but this will be entirely dependent on community requirements and availability at the time.</p> <p>Chapter 12 does not consider the adverse impacts to residential supply from surface water extraction proposed to facilitate construction activities. Appendix P makes no commitment regarding impact assessment for residential/urban water receptors.</p> <p>TRC prioritises town water supply above any proposed project and the proposal to use any of these water sources for construction water purposes is not considered an appropriate option by TRC. This has already been discussed with the proponents project team in Toowoomba on several occasions. At no time has the proponent made an agreement with TRC to access and use TRC water sources.</p> <p>As a result of the issues described above, the Draft EIS fails to meet the requirements of TOR 5.1 and TOR 11.116.</p>	<p>The Draft EIS requires amendment to meet the requirements of TOR 5.1 and TOR 11.116 and to consider local usage of proposed water supplies which may not provide enough water to service both the local population and the construction activities of the proposed project. Existing users should be given priority designation at all times.</p> <p>Figure 5.47 requires update in order to allow the reader to easily interpret proposed construction water usage over time. Further, construction water should be presented in temporal and geographical scale for easy interpretation by the reader.</p> <p>The Draft EIS also requires update to propose new and appropriate sources of construction water supply (i.e., available for construction purposes), including that required for concrete batching plants. Section 5.7.10 needs to consider the requirements of existing users and Table 5.37 should indicate the priority of current usage in order to provide relevance for the reader. Appendix P should provide further clarity regarding residential/urban water receptors including, but not limited to, the consideration of adverse impacts to water quality and quantity for these receptors.</p>	<p>The construction water strategy for the Project has been updated to reflect amendments to the reference design, stakeholder feedback received during consultation and from submissions on the draft EIS, as well as advances made in planning for construction of the Project. Revised details are provided in Chapter 5: Project Description, Section 5.6.24 regarding:</p> <ul style="list-style-type: none"> Estimated volumes required, by activity The quality of water required for various tasks The sourcing of water, including reliability and access considerations Monitoring of the take and usage of water. <p>Figure 5-23 shows the estimated water requirement over the construction period.</p> <p>The sourcing of water will be dependent on the location of need and the intended purpose of use. In each instance, construction water will be purchased from existing licenced sources that have capacity within the limits of the current licenced entitlement/allocation. Surface water sources with tradeable allocations greater than or equal to 300 megalitres are described in Table 5.35.</p> <p>Both TRC and GRC have advised through consultation and feedback on the draft EIS that potable water from their networks is not available for use by the Project as stated in Chapter 5: Project Description, Section 5.6.24. Consequently, there is no intention to obtain potable water from TRC or GRC sources. Instead, potable water for accommodation facilities and concrete batching will be obtained from potable networks within other LGAs, commercial bulk suppliers or from non-potable sources and subjected to treatment.</p> <p>Sources of construction water will be finalised as the construction approach is refined during the Detailed Design stage of the Project (post-EIS). Through this process, refined water demand planning will be undertaken, including detailed contingency options, in the event that protracted dry seasonal conditions prevail and water supply options become unavailable.</p> <p>Section 5.6.24 identifies that the ultimate water sourcing strategy for the Project will be documented in a Construction Water Plan. Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p>	Chapter 5: Project Description Section 5.6.24 Figure 5-23 Table 5-35 Appendix B5: Construction Water Requirements
218	218.0077	Local Government	Groundwater	Groundwater drawdown	<p>Groundwater: The Draft EIS acknowledges that groundwater is not considered a priority supply option, however accessing groundwater is not completely ruled out.</p> <p>Groundwater access via TRC infrastructure (bores) is not approved by the Council and if granted (through the appropriate approval process), will need to be monitored for usage and impacts to existing council bores along route which service local communities.</p> <p>As mitigation strategies for groundwater were not prepared in close consultation with TRC, the Draft EIS does not meet the requirements of TOR 11.116.</p>	The Draft EIS requires update to meet the requirements of TOR 11.116 and to commit to TRC requirements around accessing groundwater supplies.	<p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing. Currently the hierarchy of water supply source preferences prioritises non-potable sources to minimise impacts to communities and water users (Table 15.20 Chapter 15: Groundwater). Further, the use of groundwater for construction water is not a preferred water source for the Project. Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements. If the use of TRC bores is to be considered for construction water supply, the appropriate approval process will be complied with and monitoring will be conducted as per standard processes (Section 15.7.2 Chapter 15: Groundwater).</p> <p>Government bodies and local stakeholder have been consulted by ARTC regarding Water consultation as outlined in Table E-42 (Section 5.4) of Appendix E: Consultation Report. Following Project approval, ARTC is committed to upholding the engagement and consultation commitments, as the Project transitions through to construction.</p> <p>ARTC's future engagement responsibility during detailed design and construction are outlined in Section 7.2.6, Table E-72 of Appendix E: Consultation Report.</p> <p>The Proponents commitment to ongoing consultation with relevant government agencies and local stakeholders regarding groundwater is outlined in Appendix E: Consultation Report.</p> <p>Additionally, the commitment to a landowner bore make-good process is outlined in Section 15.7.4 of Chapter 15: Groundwater.</p>	Chapter 15: Groundwater Section 15.7.2 Section 15.7.4 Table 15-17 Table 15-20 Appendix B5: Construction Water Requirements Appendix E: Consultation Report Section 5.4 Section 7.2.6 Table E-42 Table E-72
218	218.0078	Local Government	Project scope		<p>Future proofing: Table 6.4 of the Draft EIS references the consideration of future asset requirements to not preclude opportunities for adjacent land use or business to access the Inland Rail corridor in the future. It is not clear whether this includes future requirements for the rail infrastructure beyond the design for freight movement to consider future passenger transport requirements.</p> <p>It is in the public interest that the Draft EIS consider that the Gowrie to Helidon Section of Inland Rail remove a critical bottleneck in the long-distance rail network, not just for freight rail but for all rail requirements. The original alignment of rail which crosses the Great Dividing Range at Toowoomba causes significant delays which make current passenger rail uncompetitive. With a major project business case underway for a faster Toowoomba to Brisbane rail connection and the Inland Rail project removing a rail bottleneck, the Draft EIS has missed an opportunity to value-add for local and regional communities.</p>	<p>The Draft EIS should be amended to consider that future-proofing for sustainability in the category of excellence would include considering passenger rail access before the rail tunnel. Considering the growth in Toowoomba's urban areas closest to the proposed projects Gowrie termination, there may be a future requirement for passenger access to the rail infrastructure. This would advance both local and regional economic and social benefits. The Draft EIS should give consideration to future access to the rail at Charlton/Gowrie as adjacent land use also includes a regional passenger airport.</p>	<p>Inland Rail will be open for any accredited operator to run a train along the rail line, once operational. The Business Case is based upon operators transporting freight (domestic goods) across a range of sectors to our cities, such as fresh food, packaged goods, hardware, white goods, and bulk goods.</p> <p>While Inland Rail is freight infrastructure, the decision to run passenger services will be a matter for each State Government and private operators. ARTC, the operators of Inland Rail, have a long history of working with Government and private operators to ensure passenger trains have access to the national rail network. This will continue to be the case for Inland Rail.</p>	N/A
218	218.0079	Local Government	Hazard and Risk		Climate response: Table 6.4 of the revised draft EIS (under climate response) fails to mention heat wave as another potential climate risk. Studies have shown a higher risk in TRC from heat wave due to the heat island effect on the bare agricultural plains that the proposed rail infrastructure traverses. Experience in Victoria has shown that heat waves have a moderate to high impact on rail infrastructure compared to road infrastructure.	The revised draft EIS requires amendment to consider the likelihood and impact of heat waves on the sustainability of the proposed rail infrastructure and the safety of rail operations during heat waves.	Heat waves and the result impacts of prolonged, elevated temperatures, are assessed in Section 21.5.1.6 of Chapter 21: Hazard and Risk of the revised draft EIS.	Chapter 21: Hazard and Risk Section 21.5.1.6

218	218.0080	Local Government	Project scope		<p>ISRS Rating: TOR 5.1 states that The EIS should demonstrate that the project is based on sound environmental principles and practices. The Principle of Sustainability is a key principle in consideration of environmental, social, economic and governance matters.</p> <p>The Draft EIS recognises the Inland Rail Programs role in demonstrating sustainability leadership and seeks to apply the infrastructure Sustainability Council of Australia (ISCA) IS Rating System (ISRS) to achieve a rating of excellence across the proposed projects detailed design, construction and operation. This is a middle rating on a scale of Commended, Excellent, Leading. If seeking to demonstrate sustainability leadership, the target should be for a rating of Leading.</p> <p>Further, the Draft EIS uses Version 1.2 of the ISRS, rather than the current Version 2.0 that has been available since July 2018 and includes the opportunity to rate the planning phase of the proposed project as well.</p>	<p>The Draft EIS should be amended to commit to a role in demonstrating sustainability excellence in keeping with the rating target and to reflect the level of consideration given to sustainability matters in the Draft EIS at the planning stage (in line with the current ISRS).</p> <p>It is in the public interest that the Draft EIS be amended to provide more robust sustainability commitments including considering the more up to date ISRS Version 2.0 as a better fit for major and complex projects with many phases of development (such as the proposed project).</p> <p>Given this, TRC request the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to aim for a target of Gold as defined in Version 2.0 of the ISCA ISRS. 	<p>Version 1.2 of the ISCA rating system has been chosen for the whole Inland Rail Program to enable a consistent approach to integrating sustainability goals and objectives.</p> <p>Chapter 7: Sustainability has been updated in the revised draft EIS to provide more detail on the sustainability commitments and mitigations incorporated into design and future actions for construction and operation of the Project.</p>	Chapter 7: Sustainability
218	218.0081	Local Government	Project scope	Cumulative impacts	<p>Cumulative impact: TOR 6.6 requires a concise summary of cumulative impacts for technical studies while TOR 7.3 states cumulative impacts should be assessed over time and in combination with impacts created by the activities of other local, upstream and downstream land uses, major projects under construction, and proposed significant development progressing through the statutory assessment processes for which information is publicly available. The EIS should also propose means to suitably address predicted cumulative impacts. Outline ways in which the cumulative impact assessment and management could subsequently be progressed further on a collective basis.</p> <p>Grazing and cropping are the dominant land uses of the project footprint (refer to Chapter 7 Section 7.5.2.1). However, the Draft EIS does not include current land uses in the cumulative impact assessment, thereby failing the requirement of TOR 7.3. The assessment of cumulative impacts only considers existing and proposed infrastructure, industrial, intensive agriculture and resource projects which are relatively minor land uses. This is a major shortcoming of the Draft EIS as there no consideration of cumulative environmental impact between the project and the dominant existing land uses.</p> <p>The cumulative impact sections currently provided in repetitive detail throughout the technical chapters, where TOR 6.6 calls for a precise summary. The dedicated cumulative impact Chapter (Chapter 21) should provide the reader with more value than to simply repeat information provided in a piecemeal and repetitive fashion in the technical chapters.</p> <p>Further, Section 21.5 recommends that proponents of other projects within the study area could be invited to participate in the Community Reference Group, which is not considered to be appropriate to effectively mitigate cumulative impacts.</p> <p>The final paragraph of Section 21.5 states that ARTC can only reasonably be responsible for managing the contributions of its activities to regional cumulative impacts. This is an incorrect statement as the proponent will be responsible for significant local impacts during the construction and operational phases of the proposed project. Impacts such as noise, dust, vibration, traffic, workforce, etc. all have very local implications.</p>	<p>The requirement of the TOR is to assess cumulative impacts in combination with impacts created by the activities of other local, upstream and downstream land uses. By definition, this includes current land uses (such as agriculture and grazing which are the dominant land uses), however the Draft EIS addresses only existing and proposed infrastructure, industrial, intensive agriculture and resource projects which are relatively minor land uses. This is a major shortcoming of the Draft EIS as there no consideration of cumulative environmental impact between the project and the dominant existing land uses that already occur along the alignment.</p> <p>The cumulative impacts assessed in the Draft EIS are not considered to be robust or inclusive, as required by TOR 7.3. Therefore, Chapter 21 does not present a true and accurate assessment of the cumulative impacts of the project. Chapter 21 needs to be revised to include assessment of cumulative impacts associated with the dominant existing land uses and not only minor land uses.</p> <p>The Draft EIS requires a commitment that the proponent and its subcontractor will liaise directly with proponents of other projects to ensure cumulative impacts can be mitigated in a collaborative manner.</p> <p>The final paragraph of Section 21.5 needs to be updated to recognise the local impacts of the construction and operational phases of the proposed project. The proponent is responsible for these and needs to liaise directly with proponents of other relevant projects to manage these local cumulative impacts.</p>	<p>Chapter 23: Cumulative Impacts, Section 23.3 states that it is recognised that the Project may contribute to cumulative impacts to land use and tenure, as the development of agricultural land cannot be fully mitigated or replaced in a like-for-like manner; however, the Project is consistent with the State land-use planning expectations for the area, having endeavoured to minimise potential land-use impacts through a rigorous route and alignment selection process. Overall, the significance of potential cumulative impacts is considered to be low and with identified mitigation measures applied, the residual land use and tenure impacts of the Project are expected to remain low both at a regional and State level.</p> <p>Table 23-9 identifies the following in respect to agricultural and cropping land:</p> <ul style="list-style-type: none"> ▶ Potential cumulative impacts will be managed through: <ul style="list-style-type: none"> ▶ Refining the reference design during detailed design to minimise the Project footprint to the extent required for the construction works and safe operation of the Project ▶ Rehabilitation of land that is temporarily disturbed in support of construction activities (e.g. for access tracks, laydown areas, etc.) at the end of its use for construction, unless otherwise agreed with the relevant landowner ▶ The development of individual property treatments in consultation with landowners/occupants, with respect to the management of cumulative construction activities on, or immediately adjacent to, private properties. These will detail any required adjustments to fencing, access, farm infrastructure or relocation of impacted structures, as required. ▶ ARTC to ensure that construction contract documentation for adjoining projects have consistent clauses regarding the monitoring and defect correction for revegetated and rehabilitated areas, particularly in areas designated as Class A and Class B agricultural land or within an IAA. ▶ Requiring all site personnel to adhere to ARTC land access protocols and procedures and property agreements when entering private properties adjacent to the Project footprint. ▶ Will develop and implement: <ul style="list-style-type: none"> ▶ A Rehabilitation and Landscaping Management Plan, as a component of the Construction Environmental Management Plan (CEMP) for the Project, which is compatible with adjoining activities and addresses cumulative impacts to agricultural land. 	Chapter 23: Cumulative Impacts Section 23.3 Table 23-9
218	218.0082	Local Government	Land Use and Tenure	Proponent commitments	Land use impacts: The Draft EIS states that the assessment of potential impacts to land use and tenure has been undertaken using the methodology detailed in Section 7.4.2 and illustrated in Figure 7.2. Land uses have been based on the Queensland Land Use Mapping Program (QLUMP) and verification of these land uses was undertaken by means of a project footprint drive-through undertaken on 15 August 2018 to 16 August 2018, combined with consultation feedback.	The Draft EIS should be amended to include a commitment to complete a new assessment prior to the commencement of construction activities to ensure that there have been no land use changes which may impact negatively on either the proposed rail or existing landowners (such as the erection of large ring tanks, fencing or other developments that do not require approvals).	<p>The revised draft EIS Chapter 8: Land Use and Tenure, presents updated information on the Project with regards to land-use assessment, identification and mapping existing land uses.</p> <p>Land use impacts to properties and lots described in Section 8.5.1 of Chapter 8: Land Use and Tenure where indirect impacts may be experienced, will be confirmed through the detailed design and property acquisition process. Where land use impacts are confirmed, individual property management measures will be developed in consultation with the landowner to reduce impacts to an acceptable and agreeable level. Management measures will include:</p> <ul style="list-style-type: none"> ▶ Individual property mitigation measures developed in consultation with landowners/occupants with respect to the development of detailed design and/or the management of construction on, or immediately adjacent to, private properties. The property mitigation measures will detail required adjustments to fencing, access, farm infrastructure, and relocation of any impacted structures, as required. ▶ Consultation with landowners will be undertaken to ensure that owners and occupiers are informed about the timing and scope of activities in their area, particularly in relation to potential impacts to access, services, or farm operational arrangements. This consultation will be ongoing throughout construction. ▶ Feedback from landowner consultation, including agreed property mitigation measures, will be incorporated into property agreements (or similar), as appropriate. 	Chapter 8: Land Use and Tenure Section 8.5.1
218	218.0083	Local Government	Project scope	Mitigation measures	Utility impacts: Section 7.5.2.7 discusses the presence of high-risk gas pipelines in the proposed project footprint. Further, Table 7.38 identifies actions for utility relocation/protection during proposed project activities. There is however no reference made in the Draft EIS relating to TRC assets or the mitigation measures already agreed between the proponents Inland Rail Utility Group and TRC during consultation sessions.	<p>The Draft EIS requires updating to include details relating asset replacement relocation.</p> <p>TRC requests the OCG impose the following condition:</p> <p>The proponent is required to consult with TRC regarding the relocation of TRC utilities including, but not limited to, who will relocate utilities, when they will be relocated, how they will be relocated, and who will be responsible for the cost of relocation, and to reach written agreement with TRC in relation to these aspects at least six months prior to the commencement of any construction activities.</p>	<p>ARTC has consulted with TRC extensively on these proposed changes, all of which have been endorsed in technical officer forums. Chapter 8: Land Use and Tenure, Section 8.3.2 identifies that consultation with utility service providers has included consultation with Toowoomba Regional Council.</p> <p>Section 8.5.1 identifies that details of consultation to support development of the revised reference design and revised draft EIS are included in Appendix E: Consultation Report. This includes consultation with Toowoomba Regional Council regarding utility impacts. Utilities/engineering infrastructure consultation is reported in Appendix E: Consultation Report, Section 5.13 and Table E-59.</p> <p>Further improvement of the vertical alignment may be conducted during design development within Inland Rail engineering standards, which will require further consultation with stakeholders and EIS change management processes where necessary.</p> <p>ARTC will continue consultation with key stakeholders including TRC and utility owners into the Detailed Design stage. In accordance with Appendix E: Consultation Report, Section 7.2, a Communication and Stakeholder Engagement Management Plan will be developed and include measures to address engagement with TRC and GRC on the schedule, progress, potential impacts and mitigation measures for the Project, and the development of partnerships to maximise social opportunities.</p> <p>Appendix B4: Utilities contains the design drawings and details of the proposed utilities interactions and proposed mitigation measures.</p>	Chapter 8: Land Use and Tenure Section 8.3.2 Section 8.5.1 Appendix B4: Utilities Sheets 1 - 73 Appendix E: Consultation Report Section 5.13 Table E-59 Section 7.2
218	218.0084	Local Government	Editorial		Land use and tenure cumulative impacts: Table 7.41 of the Draft EIS provides an assessment of land use and tenure cumulative impacts and references temporary disruptions to services and utilities resulting from the InterLinkSQ project.	The Draft EIS requires update to consider aspects and factors in relation to the relocation of utilities as these impacts could be considered to be higher than "low".	<p>As stated in Chapter 8: Land Use and Tenure, Table 8-51, ARTC will liaise with the relevant parties to establish a shared understanding of the utility and service requirements for each of the two Projects during construction, operation and maintenance. This information sharing will be used to inform the optimal timing of temporary service disruptions and realignment/relocation of services, if either is required.</p> <p>This information sharing will also be used to inform property owners, occupants and businesses in advance of the timing and scope of disruptions to services and utilities in their area.</p> <p>Therefore the impact significance is assessed as low.</p>	Chapter 8: Land Use and Tenure Table 8-51
218	218.0085	Local Government	Surface Water	Water quality	<p>Soil Salinity: Chapter 8, Section 8.5.3.6 includes a soil salinity hazard assessment for the project. It describes that each sub-catchment is considered to have either a moderate or a high hazard rating.</p> <p>Chapter 8, Section 8.6.7 describes that project activities have the potential to cause secondary salinization. It also lists various management measures that are expected to reduce the risk of secondary salinization. One control is managing the quality of construction water, which refers to the use of non-sodic water.</p> <p>Chapter 5 Section 5.4.20.1 describes that most water will be used for conditioning fill, haul road and laydown pad maintenance and dust suppression. Based on this description it was assumed that water demand for revegetation is relatively minor by comparison.</p> <p>Chapter 22 Table 22.4 specifies that water for landscaping and revegetation should meet irrigation water quality guidelines. However, it provides no requirements for construction water quality which will be the most significant risk for secondary salinity with respect to surface application of water.</p> <p>Furthermore, Chapter 5 Table 5.38 provides no specific water quality criteria for earthworks or track works.</p> <p>Furthermore, the salinity hazard does not consider the potential impacts of deep cuts (up to 20 m) on salinity hazard.</p> <p>TOR 11.93 is not met by the Draft EIS as it does not provide clear guidance or mitigation measures for mitigating secondary salinity risks to soil.</p>	<p>Update the Draft EIS to include:</p> <ul style="list-style-type: none"> ▶ Water quality criteria for construction water to minimise risks of secondary salinity. ▶ Consideration of the potential of deep cuts on salinity risk and any associated mitigation measures. 	<p>Construction water quality</p> <p>Chapter 5: Project Description, Section 5.6.24 details, non-potable water will be used for earthworks, track works and revegetation activities. Detailed discussion of ARTC's approach to construction water is outlined in Appendix B5: Construction Water Requirements. Section 4402G of the Environmental Protection Act requires that a person must not unlawfully deposit a prescribed water contaminant:</p> <ul style="list-style-type: none"> ▶ In waters ▶ In a roadside gutter or stormwater drainage ▶ At another place, and in a way, so that the contaminant could reasonably be expected to wash, blow, fall or otherwise move into waters, a roadside gutter or stormwater drainage. <p>Therefore, water used for earthworks, track works and revegetation activities will be of a quality that is:</p> <ul style="list-style-type: none"> ▶ Non-deleterious to earth fill properties ▶ Consistent with the quality requirements specified for irrigation and general water use in the <i>Australia and New Zealand Guidelines for Fresh and Marine Water Quality 2018</i> <p>Groundwater salinity & seepage</p> <p>Within the Border Rivers catchment, previous salinity risk assessment identified the use of saline groundwater for land irrigation, leaking dams, and dissolution of salts as the most common secondary salinity sources. Despite the need for greater research regarding secondary salinity formation and the impact of salinity on infrastructure assets, the risk assessment concluded salinity in the region will have a low risk to rail infrastructure (Biggs et al. , 2010b) (Chapter 15: Groundwater, Section 15.5.5).</p> <p>Through the Condamine Catchment, the groundwater impact assessment area intersected sub-catchments considered to contain a very-low-to-high overall salinity risk. The Millmerran area was considered to have a very low to low risk of secondary salinity, while the Pittsworth and Gowrie areas were considered to have moderate risk. An area of high salinity risk intersects the groundwater impact assessment area near Southbrook and presents a 'current' threat, through salinity, to infrastructure assets in the area (Searle et al. , 2007) (Chapter 15: Groundwater, Section 15.5.5).</p> <p>The predictive modelling results for seepage within deep cuts are presented in Section 15.6.2 of Chapter 15: Groundwater and provide estimates for the entire length of each modelled cut, with rates provided for typical conditions and wet conditions (following periods of high rainfall recharge). These predictive simulations indicate:</p> <ul style="list-style-type: none"> ▶ Seepage is concentrated at the bottom of the cuts, on both sides of infill material ▶ Temporary y increases in seepage may be observed in cuts with sandy soil or weathered sandstone following rainfall events ▶ Seepage of groundwater from bedrock is anticipated to be low except where it may be enhanced by weathering of fractures. <p>Seepage control measures will be adopted in accordance with QR Civil Engineering Standard QR-CTS-Part 35 – Stone and Concrete Slope Protection (Chapter 15: Groundwater Section 15.7.1 and Table 15-20). In accordance with the QR Civil Engineering Standard, exposed cut faces will be lightly compacted prior installation of strip drains and application of a 300 mm drainage blanket of granular material around weep or drain hole locations. Weepholes are installed in two rows along the cut face, one at 600 mm above the cut base and one at mid-height of the cut face. Drain hole specifications will be developed as part of the Detailed Design stage on a cut-by-cut basis. Cut faces will then be finished with stone pitching, interlocking blockwork, or concrete. Groundwater seepage and rainfall infiltration will be channelled from the cut face via the drain and weepholes to the base of the cut, where will dissipate via longitudinal drains, transpiration or infiltration and recharge.</p>	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Section 15.5.5 Section 15.6.2 Section 15.7.1 Table 15-20 Appendix B5: Construction Water Requirements

218	218.0086	Local Government	Project alignment	Severance of agricultural land	<p>Agricultural land requirements: The Draft EIS proposes large sections of the proposed alignment through agricultural land. When assessing and planning any impacts, the avoid, minimise and mitigate framework should be applied.</p> <p>The sections of the proposed alignment that do not utilise existing road (or rail) corridors should have their alignment reconsidered, particularly in areas where existing road corridors are located nearby. This is not just about reducing impacts to Class A and B Agricultural Land, but also the appropriate consideration of landowners and the viability and efficiency of future farming operations.</p> <p>Table 8.22, which compares the amount of agricultural land proposed to be sterilised as a result of the proposed current alignment to the total area in the LGA, gives a biased point of view by attempting to indicate that there will be little to no impact to agricultural land as a result of the current proposed alignment.</p>	<p>The current proposed alignment should be amended to better utilise existing linear infrastructure corridors to avoid and minimise impacts to agricultural land and farming operations. This will effectively reduce the amount of Class A and B agricultural land currently proposed to be made sterile by the proposed project and in turn, improve the proponents relationship with potentially affected landowners. Re-alignment now is considered more favourable than attempting to mitigate impacts in the future.</p> <p>The Draft EIS requires update to review the alignment to avoid and minimise impacts of Class A and B Agricultural Land. The alignment should prioritise co-location in existing linear infrastructure reserves, minimise the total disturbance footprint and minimise impacts that will reduce the viability future farming operations and efficiencies. The revised Draft EIS must include transparent reasoning for the alignment selection where it is deemed necessary to impact on Class A or B Agricultural Land.</p>	<p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ➤ ability to enhance the Inland Rail service offering ➤ construction and operating costs ➤ the outcomes of the multi-criteria analysis (MCA). <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres (m) of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <p>As described in Chapter 18: Economics, Section 18.9.1, the scale of the total loss (within the permanent disturbance footprint) of productive agricultural land is anticipated to be low. Productive agricultural land to be sterilised has been quantified in Chapter 8: Land Use and Tenure, Section 8.5.1. At a local government level, within Goondwindi, the permanent disturbance footprint traverses;</p> <ul style="list-style-type: none"> ➤ 0.02 per cent of Class A land, ➤ 0.02 per cent of Class B land, and ➤ 0.01 per cent of IAA land (Important Agricultural Area) <p>Within Toowoomba, the permanent disturbance footprint traverses approximately;</p> <ul style="list-style-type: none"> ➤ 0.17 per cent of Class A land, ➤ 0.22 per cent of Class B land, and, ➤ 0.19 per cent of IAA land <p>Overall, the permanent disturbance footprint will traverse 0.07 per cent of the impact assessment area's productive agricultural land. Chapter 18: Economics, Table 18-11 , summarises the proposed management and mitigation measures for agricultural impacts. ARTC will continue to consult with farmers, graziers and owners of agricultural businesses that are directly affected or adjacent to the Project footprint during detailed design to develop measures to mitigate impacts. Further details are provided in Chapter 8: Land Use and Tenure.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC MCA tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> ➤ environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) ➤ community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) ➤ approvals and stakeholder engagement: 12.5 per cent ➤ technical viability: 17 per cent ➤ safety: 16.5 per cent ➤ constructability: 12.5 per cent ➤ operations: 16.5 per cent 	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Figure 2.14</p> <p>Figure 2.15</p> <p>Chapter 8: Land Use and Tenure</p> <p>Section 8.5.1</p> <p>Chapter 18: Economics</p> <p>Section 18.9.1</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p>
218	218.0088	Local Government	Landscape and Visual Amenity		<p>Lighting impacts on visual amenity: TOR 5.4 requires that the EIS is to be generally in accordance with relevant policies, standards and guidelines.</p> <p>The Draft EIS does not meet TOR 5.4 regarding standards and guidelines relevant to lighting impacts and potential mitigation measures as the Draft EIS contains an outdated reference to Australian Standard (AS) 4282:2019 Control of Obtrusive Effects of Outdoor Lighting. Significant changes have been made to this document that are relevant to the proposed project (including changes to the classification of environmental sensitive areas). Furthermore, there are additional guidelines the draft EIS should include as relevant to lighting impacts and mitigation measures, namely:</p> <ul style="list-style-type: none"> ➤ National Light Pollution Guidelines for Wildlife (2020); ➤ Commission in Illumination (CIE) 126-1997 Guidelines for minimising sky glow; ➤ AS/NZS 1680.5:2012 Interior and workplace lighting, Part 5 Outdoor workplace lighting; and ➤ Dark Sky Planning Guideline: Protecting the observing conditions at Siding Spring (Department of Planning and Environment, 2016). 	<p>It is suggested that the Draft EIS be amended to meet the requirements of the related TORs and include further detail on the nearby townships and urban centres be clearly listed to identify the difference in magnitude between existing nearby sources of artificial light at night and the possible contribution from the proposed project. This would include tabulating the population and distance to townships (which gives an indication of the relative and cumulative impact of sky glow currently in the area).</p> <p>The response to this stakeholder concern would be further served by including reference to CIE 126-1997 Guidelines for minimising sky glow, AS 4282-2019 Control of the Obtrusive Effects of Outdoor Lighting, and practical measures described in the Dark Sky Planning Guideline: Protecting the observing conditions at Siding Spring (Department of Planning and Environment, 2016).</p> <p>Mitigation measures providing quantified measures/guidance for outdoor lighting, particularly during construction would be more appropriate in responding to this concern.</p> <p>For reference purposes, further detail on an assessing and mitigating visual impacts on observatories can be found in the Inland Rail EIS, Narromine to Narrabri Technical Report 12 Landscape and Visual Assessment.</p> <p>The Draft EIS should recognise the international significance of the Mount Kent Observatory, and provide mitigation measures to ensure that the astronomical observational capabilities of the Observatory are not adversely impacted to the satisfaction of the University of Southern Queensland and its astronomical partners.</p>	<p>The lighting impact assessment within the Landscape and Visual Impact Assessment (LVIA) report (refer Appendix K: Landscape and Visual Impact Assessment) has been updated. A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), which is a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>Based on consultation undertaken by ARTC with the Mt Kent Observatory, it is understood that there are no concerns regarding lighting impacts associated with the Project due to the distance of the observatory from proposed infrastructure. Lighting proposed is all essential for safety and the current mitigation measures incorporated in the report already include to keep this to the minimum required standards. Details regarding these consultations are detailed in Table E-21, 5.12.8 of Appendix E: Consultation Report.</p> <p>In addition, it is noted that there are many other more significant existing light sources closer to the observatory such as public roads with street lighting and car headlights, residential properties as well as temporal impacts associated with agricultural vehicles working in the fields at night. Substantial light sources that are located closer, or equally distant to the observatory are detailed in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. These other light sources include:</p> <ul style="list-style-type: none"> ➤ The presence of existing townships in close proximity to the observatory with the potential for night-time lighting, including the settlements of Greenmount, Nobby and Cambooya (approximately 4.5 km, 7.5 km and 9.0 km from the observatory respectively) and other townships located further from the observatory, including Pittsworth and Southbrook ➤ Proximity to Toowoomba urban area (approximately 22 km to southwestern outskirts) ➤ Presence of the existing South Western System railway (which facilitates freight movements), approximately 4.5 km from the observatory ➤ The Gore Highway is located between the Project and the Mt Kent Observatory <p>ARTC has discussed the Project with the Observatory and made a commitment to consult further at later stages of the Project.</p>	<p>Appendix E: Consultation Report</p> <p>Table E-21</p> <p>Section 5.12.8</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.10</p> <p>Section 9</p> <p>Section 9.2</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0089	Local Government	Landscape and Visual Amenity		<p>Sky glow, Mt Kent Observatory: TOR 11.21(b) states that 'matters of interest should include: any public consultation activities undertaken and their outcomes.</p> <p>Chapter 9, Section 9.4.3.3 of the draft EIS states the concern raised through stakeholder engagement regarding the impact of lighting from construction and operation of the Project on the operation of USQ's Mt Kent Observatory, located approximately 21 km southeast from the Project (at Southbrook).</p> <p>The Draft EIS does not meet TOR 11.21(b) as it does not provide adequate response (outcomes) to the concerns raised by stakeholders during public consultation.</p> <p>In response to the concerns raised regarding the environmental impacts of light at night from the proposed project on USQ's Mt Kent Observatory, the Draft EIS lists several points to explain why the potential impact does not require assessment.</p> <p>The first (bulleted) point cites the substantial distance between proposed project and the observatory – however, this distance (approximately 21 km) is significant in the context of assessment of artificial light at night's contribution to sky glow. Therefore, this point on distance does not nullify the need for a response on this concern – and should be omitted.</p> <p>The second point, regarding the relatively brief temporal nature of the light disturbance during construction and operation is valid and useful and are therefore a constructive basis on which to respond to this concern.</p> <p>The third point regarding the other existing light sources near the observatory is valid, but, due to the cumulative nature of skyglow sources, the assessment requires additional information to clearly respond to the stakeholders' concerns and recommendation of mitigation measures produced for other observatories.</p> <p>The Draft EIS does not adequately describe the potential for impact on all land uses during construction and operation of the project as required by TOR 11.72.</p>	<p>It is suggested that the Draft EIS be amended to meet the requirements of the related TORs and include further detail on the nearby townships and urban centres be clearly listed to identify the difference in magnitude between existing nearby sources of artificial light at night and the possible contribution from the proposed project. This would include tabulating the population and distance to townships (which gives an indication of the relative and cumulative impact of sky glow currently in the area).</p> <p>The response to this stakeholder concern would be further served by including reference to CIE 126-1997 Guidelines for minimising sky glow, AS 4282-2019 Control of the Obtrusive Effects of Outdoor Lighting, and practical measures described in the Dark Sky Planning Guideline: Protecting the observing conditions at Siding Spring (Department of Planning and Environment, 2016).</p> <p>Mitigation measures providing quantified measures/guidance for outdoor lighting, particularly during construction would be more appropriate in responding to this concern.</p> <p>For reference purposes, further detail on an assessing and mitigating visual impacts on observatories can be found in the Inland Rail EIS, Narromine to Narrabri Technical Report 12 Landscape and Visual Assessment.</p> <p>The Draft EIS should recognise the international significance of the Mount Kent Observatory, and provide mitigation measures to ensure that the astronomical observational capabilities of the Observatory are not adversely impacted to the satisfaction of the University of Southern Queensland and its astronomical partners.</p>	<p>The lighting impact assessment within the Landscape and Visual Impact Assessment (LVIA) report (refer Appendix K: Landscape and Visual Impact Assessment) has been updated. A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), which is a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>Based on consultation undertaken by ARTC with the Mt Kent Observatory, it is understood that there are no concerns regarding lighting impacts associated with the Project due to the distance of the observatory from proposed infrastructure. Lighting proposed is all essential for safety and the current mitigation measures incorporated in the report already include to keep this to the minimum required standards. Details regarding these consultations are detailed in Table E-21, Section 5.12.8 of Appendix E: Consultation Report.</p> <p>In addition, it is noted that there are many other more significant existing light sources closer to the observatory such as public roads with street lighting and car headlights, residential properties as well as temporal impacts associated with agricultural vehicles working in the fields at night. Substantial light sources that are located closer, or equally distant to the observatory are detailed in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. These other light sources include:</p> <ul style="list-style-type: none"> ➤ The presence of existing townships in close proximity to the observatory with the potential for night-time lighting, including the settlements of Greenmount, Nobby and Cambooya (approximately 4.5 km, 7.5 km and 9.0 km from the observatory respectively) and other townships located further from the observatory, including Pittsworth and Southbrook ➤ Proximity to Toowoomba urban area (approximately 22 km to southwestern outskirts) ➤ Presence of the existing South Western System railway (which facilitates freight movements), approximately 4.5 km from the observatory ➤ The Gore Highway is located between the Project and the Mt Kent Observatory <p>ARTC has discussed the Project with the Observatory and made a commitment to consult further at later stages of the Project.</p>	<p>Appendix E: Consultation Report</p> <p>Table E-21</p> <p>Section 5.12.8</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.10</p> <p>Section 9</p> <p>Section 9.2</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>

218	218.0090	Local Government	Landscape and Visual Amenity		<p>Visual amenity: TOR 11.85 requires that the Draft EIS 'Describe and illustrate the visual impact of the construction and operation of the project and views should be representative of public and private viewpoints, including places of residence, work and recreation.</p> <p>The Draft EIS does not meet TOR 11.85 as it does not address a significant visual impact of light at night to local communities in dark rural environments, which is obtrusive light (direct view of light sources).</p> <p>The lighting assessment has been carried out based on analysis of representative views. However, the most significant view impact on communities arising from light at night is arguably based on obtrusive light which requires consideration of the impact of direct view of light sources, particularly in dark rural environments.</p> <p>No consideration is made for direct view of light sources, and references to the Australian Standard for obtrusive lighting are outdated (the 1997 version used for the assessment was replaced in 2019). The 1997 edition is a guidance document whereas the 2019 edition specifies requirements.</p> <p>The latest version of AS/NZS 4282:2019 specifies requirements for obtrusive light that would be useful for this consideration. Although in general this standard does not apply to public (road) lighting, limits have been included in the 2019 edition which can be applied when specified by the relevant authority. This was done so that obtrusive light can be controlled in areas where it may be seen as a problem without the need to calculate the impact of every streetlight.</p>	<p>The Draft EIS requires update to meet the requirements of TOR 11.85.</p> <p>The lighting assessment methodology of the Draft EIS should be updated to include consideration of direct view of light sources (obtrusive light), as the most significant impact of light on communities at night.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to apply lighting limits in accordance with the latest version of AS/NZS 4282:2019 as it applies to obtrusive light.</p>	<p>The LVIA has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and potential impacts associated with the Project, including Project lighting, are identified in Section 6.</p> <p>A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA) has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 6</p> <p>Section 9</p> <p>Section 9.2</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0091	Local Government	Hazard and Risk		<p>Hazard and risk: The 'Additional information requests from OCG' TOR objectives for Health, hazard and safety (Appendix A, p31) require that developments are to be appropriately located, designed and constructed to minimise health and safety risks to communities and individuals. The revised draft EIS does not meet the OCG objective, as it does not mention of lighting as a component of outdoor workplace safety.</p> <p>The lighting assessment does not consider lighting as a component of outdoor workplace safety.</p>	<p>The revised draft EIS requires updating to reference the relevant standard: AS/NZS 1680.5:2012 Interior and workplace lighting, Part 5 Outdoor workplace lighting, and to include a discussion of lighting as a component of outdoor workplace safety.</p>	<p>Section 21.5.2.1 of Chapter 21: Hazard and Risk has been updated to include lighting as a component of outdoor workplace safety which discusses how the Project will comply with the relevant standard AS/NZS 1680.5:2012 Interior and workplace lighting Part 5: Outdoor workplace lighting (Standards Australia/Standards New Zealand, 2012). The Australian Standard AS/CA S009 Installation requirements for customer cabling (Wiring Rules) (Communications Alliance, 2020) is also updated in Table 21-16 of Chapter 21: Hazard and Risk.</p> <p>Additional to this, an obtrusive lighting assessment has been prepared as part of the revised draft EIS (Appendix K: Landscape and Visual Impact Assessment – Appendix 3: Obtrusive Lighting Assessment). Australian New Zealand Standard, AS/NZS 4282:2019 Control of Obtrusive Effects of Outdoor Lighting has been used as a general guide, and the AS/NZS 4282:2019 criteria have been applied to this analysis of potential quantitative lighting impacts associated with the Project.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.5.2.1</p> <p>Table 21-16</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0092	Local Government	Landscape and Visual Amenity		<p>Visual amenity: TOR 11.85 requires that the Draft EIS 'Describe and illustrate the visual impact of the construction and operation of the project and views should be representative of public and private viewpoints, including places of residence, work and recreation.</p> <p>The Draft EIS does not meet TOR 11.85, as it provides potentially misleading information regarding distances and sensitivity levels (Table 9.2) in its assessment of visual impact.</p> <p>Table 9.2 presents definitions of sensitivity levels for assessment aspects.</p> <p>For 'sensitivity to lighting the 'Attributes of categories provides typical distances for viewers from a light source for each sensitivity level. These will be misleading in relation to dark rural environments where the viewers dark adaptation increases the viewer sensitivity to more distant light sources, particularly if light source is in direct view.</p>	<p>The attributes provided in the Draft EIS should be revised by:</p> <ul style="list-style-type: none"> ▶ Deleting the typical distances or qualify distances as examples for urban areas; and ▶ Including level of significance of direct view of light sources in dark rural environments. 	<p>The LVIA has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and potential impacts associated with the Project, including Project lighting, are identified in Section 6. Further context with regard to the sensitivity categories and level of significance are provided within the Section 4.8 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA) has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>The EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.8</p> <p>Section 6</p> <p>Section 9</p> <p>Section 9.2</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0093	Local Government	Landscape and Visual Amenity		<p>Visual amenity: TOR 11.85 requires that the Draft EIS 'Describe and illustrate the visual impact of the construction and operation of the project and 'views should be representative of public and private viewpoints, including places of residence, work and recreation.</p> <p>The Draft EIS does not meet TOR 11.85, particularly with regard to selection of representative public and private viewpoints (including places of residence).</p> <p>Chapter 9, Section 9.5 of the Draft EIS does not include a subsection on Lighting Assessment. It is expected that sensitive viewpoints for a lighting assessment are likely to be different to those viewpoints selected for a visual assessment.</p>	<p>The Draft EIS should include a subsection on lighting assessment which identifies representative viewpoints assessing lighting impacts of the proposed project during construction and operation phases. As an example, potential sensitive viewpoints are likely to include:</p> <ul style="list-style-type: none"> ▶ Private (rural) residences adjacent to Turallin non-residential workforce accommodation; ▶ Any residences very close to active level crossings signalling; and ▶ Any residences where rail alignment and local topography facilitate interior incursion of light from rolling stock headlight (e.g., relocation of Viewpoint 20 from its current position to the residence ~300 m north of this viewpoint would enable more realistic assessment of the impact to residents from operation of rolling stock). <p>The landscape and visual impact assessment provided for the Draft EIS should be reviewed and updated to ensure that the assessment of impacts and proposed mitigation measures have accurately considered the scale of the proposed infrastructure and in order to appropriately meet the requirements of TOR 11.85.</p>	<p>The LVIA has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and potential impacts associated with the Project, including Project lighting, are identified in Section 6.</p> <p>A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>As described in Section 6.2.1 of Appendix K: Landscape and Visual Impact Assessment, temporary lighting impacts from night works will be associated with the non-resident workforce accommodation facilities near Yelarbon, Inglewood and Millmerran, the Turallin facility, site offices and fuel storage areas as well as construction plant and machinery where non-standard work hours are required. Temporary construction lighting may also be used at bridge laydown areas. In terms of operational lighting, the only proposed permanent lighting is associated with safety lighting associated with standard road lighting required for the Cunningham Highway Road Bridge near Yelarbon and at various controlled active level crossings.</p> <p>An assessment of each of the proposed construction facilities and miscellaneous site facilities, including qualitative lighting impacts, has also been included in the Appendix K: Landscape and Visual Impact Assessment Section 8.2 and 9.1.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p> <p>Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 6</p> <p>Section 6.2.1</p> <p>Section 8.2</p> <p>Section 9</p> <p>Section 9.1</p> <p>Section 9.2</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0094	Local Government	Editorial		<p>Viewpoint 15: The Draft EIS includes photomontages indicating significant removal of remnant roadside vegetation along Ware Road. This is a poor outcome considering the limited natural vegetation in an otherwise heavily altered landscape.</p> <p>If it is the intention of the proponent to remove remnant roadside vegetation, then the requirements in TOR 5.1 are not considered to be met. If, however, the proponent does not propose to disturb native vegetation in road reserves, then it may be considered that photomontages of Viewpoint 15 fails to meet the requirements of TOR 11.85 (describe and illustrate the visual impact of the construction and operation of the project).</p> <p>Viewpoint 17: TOR 11.85 requires the Draft EIS to describe and illustrate the visual impact of the construction and operation of the project. Include major views, view sheds, outlooks, and features contributing to the amenity of the area. Such views should be representative of public and private viewpoints, including places of residence, work, and recreation.</p> <p>Comparison of several of the illustrations of the railway in the landscape, including, but not necessarily limited to, that showing the impact to Viewpoint 17 (Pittsworth-Felton Road near Pittsworth Motor Inn (VP17) which appear to indicate that the double-stacked train may not be to scale, and may indeed be shown to be approximately one-third of the actual size of the infrastructure.</p>	<p>It is in the public interest that the Draft EIS be amended to meet the requirements of the relevant TORs including commitments which will ensure the retention of any remnant native vegetation which includes trees, particularly in or near towns. Existing native vegetation provides a buffer for the proposed project and also continues to act as an established seed bank, which is important for the provision of habitat resource and wildlife refuge.</p> <p>The landscape and visual impact assessment provided for the Draft EIS should be reviewed and updated to ensure that the assessment of impacts and proposed mitigation measures have accurately considered the scale of the proposed infrastructure and in order to appropriately meet the requirements of TOR 11.85.</p>	<p>The Landscape and Visual Impact Assessment (LVIA) has assessed impacts associated with the proposed route, and as such we are unable to comment on the relative merits (from a landscape and visual perspective) of potential alternative options that may have been considered.</p> <p>The LVIA assessment notes that the potential effect of the Project on Viewpoint 17 (now 22) during operation is High.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design.</p> <p>Current mitigation measures outlined in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment discuss potential mitigation measures for embankments and bridges, and specifically note the area in the vicinity of Pittsworth that is identified by this submission. Potential mitigation measures for noise barriers are also discussed. Where these are or may be required, they will be designed sympathetically to their surroundings, and where appropriate, will consider the inclusion of community artwork.</p> <p>In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p> <p>ARTC acknowledge the concerns of the Pittsworth community regarding the proposed rail alignment for a high fill embankment. During the community engagement process, noise, vibration, and visual obstruction have been identified as potential negative impacts to the Pittsworth community.</p> <p>As noted in Section 2.8 of the Chapter 2: Project Rationale, the alignment around the Pittsworth area was selected due to better technical viability and construction feasibility, and fewer impacts to community, stakeholder, and properties.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations. This information sharing will also be used to inform property owners, occupants and businesses in advance of the timing and scope of disruptions to services and utilities in their area.</p> <p>With respect to retention of vegetation, only as required will vegetation be removed to allow the safe construction, operation and maintenance of the rail alignment and associated infrastructure.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11.2</p> <p>Table 95</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0095		Landscape and Visual Amenity		<p>Construction impacts on visual amenity: The Land objectives provided in the OCG's TOR states that the proposed project should be designed and operated to:</p> <ol style="list-style-type: none"> Improve environmental outcomes; and Contribute to community wellbeing; and Contribute to social, economic and environmental sustainability; and Mitigate impacts to the natural landscape and visual amenity. <p>The draft EIS identifies the construction impacts on landscape and visual amenity to VP17 as "moderate" due to the temporary nature of the construction component. This methodology is somewhat flawed as all construction for the proposed is temporary, and therefore the highest rating given in "moderate" for this reason. It is arguable that the impact on settlements and towns will be "high" given the intrusion of plant equipment, non-resident workforce and lighting will have a higher overall intrusive impact than the operational aspects. Serious consideration should be given to the overall impacts of construction, and not minimise the impact because it is only temporary.</p>	<p>The Draft EIS has not adequately demonstrated how the impacts to the natural landscape and visual amenity will be mitigated when construction is within close proximity to settlements and towns. This information is crucial to achieving the TOR and ensuring the protection of visual amenity, community wellbeing and the natural landscape. As a result, the Draft EIS requires update to adequately address these issues and to meet the requirements of the OCG's TOR.</p>	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts.</p> <p>The LVIA assesses that the potential magnitude of effect of the Project on Viewpoint 17 (now 22) during operation is High. The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p> <p>An assessment of each of the proposed construction facilities and miscellaneous site facilities, including qualitative lighting impacts, has also been included in the Appendix K: Landscape and Visual Impact Assessment Section 8.2 and 9.1.</p> <p>ARTC acknowledges that construction impacts are not pleasant for communities, it is considered appropriate that typically their significance is lower than long term/permanent impacts as usually people have greater tolerance for something for a short while than something that is present for a long time. Factors other than temporary impacts of views are rightly given higher importance in terms of issues concerning route selection and design. Notwithstanding this, the Project cannot proceed without construction and it is agreed that measures to minimise the landscape and visual impacts of construction activities to the greatest practicable extent are necessary as included in Section 11.2, Table 95 to minimise the intrusion on views and amenity of the community. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p> <p>With regards to lighting impacts, the revised AS 4282 has been reviewed and all reference in the LVIA have been updated (refer Section 3 of Appendix K: Landscape and Visual Impact Assessment). A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10. The lighting impact assessment within the LVIA report has also been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Appendix K: Landscape and Visual Impact Assessment Section 9: Lighting Impact Assessment). In addition, an Obtrusive Lighting Assessment (OLA), a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>The qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 3</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 8.2</p> <p>Section 9</p> <p>Section 9.1</p> <p>Section 9.2</p> <p>Section 11.2</p> <p>Table 95</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0095		Landscape and Visual Amenity		<p>Construction impacts on visual amenity: The Land objectives provided in the OCG's TOR states that the proposed project should be designed and operated to:</p> <ol style="list-style-type: none"> Improve environmental outcomes; and Contribute to community wellbeing; and Contribute to social, economic and environmental sustainability; and Mitigate impacts to the natural landscape and visual amenity. <p>The draft EIS identifies the construction impacts on landscape and visual amenity to VP17 as "moderate" due to the temporary nature of the construction component. This methodology is somewhat flawed as all construction for the proposed is temporary, and therefore the highest rating given in "moderate" for this reason. It is arguable that the impact on settlements and towns will be "high" given the intrusion of plant equipment, non-resident workforce and lighting will have a higher overall intrusive impact than the operational aspects. Serious consideration should be given to the overall impacts of construction, and not minimise the impact because it is only temporary.</p>	<p>The Draft EIS has not adequately demonstrated how the impacts to the natural landscape and visual amenity will be mitigated when construction is within close proximity to settlements and towns. This information is crucial to achieving the TOR and ensuring the protection of visual amenity, community wellbeing and the natural landscape. As a result, the Draft EIS requires update to adequately address these issues and to meet the requirements of the OCG's TOR.</p>	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. Factors other than temporary impacts of views are rightly given higher importance in terms of issues concerning route selection and design. Notwithstanding this, the Project cannot proceed without construction and it is agreed that measures to minimise the landscape and visual impacts of construction activities to the greatest practicable extent are necessary as included in Section 11.2, Table 95 to minimise the intrusion on views and amenity of the community. Ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p> <p>With regards to lighting impacts, the revised AS 4282 has been reviewed and all reference in the LVIA have been updated (refer Section 3 of Appendix K: Landscape and Visual Impact Assessment). A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10. The lighting impact assessment within the LVIA report has also been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Appendix K: Landscape and Visual Impact Assessment Section 9: Lighting Impact Assessment). In addition, an Obtrusive Lighting Assessment (OLA), a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>The qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>The revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 8.2</p> <p>Section 9</p> <p>Section 9.1</p> <p>Section 9.2</p> <p>Section 11</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p> <p>Table 95</p>
218	218.0096	Local Government	Landscape and Visual Amenity		<p>Visual amenity: TOR 11.85 requires that the Draft EIS "Describe and illustrate the visual impact of the construction and operation of the project and views should be representative of public and private viewpoints, including places of residence, work and recreation.</p> <p>The Draft EIS does not meet TOR 11.85, particularly with regard to selection of representative public and private viewpoints (including places of residence).</p> <p>Due to the lack of viewpoints selected from permanent (particularly rural) residences, the lighting assessment has not considered the potential impacts of obtrusive light from light sources in direct line of sight during night construction and operation phases (e.g., rolling stock headlight and active level crossing signalling).</p>	<p>To meet this requirement, the Draft EIS should be revised to include lighting impact assessment with consideration for obtrusive light from light sources in direct line of sight during night construction and operation phases from new viewpoints identified in the comment above.</p>	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints have been selected across the LVIA study area to represent a range of impacts. The potential impacts associated with the Project, including Project lighting, are identified in Section 6.</p> <p>Private dwellings have not been directly assessed within the Landscape and Visual Impact Assessment (LVIA) (i.e. they are considered with reference to nearby public viewpoints) since isolated private views are typically afforded lower significance in LVIA. However, it is considered that an adequate number of viewpoints have been included to assess representative impacts suitable for EIS stage. As part of the Project's mitigation measures and controls, ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p> <p>Several additional viewpoints have been included in the revised draft EIS. This includes an additional viewpoint assessment and visualisation (Viewpoint 4) assessing potential impacts within Yelarbon with regards to the GrainCorp silo artwork viewing area and the potential provision of noise walls in this location. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers. An assessment of each of the proposed construction facilities and miscellaneous site facilities has also been included in the Appendix K: Landscape and Visual Impact Assessment Sections 8.2 and 9.1.</p> <p>A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights on representative viewpoint locations (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment). This assesses potentially affected sensitive receptors, and discusses potential impacts associated with train headlights and active level crossings.</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. In particular, the revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment for further details of Appendix K: Landscape and Visual Impact Assessment.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 6</p> <p>Section 8.2</p> <p>Section 9</p> <p>Section 9.1</p> <p>Section 9.2</p> <p>Section 11</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0096	Local Government	Outline EMP		<p>Establishment Period. Section 22.11.3.1 of the Draft EIS states that rehabilitation/reinstatement results in a stabilised landscape requiring minimal maintenance and as a result, fails to meet the requirements of TOR 5.1.</p> <p>Newly rehabilitated areas are highly prone to destabilisation and degradation given the lack of established vegetation. Further, the vital part of the rehabilitation process will be the regular watering of all new plants for a suitable establishment period in order to ensure survival. Rehabilitation initially requires a high level of maintenance for what could be an extended period of time (depending on conditions) and as such, these issues should be adequately addressed.</p>	<p>In order to meet the requirements of TOR 5.1, the Draft EIS should be updated to commit to a suitable Establishment Period (18-24 months min.) for new plants prior to describing the required on-going maintenance schedule.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required include an appropriate on-going maintenance schedule in the Rehabilitation and Landscaping Management Sub-plan and provide for TRC agreement at least six months prior to the commencement of any construction activities.</p>	<p>A Rehabilitation and Landscaping Management Plan will be developed as a component of the Construction Environmental Management Plan and will be further refined throughout each stage of the Project, where required. On-going maintenance has been included within the relevant management plans and Plans as a part of the Outline EMP (Chapter 24: Draft Outline Environmental Management Plan).</p> <p>Prior to each stage of the Project, each management plan, where relevant, will be further refined in consultation with the relevant stakeholders.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0097	Local Government	Landscape and Visual Amenity		<p>Visual amenity: The Land objectives provided in the OCGs TOR states that the proposed project should be designed and operated to:</p> <ol style="list-style-type: none"> Improve environmental outcomes; and Contribute to community wellbeing; and Contribute to social, economic and environmental sustainability; and Mitigate impacts to the natural landscape and visual amenity. <p>The proposed project greatly influences the setting of Pittsworth and Southbrook by introducing large-scale infrastructure (embankments and bridges) into the rural setting of the towns, thereby significantly changing the appearance and identity of the settlements.</p> <p>Of particular note in Pittsworth is the new rail alignment, deviating from the existing rail alignment which bisects the town. By creating a new alignment, the township will experience greater upheaval in terms of landscape alterations (vegetation clearing, new infrastructure, etc) which will ultimately result in a change to the visual amenity, scenic outlooks and landscapes.</p> <p>Chapter 9 identifies the operational impact of the Project on VP17 (Pittsworth-Felton Road near Pittsworth Motor Inn) as high due to the (max) 13.6m embankments, lack of screening vegetation, new bridge infrastructure and new fencing. Adding to this the potential of double-stacked trains, and the view from this area will be significantly impacted during the operation of the Project. Further, Chapter 9 does not take into account any potential 'noise barriers, which may have further impacts on the visual amenity of the areas.</p> <p>Table 9.55 and corresponding text proposes mitigation measures to reduce and manage the impact of infrastructure. The proponent must work collaboratively with TRC and the local communities (particularly in areas the Draft EIS reports as impacting visual amenity and landscapes) and develop suitable mitigation measures in consultation with the impacted region.</p> <p>Processes relating to how complaints will be managed during construction and operation phases should be made in collaboration with TRC and relevant communities/towns in the area to ensure a satisfactory process will be available to the community.</p>	<p>The Draft EIS requires revision to appropriately mitigate proposed impacts to the community as a result of the proposed project.</p> <p>TRC requests that the OCG impose the following conditions:</p> <ol style="list-style-type: none"> The proponent is required to work collaboratively with TRC and the potentially affected communities of Brookstead and Pittsworth to develop suitable mitigation measures for the proposed impacts on visual amenity and the surrounding landscape, and to reach written agreement with the Council at least six months prior to the commencement of any construction activities. The proponent is also required to develop an appropriate consultation process with TRC and the community to ensure the handling of complaints is managed appropriate by both the proponent and their contractors. 	<p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. Development of the revised reference design for the Project has progressed in parallel with the impact assessment process and the revised reference design has been slightly amended for the revised EIS, to reflect outcomes of ongoing engagement with the community and key stakeholders.</p> <p>As a consequence, design solutions for avoiding, minimising or mitigating impacts have been incorporated into the reference design and revised EIS design as appropriate and where possible. The revised reference design has been developed in consideration of improving environmental outcomes, contributing to community wellbeing, contributing to social, economic and environmental sustainability, and mitigating impacts to the natural landscape and visual amenity. Some of the mitigation measures and controls that have been factored into the design, or otherwise implemented during the revised reference design stage for the Project are as follows:</p> <ul style="list-style-type: none"> The Project has, where possible, avoided impacts on nationally or regionally protected landscape areas such as the Wondul Range National Park and has minimised impacts on State Forests such as Whetstone State Forest by following the edge of the protected area to the greatest extent possible The Project has been intentionally aligned along the eastern boundary of the Rainbow Reserve so as to minimise the extent of encroachment into this reserve, whilst also avoiding severance impacts to agricultural lots to the east of Rainbow Reserve The Project has avoided, where possible, direct impacts on areas noted as being of regional landscape significance defined using the regional scenic amenity methodology (ShapingSEQ) The Project has been aligned to be co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes The alignment has been positioned to reduce the number of crossings and extent of impact on watercourses The Project footprint defined in the revised reference design has aimed to minimise vegetation clearing extents to that required to safely and efficiently construct, operate and maintain the works The alignment has avoided significant settlements to the greatest extent possible to assist in minimising visual impacts (e.g. Inglewood, Millmerran, Pittsworth) except where the alignment is within or adjacent to existing rail corridor (i.e. through Yelarbon, Pampas and Brookstead) The revised draft EIS alignment has changed to minimise impacts in the vicinity of Millmerran. <p>Furthermore, relevant mitigation measures have been included in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment to reflect the need for additional liaison during the Detailed Design stage with stakeholders including TRC and other landowners to facilitate appropriate landscape design, e.g., new street tree planting. A Rehabilitation and Landscaping Management Plan will be developed for the Project, as a component of the CEMP. This Plan will be developed in consultation with local governments and affected communities , in addition to location and lot specific reinstatement commitments. To ensure community and government inputs are considered, this Plan will be developed in consultation with local governments and affected communities, in addition to location and lot specific reinstatement commitments.</p> <p>Additional assessments on the visual impact of additional rail infrastructure have also been assessed. At the time of the original Landscape and Visual Impact Assessment (LVIA) the need for noise barriers had not been determined. The LVIA (refer Appendix K: Landscape and Visual Impact Assessment) has now been updated to recognise the potential for additional visual impacts should the conceptual noise barriers be implemented.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 2 (now 3), 15 (now 20) and 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design. Additional visualisations have also been provided to illustrate potential for mitigation of impacts, including new visualisations (and associated viewpoint assessments) in the vicinity of Pittsworth (refer Viewpoint 23 and Viewpoint 24) and Yelarbon (refer Viewpoint 4). (Refer to Section 8.2, Appendix K: Landscape and Visual Impact Assessment). Artist's impression showing the potential for mitigation measures in these locations to reduce the visual impact/improve visual amenity have been prepared, noting that these are indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and managers.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2</p> <p>Section 11</p> <p>Section 11.2</p> <p>Table 95</p>
218	218.0098	Local Government	Landscape and Visual Amenity		<p>Impacts from deep cuttings and permanent spoil mounds: TOR 5.1 requires the EIS to 'analyse that all relevant environmental, social and economic impacts of the project are identified and assessed, and to recommend mitigation measures to avoid or minimise adverse impacts. The EIS should demonstrate that the project is based on sound environmental principles and practices. The Draft EIS does not meet the requirements of TOR 5.1 as Section 9.8 does not describe the impact of deep cuttings (to 20 m) to landscape amenity (environmental and social impacts) and how these impacts may be mitigated, particularly where deep cuttings are located near ridgelines and in highly visible locations.</p> <p>The Draft EIS proposes to temporarily stockpile excess material along the rail corridor and then form these stockpiles into permanent spoil mounds which are spread out to minimise height. The Draft EIS does not identify where the permanent spoil mounds will be located, and they are not mentioned or assessed as part of the visual impact assessment at Chapter 9.</p> <p>It is considered that the Draft EIS does not adequately address the landscape and visual amenity requirements of TOR 11.84 to 11.87.</p>	<p>It is in the public interest that the Draft EIS be amended to meet the requirements of TOR 5.1 and 11.84 to 11.87 including describing site specific landscape measures which will facilitate vegetated buffers at deep cuttings, and which may have the potential to compromise the visual amenity of the rural landscape. Deep cut treatments should be included in areas outside of the cut extents as well as within cut batters. The Draft EIS should specify the techniques to be adopted to cut batters (including benching and cultivation techniques to facilitate revegetation). All appropriate techniques should be investigated and adapted for specific ground conditions.</p> <p>The Draft EIS must also consider visual amenity impacts of permanent spoil mounds and associated mitigation measures.</p>	<p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. Table 95 within Section 11.2 of Appendix K: Landscape and Visual Impact Assessment of the revised draft EIS includes the following mitigation on cuttings for visual impact on rail infrastructure "Cuttings: Assess opportunities to blend cut batters into their landscape setting (e.g. considering potential for revegetation, rock pitching, etc.). Particularly with consideration to the cut near Athol (approximately Ch 189 km to Ch 190 km)". This proposed mitigation will be undertaken during the Detailed Design stage of the Project.</p> <p>Chapter 5: Project description of the revised draft EIS, has not identified the use of permanent spoil mounds to manage excess cut material. The Chapter discusses the Project's bulk earthwork volumes and states that the balancing of the cut and fill volumes may result in surplus or deficit of bulk earthworks material, depending on adjustments made during detailed design and the feasibility and success of material treatment options. Different options have been identified for surplus of bulk earthworks material including reuse of localised excess cut material within the Project. Detailed mass haul assessment will be carried out in the Detailed Design stage to assess the possibility of the following options, as per Section 5.6.16:</p> <ul style="list-style-type: none"> Use excess rock material for scour protection of embankments, bridges and culverts, if suitable Use excess material for temporary works construction, such as access roads, laydown areas etc. Construct the RMAR at rail formation Make clean, excess material available for use by other developments near the Project Rehabilitate borrow pit sites. Offsite disposal to landfill will only occur as a last resort, if the material is considered unsuitable for other uses, e.g. due to contamination reasons. <p>Included in the bulk earthworks, it is anticipated that 5 per cent of all cut material classified as spoil will be transported from the point of generation to stockpiles, via access tracks and temporary haul roads established within the rail corridor. The transportation routes for the movement of cut-and-fill material, including spoil, have been assessed in Section 4.2 Appendix AA: Traffic Impact Assessment.</p> <p>There will need to be an evaluation in each instance of the ability to revegetate e.g. reliant upon the correct substrate and balanced with land take and knock-on issues such as areas of ecological significance. This can be more adequately addressed at Detailed Design stage. Spoil from the Project will be avoided and reduced during construction and disposal of excess spoil will be done be through approved licenced facilities. Offsite disposal to landfill should only occur if the material is considered unsuitable for other uses in this hierarchy, e.g. due to geotechnical, contamination or saturation reasons Table 2.2 of revised draft EIS Appendix AB: Earthworks Strategy and Draft Soil Management Plan.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.16</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 4.2</p> <p>Appendix AB: Earthworks Strategy and Draft Soil Management Plan</p> <p>Table 2.2</p> <p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 11</p> <p>Section 11.2</p> <p>Table 95</p>
218	218.0099	Local Government	Landscape and Visual Amenity		<p>Potential impacts: The Land objectives provided in the OCGs TOR states that the proposed project should be designed and operated to:</p> <ol style="list-style-type: none"> Improve environmental outcomes; and Contribute to community wellbeing; and Contribute to social, economic and environmental sustainability; and Mitigate impacts to the natural landscape and visual amenity. <p>The Draft EIS discusses the potential short-term (borrow pits, construction, lighting, vegetation clearing, stockpiling, site offices/parking, etc.) and long-term (trains, noise barriers, bridges, embankments, cut/fill, etc.) impacts to amenity as a result of the proposed project.</p> <p>Of specific concern is the proposed noise barriers which have been identified as potentially required at Brookstead and Pittsworth. No indicative imagery has been provided by the Proponent in Table 9.6.2 with the comment that 'no indicative imagery is available for noise barriers. Locations and dimensions of any potential noise barriers will be subject to confirmation through the detail design process. However, detailed conceptual information has been provided in Chapter 14 and Appendix T about whether a barrier is required or not, yet no information relating to the impacts on amenity or landscapes have been provided in these sections.</p> <p>The visual impact of 'noise barriers, particularly on these two settlements, is of great concern to council particularly as no indication of design has been provided. SPP Liveable Communities clearly articulates that development to be designed to 'value and nurture local landscape character and the natural environment and 'maintain or enhance important cultural landscapes and areas of high scenic amenity ((3)(a) and (b)).</p> <p>The Draft EIS has not adequately demonstrated how the impacts to the natural landscape and visual amenity will be mitigated as no clear information has been provided around the noise barriers. This information is crucial to achieving the requirements of the OCGs TOR and to ensuring the protection of visual amenity, community wellbeing and the natural landscape.</p>	<p>The Draft EIS requires update to appropriately consider and commit to protecting amenity (landscape, visual, noise etc).</p> <p>Details of proposed noise barriers must be provided to council prior to the detailed design process. The severity of potential impacts on the two settlements of Brookstead and Pittsworth must be considered before this stage of the proposed project.</p> <p>TRC requests that the OCG impose the following conditions:</p> <ol style="list-style-type: none"> The proponent is required to work collaboratively with TRC and the potentially affected communities of Brookstead and Pittsworth to design appropriate noise barriers which limit both the noise and visual impact of the proposed project and to reach written agreement with the Council regarding the design of noise barriers at least six months prior to the commencement of any construction activities. The proponent is also required to develop an appropriate consultation process with TRC and the community to ensure the handling of complaints is managed appropriate by both the proponent and their contractors. 	<p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. Development of the revised reference design for the Project has progressed in parallel with the impact assessment process and the revised reference design has been slightly amended for the revised EIS, to reflect outcomes of ongoing engagement with the community and key stakeholders.</p> <p>As a consequence, design solutions for avoiding, minimising or mitigating impacts have been incorporated into the reference design and revised EIS design as appropriate and where possible. The revised reference design has been developed in consideration of improving environmental outcomes, contributing to community wellbeing, contributing to social, economic and environmental sustainability, and mitigating impacts to the natural landscape and visual amenity. Among the mitigation measures and controls that have been factored into the design, or otherwise implemented during the revised reference design stage for the Project are as follows:</p> <ul style="list-style-type: none"> The Project has, where possible, avoided impacts on nationally or regionally protected landscape areas such as the Wondul Range National Park and has minimised impacts on State Forests such as Whetstone State Forest by following the edge of the protected area to the greatest extent possible The Project has been intentionally aligned along the eastern boundary of the Rainbow Reserve so as to minimise the extent of encroachment into this reserve, whilst also avoiding severance impacts to agricultural lots to the east of Rainbow Reserve The Project has avoided, where possible, direct impacts on areas noted as being of regional landscape significance defined using the regional scenic amenity methodology (ShapingSEQ) The Project has been aligned to be co-located with existing rail and road infrastructure where possible, minimising the need to develop land that has not previously been subject to disturbance for transport infrastructure purposes The alignment has been positioned to reduce the number of crossings and extent of impact on watercourses The Project footprint defined in the revised reference design has aimed to minimise vegetation clearing extents to that required to safely and efficiently construct, operate and maintain the works The alignment has avoided significant settlements to the greatest extent possible to assist in minimising visual impacts (e.g. Inglewood, Millmerran, Pittsworth) except where the alignment is within or adjacent to existing rail corridor (i.e. through Yelarbon, Pampas and Brookstead) The revised draft EIS alignment has changed to minimise impacts in the vicinity of Millmerran. <p>Furthermore, relevant mitigation measures have been included in Section 11.2, Table 95 of Appendix K: Landscape and Visual Impact Assessment to reflect the need for additional liaison during the Detailed Design stage with stakeholders including TRC and other landowners to facilitate appropriate landscape design, e.g., new street tree planting. A Rehabilitation and Landscaping Management Plan will be developed for the Project, as a component of the CEMP. This Plan will be developed in consultation with local governments and affected communities, in addition to location and lot specific reinstatement commitments. To ensure community and government inputs are considered, this Plan will be developed in consultation with local governments and affected communities, in addition to location and lot specific reinstatement commitments.</p> <p>Additional assessments on the visual impact of additional rail infrastructure have also been assessed. At the time of the original Landscape and Visual Impact Assessment (LVIA) the need for noise barriers had not been determined. The LVIA (refer Appendix K: Landscape and Visual Impact Assessment) has now been updated to recognise the potential for additional visual impacts should the conceptual noise barriers be implemented.</p> <p>The existing viewpoint assessments and visualisations provided in the revised draft EIS for Viewpoint 2 (now 3), 15 (now 20) and 17 (now 22) have been updated to include the provision of noise walls to communicate potential visual impacts associated with these, noting that the location and height of proposed potential noise walls are subject to further detailed design. Additional visualisations have also been provided to illustrate potential for mitigation of impacts, including new visualisations (and associated viewpoint assessments) in the vicinity of Pittsworth (refer Viewpoint 23 and Viewpoint 24) and Yelarbon (refer Viewpoint 4). (Refer to Section 8.2, Appendix K: Landscape and Visual Impact Assessment). Artist's impression showing the potential for mitigation measures in these locations to reduce the visual impact/improve visual amenity have been prepared, noting that these are indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant land owners and Regional Councils.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 8.2</p> <p>Section 11</p> <p>Section 11.2</p> <p>Table 95</p>
218	218.0100	Local Government	Flora and Fauna		<p>Impacts to flora and fauna: The Draft EIS does not respond to TOR 11.95 'describe the likely impacts on the biodiversity and natural environmental values of affected areas arising from the construction and operation of the project' or TOR 6.2 'the assessment should cover both the short term and long term and state whether any relevant impacts are likely to be irreversible. The assessment should also discuss scenarios of unknown and unpredictable impacts,' as the identification of predicted population changes to flora and fauna has not been achieved.</p> <p>In addition, in order to fully understand proposed project impacts on biodiversity the Draft EIS has not correlated population changes to identified sustainable populations of affected flora and fauna as required by the State Planning Policy 2017Biodiversity which states that the 'health and resilience of biodiversity is maintained or enhanced to support ecological processes.'</p>	<p>The Draft EIS should be amended to include further studies and assessment to accurately identify predicted population changes to flora and fauna populations as a result of proposed project activities. As part of this, the Draft EIS should correlate the predicted population changes with identified sustainable populations of impacted flora and fauna.</p>	<p>Further field assessments have been undertaken as part of the revised draft EIS to target threatened species, reassess the likelihood of occurrence and refine habitat mapping, including additional assessments to quantify areas of important habitat and habitat critical to the survival of threatened species. A detailed assessment of potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Results of the additional surveys including locations and quantification of ecological values, including threatened species, are also provided in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The impact assessment outlined in Chapter 11: Flora and Fauna includes estimations of magnitude of disturbance for environmental values and a significant residual impact assessment. These sections outline impacts to specific species, including those under the MSES and MNES guidelines.</p> <p>Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project footprint. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction, Construction Works and Operations stages.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Section 11.5</p> <p>Section 11.6</p> <p>Section 11.7</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0101	Local Government	Editorial		Incorrect referencing: Table 10.3 of the Draft EIS lists previous dedicated ecological assessments and reports associated with the project but fails to reference the assessments which informed Figure 10.2. Further, the assessments provided in Table 10.3 are not clearly referenced on Figure 10.3.	The Draft EIS should be updated to clearly and appropriately reference all surveys completed to inform the document including those apparently completed by Eco Logical (05.09.16 and 30.09.16).	The revised draft EIS includes the results of completed flora and fauna investigations. The desktop assessment and field surveys in Appendix L: Terrestrial and Aquatic Ecology Technical Report and in Appendix O: Matters of National Environmental Significance Report detail all survey efforts undertaken to inform the draft EIS and revised draft EIS.	Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 3 Section 5 Section 6 Appendix O: Matters of National Environmental Significance Report Section 3 Section 5
218	218.0102	Local Government	Flora and Fauna	Survey effort/field investigation data	<p>Lack of commitment to avoid impacts to flora and fauna: The Draft EIS does not respond to TOR 11.27 'the EIS should describe any mitigation measures proposed to reduce the impact on the listed threatened species and ecological communities and proposed mitigation measures. Supporting evidence should be provided to demonstrate the appropriateness of mitigation measures proposed. Where the likely success of mitigation measures cannot be supported by evidence, identify contingencies in the event the mitigation is not successful.'</p> <p>The approach to be adopted when considering impacts on biodiversity is to avoid, minimise and offset. This is expressly reflected in Local, State and Federal regulatory frameworks for minimising ecological impacts from new developments. The 'avoid, minimise, offset' approach operates as a hierarchy, with avoidance and mitigation measures being the preferred and primary strategies for managing the environmental impact of a proposal. This is because avoidance and mitigation directly reduce the scale and intensity of the potential impact, whereas offsets do nothing to reduce the impact and only compensate for any residual significant impact. As is outlined in Queensland and Federal Government policy, avoidance and mitigation measures can reduce and, in some cases, remove the need for offsets if the residual impact is not significant. Offsets will not be considered until all reasonable avoidance and mitigation measures are considered, or acceptable reasons are provided as to why avoidance or mitigation of impacts is not reasonably achievable.</p> <p>Environmental Offsets: The proponent has adopted an approach which is inconsistent with the 'avoid, minimise, offset' hierarchy. Rather, the proponents position as reflected in the Draft EIS, is that its preliminary investigations should be accepted for the purpose of determining whether to grant consent to the Draft EIS and that further investigations to scope the actual impacts will be undertaken later during the detailed design phase. The proponent states that they have incorporated the precautionary principle (10.4.7) and that they will assume for the current assessment processes that the identified ecological processes receptors are present and will carry out further investigations in this regard later.</p> <p>Example During Phase 2 of the proposal (detailed design phase post EIS), sensitive ecological receptors identified during the Draft EIS will be subject to further investigation to more accurately determine the magnitude of the proposed and significant adverse impacts upon identified ecological receptors. The specific mitigation measures will then be applied to ensure that the significance ratings of any potential impacts are classified to as low as reasonable practicable (ALARP) and the more significant adverse impacts are offset. This demonstrates a seemingly deliberate intention on the part of the proponent to avoid undertaking detailed analysis at the preliminary draft approval stage and may indicate that the proponent is avoiding the discovery of unacceptable impacts not capable of mitigation that could potentially result in a refusal of the application.</p> <p>The Draft EIS proposes a form of environmental offset for any land clearing which could be directly allocated to a specific Section of track. As a result, the Draft EIS does not recognise the preferred hierarchy for managing likely impacts as provided in TOR 6.4 that "...to: (a) avoid; (b) minimise/mitigate; and (c) offset once (a) and (b) have been applied..."</p>	<p>The Draft EIS requires amendment to further outline and clarify that commitment to the avoidance of potential impacts is the proposed projects first objective and has been extensively considered. Further surveys including on ground assessments are required to assist in the identification of core fauna and flora habitats. Minimise or mitigating options are secondary options to be employed after all avenues of avoidance have been exhausted.</p> <p>Supporting evidence should be provided to demonstrate the appropriateness of the mitigation measures proposed. Where the likely success of mitigation measures cannot be supported by evidence, the proponent should identify contingencies in the event the mitigation is not successful.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to apply mitigation measures in accordance with the hierarchy of avoid, minimise, offset with avoidance and mitigation measures to be the preferred and primary strategies for managing the adverse environmental impact of the proposed project to ensure that there is no significant residual impact as a result of the proposed project. This should include, but not be limited to, a commitment from the proponent to ensure that the construction contractor reduce the width of the proposed rail corridor to ALARP.</p>	<p>A number of alternative routes for the Project footprint have been considered during the concept assessment stage (from early 2016 to late 2017) of the Project (Chapter 2: Project Rationale, Section 2.8 and Section 2.9). In all instances, the guiding principles of ecologically sustainable development have been factored into the assessment and selection of corridor and alignment options for the Project.</p> <p>The Project footprint has been subject to historical disturbance and clearing, with one third of the alignment length located within brownfield (areas already subject to previous development). The remaining greenfield portions of the Project footprint extend largely through areas subject to agricultural land uses. The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross drainage and rail maintenance access roads. Efforts to avoid and minimise the extent of impacts to ecological values through revisions to the reference design for the Project are discussed in Chapter 11: Flora and Fauna.</p> <p>In addition, further field assessments have been undertaken as part of the revised draft EIS to target threatened species, reassess the likelihood of occurrence and refine habitat mapping. A detailed assessment on Potential Impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Results of the additional surveys including locations and quantification of ecological values, including threatened species, are also provided in the revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project footprint. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during Detailed Design, Pre-Construction Activities and Early Works stage, Construction Works and Operations stages. Species specific mitigation measures for MNES and MSES flora and fauna species are provided in Chapter 11: Flora and Fauna.</p> <p>The Impact assessment summarised in Chapter 11: Flora and Fauna (and provided in detail in Appendix L: Terrestrial and Aquatic Ecology Technical Report) identifies the significant residual impacts for the Project based on the implementation of avoidance, minimisation and mitigation measures discussed above and will be offset as per the Biodiversity Offset assessment provided in Chapter 11: Flora and Fauna.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report
218	218.0103	Local Government	Flora and Fauna	Survey effort/field investigation data	<p>The Draft EIS should be updated to commit to completing further on ground studies and surveys to validate and ground truth Figures 10.8d, 10.10, 10.11 and 10.12D, and include findings in the document accordingly. A true assessment of potential impacts and the implementation of meaningful management measures can only be made if the ecological values and impacts are understood and not assumed.</p> <p>In addition, the Draft EIS should further identify mitigation strategies including, but not limited to, the provision of more fauna crossing structures at key highly biodiverse areas along the proposed route (such as between Chainage 170-200).</p>	<p>Lack of appropriate and robust ecological survey: The Draft EIS does not respond to TOR 11.27 'the EIS should describe any mitigation measures proposed to reduce the impact on the listed threatened species and ecological communities and proposed mitigation measures. Supporting evidence should be provided to demonstrate the appropriateness of mitigation measures proposed. Where the likely success of mitigation measures cannot be supported by evidence, identify contingencies in the event the mitigation is not successful.'</p> <p>Further the Draft EIS does not address TOR 5.1 'the objectives of the EIS are to ensure that all relevant environmental, social and economic impacts of the project are identified and assessed, and to recommend mitigation measures to avoid or minimise adverse impacts. The EIS should demonstrate that the project is based on sound environmental principles and practices.' This is demonstrated by the proponent failing to provide mitigation measures proposed for Chainage 170-200 where highly biodiverse and sensitive environmental areas are located (as demonstrated by the number of environmental triggers/provisions (Figure 10.8d, Figure 10.10, Figure 10.11 and Figure 10.12d)).</p> <p>Chapter 10 outlines the results of the proponent's desktop assessment. Figure 10.8d indicates verified specimen backed records with four specimen records of Koalas occurring between Chainage 170 and Chainage 180. Figure 10.10 highlights the Matters of State Environmental Significance between Chainage 174-180 are various patches of MSES essential habitat. Figure 10.12D outlines various ecological corridors. The area between Chainage 170 and Chainage 180 is mapped as a BPA mapping Regional Terrestrial Ecological corridor. Figure 10.11 indicates the Koala mapping as prescribed under the Koala Conservation Plan 2017. Koala habitat is highlighted to occur between Chainage 190 and 200.</p> <p>Each of the above map references indicates the importance of the area for fauna (in particular Koalas) between Chainage 170 and 200. Despite this, the proposed Fauna Movement Strategy found at Appendix M does not outline any Fauna crossing structures between Chainage 149 and 197 (refer to Appendix M Figure 2.1d). Given the multiple environmental layers that are triggered between Chainage 170 and 200 the preliminary Fauna Crossing Structures are grossly inadequate.</p> <p>A key concern of TRC's is that if the project gains approval based on the current level of survey and assessment, it will be too late to apply avoidance and minimisation strategies later in the process as the alignment will be "locked in". This means the only form of mitigation available will be environmental offsets, which as stated earlier is the least preferred option.</p>	<p>Since the draft EIS was released for public submission ARTC has undertaken additional ecology surveys. The surveys were undertaken by Cardno (2021) and AusEcology (2022), which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods of these survey efforts and the results are available in Chapter 11: Flora and Fauna.</p> <p>A fauna connectivity strategy has also been prepared for the Project (see Appendix P: Fauna Connectivity Strategy) which identifies the location of proposed fauna crossing opportunities for species such as Koala (Phascolarctos cinereus). The structures will aim to align with the State significant fauna movement corridor to the north of Inglewood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the Detailed Design stage. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the Detailed Design stage.</p>	Chapter 11: Flora and Fauna Appendix P: Fauna Connectivity Strategy Section 5 Section 5.10 Section 5.14

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0104	Local Government	Flora and Fauna		<p>Lack of consideration of actual impact to flora and fauna: Section 10.9 discusses the potential impacts of the proposed project on flora and fauna. However, there is no definitive statement of impacts presented throughout Chapter 10. As a result, the requirements of TOR 5.1 have not been met. Further to this, the mitigation measures provided in Section 10.10 are not presented clearly. Section 10.11 discusses mitigated impacts but there is no clear way to compare potential impacts to actual impacts and therefore assess if the proposed mitigation measures will be effective. It is also clear that more detailed flora/fauna survey work is required through the detailed design stage.</p> <p>The Chapter provides the reader with no information on actual impacts, nor does the Chapter reference other chapters where these actual impacts may be discussed. The summary in Table 10.27 notes that:</p> <ul style="list-style-type: none"> Flora species impacts 'may occur' from 10 out of the 14 different disturbance traits listed. Fauna species impacts 'may occur' from 12 out of the 14 different disturbance traits listed. TEC impacts 'may occur' from 6 out of the 14 different disturbance traits listed. 	<p>The Draft EIS requires updating to discuss potential impacts in detail, rather than relying on the current summary and commit to completing more detailed surveys prior to the commencement of proposed project activities. The Draft EIS discuss whether potential impacts were included in the risk assessment or if the Draft EIS was limited to actual impacts only (as it appears to do). The Draft EIS should include:</p> <ul style="list-style-type: none"> What flora species will be lost, how many, where along the alignment and in what densities? What fauna species will be lost, how many, where along the alignment and in what densities? How the risk assessment resulted in changes to the proposed alignment? The Multicriteria Analysis in Chapter 2 notes that Environmental Impacts are ranked at 12% of the entire risk rating for the proposed project. With such high risks of impacts noted in Table 10.27, the Draft EIS should include an overall Environmental Sensitivity score as part of the risk analysis. 	<p>Further field assessments have been undertaken as part of the revised draft EIS to target threatened species, reassess the likelihood of occurrence and refine habitat mapping, including additional assessments to quantify areas of important habitat and habitat critical to the survival of threatened species. A detailed assessment on potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Results of the additional surveys including locations and quantification of ecological values, including threatened species, are also provided in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The Impact Assessment outlined in Chapter 11: Flora and Fauna includes estimations of magnitude of disturbance for environmental values and a Significant residual impact assessment. These Sections outline impacts to specific species, including those under the MSES and MNES guidelines.</p> <p>Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project footprint. These are outlined in Chapter 11: Flora and Fauna with a detailed breakdown of proposed Project impact mitigation measures during Detailed design, Pre-construction, Construction and Operational stages.</p>	<p>Chapter 11: Flora and Fauna Section 11.5 Section 11.6 Section 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 5</p>
218	218.0105	Local Government	Flora and Fauna		<p>Unacceptable impacts to flora and fauna: Section 10.9.1 of the Draft EIS includes a very general statement that 'vegetation clearing and habitat loss are likely to occur during construction-phase activities' and fails to clearly describe impacts will occur, to what species, and where the location of these impacts will be along the proposed alignment.</p>	<p>The Draft EIS requires update to consider what flora and fauna species will be impacted by the proposed alignment and construction footprint (including, but not limited to, expected numbers and appropriate mitigation measures), including realignment of the proposed project. The Draft EIS should include details regarding where the proposed alignment or ancillary features (pads, loops, turn outs, crossings etc) were specifically moved or altered (i.e., reduced width) because of impacts on flora and/or fauna.</p>	<p>A detailed assessment of potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Some examples of identified impacts include habitat loss and degradation, displacement of threatened species, barrier/edge effects, lighting, dust, erosion, and contamination. The impact assessment outlined in Chapter 11: Flora and Fauna includes the quantified magnitude of potential impacts and a significant residual impact assessment.</p>	<p>Chapter 11: Flora and Fauna Section 11.5 Section 11.6 Section 11.7</p>
218	218.0106	Local Government	Project scope		<p>Project footprint: Section 10.9.1 of the Draft EIS notes a total project footprint of 3,203.78 ha for a 216 km rail line. There is no information on how this Figure is calculated and no Figure showing clearly labelled corridor widths.</p> <ul style="list-style-type: none"> 3,204 ha = 32,040,000 m² 32,040,000 m² = 216 km Average width = 148.3 m Table 5.4 notes a minimum corridor width of 40 m. <p>Section 10.9.1 of the Draft EIS notes 563.24 ha of remnant vegetation and 34.64 ha of regrowth proposed to be cleared. There is no discussion of different alignment options to compare which alignment may preserve greater portions of valuable and significant regional ecosystems and no breakdown of which regional ecosystems are included in these totals. Section 10.9.1 of the Draft EIS notes 563.24 ha of remnant vegetation and 34.64 ha of regrowth proposed to be cleared. There is no discussion of different alignment options to compare which alignment may preserve greater portions of valuable and significant regional ecosystems and no breakdown of which regional ecosystems are included in these totals.</p>	<p>The Draft EIS requires updating to confirm the range of widths for the proposed corridor, including the minimum, maximum and overall average widths on suitably scaled Plans. This should include clarification on how the width of the rail corridor will be designed in order to minimise disturbance and the clearing of vegetation.</p> <p>The document should aim to provide information outlining the width of the corridor through areas of environmental significance sorted by chainage location so a comparison can be made against the alignment maps and provide a discussion of how the corridor width was adjusted to minimise impacts on flora and fauna species. This should include a commitment from the proponent to ensure that the construction contractor reduce the width of the proposed rail corridor to ALARP in order to ensure that there is no significant residual impact as a result of the proposed project.</p> <p>The Draft EIS should also include a summary of all the regional ecosystems to be impacted by the proposed alignment and construction footprint by ecosystem type, area to be cleared, area to be offset/restored, and provide information relating directly to what has been done to avoid or reduce these construction and alignment impacts, including describing where the proposed alignment was specifically altered because of reduced impacts to flora and ecosystems.</p>	<p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the two-kilometre-wide study area to a focused area of investigation (varying between 150 metres (m) to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and state government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS, Chapter 2: Project Rationale, Section 2.7) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ability to enhance the Inland Rail service offering construction and operating costs multi-criteria analysis (MCA). <p>Figure 2.15, Chapter 2: Project Rationale is a summary of the multi-criteria analysis (MCA) outcomes that were documented in the Corridor Options Report (AECOM, 2017b). The process for this comparative assessment of the four route options is shown in Figure 2.14. As described in Chapter 2: Project Rationale, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis (MCA) tool, which is used across Inland Rails program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation report), and the findings of environmental and engineering investigations. The weighted criteria in the MCA tool includes:</p> <ul style="list-style-type: none"> environmental impacts: 12.5 per cent (including potential ecological, visual, noise and vibration, flooding and water impacts, and the effect on air quality and greenhouse gas emissions) community impacts: 12.5 per cent (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts) approvals and stakeholder engagement: 12.5 per cent technical viability: 17 per cent safety: 16.5 per cent constructability: 12.5 per cent operations: 16.5 per cent. <p>In the 2010 Inland Rail Alignment Study (IRAS), two main route options were considered for Inland Rail in Queensland, one going to Brisbane via Toowoomba and the other via Warwick and Rathdowney. The outcome of this study noted that while the option via Warwick provided some reduction in transit time, the route via Toowoomba had lower capital cost and significantly higher demand/revenue. The Toowoomba route was therefore preferred. Since the 2010 IRAS, it has also become evident that the Toowoomba option is better positioned to take advantage of economic growth opportunities, such as the developing Charlton-Wellcamp precinct and the InterlinkSQ intermodal development.</p> <p>The Inland Rail Implementation Group (IRIG) in 2015 endorsed the 2010 IRAS alignment via Toowoomba, noting that this would also enable use of the Gowrie to Grandchester transport corridor protected by the Queensland Government. ARTC took this concept alignment and refined it during 2015 and 2016, with the route by October 2016 being known as the Base Case (Modified) route.</p> <p>In October 2016, the Australian Government determined that there would be an assessment of four rail alignment corridors between Yelarbon and Gowrie.</p> <ul style="list-style-type: none"> Corridor 1: Base Case (Modified) from Yelarbon to Gowrie via Millmerran and Mt Tyson Corridor 2: Base Case (Modified) with a deviation to pass close to Wellcamp and Charlton Corridor 3: Yelarbon to Gowrie via Karara, Leyburn and Felton Corridor 4: Yelarbon to Gowrie via Karara, Clifton and Wyreema and utilising the existing rail line close to Warwick <p>The corridor assessment process was conducted by independent consultants Aurecon and AECOM and overseen by the Yelarbon to Gowrie Project Reference Group (PRG) that was established by the Australian Government in November 2016. The PRG consisted of community and industry representatives with an independent Chair, Mr Bruce Wilson AM, appointed by the Government. The assessment work was summarised in the Corridor Options Report dated 21 April 2017 and made publicly available by the Australian Government on 21 September 2017.</p> <p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the base case via Wellcamp Charlton alignment forming the centreline of a two-kilometre-wide study area was to be progressed through Border to Gowrie phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. The Government-determined two-kilometre-wide study area is referenced within Chapter 2: Project Rationale of the revised draft EIS which describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>Subsequent to the submission of the draft EIS to the Coordinator-General, the then Deputy Prime Minister, in May 2020, instigated a review of alternative Project alignments via Whetstone State Forest and Cecil Plains. The Department of Infrastructure, Transport, Regional Development and Communications, engaged an independent consultant (GTA Consultants) to conduct the review, which considered, inter alia, information provided by ARTC and confirmed that the information provided was prepared on a 'like-for-like' basis. The review concluded that the alternative alignment would result in a longer distance and transit time, increased construction, operating and maintenance costs, a greater number of businesses and residences within 200 metres of the alignment, and potential delays in Project delivery timeframes. The Australian Government released the report in November 2020. Please refer to the Inland Rail B2G Alternative Route Comparison Review for further details (inlandrail.gov.au/understanding-inland-rail/publications-and-reports).</p> <ul style="list-style-type: none"> The broader Inland Rail route analysis is documented in Melbourne to Brisbane Inland Rail Route History 2006:2020 (ARTC, 2020d) document, where pages 83 to 95 relate specifically to Border to Gowrie. 	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Figure 2.14 Figure 2.15 Appendix E: Consultation Report</p>
218	218.0107	Local Government	Flora and Fauna		<p>Impacts to fauna: Section 10.9.2 of the Draft EIS is vague and impacts to fauna species are not summarised. The Section provides several ways impacts to fauna may occur (physical trauma, entrapment, loss of habitat leading to indirect mortality) however there is no discussion of why the proposed alignment will lead to the least amount of fauna species injury or mortality.</p> <p>As noted in an earlier comment, the lack of proposed fencing for sections of the rail presents a risk to livestock and native fauna.</p>	<p>The Draft EIS requires updating to include a summary of all the fauna species likely to be impacted by the proposed alignment and construction footprint. This should include which species are listed as threatened or significant from a local, state or federal point of view, and confirm what has been done to avoid or reduce the proposed impacts to fauna as a result of proposed project activities. This should also illustrate where the proposed alignment was specifically altered in order to reduce potential impacts to fauna species.</p> <p>The draft EIS must consider how risks and impacts to livestock and native fauna will be managed where fencing is not utilised on floodplains.</p>	<p>Further field assessments have been undertaken as part of the revised Draft EIS to target threatened species, reassess the likelihood of occurrence and refine habitat mapping. A detailed assessment on potential impacts of the Project has been conducted and can be found in Chapter 11: Flora and Fauna. Results of the additional surveys including locations and quantification of ecological values, including threatened species, are also provided in the revised draft EIS, Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>Mitigation measures have been considered to reduce the potential impacts to flora and fauna within the Project footprint. A detailed breakdown of proposed Project impact mitigation measures during detailed design, pre-construction, Construction Works and Operations stages and species specific mitigation measures for MNES and MSES flora and fauna species are provided in Chapter 11: Flora and Fauna.</p> <p>Opportunities for the provision of fauna exclusion fencing and fauna movement solutions have been identified (Appendix P: Fauna Connectivity Strategy). These include fencing strategies to guide species such as Koala to safe movement opportunities and will be refined through the detailed design process.</p>	<p>Chapter 11: Flora and Fauna Section 11.5 Section 11.6 Section 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix P: Fauna Connectivity Strategy</p>
218	218.0108	Local Government	Land Resources		<p>Reduction of soil viability: Section 10.9.3 of the Draft EIS notes that impacts to the biological viability of soil to support plant growth may result from soil compaction, which will occur as a result of the proposed rail alignment and ancillary infrastructure such as pads, loops, turn outs, crossings etc. Further, the Section states that these would be permanent features where there will be no practical way to restore soil or promote plant growth.</p> <p>It is unclear to the reader why this issue has been raised, given the lack of solution to permanent disturbance such as this.</p> <p>Further, the Section notes that 'unmitigated potential impacts of soil compaction are generally short term and temporary'. This would only be considered to be true for areas where temporary structures, such as construction pads, lay down areas, access tracks, etc, would be constructed and then those areas appropriately rehabilitated when no longer in use.</p>	<p>The Draft EIS requires amendment to consider the following issues:</p> <ul style="list-style-type: none"> The project footprint of 3,203.78 ha should be further defined as temporary or permanent disturbance. Provide detail relating directly to how much temporary disturbance will occur above the project footprint quoted above. What is being done to offset the permanent loss of agricultural land as a result of the proposed project 	<p>A detailed soil investigation in Appendix J: Soil Assessment Report has been undertaken along the Project alignment disturbance footprint (including permanent and temporary) which will further understand the soil properties and refine existing soil mapping. Refer to Appendix J: Soil Assessment Report, Section 3.2 and Section 5.0. Findings from the detailed soil investigation have informed soil-specific management measures and will include soil viability. Refer to Appendix AB: Earthworks Strategy and Draft Soil Management Plan, Part B (Section 3).</p> <p>Details on what type of land is impacted by both the temporary and permanent footprints, including impacts to agricultural land, and how this is being mitigated is available in Chapter 8: Land Use and Tenure, Section 8.5.1 and 8.6. The list of impacted properties has also been updated and is provided in Appendix F: Impacted Properties.</p>	<p>Chapter 8: Land Use and Tenure Section 8.5.1 Section 8.6 Appendix AB: Earthworks Strategy and Draft Soil Management Plan Section 3 Appendix F: Impacted Properties Appendix J: Soil Assessment Report Section 3.2 Section 5.0</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0109	Local Government	Flora and Fauna		Habitat fragmentation: Section 10.9.5 of the Draft EIS notes that 'most of the impact assessment area exists in a very fragmented environment but functional connectivity is retained through local linkages of remnant and regrowth vegetation'. There is no discussion of which proposed alignment provided the least fragmentation. It also seems that removal of existing linkages in fragmented vegetation is considered an acceptable outcome for the proposed project.	<p>The Draft EIS requires amendment to include detail relating to appropriately avoiding or reducing connectivity issues to ensure that there is no significant residual impact to habitat as a result of the proposed project, including committing to changes to the proposed rail alignment in order to ensure this is achieved. This should also include detailing where the proposed alignment was specifically altered because of reduced impacts to fauna species and connectivity of habitat.</p> <p>The Draft EIS should be updated include the preservation of linkages and connectivity in areas of low remnant vegetation presence to preserve what little connectivity is left. This should include locating proposed offsets in areas of fragmentation may improve the overall quality of some fauna linkages and reduce edge effects in the long term.</p>	<p>The discussion of potential impacts to Biodiversity Corridors as a result of the Project has been updated for the revised Draft EIS. A fauna movement and fencing strategy has also been prepared for the Project (Appendix P: Fauna Connectivity Strategy) which identifies the location of proposed fauna crossing opportunities for species such as Koala and Greater Glider. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process and in the Wildlife Connectivity Plan that will be prepared. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities (Appendix P: Fauna Connectivity Strategy. These opportunities will be refined through the detailed design process and incorporated where appropriate (revised draft EIS Appendix L: Terrestrial and Aquatic Ecology Technical Report).</p> <p>The potential impacts to connectivity have also been assessed with respect to the Significant residual impacts guidelines in Appendix L: Terrestrial and Aquatic Ecology Technical Report and biodiversity offsets discussed in Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie.</p>	<p>Chapter 11: Flora and Fauna Section 11.5 Section 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 5 Section 6 Appendix P: Fauna Connectivity Strategy Section 3 Section 4 Appendix Q: Queensland Environmental Offset Delivery Strategy - Border to Gowrie</p>
218	218.0110	Local Government	Flora and Fauna		<p>Habitat fragmentation: Section 10.9.7 and 10.9.8 of the Draft EIS notes that 'habitat fragmentation resulting from the project are considered to be long term and irreversible. '</p> <p>The proposed project travels through approximately 50 km of Bringally State Forest however no information is presented regarding why the proposed alignment must travel through this area of environmental sensitivity (which will effectively expose the State Forest to a doubling of edge effect and habitat fragmentation).</p>	<p>The Draft EIS requires update to include detail relating directly to when the proposed alignment has been amended to avoid or reduce habitat fragmentation and discuss why the edge effect and fragmentation of a State Forest is considered a good environmental outcome for the proposed project.</p>	<p>Following the completion of the Corridor Options Report for Border to Gowrie in 2017, the Australian Government announced the Base Case via Wellcamp Charlton alignment as the preferred concept alignment for the Project. The Corridor Options Report, the preparation of which was overseen by a Project Reference Group appointed by the Australian Government and chaired by Mr Bruce Wilson AM, was made publicly available by the Australian Government on 21 September 2017. The estimate of quantities used in cost estimates contained in the report was subject to an independent review by RPS in August 2017, with no shortcomings identified.</p> <p>The base case via Wellcamp Charlton alignment formed the centreline of a 2 km-wide study area to be progressed through ARTC's phase 2 'feasibility design' and draft EIS submission to the Queensland Coordinator-General. Chapter 2: Project Rationale of the revised draft EIS describes the route selection process for the proposal, both before and after confirmation of the study area.</p> <p>ARTC has worked with stakeholders throughout phase 2 'feasibility design' to refine the 2 km wide study area to a focused area of investigation (varying between 150 m to 1000 m wide depending on certainty) and finally, to a proposed rail corridor and construction footprint (available on social pinpoint and via landowner maps). This included discussing proposed design developments and options at local council and State government meetings, face-to-face meetings with affected landowners, town hall meetings, community consultative committees (Inner Darling Downs CCC and Southern Darling Downs CCC), drop-in sessions and regular updates via eNews, Project newsletters, regional print advertisements, and updates to the Inland Rail website.</p> <p>The preferred location for the proposed rail corridor (as presented in the draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA). <p>As described in Chapter 2: Project Rationale of the revised draft EIS, Section 2.8 and Section 2.9, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS, Section 4), and the findings of environmental and engineering investigations.</p> <p>Appendix E: Consultation Report, Section 5.7 discusses the extensive consultation done regarding Bringally and Whetstone State Forests. Where the Project requires land to be acquired for the permanent footprint within a state forest, partial revocation of the state forests in accordance with the <i>Forestry Act 1959</i> (Qld) will be required to enable the future gazettal of rail corridor over the same land. This process has required extensive consultation with a range of stakeholders, to subsequently acquire the interests over the proposed state forest revocation area. The request for revocation of state forest triggers the need for an application for Protected Area Estate Revocation under the <i>Forestry Act 1959</i> (Qld) and requires a compensation ratio of 5:1 for tree removal.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Appendix E: Consultation Report of the revised draft EIS Section 4 Section 5.7</p>
218	218.0110	Local Government	Flora and Fauna		<p>Habitat fragmentation: Section 10.9.7 and 10.9.8 of the Draft EIS notes that 'habitat fragmentation resulting from the project are considered to be long term and irreversible. 218	218.0111	Local Government	Flora and Fauna		<p>Artificial light impact on native fauna: Section 10.9.9 of the Draft EIS notes that artificial light sources may draw native reptiles, bats, birds and other nocturnal animals to feed to insects attracted to the light source. By default, higher order predators of these species will also frequent these areas to feed on those initial predators. This should be discussed.</p> <p>From information provided, it is unclear which areas will have permanently lighting installed and how much habitat will be affected. Lighting will also increase the likelihood of animal strike by vehicles, and this should be discussed.</p>	<p>The Draft EIS requires update to:</p> <ul style="list-style-type: none"> Describe where the rail alignment and its ancillary features will have permanent lights installed and what area of influence these lights will have on attracting native fauna. Confirm what has been done to avoid or reduce impacts of permanent lighting on native fauna by detailing how the proposed alignment has been altered to avoid fauna habitat and what alternate measures could be included instead of permanent light sources. Explain what cumulative effects noise and lighting will have on animal populations? It is important to note that lighting may attract some native fauna species that then become susceptible to injury or death through predation or vehicle strike, but noise emissions may also force other fauna species away. The Draft EIS should consider what new species may then fill the void left by the departed species and what impacts they will have on the remaining native species. 	<p>The discussion of potential impacts of lighting on flora and fauna has been updated in the revised draft EIS and is outlined in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report. Permanent lighting locations are outlined in Appendix K: Landscape and Visual Impact Assessment. Potential impacts and mitigations measures to reduce light spill are contained in Appendix K: Landscape and Visual Impact Assessment.</p> <p>Chapter 11: Flora and Fauna states that measuring light to assess its effect on wildlife is challenging and an emerging area of research and development. There is currently no globally recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species' visual systems. Some insectivorous bat species avoid lit areas, with lit edges acting as barriers to movement, decreasing the available habitat for the species and delaying emergence at night. Some other more generalist insectivorous bat species are able to tolerate light and utilise lit edges for feeding and dispersal.</p> <p>Qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting.</p> <p>Chapter 11: Flora and Fauna notes that noise associated with construction activities will be short-term in duration, and it is likely that fauna may temporarily move out of areas subject to high levels of noise (i.e. move into areas perpendicular to the alignment that contain bushland which will act to reduce noise exposure). It is expected that this avoidance behaviour will be short-term in nature and will only last for the duration of the construction activities. Operational noise may lead to some fauna species temporarily vacating/avoiding nearby habitat; however, operational noise will be temporary (occur as frequent pulses), and fauna species would be expected to return to the area once the pulse has passed.</p> <p>The discussion of potential impacts of noise on flora and fauna has been updated in the revised draft EIS and is outlined in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Project impacts from noise and vibration are assessed in detail in the revised draft EIS, Chapter 16: Noise and Vibration, Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Technical Report and Appendix W: Noise and Vibration Assessment – Railway Operations Technical Report.</p>	<p>Chapter 11: Flora and Fauna Section 11.5 Appendix K: Landscape and Visual Impact Assessment Appendix L: Terrestrial and Aquatic Ecology Technical Report Chapter 16: Noise and Vibration Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Technical Report Appendix W: Noise and Vibration Assessment – Railway Operations Technical Report</p>
218	218.0111	Local Government	Flora and Fauna		<p>Artificial light impact on native fauna: Section 10.9.9 of the Draft EIS notes that artificial light sources may draw native reptiles, bats, birds and other nocturnal animals to feed to insects attracted to the light source. By default, higher order predators of these species will also frequent these areas to feed on those initial predators. This should be discussed.</p> <p>From information provided, it is unclear which areas will have permanently lighting installed and how much habitat will be affected. Lighting will also increase the likelihood of animal strike by vehicles, and this should be discussed.</p>	<p>The Draft EIS requires update to:</p> <ul style="list-style-type: none"> Describe where the rail alignment and its ancillary features will have permanent lights installed and what area of influence these lights will have on attracting native fauna. Confirm what has been done to avoid or reduce impacts of permanent lighting on native fauna by detailing how the proposed alignment has been altered to avoid fauna habitat and what alternate measures could be included instead of permanent light sources. Explain what cumulative effects noise and lighting will have on animal populations? It is important to note that lighting may attract some native fauna species that then become susceptible to injury or death through predation or vehicle strike, but noise emissions may also force other fauna species away. The Draft EIS should consider what new species may then fill the void left by the departed species and what impacts they will have on the remaining native species. 	<p>The discussion of potential impacts of lighting on flora and fauna has been updated in the revised draft EIS and is outlined in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report. Permanent lighting locations are outlined in Appendix K: Landscape and Visual Impact Assessment, Section 9.Potential impacts and mitigations measures to reduce light spill are contained in Appendix K: Landscape and Visual Impact Assessment, Section 11.2.</p> <p>Chapter 11: Flora and Fauna states that measuring light to assess its effect on wildlife is challenging and an emerging area of research and development. There is currently no globally recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species' visual systems. Some insectivorous bat species avoid lit areas, with lit edges acting as barriers to movement, decreasing the available habitat for the species and delaying emergence at night. Some other more generalist insectivorous bat species are able to tolerate light and utilise lit edges for feeding and dispersal.</p> <p>Qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting.</p> <p>Chapter 11: Flora and Fauna notes that noise associated with construction activities will be short-term in duration, and it is likely that fauna may temporarily move out of areas subject to high levels of noise (i.e. move into areas perpendicular to the alignment that contain bushland which will act to reduce noise exposure). It is expected that this avoidance behaviour will be short-term in nature and will only last for the duration of the construction activities. Operational noise may lead to some fauna species temporarily vacating/avoiding nearby habitat; however, operational noise will be temporary (occur as frequent pulses), and fauna species would be expected to return to the area once the pulse has passed.</p> <p>The discussion of potential impacts of noise on flora and fauna has been updated in the revised draft EIS and is outlined in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report. 218	218.0112	Local Government	Waste and Resource Management		<p>Litter: Section 10.9.10 of the Draft EIS notes that litter may impact on native wildlife through ingestion, increase the spread of disease as well as the potential to cause bushfire (cigarette butts). The document fails to provide figures relating to the actual amount of litter found along similar rail lines throughout rural Australia.</p>	<p>The Draft EIS should be updated to provide an estimate of the quantities of litter that can be expected to be found along the rail corridor and how will the corridor owner will manage litter into the future.</p>	<p>The revised draft EIS considers waste disposal characteristics for the region, rather than the rail corridor specifically. Table 22-2 of Chapter 22: Waste and Resource Management provides an estimate of regional waste disposal characteristics which includes 103,499 tonnes for general waste. Table 22-10 summarises the management of waste types generated by the Project which includes debris and litter as a waste type and provides management options as per the waste management hierarchy.</p>	<p>Chapter 22: Waste and Resource Management Table 22-2 Table 22-10</p>
218	218.0113	Local Government	Flora and Fauna	Erosion	<p>The Draft EIS requires update to consider where areas of environmentally sensitive habitat will be impacted as a result of changes to overland flow or increased velocity from creeks or waterway crossings. The draft EIS must consider how these changes to landscape hydrology may impact terrestrial, riparian and aquatic ecological communities.</p>	<p>Changes to overland flow: Section 10.9.12 of the Draft EIS notes that localised impacts from erosion and sedimentation may occur as a result of concentrated runoff from stockpile locations, near culverts and bridges, and from changes to overland flow paths.</p>	<p>The revised draft EIS has been updated to address potential impacts from localised erosion and sedimentation to environmentally sensitive areas including terrestrial, riparian and aquatic ecological communities. Potential impacts relating to erosion and sedimentation, hydrology, and flooding are identified in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report. Proposed mitigation measures relating to the potential impacts are outlined in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5, 11.6 and 11.7 Appendix L: Terrestrial Ecology Technical Report Sections 5 and 6</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0114	Local Government	Flora and Fauna	Survey effort/field investigation data	<p>Mitigation: Mitigation measures presented in Section 10.10.1 and 10.10.2 are presented as a best guess approach that used an unquantified impact assessment process that did not measure or describe known impacts on flora and fauna species. There can therefore be no determination of the success of the proposed mitigation measures presented in these sections and it may be assumed that impacts will go unchecked and loss of flora and fauna species will be inevitable and unknown.</p> <p>The 'reference design phase' purportedly completed in parallel with the impact assessment process (Section 10.10.1) is not clearly outlined in Chapter 10.10 or 10.11. There is no discussion of where EVNT species have been identified under a current alignment or indications of where the alignment has been moved to avoid impacts.</p>	<p>The Draft EIS requires update to include potential impacts to flora and fauna which are determined through detailed site inspections and that provide definitive discussion on likely impacts, including areas of known locations of EVR flora and fauna species, numbers and distributions. Once the impacts are fully known, the Draft EIS should provide a discussion on how the proposed alignment has been altered to avoid the largest amount of environmentally sensitive areas.</p> <p>The Draft EIS should also consider what flora and fauna species will be lost as a result of an increased footprint of disturbance due to the proposed focus on safety measures.</p>	<p>Further field assessments have been undertaken as part of the revised Draft EIS, which ground-truthed the Project disturbance footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the detailed design and construction stage of the Project. Results of these surveys including locations and quantification of ecological values, including threatened species, is provided in Appendix L: Terrestrial and Aquatic Ecology Technical Report.</p> <p>The mitigation measures outlined in Chapter 11: Flora and Fauna have been revised with consideration of the additional ecological survey results. The Draft Fauna Management Plan (see Appendix N: Draft Fauna Management Plan) outlines performance, management and reporting requirements associated with the management of fauna throughout the Project. A Biodiversity Management Plan will be developed as part of the Construction Environmental Management Plan and will include appropriate criteria, directives and procedures. The plan will include requirements for inspections, monitoring and performance objectives, and corrective actions should the outcomes not achieve the adopted objectives.</p> <p>Chapter 11: Flora and Fauna outlines how ecological values were avoided and minimised through the development of the revised reference design.</p>	<p>Chapter 11: Flora and Fauna Section 11.5 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix N: Draft Fauna Management Plan</p>
218	218.0115	Local Government	Flora and Fauna		<p>Project footprint: Section 10.10.1 notes that the project footprint was restricted to that required for 'safe and efficient construction'. This is an unqualified remark not supported by any data or further information. In no way does 'safe or efficient construction' imply that environmentally sensitive areas were avoided, or that adverse impacts on the environment were minimised in order to ensure that there will be no significant residual impact as a result of the proposed project.</p>	<p>The Draft EIS requires update to confirm what has been done to avoid or reduce connectivity issues through changes to the proposed rail alignment as a result of an increased or decreased construction and operational footprint due to safety constraints. This should include a discussion of whether any considered alignment options were identified as more or less safe than others and if so, describe what caused these unsafe alignment options and posed construction risks, and whether or not these areas were in the vicinity of environmentally sensitive areas.</p> <p>The Draft EIS should also consider what flora and fauna species will be lost as a result of an increased footprint of disturbance due to the proposed focus on safety measures.</p>	<p>A number of alternative routes for the Project footprint have been considered during the concept assessment stage (from early 2016 to late 2017) of the Project (Chapter 2: Project Rationale, Section 2.9). In all instances, the guiding principles of ecologically sustainable development have been factored into the assessment and selection of corridor and alignment options for the Project.</p> <p>The Project footprint has been subject to historical disturbance and clearing, with one third of the alignment length located within brownfield (areas already subject to previous development). The remaining greenfield portions of the Project footprint extend largely through areas subject to agricultural land uses. The nominated rail corridor has been restricted to the land required to accommodate permanent infrastructure components of the railway, including earthworks, cross drainage and rail maintenance access roads.</p> <p>Revised draft EIS Chapter 11: Flora and Fauna and Appendix L: Terrestrial Ecology Technical Report provide strategies that have been used to minimise impacts through the revised reference design stage of the Project to avoid habitat for threatened species wherever possible.</p> <p>A preliminary fauna movement provision and fencing strategy has also been prepared for the Project (Appendix P: Fauna Connectivity Strategy) which identifies the location of proposed fauna crossing opportunities for species such as Koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingleswood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process.</p>	<p>Chapter 2: Project Rationale Section 2.9 Chapter 11: Flora and Fauna Appendix L: Terrestrial Ecology Technical Report Appendix P: Fauna Connectivity Strategy</p>
218	218.0116	Local Government	Surface Water		<p>Watercourse crossings: Section 10.10.1 notes that watercourse crossings and bridges have been designed to maintain aquatic fauna passage and minimise the risk of blockages and impacts to the bed, banks and environmental flow of watercourses (in accordance with DAF, 2018e).</p> <p>Table 5.1 of the Draft EIS notes that there will be:</p> <ul style="list-style-type: none"> 120 box culverts and 212 reinforced concrete pipe culverts along the alignment. 34 bridge crossings (Section 10.10.1 notes there will be 20 bridges structures over waterways). <p>The comment in the Draft EIS that all culvert crossing and all bridge crossing have been designed in accordance with DAF (2018,e) provides a very clear indication that the proposed alignment route is already decided upon and the Draft EIS process is nothing more than an exercise in approval and not alignment impact mitigation or alignment refinement. Bridges, culverts and their approaches away from high banks or avoid pylons and footings in low flow channels cannot be appropriately designed without completing detailed survey of every creek crossing and confirming maximum pier/pylon separation distances and spans.</p>	<p>The Draft EIS requires update to include detail regarding:</p> <ul style="list-style-type: none"> How many of the 323 culverts are in watercourses and how many were specifically designed in accordance with DAF (2018,e). How many of the 34 bridges are in watercourses and how many were specifically designed in accordance with DAF (2018,e). How the design of each individual bridge avoided impacts to bed, banks and environmental flow of watercourses. How often extra-long bridge spans are required so that no pylon or pier footing would be inside the high banks of the waterway. How many of the 34 bridges and 323 culverts meet the self-assessable standards for waterway barrier works and riverine protection permits. What is being done to protect the waterways during construction. Whether concrete pours will be completed inside or outside waterways. If inside, will pours occur when water is present in the waterway. What is being done to minimise impact to riparian zones during construction. What revegetation activities will occur in riparian zones following construction. 	<p>A review of the DAF Queensland Waterways for Waterway Barrier Works mapping was undertaken, identifying a total of 100 waterways for waterway barrier works that are intersected by the Project alignment (Appendix S: Surface Water Quality Technical Report, Section 4.6.2). Of the 100 waterways, several of the waterways are crossed by the Project alignment in multiple locations. The 100 waterways intersecting the original Project footprint are classified (derived from DAF mapped waterways) as follows:</p> <ul style="list-style-type: none"> The alignment intersects 66 waterways mapped as green The alignment intersects 15 waterways mapped as orange The alignment intersects 9 waterways mapped as red The alignment intersects 10 waterways mapped as purple. <p>The planned structure type at each waterway intersection is shown on the environmental drawings presented in Appendix B1: Design Drawings of the revised draft EIS.</p> <p>The level of risk relating to each waterway will be considered during detailed design of all structures located within the bankfull width of waterways, such as culverts, bridges (piers and abutments) and other potential barriers. A list of cross-drainage infrastructure points along the Project alignment is provided in Appendix S: Surface Water Technical Report. Designs will be in accordance with the factsheet, What is not a waterway barrier work? (DAF, 2017c), or accepted development requirements for operational work that is constructing or raising waterway barrier works, or under a relevant development approval.</p> <p>In-stream works will be undertaken in accordance with Accepted Development Requirements for Operational Work that is Constructing or Raising Waterway Barrier Works (DAF, 2018e) for lower-risk watercourses (Appendix S: Surface Water Quality Technical Report, Section 6.2). In-stream works for higher-risk watercourses will be planned and undertaken in accordance with applicable assessment benchmarks for assessable development. Where in-stream works are developed in accordance with applicable accepted development requirements or acceptable outcomes within relevant codes, works are expected, at a minimum, to reduce increases in barriers for water movement during construction.</p>	<p>Appendix B1: Design Drawings Appendix S: Surface Water Quality Technical Report Section 4.6.2 Section 6.2</p>
218	218.0117	Local Government	Flora and Fauna		<p>Rather than having to redesign the culverts that are already designed to DAF (2018,e) the proponent should consider altering the proposed alignment to avoid fauna connectivity issues (a better solution which will better align with the Multicriteria Analysis shown in Figure 2.5 which is supposed to consider reductions in environmental impacts).</p>	<p>Wildlife crossings: Section 10.10.1 notes that 'opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the detailed design process.' This indicates that detailed design work has not yet commenced. If this is the case, the Draft EIS should discuss how 323 culverts and 34 bridges can be designed in accordance with DAF (2018,e) if the detailed design process has not yet occurred.</p> <p>The Draft EIS also notes that watercourse crossings and bridges 'have been designed to maintain aquatic fauna passage' and minimise the risk of blockages and impacts to the bed, banks and environmental flow of watercourses.</p> <p>The revised Appendix P: Fauna Connectivity Strategy proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g., revegetation). These scenarios will be used to inform design workshops and community consultation at the Detailed Design stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Transport Infrastructure Delivery manual (DTMR 2024). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the Detailed Design stage, once design workshops and community consultation are complete.</p> <p>The DKPMP provided specific details how ARTC propose to deal with koalas that are located within the construction footprint. Translocation of koalas to new areas will not be used as a preferred strategy. Additional management and mitigation measures are outlined in Chapter 24: Draft Outline Environmental Management Plan. The standalone Draft Fauna Management Plan (Appendix N: Draft Fauna Management Plan) outlines the roles and responsibilities of personnel undertaking management and mitigation measures. In the case of treating sick/injured fauna, a qualified Fauna Spotter Catcher will be responsible for handling and relocating fauna to suitable habitat and ensuring injured any and/or sick fauna are assessed and treated according to the requirements of the Biodiversity Management Plan.</p> <p>Regarding the proposed solution, the preferred location for the proposed Project rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> Ability to enhance the Inland Rail service offering Construction and operating costs Multi-criteria analysis (MCA), including detailed environmental considerations. <p>As described in Section 2.8 and Section 2.9 of Chapter 2: Project Rationale of the draft EIS, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in EIS, Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p>	<p>Since the submission of the draft EIS, ARTC has developed the following key documents to support the revised draft EIS: EIS, Appendix M: Draft Koala Management Plan and Appendix P: Fauna Connectivity Strategy. These documents will be standalone appendices for the revised draft EIS and were developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures to protect vulnerable and endangered species.</p> <p>Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingleswood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the Detailed Design stage. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the Detailed Design stage and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy)</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix N: Draft Fauna Management Plan Appendix P: Fauna Connectivity Strategy</p>
218	218.0118	Local Government	Flora and Fauna		<p>Light impacts for wildlife not addressed: TOR 11.96 requires that the Draft EIS 'Describe any proposed measures to avoid, minimise or mitigate potential impacts on natural values, and enhance these values' ... 'In particular, address measures to protect or preserve any threatened or near-threatened species...'</p> <p>Section 10.9.9 highlights the potential impacts from artificial light on wildlife during the construction and operation phases of the project, including specific mention of increased susceptibility to predation; altered foraging; and changes to congregation habits and locations. However, there are no mitigation measures listed generally in Section 10.10.2 (proposed mitigation measures) or detailed specifically in Table 10.29 that would address this specific issue and as such, the Draft EIS does not meet the requirements of TOR 11.96 (as they relate to mitigation).</p>	<p>The Draft EIS requires update to include the mitigation measures required to reduce potential impacts to wildlife arising from light at night during both the construction and operation phases of the proposed project.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> The proponent is required to apply mitigation measures to reduce potential impacts to wildlife arising from light at night in accordance with National Light Pollution Guidelines for Wildlife (January 2020). 	<p>The discussion of potential impacts of lighting on flora and fauna has been updated in the revised draft EIS and is outlined in Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report. While construction lighting will be temporary, operational lighting will be long term but it will be localised to infrastructure and transient in nature with vehicle movement.</p> <p>Chapter 11: Flora and Fauna notes that measuring light to assess its effect on wildlife is challenging and an emerging area of research and development. There is currently no globally-recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species' visual systems. Some insectivorous bat species avoid lit areas, with lit edges acting as barriers to movement, decreasing the available habitat for the species and delaying emergence at night. Some other more generalist insectivorous bat species are able to tolerate light and utilise lit edges for feeding and dispersal.</p> <p>Qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting.</p> <p>Potential impacts and mitigations measures to reduce light spill are contained in Appendix K: Landscape and Visual Impact Assessment, Section 11.2. Additionally, mitigation measures for light impacts are outlined in Chapter 24: Draft Outline Environmental Management Plan which includes that the detailed design is to incorporate lighting to the minimal level required to meet operational road and rail safety requirement; attenuation measures to minimise light spillage will be assessed and incorporated into the detailed design such as selection of appropriate light fittings/shield and/or at receptor treatments; limit the potential for vertical illuminance by selecting luminaries that direct light downwards to avoid lateral glare.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan Appendix K: Landscape and Visual Impact Assessment Section 11.2</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0119	Local Government	Flora and Fauna	Survey effort/field investigation data	<p>The Draft EIS should be updated after further survey work is completed to determine the true impacts to flora, fauna, and ecological communities (including regional ecosystems). This data should be collated into a simple analysis of impacts along several alignment options to determine the alignment of least environmental impact. The Draft EIS can then use the Multicriteria Analysis shown in Figure 2.5 as a tool for determining the best alignment option.</p>	<p>MNES, MSES: Table 10.29 of the Draft EIS includes provisions for the future survey of MNES and MSES species, with specific consideration to 'methods and sequencing of protected plant surveys, including seasonal timing...'</p> <p>The Draft EIS suggests approval based on a host of possible impacts will be managed by possible mitigation measures. Table 10.29 notes that at minimum, the following species may be impacted by the proposed alignment:</p> <ul style="list-style-type: none"> ▶ 18 MNES flora species; ▶ 3 different MSES flora species; ▶ 23 MNES fauna species; ▶ 3 different MSES fauna species; ▶ 15 MNES migratory fauna species. <p>By comparison, the New Acland Coal Project EIS confirmed that only 4 EVNT flora species and 2 fauna species would occur within the mine's footprint of disturbance (EIS Executive Summary, page 11, dstdmip.qld.gov.au/_data/assets/pdf_file/0018/33408/executi ve-summary.pdf)</p> <p>The New Acland approval has been blocked by State and Federal agencies for several years while further information had to be compiled and appealed through the court system.</p> <p>It is clear from Table 10.29 that a very large amount of survey work is required before the full extent of impacts are known. Only then can the full impacts be measured against a true assessment of risks from the Multicriteria Analysis shown in Figure 2.5. Without this work being completed, those approving the Draft EIS are doing so based on incomplete information and no revision of alignment based on environmental impacts.</p>	<p>Since the draft EIS was released for public submission ARTC has undertaken additional ecology surveys to ground-truth the Project footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the Detailed Design and Construction Works stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods and results of these survey efforts are available in Chapter 11: Flora and Fauna.</p> <p>The full survey reports are available in Appendix A of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ Ability to enhance the Inland Rail service offering ▶ Construction and operating costs ▶ Multi-criteria analysis (MCA). <p>As described in Section 2.8 and Section 2.9 of Chapter 2: Project Rationale, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to reference design since draft EIS to reflect the alignment maturity.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance</p>
218	218.0120	Local Government	Surface Water	Water quality	<p>Surface water and ecosystem impacts: Table 10.29 of the Draft EIS notes that a Surface Water Management Sub-Plan will be prepared and include a risk management framework for the evaluation of the risks to surface water quality and ecosystems in the receiving environment. This information would be useful for assessing impacts and the adequacy of proposed mitigation measures as part of a draft EIS process, yet the evaluation has not been completed by the proponent.</p>	<p>The Draft EIS requires update to complete the risk management framework for surface water quality and ecosystem impacts and to determine whether the proposed alignment will change if water quality or ecosystem impacts are deemed too great. This is also required to determine the adequacy of any proposed mitigation measures.</p>	<p>The surface water assessment for the revised draft EIS has adopted a significance-based impact assessment method. This method has required consideration of the likely sensitivity of a receptor (e.g. the quality or resource value of surface waters) and the magnitude (e.g. intensity, duration and spatial extent) of potential impact on that receptor. In combination, the sensitivity of a receptor and the magnitude of potential impact enable the significance of a risk to be established. This approach has enabled the risks to surface water quality and ecosystems in the receiving environment to be assessed, as presented in Section 13.25.1 and Table 13-13 of Chapter 13: Surface Water. The impact assessment summary is provides in Section 13.27 of Chapter 13: Surface water.</p> <p>Reference to a risk management framework (as part of Surface Water Management Plan) has been removed from discussion of the Surface Water Plan in the revised draft EIS.</p>	<p>Chapter 13: Surface Water Section 13.25.1 Section 13.27 Table 13-13</p>
218	218.0121	Local Government	Flora and Fauna	Monitoring	<p>The Draft EIS requires updating to include a commitment that any Rehabilitation and Landscape Management Sub-plan will include rehabilitation success criteria and a defined and appropriate period for care and maintenance.</p>	<p>Rehabilitation monitoring commitment: Table 10.29 of the Draft EIS notes that a Rehabilitation and Landscape Management Sub-plan will be prepared as part of detailed design however this is not discussed in text and there is no mention regarding rehabilitation success criteria and how long a care and maintenance phase would need to be.</p>	<p>A Rehabilitation and Landscaping Management Plan will be developed for the Project as a component of the Construction Environmental Management Plan (CEMP). Details of the environmental outcomes, performance criteria, proposed mitigation measures, monitoring and adaptive management for this plan are contained in Chapter 24: Draft Outline Environmental Management Plan, Chapter 11: Flora and Fauna, and Appendix L: Terrestrial and Aquatic Ecology Technical Report. The plans will contain location-specific reinstatement commitments.</p> <p>Details regarding a Rehabilitation and Landscaping Management Plan have been included in Chapter 11: Flora and Fauna. Chapter 24: Draft Outline Environmental Management Plan outlines the Rehabilitation and Landscaping Management Plan including rehabilitation success criteria, monitoring and maintenance, and corrective actions if the outcomes of rehabilitation and/or reinstatement/stabilisation are not achieved.</p>	<p>Chapter 11: Flora and Fauna Section 11.6 Chapter 24: Draft Outline Environmental Management Plan Appendix L: Terrestrial and Aquatic Ecology Technical Report Section 6.1</p>
218	218.0122	Local Government	Flora and Fauna		<p>The Draft EIS requires update to discuss Figures 2.1a to 2.1d of Appendix M in the body of the Draft EIS. Further, the Draft EIS should detail future surveys which will occur to determine if the proposed number of wildlife crossings will remain the same and on what basis would such a decision be made. Success rates for fauna movement should be included as a commitment and include appropriate performance criteria commitments for successful of wildlife crossings.</p>	<p>Wildlife crossings: Section 10.10.2.1 (and shown in Appendix M, Figures 2.1a to 2.1d) of the Draft EIS includes information related to wildlife crossings/fauna under and overpasses. Figures shown in Appendix M are not referenced in Chapter 10, yet wildlife crossings are considered to be an integral component to mitigate fauna corridor and connectivity impacts.</p> <p>6 fauna crossings are proposed in the Condamine Floodplain and 13 in Bringally State Forest. There is however no comment in the Draft EIS that this number of crossing is sufficient and there is no commitment that this will be the absolute minimum number of crossings. The Draft EIS includes non-committal statements such as 'a specific goal might be to ensure more than 90% of individuals that approach a crossing structure successfully cross it', without providing data to back this statement up.</p>	<p>Post the release of the draft EIS, ARTC has completed additional detailed field surveys across the Project alignment to identify ground-truthed vegetation communities and associated habitats. This field-verified data has been used to classify koala habitat according to its function as foraging and breeding habitat and dispersal habitat in accordance the definition of 'habitat critical to the survival' of the species, as defined under the EPBC Act. The most recent field data from the Technical Ecological Assessment from Ausecology (2022) for the Project, as well as recent field surveys for the Project undertaken by Environmental Resources Management (ERM) and University of Sunshine Coast (USC) was used to support the development the revised draft EIS.</p> <p>Since the submission of the draft EIS, ARTC has developed the following key document to support the revised draft EIS Appendix P: Fauna Connectivity Strategy. This document will be standalone Appendix for the revised draft EIS and was/developed because of direct engagement with various Commonwealth and State agencies, community conservation groups, Community Consultative Committee meetings and from written submissions received on the draft EIS, as part of the EIS public notification process. Refer to Appendix E: Consultation Report, Consultation Outcomes.</p> <p>Mitigation measures and controls have been factored into the Project to reduce the impact of habitat fragmentation and impacts on fauna populations, including koalas, during both the Construction Works and Operations stages. Vegetation clearance will be restricted to the minimum area required to enable the safe and efficient construction, operation and maintenance of the rail corridor, including minimising the disturbance of environmentally sensitive areas. Habitat for threatened species has been avoided wherever possible, as outlined further in Appendix L: Terrestrial and Aquatic Ecology Technical Report. The Draft Outline Environmental Management Plan (Chapter 24: Draft Outline Environmental Management Plan) include management and mitigation measures to protect vulnerable and endangered species.</p> <p>Revised draft Appendix P: Fauna Connectivity Strategy identifies the location of proposed fauna crossing opportunities for species such as koala. These have primarily been co-located with waterway crossing structures to maintain habitat connectivity across the rail corridor. The structures will aim to align with the State significant fauna movement corridor to the north of Ingelwood and locations assessed as providing movement opportunities for the greatest number of species. Opportunities to incorporate fauna infrastructure at other potential crossing points (such as large culverts) will be considered during the Detailed Design process. Opportunities for the provision of fauna fencing and fauna movement solutions have been identified. These include fencing strategies to guide species such as Koala to safe movement opportunities. These opportunities will be refined through the Detailed Design process and incorporated where appropriate (Appendix P: Fauna Connectivity Strategy).</p> <p>Appendix P: Fauna Connectivity Strategy, Section 6 proposes five different scenarios to mitigate the impact of the Project on connectivity for fauna and reduce wildlife mortality. These scenarios experiment with a range of fencing options and the type, placement and number of crossing structures and other mitigation measures (e.g., revegetation). These scenarios will be used to inform design workshops and community consultation at the Detailed Design stage. The exact type, design, number and location of crossing structures, fencing and other mitigation measures will be finalised during this stage. These plans and strategies have prepared with reference to Koala-sensitive Design Guidelines (DES, 2022), various internal ARTC guidelines and DTMR's Fauna Sensitive Road Design: volume 1 and 2 (DTMR 2000 and 2010 respectfully). The exact type, number and location of crossing structures, fencing and other mitigation measures will be finalised at the Detailed Design stage, once design workshops and community consultation are complete. However, five different mitigation scenarios have been proposed and evaluated as part of the revised Appendix P: Fauna Connectivity Strategy.</p> <p>The overarching goals of the Fauna Connectivity Strategy (FCS) are to:</p> <ul style="list-style-type: none"> ▶ Maintain and, where possible, enhance the cross-rail movement of fauna. ▶ Prevent the injury and mortality of fauna from train collision, especially for listed threatened wildlife species. <p>These two goals set the broad direction and outcomes that ARTC plan to achieve by implementing the FCS, but they are not specific enough to clearly inform Detailed Design of the railway to achieve these outcomes. SMART goals (i.e., Specific, Measurable, Achievable, Relevant, Time-bound) are required to guide the development of the Strategy and enable evaluation of mitigation success after construction.</p> <p>The ability to set SMART goals relies on a comprehensive assessment of the ecological conditions of the Project Section of the Inland Rail Program; detailed knowledge of the likely and potential impacts of the railway on those ecological values, and the formulation of sensible and relevant targets. The 'SMART' objectives for each target species are presented in Appendix P: Fauna Connectivity Strategy, Table 2.1. - 'SMART' goals for each of the Project target species.</p> <p>Post construction ecological monitoring and evaluation of the on-ground implementation of the FCS will be undertaken to determine whether the SMART goals are progressively being achieved. A comprehensive Monitoring, Evaluation and Reporting Plan (MER Plan) that evaluates the use of crossing structures (i.e., rate of crossing by different species) and the effectiveness of crossing structures will be developed during phase 2 'feasibility design' of the Strategy. It is not possible to develop a specific MER Plan now because the number and type of crossing structures and other treatments has not been specified. This will be completed in the Detailed Design stage.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 4.2 Section 5.1 Section 5.10 Appendix P: Fauna Connectivity Strategy,</p>
218	218.0123	Local Government	Flora and Fauna	Survey effort/field investigation data	<p>The Draft EIS requires update to address the fact that further detailed ecological studies are required to effectively refine the current proposed alignment in a way which ensures impacts to environmental aspects (including, but not limited to, flora and fauna) are mitigated to ensure that there is no significant residual impact as a result of the proposed project.</p> <p>The Draft EIS makes it clear that the Project will rely heavily on 'possible impact mitigation' rather than avoiding areas of environmental significance or reducing the footprint of disturbance. This is not considered to be a robust enough approach for a proposed rail alignment which will significantly impact the surrounding environment if not managed appropriately.</p>	<p>Lack of ecological survey: Section 10.11.1 states that 'ARTC are committed to undertaking detailed ecological surveys throughout the project footprint in parallel to the development of detailed design.' All of the impacts noted in Chapter 10 are therefore assumed or indicative only, and cannot be used to determine actual impacts, and further survey work are required in order to identify these impacts.</p> <p>Further, there is potential for the species not included in Tables 10.32, 10.33, 10.34 and 10.35 to be found to be present, resulting in the potential for even further impacts from the proposed project.</p> <p>Should the proposed project be approved without being called upon to complete robust, detailed and appropriate ecological surveys, there will be no opportunity to mitigate these impacts at all other than offsets which are the least preferred option.</p> <p>Chapter 2 shows several corridor options, yet there is no summary of the Multicriteria Analysis shown in Figure 2.5 to indicate how identified environmental impacts changed the proposed alignment options or narrowed the options to the current proposed alignment as now presented.</p>	<p>Since the draft EIS was released for public submission ARTC has undertaken additional ecology surveys which ground-truthed the Project footprint. The purpose of these assessments was to build upon the studies undertaken for the draft EIS and inform the Detailed Design and Construction Works stage of the Project. The surveys determined the presence or likelihood of presence for species and/or ecological communities protected under relevant State and Commonwealth legislation and local government environmental planning requirements. The methods and results of these survey efforts are available in Chapter 11: Flora and Fauna.</p> <p>The full survey reports are available in Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance.</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none"> ▶ Ability to enhance the Inland Rail service offering ▶ Construction and operating costs ▶ Multi-criteria analysis (MCA). <p>As described in Section 2.8 and Section 2.9 of Chapter 2: Project Rationale, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to reference design since draft EIS to reflect the alignment maturity.</p>	<p>Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 11: Flora and Fauna Appendix L: Terrestrial and Aquatic Ecology Technical Report Appendix O: Matters of National Environmental Significance Appendix B3: Changes to reference design since draft EIS</p>
218	218.0124	Local Government	Editorial		<p>TEC's: Table 10.32 notes the TEC Myall Woodland and TEC Poplar Box both have the same habitat areas of 81.92 ha and same percentage disturbance of 5.02%.</p>	<p>It is recommended that the proponent check this data and update the Draft EIS accordingly.</p>	<p>Additional detailed survey efforts have been undertaken since the draft EIS. The results of these surveys have informed the update of Appendix L: Terrestrial and Aquatic Ecology Technical Report and Appendix O: Matters of National Environmental Significance Report.</p>	<p>Appendix L: Terrestrial and Aquatic Ecology Technical Report Sections 4 and 5 Appendix O: Matters of National Environmental Significance Report</p>
218	218.0125	Local Government	Air Quality		<p>Operational movements: Table 2.4 of Appendix R presents forecasted typical and peak volume of trains to be used by the Project in 2040. These projections have been used to estimate pollutant emission rates (provided in Table 5.7) from diesel combustion in locomotives. However, Section 2.3 does not make clear as to how the peak weekly movements were determined from typical weekly movements for each locomotive class.</p>	<p>Chapter 12 and Appendix R should be revised to include additional information on how the peak weekly train movements for 2040 were estimated.</p>	<p>For the purpose of developing the infrastructure for Inland Rail, ARTC developed a train plan to translate the predicted tonnage profile expected on Inland Rail from the 2015 Business Case, into an outline train number and frequency. The information was validated in the Inland Rail operation model. This train plan forms the basis for the development of a future working timetable.</p> <p>The daily train volumes for the various route sections have been calculated. The typical and peak weekly train volumes for the various route sections has been modelled for 2020, 2025 and 2040 by route Section between the NSW/QLD border through to the township of Gowrie.</p> <p>The peak train numbers represent the design capacity of the individual rail section, while the typical train numbers represent the modelled train numbers for each year. The peak train numbers have been used for operational air quality modelling and for subsequent impact assessment for the revised draft EIS. Chapter 12: Air Quality (Section 12.52) and Appendix R: Air Quality Technical Report (Section 2.3) have been revised to include this additional information on how the peak weekly train movements for 2040 were estimated.</p>	<p>Chapter 12: Air Quality Section 12.52 Appendix R: Air Quality Technical Report Section 2.3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0126	Local Government	Air Quality		<p>Air quality background levels: For determining background concentrations, specifically for the short-term averaging particulates (i.e., 24-hour average PM10 and PM2.5 concentrations) and 24-hour average Toluene and Xylene, the 70th percentile value was considered from the available monitoring datasets.</p> <p>Using the 70th percentile value to inform background concentration for short-term averaging pollutants (i. e., 1-hour, 8-hour, 24-hour averaging periods) is an approach which is largely accepted by various regulatory agencies. Reference to the usage of the 70th percentile values for determining background concentrations can be found in regulatory guidelines such as the Brisbane City Council - Air Quality Planning Scheme Policy (AQPSP) and Vic -EPA State Environment Protection Policy (SEPP) Air Quality Management.</p> <p>Although usage of the 70th percentile values is acceptable, this approach tends at times to underestimate the background concentrations of the study area. Table 4.5 and Table 4.6 of the Air Quality Technical Report summarises the PM10 and PM2.5 statistics measured from the Inland Rail Air Quality Monitoring Station which is located at a residential dwelling off Draper Road, Charlton. The time-series for the 24-hour average PM10 concentrations measured between September 2018August 2019 shows that there have been nine (9) exceedances of the 24-hour average ambient assessment criteria of 50 µg/m3. These exceedances are attributed to dust storms and bush fires that occurred during the monitoring period. Nine (9) exceedances of the assessment criteria over a one (1) year period would imply that the 24-hour average concentrations complied with the assessment criteria for more than 95% of the time. As-such, using the 70th percentile value would underestimate the background PM10 levels which have been used in the determination of cumulative concentrations.</p> <p>On the contrary, usage of the 70th percentile concentration for determining background levels of Toluene and Xylene is deemed acceptable as the values have been referenced from the Springwood monitoring station which is situated in a very busy urban environment as opposed to the study area, which is largely a rural landscape as noted in the Terrain and Land Use Section (Section 4.4) of the Air Quality Technical Report.</p>	<p>It is recommended that the Air Quality Technical Report be revised to use the 90th percentile value from the Inland Rail AQMS be used instead of the 70th percentile for determining the background particulate (PM10 and PM2.5) concentrations as it provides a conservative picture of the local air quality levels. The use of 90th percentile value would still filter out the observations corresponding to the bush fire and dust storm activities.</p>	<p>Section 4.2 of Appendix R: Air Quality Technical Report, reports that the Brisbane City Council Air Quality Planning Scheme Policy (BCC AQPSP) (2014) is a robust technical document which is widely used throughout Qld regardless of the type of project or the rural or urban setting of the assessment area. BCC AQPSP prescribes that the 70th percentile of measured concentrations should be used for the assessment of pollutant species with short-term air quality goals. The BCC AQPSP does not prescribe the use of other percentiles (e.g.90th). In accordance with the BCC AQPSP, the 70th percentile concentration has been used as the adopted background concentration for assessment of the 24 hour average goals for PM10, PM2.5, toluene and xylene, and for the assessment of the 1 hour average goal for toluene.</p> <p>Using 90th percentile measured concentrations as background concentrations is not recommended by recognised air quality assessment technical guidance, and therefore this approach has not been adopted for the assessment.</p> <p>The Inland Rail air quality monitoring station (AQMS) is located approximately 200 metres to the south of the existing QR Western Line, and measured concentrations at the station are influenced by emissions from existing freight rail traffic operating on the Queensland Rail network. Due to the influence of freight rail emissions on measured concentrations, the Inland Rail AQMS represents a conservative estimate of background air quality (Appendix R: Air Quality Technical Report, Section 4.2).</p> <p>Particulate matter less than 10 micrometres (PM10) and particulate matter less than 2.5 micrometres (PM2.5) monitoring data from the Inland Rail AQMS has been used to define existing background concentrations for these pollutants for use in the assessment. As noted in Section 4.2 of Appendix R: Air Quality Technical Report, the 70th percentile concentrations for PM10 and PM2.5 over the monitoring dataset for the Inland Rail AQMS are higher than the 70th percentile concentrations measured at the Millmerran AQMS, which is also located within the study area near Commodore Mine. On this basis, and due to the presence of the Queensland Rail Western Line near the Inland Rail AQMS, the adopted 70th percentile 24 hour concentrations for PM10 and PM2.5 from the Inland Rail AQMS could be considered a conservative estimate of background air quality.</p> <p>The purpose of the assessment is to investigate the potential air quality impact under typical conditions. Using 90th percentile measured concentrations as background concentrations is not recommended by recognised air quality assessment technical guidance, and therefore this approach has not been adopted for the assessment. Measured 70th percentile concentrations from monitoring locations representative of the study area have been used as recommended by the Brisbane City Council Air Quality Planning Scheme Policy. The use of the 70th percentile is considered appropriate.</p>	Appendix R: Air Quality Technical Report Section 4.2
218	218.0127	Local Government	Air Quality	Cumulative impacts	<p>Air quality cumulative impact: Cumulative impact assessment requires assessment of all sources of emissions in the study area including emissions from the proposed project and emissions from existing and proposed sources. The existing background air quality levels (quantified from the Inland Rail AQMS) are then added to the predicted impacts from these sources to estimate the cumulative impacts.</p> <p>For this Air Quality Technical Report, the other sources of emissions included in the model comprises of contributions from the Commodore Mine, Millmerran Power Station and other sections of the Inland Rail Project and the existing West Moreton system.</p> <p>Review of Appendix R identified some concerns with the methodology adopted for estimating contributions from the Commodore Mine to determine cumulative concentrations.</p> <p>Table 5.9 of the Air Quality Technical Report presents the NPI emissions estimated from the Commodore Mine from 2012-13 to 2018-19. Based on reviewing the information presented in Table 5.9, it is observed that particulate and NOx emissions from the Commodore Mine have steadily increased from 2012-13 to the most recent reporting period i.e.2018-19. As-such, usage of the 2018-19 reporting year would be more appropriate and representative as opposed to the 2016-17 year that was used in to inform Appendix R. Moreover, there is no valid information justifying the use of the 2016-17 reporting year.</p> <p>Furthermore, Appendix R states that preliminary modelling with emissions from the 2016-17 reporting year predict exceedances of the 24-hour average PM10 assessment criteria (50 g/m3) at receptor no.186, which is approximately 1.1 km north of the mine site.</p> <p>Rather than using the emissions from the 2016-17 reporting year, which predict an exceedance at receptor no.186, Appendix R further scales down the PM10 and PM2.5 emissions from the mine such that the 24-hour average PM10 concentration at receptor no.186 does not exceed the 50 egg/m3 assessment criteria. The justification provided for scaling down of the PM10 and PM2.5 emissions from the Commodore Mine is that the Environmental Authority (EA) permit issued for the mine states that all reasonable and feasible measures are to be undertaken so that the PM10 concentrations do not exceed the 50 g/m3 assessment criteria. This assumption would be considered appropriate if backed up with ambient monitoring data at receptor 186, where 24-hour average ambient PM10 concentrations are in compliance with the assessment criteria.</p> <p>The methodology proposed in Appendix R underestimates the particulate emissions from the Commodore Mine by using emissions from the 2016-17 NPI reporting year and further reduces the contribution from the mine by scaling down the 2016-17 NPI emissions such that compliance may be seen to be achieved at the worst impacted receptor for the mine (i.e. no.186).</p> <p>This approach could potentially underestimate the emission contribution from the Commodore Mine. Also, it is worth noting that particulate emissions from both the Commodore Mine and the Millmerran Power Station are unlikely to be captured by the Inland Rail Air Quality Monitoring Station due to a considerable separation distance between these sources and the monitoring station. If there is a possibility that the emissions from the mine and the power station are indeed captured by the monitoring station, there exists a plausible explanation for using slightly lower emissions from the mine and the power station due to the possibility of double counting.</p> <p>Based on the above observations, it is quite likely that the contribution from the Commodore Mine has been underpredicted for determining cumulative particulate concentrations.</p>	<p>Chapter 12 and Appendix R should be revised to incorporate the following recommendations:</p> <ul style="list-style-type: none"> Usage of the most recent NPI reporting year to estimate emissions from the Commodore Mine. Scaling down of the emissions to achieve compliance at the most impacted receptor should be avoided. Appendix R should demonstrate that if elevated background concentrations prevail, there are no additional exceedances of the 24-hour average PM10 and PM2.5 ground level concentrations occurring as a result of the proposed project. 	<p>Following the completion of the previous air quality assessment for the Project, an air quality monitoring station (AQMS) was established at 524 Millmerran Inglewood Road, Millmerran, near the Commodore Mine and Millmerran Power Station. This monitoring station is referred to as the Millmerran AQMS. Particulate matter less than 10 micrometres (PM10) and particulate matter less than 2.5 micrometres (PM2.5) air quality monitoring data from this station has been considered in the revised assessment (Chapter 12: Air Quality, Section 12.4.2).</p> <p>Monitoring data from the Millmerran AQMS indicates that PM10 and PM2.5 concentrations at the monitoring location are typically well below the air quality goals for these pollutants, the only exception being during exceptional regional air quality events (e.g. dust storms). Detailed discussion of the Millmerran AQMS monitoring data is presented in Section 4.2 in Appendix R: Air Quality Technical Report.</p> <p>The method adopted for the inclusion of emissions from the Commodore Mine and Millmerran Power Station in the assessment is presented in Section 12.33 of Chapter 12: Air Quality, and Section 5.3 of Appendix R: Air Quality Technical Report. As discussed, the revised assessment has used National Pollution Inventory (NPI) reported 2019/2020 emissions data for Commodore Mine and Millmerran Power Station. However, due to the monitoring data from the Millmerran AQMS which shows generally low level concentrations, particulate emissions from the mine have been scaled down to match measured concentrations.</p> <p>From the initial modelling (using unscaled emissions), the predicted maximum 24 hour PM10 concentration at the worst affected receptor (receptor R435, previously named R186) was in excess of 250 microgram per cubic metre (µg/m3), with over 50 exceedances of the PM10 24 hour goal of 50 µg/m3 predicted for the modelled year. Conversely, the Millmerran AQMS monitoring results showed a maximum 24 hour PM10 concentration of 49 µg/m3 from a dust storm, with concentrations mostly between 10 and 20 µg/m3. After scaling down the Commodore Mine emissions, the cumulative predicted maximum 24 hour PM10 concentration at the worst affected receptor (R435) was 42.5 µg/m3.</p> <p>Based on the monitoring data from the Millmerran AQMS, and the accepted uncertainty in the accuracy of the emissions estimation techniques for mining activities as presented in the NPI guidance documents (Section 5.3 in Appendix R: Air Quality Technical Report), scaling down 2019/2020 emissions from the mine is considered to be the most appropriate method for the assessment.</p> <p>Chapter 12: Air Quality and Appendix R: Air Quality Technical Report have been updated to reflect the updates to the assessment and to present the monitoring data from the Millmerran AQMS.</p> <p>The air quality assessment, Chapter 12: Air Quality and Appendix R: Air Quality Technical Report, have been revised to include consideration of the most recent NPI emissions data for 2019/2020 and air quality monitoring data available from the Millmerran AQMS established near the Commodore Mine and Millmerran Power Station.</p>	Chapter 12: Air Quality Section 12.33 Section 12.4.2 Appendix R: Air Quality Technical Report Section 4.2 Section 5.3

218	218.0128	Local Government	Air Quality	Modelling	<p>Air quality: Meteorological modelling for the proposed project was undertaken using the TAPM/CALMET models and was largely conducted in accordance with the regulatory guidelines. Three (3) CALMET domains each encompassing 87.5 km x 87.5 km with a grid resolution of 500 m were developed to simulate the meteorological conditions across the extent of the study area. CALMET modelling was conducted for the 2013 calendar year. The justification provided for selecting the 2013 calendar year was that neutral conditions were observed for this year and the remaining years between 2008-2017, were either characterised by El Nino (2015-2016 and 2009-2010) and La Nina periods (2010-2012 and 2008-2009). Using the Southern Oscillation Index (SOI), Oceanic Nino Index (NOI) and Multivariate ENSO Index for the El Nino-Southern Oscillation (ENSO), it was observed that 2013 was relatively neutral for ENSO and therefore was considered appropriate for the meteorological modelling.</p> <p>This approach is justified and the reasons for selecting the 2013 calendar year are comprehensive, however, it would be beneficial if there was additional information presented mainly from a comparative perspective, as to how the stability/mixing height parameters vary due to the prevalence of the El-Nino and La-Nina effects.</p> <p>Figure 4-3 through to Figure 4-11 presents the CALMET derived stability and mixing heights for each of the modelled CALMET domains. It would be beneficial if these parameters were simulated for a El-Nino/La-Nina year for at least one (1) modelling domain.</p>	It is recommended that the Air Quality Technical Report be revised to present CALMET mixing height and stability parameters for a typical El-Nino/LA-Nina year for at least one (1) CALMET modelling domain.	Section 5.3 in Appendix A of Appendix R: Air Quality Technical Report has been updated to present atmospheric stability and mixing height from the CALMET model for El-Nino dominant, La-Nina dominant, and neutral years. A Review of El Nino/La Nino selection year criteria showed no significant difference in mixing height or atmospheric stability between La Nina, El Nino, or neutral years. On this basis, the use of a neutral year (2013) is considered to provide a representative year for the assessment with respect to these meteorological conditions.	Appendix R: Air Quality Technical Report Section 5.3 of Appendix A
218	218.0129	Local Government	Air Quality		<p>Livestock Odour: Chapter 12 identifies livestock trains as presenting the greatest risk of nuisance related to odour emissions. The draft EIS described associated odours as strong to very strong and the offensiveness of the odour would be unpleasant. The Draft EIS identified no significant impacts to amenity due to odour from livestock trains because:</p> <ul style="list-style-type: none"> the livestock train pass by events would only be 6 per week. no more than 1 hour duration. and residents and visitors would have a higher tolerance to intermittent odour from agricultural sources. <p>The assessment of odour impacts does not meet TOR 11.134 as the assessment of amenity impacts does not:</p> <ul style="list-style-type: none"> Adequately consider cumulative impacts of odour at receptors. If the population is already exposed to odour from local agricultural activities, what impacts may occur to amenity from adding an additional odour source? Clearly explain the frequency of source of the odour. Will the 6 livestock trains arrive over the course of 1 week or could they arrive in one day? <p>Explain the estimated duration of a livestock train pass by which may be up to 1 hour and intensity of impact compared to more common livestock transport methods such as a livestock truck. This would seem like a considerably longer duration than say a livestock truck (which is understood given the length of the train). How does the scale of livestock numbers on a livestock train compare to livestock numbers on a cattle truck?</p>	<p>The air quality assessment should be revised to meet TOR 11.134 to more accurately assess the air quality amenity impacts and cumulative impacts of the project. At present, the draft EIS doesn't give due consideration of the odour source compared to more common sources such as livestock trucks. It also assumes that residents and visitors will be able to tolerate the additional and presumably more significant odour source.</p>	<p>Livestock transport is not expected along the entire Project alignment, with the transportation of livestock only expected to occur between Oakey to Gowrie, with trains only travelling loaded in one direction (northbound). A qualitative assessment of odour from livestock trains is presented in Chapter 12: Air Quality, Section 12.52.5 using FIDOL (Frequency, Intensity, Duration, Offensiveness, Location) factors.</p> <p>Based on the assessment using the FIDOL factors, it is not expected that odour impacts from livestock transport will be significant.</p> <p>The duration of odour at a sensitive location is expected to be short, with a single train representing approximately 1 minute of potential odour exposure time, for a 900 metre train travelling at an average speed of 60 kilometres per hour. Livestock trains are assumed to pass by at a maximum of once per week, which represents an exposure duration of approximately 60 seconds per week, meaning the frequency of this event is low.</p> <p>Odour impacts can be cumulative if odour emitted by multiple sources is of the same character (the same type of odour). Although intermittent agricultural odour is expected to be common to the existing ambient air environment, the potential for significant cumulative odour impacts is considered to be low due to the short duration of a train pass-by event (Chapter 12: Air Quality, Section 12.52.5).</p> <p>Odour emissions, like all pollutant emissions to air, will be dispersed subject to wind conditions occurring during their emission. Wind speed and direction have direct influence on the dispersion of emissions and the impact of odour on sensitive receptors. High wind speeds are likely to disperse emissions faster, whereas days with low windspeeds have potential for odour emissions to linger. However, the train travel will generate turbulence which will aid the dispersion of emissions, in addition to increasing the volume of air and decreasing odour concentration.</p> <p>Comparison against other existing odour sources is not required for the purpose of an odour impact assessment. It is considered that ToR 11.134 has been satisfied.</p>	Chapter 12: Air Quality Section 12.52.5
218	218.0130	Local Government	Air Quality		<p>Microbiological emissions to air: The Draft EIS does not meet TOR 11.131 or 11.142. This is because the air quality assessment does not give any consideration to microbiological contaminants in air emissions during operations, namely Q-fever (<i>Coxiella burnetii</i>) in dust from livestock trains. TOR 11.131 requires assessment of all contaminants and materials that may be released from the project. TOR 11.142 requires the Draft EIS to describe potential risks to people, with specific consideration to be given to airborne contaminants. The Draft EIS does not meet either of these requirements of the TOR.</p> <p>QLD Health provide extensive information about Q-fever which is summarised here (refer to worksafe.qld.gov.au/safety-and-prevention/hazards/hazardous-exposures/biological-hazards/diseases-from-animals/q-fever). Q-fever is an infectious disease spread from animals (mainly cattle, sheep and goats) to humans by a bacterial called (<i>Coxiella burnetii</i>). People become infected with Q-fever by inhaling contaminated aerosols and dusts. Sources of relevance to the project can include animal wastes (urine, faeces etc) and contaminated machinery/equipment/vehicles. The risk of infection is significant as:</p> <ul style="list-style-type: none"> Q fever is very infectious, and people can become infected from inhaling just a few bacteria. Large numbers of bacteria are shed by infected animals. The bacteria can survive in the environment for long periods, tolerate harsh conditions and spread in the air. <p>Information from the Australian Q-fever Register website (qfever.org/aboutqfever/indirectExposure) states that people may be exposed to infected dusts even if located a kilometre or more from the source. Much larger potential zones of infection are reported by various studies, ranging from 5 km to more than 10 km. Stock transport trucks are identified a source of infective dusts. Research by University of Queensland published in the BMC Infectious Diseases Journal in 2018 noted that outbreaks of Q-fever had been reported previously in Europe for residents living along roads where livestock were transported. Based on this information, the livestock trains present a health risk to receptors with regards to Q-fever and this needs to be assessed by the draft EIS.</p>	<p>The Draft EIS needs to be reviewed to meet TOR 11.131 or 11.142. More, specifically, the air quality assessment (Chapter 12) and hazard and risk assessment (Chapter 19) need to be revised and updated to include an assessment of the potential risks of Q-fever from livestock trains to human health.</p> <p>It is recommended that the proponent consult with Queensland Health in relation to the further assessment of this matter. This is to ensure that an appropriate method of assessment is used that an acceptable zone of infection (i.e., study area) is applied to adequately assess the hazards and risks to public health from the project with respect to Q-fever.</p>	<p>It is expected that risk of Q-fever infection would be lower in Australia than what is experienced in Europe as described by the referenced Qld health article. The cited article notes that infection zones from livestock transport routes can range up to over 10 kilometres. However, the paper also cites that Q-fever infection risk are due mainly from the transport of goats and sheep in Europe and that all documented outbreaks were a result of infected sheep or goats and not cattle. As cattle are the livestock that would most commonly be transported (based on Queensland total cattle and sheep numbers, 25 million and 2.1 million, respectively) it is expected that the Q-fever risk would be less than what the article references occur in Europe (Chapter 12: Air Quality, Section 12.52.6).</p> <p>Environment Protection Agency (EPA) Victoria provides guidance on planning approvals and public health risks from Q-fever (Q-Fever: Guidance for Preparing Planning Approvals, 2020). The guideline considers activities such as intensive animal production (>5,000 animals), livestock saleyards/holding pens, and abattoirs as presenting a high risk of Q-fever infection. The transport of livestock along the Border to Gowrie corridor is expected to be significantly less intensive than any of the high-risk activities, which are permanent and stationary land uses (Chapter 12: Air Quality, Section 12.52.6). It is noted that as part of the assessment of Q-fever risk, Queensland Health was consulted in 2021. Queensland Health advised that the risk of Q-fever infection from livestock trains would be "broadly similar to a road train transporting cattle" (Dr Liam Flynn, 2021). Overall, based on the guidance provided in the EPA Victoria guideline, the Project and the transport of livestock along the Inland Rail Project alignment is considered to present a low level risk of Q-fever.</p> <p>It is highlighted that livestock trains are not proposed to use the majority of the Project alignment, and will only join the Inland Rail Project alignment at Gowrie via the West Moreton System.</p> <p>Further information on the risk of Q-fever has been included within the air quality assessment (Chapter 12: Air Quality, Section 12.52.6) in the form of a qualitative risk assessment. Chapter 12: Air Quality, Section 12.52.6 provides a description of <i>Coxiella Burnetii</i> (<i>C. burnetii</i>) bacteria, which can cause Q-Fever in humans, and provides an assessment of risk as a result of the Project.</p>	Chapter 12 Air Quality Section 12.52.6
218	218.0131	Local Government	Air Quality		Australian drinking water guidelines: Chapter 12 refers to the Australian Drinking Water Guidelines cites the date of publication as 2011 and 2018. The guidelines were updated in May 2019.	Revise the air quality assessment and the consideration of tank water quality impacts to refer to the most recent update of the Australian Drinking Water Guidelines (May 2019). Ensure criteria used in the assessment are updated accordingly to reflect the most current guidance on drinking water quality.	<p>The air quality impact assessment correctly uses the 2019 Australian Drinking Water Guidelines. However, the guidelines are named "Australian Drinking Water Guidelines 2011" (version 3.5), which were updated in 2018.</p> <p>Since the previous assessment, an updated version of the drinking water guidelines was released in January 2022 (version 3.7). The revised air quality assessment for the Project and described in the revised draft EIS has considered this criteria presented in the 2022 version. However, it is noted that the drinking water criteria in the 2022 version are consistent with previous versions and the criteria which was previously adopted in the assessment. Reference to the 2022 version has been included in Chapter 12: Air Quality and Appendix R: Air Quality Technical Report.</p>	Chapter 12: Air Quality Appendix R: Air Quality Report
218	218.0132	Local Government	Surface Water		Weather stations: Figure 12.2 does not include all local weather stations, including BOM weather stations at Toowoomba Airport, Yelarbon and Goondiwindi. Toowoomba Airport is included in Table 12.10, so it is unclear why it hasn't also been included in Figure 12.2.	<p>The Draft EIS requires updating to include all weather stations relevant to the proposed project in order to provide relevant and accurate data.</p>	<p>The revised draft EIS Appendix S: Surface Water Quality Technical Report has been updated to include weather station data sourced from the BOM weather stations at Toowoomba Airport and Goondiwindi in Section 4.4.1 of Appendix S: Surface Water Quality Technical Report and Section 13.24.1 of Chapter 13: Surface Water. Section 13.2 of Chapter 13: Surface Water and Figure 4.1 of Appendix S: Surface Water Quality Technical Report have been amended.</p> <p>The revised draft EIS Chapter 13: Surface Water and Appendix S: Surface Water Quality Technical Report have been amended to outline updated relevant BoM weather station data.</p>	Chapter 13: Surface Water Section 13.24.1 Section 13.2 Appendix S: Surface Water Quality Technical Report Section 4.4.1 Figure 4.1
218	218.0133	Local Government	Surface Water	Survey effort/field investigation data	Missing assessment sites: Table 12.6 and Figure 1.2 require additional assessment sites (including all mapping).	<p>The Draft EIS should be updated to include all assessment sites in Figures 12.1a and 12.1b. Further, it is recommended that two more sampling sites be established:</p> <ul style="list-style-type: none"> On Oakey Creek near Kingsthorpe (as this area is at major risk of impact from proposed project activities, even though it is outside of alignment). At Yelarbon (high risk of impact creek) as there is currently a significant distance between sampling locations. 	<p>The selection of appropriate water quality assessment sites is presented in Appendix S: Surface Water Quality Technical Report, Section 3.1.2. Sites were chosen to be representative of the variety of aquatic habitats along the Project alignment, practicality of access, inclusion of waterways of a variety of stream orders and locations upstream and downstream of the Project. It was not desired or feasible to sample every waterway potentially impacted by the alignment and the sample sites chosen were considered sufficiently representative such that the existing conditions would be adequately represented, and impacts resulting from the Project, should they occur, would be detected.</p> <p>ARTC has commenced a surface water monitoring program for the Project (Section 13.6.3 of Chapter 13: Surface water). This Program consists of baseline surface water monitoring (commenced to inform the EIS) and construction surface water monitoring. The locations, frequency and parameters of interest for water quality sampling during construction will be subject to confirmation as part of the CEMP, to be reviewed and accepted by the Environmental Monitor. Surface water monitoring locations will be reviewed prior to commencement of construction to ensure that locations of potential impact, such as those recommended in the submission, are appropriately represented in the Construction Works stage of the surface water monitoring program.</p>	Chapter 13: Surface Water Section 13.6.3 Appendix S: Surface Water Quality Technical Report Section 3.1.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0134	Local Government	Flora and Fauna		The Draft EIS requires amendment to provide a description of what an aqua score is, what it means when there is no aqua score, and correct the wording around GDE mapping, including correcting Appendix R to include appropriate GDE ratings and to include figures showing the locations of these springs.	Project mapping and footprint: The Draft EIS states that 'both aquatic and terrestrial groundwater-dependant ecosystems (GDEs) have been mapped by DES along the project footprint, between NSW/QLD border and Millmerran'. This gives the reader the impression that GDE mapping covers that Section only, whereas other information indicates that this is not entirely correct. Further, the document states that the site does not have an 'aqua score' but fails to discuss how this is relevant to the proposed project. TRC consider that some of the springs in Table 4.13 of Appendix R would rate higher than 'low' potential GDE. Further, GDE's are not clearly indicated on the maps following.	Chapter 11: Flora and Fauna outlines that GDEs were identified along the alignment from the NSW/QLD border to Millmerran. Appendix L: Terrestrial and Aquatic Ecology Technical Report provides further details that ratings of the GDEs were derived by assessment of the DES GDE modelling. GDE mapping considered the impact assessment area and the Project alignment. The mapping is suitable for use at a regional scale, and is produced from an assessment of vegetation mapping, wetland mapping, expert knowledge and the results of existing research.	Chapter 11: Flora and Fauna Sections 11.5 and 11.7 Appendix L: Terrestrial and Aquatic Ecology Technical Report
218	218.0135	Local Government	Project scope		Key infrastructure: Section 12.7.5 is focused primarily on transport infrastructure and does not list all existing key infrastructure.	The Draft EIS requires correction to include all key utilities (including, but not limited to, electricity utilities).	Utility impacts have been described in Chapter 5: Project Description, Section 5.4.11. Appendix B4: Utilities contains the design drawings and details of the proposed utilities interactions. ARTC have documented all utility impacts including their associated risk ratings in the Utility Impact Register (UIR), which can be provided as required.	Chapter 5: Project Description Section 5.4.11 Appendix B4: Utilities Sheets 1 - 73
218	218.0136	Local Government	Surface Water		Residential water supply: Section 12.8.1 of the Draft EIS discusses the various impacts the proposed project will have on a number of receptors (provided in Table 12.51). However, there is no mention of impacts on surface storages used for raw water supply for residential/human consumption (e.g., Cecil Plains Weir).	The Draft EIS requires update to include a discussion relating directly to the source of residential/human consumption supply as an impact.	The flooding and hydrology study presented in Appendix T1 and T2: Hydrology and Flooding Technical Report - Volume 1 and 2 of the revised draft EIS has assessed impacts to existing overland flow as a consequence of the Project. Whilst change to hydraulic regimes may occur (due to new infrastructure) at 1% AEP conditions, hydrological modelling indicates that no significant changes are expected to base-flow and low-flow conditions and that access to surface water resources will not be affected. As stated in Table 13-16 of Chapter 13: Surface Water, the detailed design will be developed to ensure that, where possible, private water storages are avoided and that affected landowners retain access to existing natural resources. If impacts to access to existing natural resources cannot be avoided through design, appropriate compensation arrangements will be discussed and agreed with the relevant impacted landowner. Where the Project will result in disturbance to private surface water storages (e.g. dams), ARTC will consult with the owners of relevant, legal storage structures prior to works commencing to agree an approach to avoidance, mitigation, rectification or compensation (if applicable). It is noted that the Cecil Plains Weir, referenced by the submission, is located 40 km from the Project alignment. The flooding, hydrology and surface water quality assessments conducted for the revised draft EIS indicate that the Project will not impact on the volume or quality of water available in any surface water storage used for municipal raw water supply.	Chapter 13: Surface Water Table 13-16 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Appendix T2: Hydrology and Flooding Technical Report - Volume 2
218	218.0137	Local Government	Waste and Resource Management		Domestic Wastewater: Section 12.8 mentions the on-site storage and containment of wastewater for camps etc yet fails to provide detailed information in relation to the management of such wastewater.	The Draft EIS requires updating to include committing to the appropriate management of wastewater including, but not limited to, describing: <ul style="list-style-type: none">How and where wastewater will be disposed of given zero discharge requirements;Irrigations agreement with landowners; andTransport to appropriate facilities.	Project wastewater is discussed in Chapter 13: Surface Water, Section 13.25.1 Potential Impacts. Proposed mitigation measures to manage workforce accommodation wastewater has been outlined in Chapter 24: Draft Outline Environmental Management Plan. As outlined in Chapter 24: Draft Outline Environmental Management Plan, further engagement is to be undertaken by the contractor with owners and operators of licenced waste disposal facilities and licenced waste carriers. ARTC have documented all utility impacts including their associated risk ratings in the Utility Impact Register (UIR), which can be provided as required.	Chapter 13: Surface Water Section 13.25.1 Chapter 24: Draft Outline Environmental Management Plan
218	218.0138	Local Government	Waste and Resource Management		Flood impact on existing Sewage Pumping Station and associated switchboard: The Draft EIS provides no information regarding what the expected increase in water level is or consider different velocities under the various scenarios.	The Draft EIS requires update to identify how existing TRC infrastructure will be modified to cater for the increase in peak levels of water resulting from changed surface water hydrology as a result of the presence of the proposed project.	The Flood Sensitive Receptor database has been updated to include additional public utility assets such as sewage treatment plants and electricity substations. Changes in flood levels, velocities and time of inundation have been assessed and are reported (and mapped) in the Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and Section 14.8 of the revised draft EIS Chapter 14: Flooding and Geomorphology. The impact assessment include impacts to Toowoomba Regional Council assets.	Chapter 14: Flooding and Geomorphology Section 14.8 Appendix T1: Hydrology and Flooding Technical Report - Volume 1
218	218.0139	Local Government	Flooding		Condamine River and Floodplain: The Draft EIS provides no information regarding the expected increase in water level as a result of constructing the proposed project across a significant and intense floodplain area, the document also fails to consider different velocities under the various scenarios.	The Draft EIS requires update to identify how existing TRC infrastructure will be modified to cater for the increase in peak levels as a result of the current proposed alignment which effectively cuts the Condamine River Floodplain in two. The proponent should consider alternate and appropriate flood mitigation measures for the Floodplain, including, but not limited to, constructing a viaduct to cross this significant and intense floodplain.	Operational flood impacts in the Condamine River floodplain have been described in Section 14.8.1 of the revised draft EIS Chapter 14: Flooding and Geomorphology and Section 7.5.3 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 and have considered various AEP events. Justification and mitigation measures have been provided against each Flood Impact Objective exceedance within the summary tables provided. The Flood Sensitive Receptor database has been reviewed to include additional public utility assets such as STPs, Electric Substations etc. as part of the revised draft EIS. If TRC are concerned about any other specific TRC assets not reported on please let us know so we can include those assets.	Chapter 14: Flooding and Geomorphology Section 14.8.1 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 7.5.3
218	218.0140	Local Government	Editorial		Inconsistent data: Considering that an objective of Table 12.131 is to have the peak impact of equal to or less than 10 mm and Table 12.75 shows that there is the potential for greater than this, the conclusion that the hydrologic and flooding assessment undertaken has demonstrated that the Project is predicted to result in impacts on the existing flooding regime that generally comply with the flood-impact objectives that have been adopted for the project does not appear to be correct.	The Draft EIS should be amended to increase the number and size of culverts etc in order to reduce impact on sensitive receptors. Further, the proposed size of culverts requires serious reconsideration.	The nominated Flood Impact Objectives, as detailed in Chapter 14: Flooding and Geomorphology Section 14.6.3, Table 14-4 were developed in consultation with the Expert Flood Panel to provide guidance as to the point at which a more detailed consideration of impacts is required when they are exceeded. The Project will target achieving the Flood Impact Objectives for events up to and including the 1% AEP (without climate change) for land, receptors, and/or infrastructure that is potentially impacted by the Project. Where it is not practicable or feasible to achieve the Flood impact Objectives at Flood Sensitive Receptors and/or the nominated land uses, acceptable impacts and/or appropriate mitigation measures will be determined on a case-by-case basis, including through consultation with stakeholders and landowners (refer to Appendix T1: Hydrology and Flooding Technical Report - Volume 1, Section 22.4). Ongoing design of the Project including culvert composition and sizing will continue in the Detailed Design stage of the Project and in accordance with the Flood Impact Objectives and modelling outcomes.	Chapter 14: Flooding and Geomorphology Section 14.6.3 Table 14-4 Appendix T1: Hydrology and Flooding Technical Report - Volume 1 Section 22.4
218	218.0141	Local Government	Project scope		Project footprint: Section 13.24.1 of the Draft EIS does not make clear whether the proposed project footprint includes the land temporarily required for accommodation camps and work depots.	The Draft EIS requires update to either make clear to the reader what the proposed project footprint size is and confirm that it includes all infrastructure requirements including, but not limited to, accommodation camps, laydown areas and work depots.	Chapter 15: Groundwater, Section 15.3.1 states that the Project footprint consists of the permanent footprint, which encompasses all permanent infrastructure required for the Project, and the temporary footprint, which encompasses all land that is temporarily required to enable construction of the Project.	Chapter 15: Groundwater Section 15.3.1
218	218.0142	Local Government	Groundwater		Use of bores: Table 13.4 identifies 30 additional bores proposed for monitoring activities, however there is no detail regarding why these locations were chosen or the potential for using existing bores. Further, many of these bores are located in close vicinity of each other (e.g., BH2203-2205, which does not make practical sense).	Table 13.4 requires amendment to include proposed bore usage (whether the bore is for monitoring of impacts by bridge piers, cutting, or if it is for general monitoring purposes). This detail is unable to be inferred from figures and should be discussed in detail in the body of the report (as appropriate).	Information regarding the rationale for installation and monitoring of each Project monitoring bore is provided in the GMMP and detailed in revised draft EIS Chapter 15: Groundwater, Section 15.7.3 and Table 15.20.	Chapter 15: Groundwater Section 15.7.3 Table 15.20
218	218.0143	Local Government	Groundwater	Water quality	Groundwater and soil salinity: The Draft EIS highlights an area of high salinity risk near Southbrook. This is also an area where the proposed alignment has its deepest cut and also a substantial impact to groundwater (the levels of which directly contribute to increased salinity risk). The Draft EIS fails to discuss how salinity is potentially transported in this area or how the proposed project intends to have the impact mitigated to ensure that there is no significant residual impact as a result of the proposed project. Concentrating and distributing salinity, whatever the source, is of concern to TRC given the high risk of spread resulting in pockets of high salinity. Section 4.7.3.2 of Appendix R identifies areas of high and moderate salinity risk however this high-concern issue is not addressed further in the Appendix.	The Draft EIS requires amendment to adequately address the high salinity risk near Southbrook and what mitigation measures are in place to manage spread to ensure that there is no significant residual impact as a result of the proposed project. The assessment in Chapter 8 requires review and update in order to be appropriately addressed.	The salinity risk near Southbrook refers to salinity within soil. Potential for transport of salinity is highest for surface water flows within the construction footprint. Installation of erosion and sediment control measures will minimise risk of saline run-off from exposed soils. Further, regional salinity discussed within Section 4.7.3 of Appendix U: Groundwater Technical Report generally refers to secondary soil salinity as a result of upwelling or irrigation of saline groundwater and the resulting dissolution of salts in the soil profile. This is discussed in the context of risk to infrastructure, not risk to groundwater. The depth to groundwater in the area of Southbrook is > 50 m (Main Range Volcanics). A detailed soil investigation (Appendix J: Soil Assessment Report, Section 3.2) has been undertaken in 2021 along the Border to Gowrie disturbance footprint to further understand the soil properties and refine existing soil mapping. Findings from the detailed soil investigation have informed soil-specific management measures (including for saline and sodic soils, refer to Section 4.8 of Appendix J: Soil Assessment Report) and assist in planning, detailed design of structures, embankments, erosion control measures (temporary and permanent), soil treatment and management, and site rehabilitation planning. No changes are proposed to Chapter 15: Groundwater as the salinity risk near Southbrook refers to salinity within soil, not groundwater.	Chapter 15: Groundwater Appendix U: Groundwater Technical Report Section 4.7.3 Appendix J: Soil Assessment Report Section 3.2 Section 4.8
218	218.0144	Local Government	Groundwater		Seepage: Considering the location of the proposed cuts, 310-C44, for its length and location, appears as if it is on the low side for seepage.	The Draft EIS should be amended to include further investigation and remediation as required.	The inputs and results of the predicative groundwater modelling have been reviewed and revised as part of the revised draft EIS. The model has been revised to reflect the design changes and to include additional data collected. The details of the revised predictive modelling are included in Appendix U: Groundwater Technical Report, Section 6.3. Noting that the design and location of all cuts along the alignment have changed with revised reference design, since the draft EIS and C44 is now redundant.	Appendix U: Groundwater Technical Report Section 6.3
218	218.0145	Local Government	Groundwater		Community water supply: The drawdown and seepage estimates provided for Ch 174.52 are concerning for TRC as the groundwater in this area is of high importance to the TRC area. TRC are currently investigating the potential to use this aquifer to make a much-needed contribution to the communities drinking water supply, with findings indicating that the option is a positive one. There is also a GDE attached to this aquifer.	The Draft EIS should be amended to show how the proposed impact on this aquifer will be appropriately managed. This discussion should not only include localised drawdown, but also the overall impact on the aquifer. Discussing drainage only is not considered sufficient as this does not prevent or reduce impacts on the aquifer. If left, this would create an unnecessary draw on the aquifer. TRC are open to this water being used during construction however any access for construction purposes will require sealing off before construction is finalised. It should be noted that even the granting of a temporary permit to access this aquifer may be difficult. TRC requests that the OCG impose the following condition: <ul style="list-style-type: none">The proponent is required to consult with TRC regarding groundwater, drawdown and the use of groundwater for construction purposes and to make written agreement with Council regarding this issue at least six months prior to commencing any construction activities. This includes committing to sealing off any required access post-construction.	The predicative groundwater modelling results indicated that the horizontal extent of drawdown is predicted to extend a maximum of 10 m to 43 m horizontally from the rail centreline (from the deepest cuts). This drawdown will be localised around the vicinity of the deep cuts that intersect groundwater only. No regional groundwater drawdown/wider impact on the aquifer is anticipated. The modelling was updated and further refined as part of the revised draft EIS, see Chapter 15: Groundwater, Section 15.6.2 and Appendix U: Groundwater Technical Report, Section 6.3. Noting that the design and location of all cuts along the alignment have changed since the draft EIS. Drawdown is no longer predicted in this area. Baseline groundwater monitoring has been undertaken to develop a representative baseline dataset for comparative purposes to assess any potential deterioration of water quality and level change resulting from the Project (Chapter 15: Groundwater, Section 15.4.2 and 15.4.4). Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset. The baseline groundwater dataset, in addition to regular groundwater monitoring during the Construction Works and Operations stages of the Project (quality and levels), will allow for trend analysis and the early detection of possible water quality and level changes resulting aspects of the Project (see the groundwater management and monitoring program (GMMP) in Chapter 15: Groundwater, Section 15.7.3 for a detailed approach to monitoring for impacts during construction).	Chapter 15: Groundwater Section 15.4.2 Section 15.4.4 Section 15.6.2 Section 15.7.3 Appendix U: Groundwater Technical Report Section 6.3

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0146	Local Government	Groundwater		Flow pathways: Alterations of existing groundwater flow pathways: The Draft EIS discusses deep cuts in the Main Range Volcanics but should also consider the possibility that there are localised fractures that have their only pathway out via what is now a cutting. If the cutting is sealed, this pathway may be closed with pressure building up and the water finding an alternate path.	While it is noted that this is difficult to determine until the cutting is done, and even then, may still be unknown, the Draft EIS should be amended to appropriately commit to further investigation and remediation.	<p>Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (Chapter 15: Groundwater, Section 15.4.4). Mitigation measures to be implemented for potential impacts associated with the Project are presented in Table 15.20 of Chapter 15: Groundwater. Mitigation measures include visual inspection of deep cuts to help identify areas of seepage. Groundwater modelling and monitoring will be undertaken upgradient and downgradient of deep cuts anticipated to intercept groundwater.</p> <p>A Groundwater Management and Monitoring Plan (GMMP) has been developed for ongoing assessment of the potential impacts (see Section 8.3 of Appendix U: Groundwater Technical Report, Chapter 24: Draft Outline Environmental Management Plan). The GMMP will be assessed and updated before the commencement of each future Project stage (Pre-Construction Activities and Early Works, Detailed Design, Construction Works and Operations) such that the GMMP for subsequent stages is informed by the outcomes of the previous stage.</p> <p>Mitigation measures to be implemented for potential impacts associated with the Project are presented in Table 15.20 of Chapter 15: Groundwater. Mitigation measures include visual inspection of deep cuts to help identify areas of seepage. Groundwater monitoring will be conducted throughout the Construction Works and Operations stages of the Project to monitor for potential adverse impacts as a result of the Project.</p> <p>As outlined in Chapter 24: Draft Outline Environmental Management Plan, ARTC will undertake groundwater modelling and monitoring upgradient and downgradient of any deep cuts, as well as cuts which intercept groundwater. Modelling will be undertaken prior to construction, for a duration suitable to determine no impacts have occurred as a result of construction of the cutting.</p>	<p>Chapter 15: Groundwater Section 15.4.4 Table 15-20</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix U: Groundwater Technical Report Section 8.3</p>
218	218.0147	Local Government	Groundwater	Water quality	Groundwater contamination: The Draft EIS fails to discuss other sources of contamination over the long term. The possible contamination of groundwater due to heavy metals etc coming from the rail and seeping into the ground should be considered. This seepage will occur over the life of the rail and as such, should not be ignored.	The Draft EIS should be amended to include details of research findings from other locations where rail has been in existence for extended periods and propose appropriate mitigation measures based on these findings.	<p>Existing contamination along existing sections of rail corridor is confined to the surface and has not been transported deeper into the soil profile or into groundwaters; therefore, contamination of groundwater from operation of the rail corridor is also not expected to occur.</p> <p>Predictive modelling for has determined that groundwater seepage may occur from the face of deep cuts (>10 m) where groundwater is intersected; however, the assessment has concluded that seepage water, in general, will evaporate (Chapter 15: Groundwater, Section 15.6.2). Potential contamination from ongoing operation of the rail will be surficial in nature and not expected to interact with groundwater. Minimum groundwater depths for shallow aquifers along the Project alignment range from ~5 mBGL (Border Rivers Alluvium) to ~15 mBGL (Condamine Alluvium) (Chapter 15: Groundwater, Section 15.5.5). Seepage control measures will be adopted in accordance with QR Civil Engineering Standard QR-CTS-Part 35 – Stone and Concrete Slope Protection (Chapter 15: Groundwater Section 15.7.1 and Table 15-20)</p> <p>Chapter 9: Land Resources of the revised draft EIS includes the outcomes of investigations undertaken since the draft EIS was issued.</p>	<p>Chapter 9: Land Resources Chapter 15: Groundwater Section 15.5.5 Section 15.6.2 Section 15.7.1 Table 15-20</p>
218	218.0148	Local Government	Groundwater		Groundwater resources: The Draft EIS states that the reference design is for a 300 mm drainage blanket (to be applied to the face of all cuts). This may be considered adequate if the solution is to allow the aquifer to continue to flow. Allowing the aquifer to free flow at rates of up to 3.3 L/s, will in the long-term damage an already strained resource.	<p>The Draft EIS should be amended to consider alternate treatments. This water is unlikely to return to the aquifer and is therefore lost. Permanent allocations of this magnitude are not available, unless sufficient is able to be purchased via the open market.</p> <p>The Draft EIS should include an assessment of the impact the addition of this water to surface water flows will have on flood water, wildlife, weeds and pests.</p>	<p>The Detailed Design stage will allow for updates and changes to the design as required. The application of the drainage blanket is proposed for the Construction Works stage.</p> <p>Deep cuts will be drained in perpetuity, as required to prevent groundwater pressure build-up and maintain the structural integrity of the cutting faces. The seepage from deep cutting faces will be managed in accordance with QR Civil Engineering Standard QR-CTS-Part 35 – Stone and Concrete Slope Protection (QR, 2010). Groundwater seepage and rainfall infiltration will be channelled from the cut face via the drain and weepholes to the base of the cut, where it will dissipate via surface water drainage infrastructure and eventual transpiration or infiltration and recharge (Chapter 15: Groundwater, Section 15.6.2).</p> <p>The seepage analysis will be refined for deep cuts, from results of the ongoing investigations, during the detailed design (for example lining high permeable sections of the cuts, drainage blanket specifications, shotcrete and weep hole specifications) to avoid and/or minimise groundwater seepage.</p> <p>The predicative groundwater modelling has been revised as part of the revised draft EIS, to reflect the design changes and to include additional data collected (Chapter 15: Groundwater, Section 15.6 and Appendix U: Groundwater Technical Report, Section 6.3).</p>	<p>Chapter 15: Groundwater Section 15.6 Section 15.6.2</p> <p>Appendix U: Groundwater Technical Report Section 6.3</p>
218	218.0149	Local Government	Groundwater		Groundwater monitoring: The monitoring program proposed in the Draft EIS does not include the length of time the program will run. This should be longer than the construction phase, particularly in the areas where proposed cuttings impact on the groundwater.	<p>The Draft EIS should include a commitment from the proponent to undertake rectification works should issues with groundwater (as a result of the proposed project) be identified. This should include reporting to the appropriate regulatory and statutory bodies and making groundwater data publicly available on QLD Globe.</p> <p>TRC requests that the OCG impose the following condition:</p> <ul style="list-style-type: none"> ▶ The proponent is required to complete an analysis of monitoring data and provide the findings in report format to TRC and other regulatory bodies and/or interested parties at least six months prior to any construction activities. 	<p>Section 15.7.3 in Chapter 15: Groundwater and Appendix U: Groundwater Technical Report, Section 8.3, detail the proposed groundwater management and monitoring program (GMMP) for each Project stage. Site-based groundwater monitoring events are on hold until the Detailed Design stage of the Project. Site-based monitoring will resume, in accordance with the Monitoring and Sampling Manual 2009 (DES, 2009) over sufficient time to achieve a baseline dataset (Chapter 15: Groundwater, Section 15.4.4). Following the baseline assessment, a Construction GMMP, discussed in 15.7.3 in Chapter 15: Groundwater, will be undertaken for the length of the construction period, with frequency of sampling to be decided based on the baseline and construction requirements.</p> <p>During operation, there will also be an Operation GMMP in place, discussed in Section 15.7.3 in Chapter 15: Groundwater with the length and frequency to be determined by the preceding groundwater management and monitoring programs.</p> <p>Office of Coordinator-General is responsible for conditioning the groundwater monitoring requirements for the Project. ARTC will provide monitoring reports as conditioned by the approving authority.</p>	<p>Chapter 15: Groundwater Section 15.4.4 Section 15.7.3</p> <p>Appendix U: Groundwater Technical Report Section 8.3</p>
218	218.0151	Local Government	Noise and Vibration		<p>Inappropriate noise criteria: The proponent has nominated noise criteria which will ensure that the majority of the cost of rail noise mitigation, financial or otherwise, is borne by the community.</p> <p>The L_{wmax} trigger level utilised to inform noise mitigation in the Draft EIS is 80 dB(A). For perspective, acceptable construction for a dwelling in a rail noise corridor that experiences 80 dB(A) L_{max} is:</p> <ul style="list-style-type: none"> ▶ Minimum 10.38mm laminated glass with acoustic seals for small windows; ▶ Minimum 14.38mm laminated glass or double-glazing with acoustic seals for large windows and sliding doors; ▶ Double brick walls; and ▶ Insulated roof with sarking. <p>This is an extremely onerous level of noise mitigation required at 80 dB(A) L_{max}, however the same noise level is only the point at which the proponent will consider mitigation.</p> <p>Queensland mandates acoustic construction requirements via the QDC MP4.4 for dwellings in a noise corridor with rail noise levels over 69 dB(A) L_{max}. QDC MP4.4 does not provide Leq criteria. WHO guidelines recommend 44 dB(A) L_{night} as the limit to mitigate sleep disturbance.</p> <p>Therefore, it can be considered that any sensitive dwellings that are predicted to experience noise over 44 dB(A) L_{night} and 69 dB(A) L_{max} and below the trigger levels are being overlooked by this assessment. These dwellings (and there are hundreds of them) will experience varying noise impacts but will not receive any mitigation from the proponent.</p> <p>TOR 5.1 states the objectives of the EIS are to ensure that all relevant environmental, social and economic impacts of the proposed project are identified and assessed, and to recommend mitigation measures to avoid or minimise adverse impacts. Based on these findings, the Draft EIS does not satisfy the fundamental objective described in TOR 5.1. As clearly demonstrated below, the true impacts of noise and vibration from the project have been grossly underestimated and dismissed. This is not acceptable to TRC.</p>	<p>The draft EIS does not meet TOR 5.1 and the true impacts of noise and vibration from the project have been grossly underestimated and dismissed. This is not acceptable to TRC. The Draft EIS requires correction to include:</p> <ul style="list-style-type: none"> ▶ Detailed commitments from the proponent to mitigate noise for residences on or in the vicinity of the rail corridor to ensure that there is no significant residual impact as a result of the proposed project. ▶ Use of appropriate noise criteria. ▶ A true and accurate assessment of noise and vibration impacts on sensitive receptors. 	<p>The revised draft EIS has been updated to address potential impacts from operational railway noise and vibration to sensitive receptors along the Project alignment. The revised modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The noise assessment criteria from the Interim Guideline are designed to manage impacts to amenity and annoyance. Furthermore, the assessment has identified the maximum noise levels to support the review of mitigation measures to address impacts such as sleep disturbance, that are reasonable and practicable. Noise mitigation shall be provided by ARTC where the Department of Transport and Main Roads criteria are not met, including the potential for at-property treatments. QDC MP4.4 does not apply to infrastructure providers such as Inland Rail. Comparison of the requirements of MP4.4 against the Project is inconsistent with the approach defined in the Interim Guideline to define potential impacts.</p> <p>Operational noise mitigation measures are recommended in Chapter 16: Noise and Vibration, Section 16.10 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 17. The development and implementation of such measures will be subject to further detailed studies and verification of noise levels during initial operations. There will be engineering, and further acoustic assessment works (including noise modelling) undertaken during the detailed design and construction stages of the Project. It is premature to present specific property treatments when the railway noise levels may be further refined, and other mitigation solutions developed during detailed design.</p> <p>ARTC will ensure required mitigation is in place at the start of operations. The at-property treatments shall be considered as soon as possible once the assessment of the final design is complete to support the mitigation of construction impacts and minimise the risk of not having mitigation in place prior to the commencement of railway operations. The determination of eligibility of treatments, and the specific treatment provided, is also likely include the measurement of noise levels from the operation of the Project. Particularly, where the modelled (predicted) noise levels are within a relatively small margin of compliance.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through operations.</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 17</p>
218	218.0156	Local Government	Noise and Vibration	Operational rail noise	<p>Operational noise: The Draft EIS discusses using a 7dB(A) adjustment for external to internal noise levels through an opened window with regard to non-residential sensitive receivers. The last sentence states that "in practice, many of the buildings listed in Table 14.35 will be a modern building construction and likely have air-conditioning, so windows do not need to be opened. This would result in a lower railway noise levels within buildings and potentially reduce noise mitigation requirements.</p> <p>For example, Brookstead State School may have air-conditioning installed already, but currently only use it for 2 months per year. If the proponent assesses the mitigation requirements of the school based on windows closed and air-conditioning running, the proponent takes advantage of the existing improvements made by the school while forcing them to change their normal use of the windows and air-conditioning. This may result in reduced amenity, increased electricity costs, increased greenhouse gas emissions associated with increased electricity usage at the school, while the proponent benefits by showing that internal criteria are met.</p>	<p>The proponent should make a clear commitment regarding the management of mitigation at sensitive receptors rather than rely on the assumption that existing acoustic improvements at a location will minimise the proponents liability to mitigate appropriately.</p> <p>This should be considered when at-property mitigation is negotiated</p>	<p>Facade reduction is a conservative estimate of the difference between outdoor railway noise and indoor railway noise allowing for windows to be open for ventilation.</p> <p>In the assessment of construction noise impacts, the CoP Vol 2 also prescribes that internal airborne construction noise criteria be met where reasonable and practicable for the sensitive receptor types that include hospital & health care service , educational establishment, community use & place of worship, as discussed in Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic. To assess the noise model predicted external noise levels against the internal (indoor) noise limits presented in Table 3-4 of Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic, the noise limits are adjusted by a facade correction which accounts for the reduction of noise achieved by the building (with windows open). For the educational establishments and community buildings potentially impacted by the Project, a conservative 7 dB facade noise reduction has been applied, in the absence of actual measurement data, based on the guidance provided in DES Noise and Vibration EIS Information Guideline recommended for typical Queensland buildings. Further to the this, sound insulation testing of facades typically representative of the educational buildings at Yelarbon State School, Brookstead State School, Pittsworth State High School and Southbrook Central State High were measured by WSP (WSP Report B2G Inland Rail Background Noise Monitoring and Facade Sound Insulation testing dated 21 February 2023). This information was also taken into account in the assessment as discussed in Section 3.3.1 of Appendix V: Noise and Vibration Assessment - Construction and Road Traffic.</p> <p>The applicable DTMR Interim Guideline operational rail noise criteria for both residential and educational receivers are same and define an outdoor criteria (Section 3 of Appendix W: Noise and Vibration Assessment - Railway Operations). Where these outdoor criteria are exceeded, feasible and practicable noise mitigation measures for non-residential receivers will be further investigated during the Detailed Design stage and installed prior to Inland Rail operations commencing (see Section 16.10 of Chapter 16: Noise and Vibration).</p>	<p>Chapter 16: Noise and Vibration Section 16.10</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Section 3.3</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Section 3</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0162	Local Government	Noise and Vibration	Operational rail noise	<p>Operational noise impact: Section 14.8.2.2 presents examples of at-premises noise mitigation such as increased glazing or facade construction. It is not expected that this is intended to limit possible mitigation options, but it is unclear to the reader nonetheless.</p> <p>The word or should not be used as it implies that increased glazing AND facade construction will not be offered together. Air-conditioning should also be mentioned here as any improvements to glazing and facades imply that windows are permanently closed and air-conditioning will be required.</p> <p>Section 14.8.2.2 states that external rail noise levels have the potential to be clearly audible above the ambient noise environment in close proximity to the rail corridor, such as the initial 400 m from the rail corridor. This distance is underestimated. Using receiver 255402 as an example, it is approximately 1600 m from the rail line and is predicted at 73dBA Lmax which is approximately 45dBA above the night-time rating background level in the area. This demonstrates the trains will be clearly audible at distances FAR in excess of 400 m.</p> <p>Section 14.8.2.2 further states that given the high level of noise that can be experienced close to a rail corridor during train pass-bys, there can still be potential for noise-related impacts, including sleep disturbance, where property treatments are implemented.</p> <p>Again, close to a rail corridor should be understood as meaning much further than 400 m and there are hundreds of dwellings with noise levels over the WHO guidelines but which the Draft EIS fails to commit to provide appropriate mitigation to.</p> <p>The Draft EIS further states that proposed mitigation measures may not be able to provide an amenable dwelling yet fails to provide a solution for situations where that is the case.</p>	<p>The Draft EIS requires updating to:</p> <ul style="list-style-type: none"> ▶ Correct Section 14.8.2.2; ▶ Quantify the extent of the impact of rail noise on outdoor spaces with relation to the exceedance of background levels; and ▶ Provide a solution for when noise criteria cannot be met with mitigation. 	<p>The revised draft EIS has been updated to address potential impacts from noise and vibration at the sensitive receptors along the Project alignment. The assessments consider noise and vibration that could occur during the construction of the Project, changes to the local road network, and the future railway operations.</p> <p>At-property treatments will be provided based on the level of exceedance and, as the submitter points out, could therefore include both upgraded glazing and facade improvements. Section 16.10 of Chapter 16: Noise and Vibration of the EIS discusses at-property treatments that form part of the mitigation measures.</p> <p>The operational railway noise modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The operational noise model extended 2 km from the Project alignment, taking into account over 8000 buildings. Of the buildings identified, 2,388 receptors were identified as being potential noise and vibration sensitive receivers. The individual sensitive receptors are detailed in the route maps provided in Appendix A of Appendix W: Noise and Vibration Assessment - Railway Operations. ARTC notes the submitter's concerns regarding additional impact in areas with low background noise levels and during the night time period. The Interim Guideline does not require noise from railway operations, including where noise mitigation is implemented, to be inaudible at sensitive receptors. The Interim Guideline does not require consideration of background noise levels in the assessment or the time of day that rail traffic is operating. DTMR have been explicit in requiring ARTC to undertake the assessment in compliance with the state guideline. ARTC acknowledge that the potential for annoyance or disturbance from rail noise is subjective and can remain a potential impact even where noise mitigation is implemented, and noise levels are well within the noise criteria.</p> <p>As specified, in Section 16.10 of the revised draft EIS, ARTC will undertake operational noise and vibration monitoring following commencement of Inland Rail to ensure that the noise modelling was accurate and noise mitigation has been provided as required. If the monitoring identifies any additional exceedances of the criteria, ARTC will provide additional feasible and practicable mitigation.</p> <p>ARTC are committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the Detailed Design stage to minimise disruption in the Construction Works stage and through to operations.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 6</p> <p>Section 10</p> <p>Appendix A</p>
218	218.0163	Local Government	Noise and Vibration	Operational rail noise	<p>Noise: Section 14.11 states the external rail noise levels have the potential to be clearly audible above the ambient noise environment in relatively close proximity to the rail corridor, such as the initial 300 m from the rail corridor.</p> <p>The distance of 300 m has changed from the 400 m quoted in Section 14.8.2.2, but in either case it is far underestimated.</p>	<p>The current assessment grossly underestimates the true extent of noise impacts. The Draft EIS requires update to provide consistent and accurate data regarding the true extent of the impact of rail noise on outdoor spaces.</p>	<p>The operational noise model extends 2 km from the Project alignment, taking into account over 8000 buildings. Of the buildings identified, 2408 2,396 receptors were identified as being potential noise and vibration sensitive receivers (refer to Section 5 of Appendix W: Noise and Vibration Assessment - Railway Operations). ARTC is confident that our noise modelling is an accurate representation of external noise impacts.</p> <p>The operational rail noise and vibration assessment has been revised to comply with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology of noise and vibration from the railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4.As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately). Railway noise modelling is further described in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 6.The revised modelling outputs are discussed in Chapter 16: Noise and Vibration, Section 16.8 and Appendix W: Noise and Vibration Assessment - Railway Operations, Section 10.</p> <p>The Interim Guideline does not require noise from railway operations, including where noise mitigation is implemented, to be inaudible at sensitive receptors. ARTC acknowledge that the potential for annoyance or disturbance from rail noise is subjective and can remain a potential impact even where noise mitigation is implemented, and noise levels are well within the noise criteria.</p> <p>As specified, in Section 16.10 of the revised draft EIS, ARTC will undertake operational noise and vibration monitoring following commencement of Inland Rail to ensure that the noise modelling was accurate and noise mitigation has been provided as required. If the monitoring identifies any additional exceedances of the criteria, ARTC will provide additional feasible and practicable mitigation.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.8</p> <p>Section 16.10</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations</p> <p>Section 4</p> <p>Section 5</p> <p>Section 6</p> <p>Section 10</p>
218	218.0164	Local Government	Editorial		<p>Inconsistent terminology: Chapter 14 is inconsistent in the use of the term day, evening and night and the hours of the day that they apply to. This can affect assessment criteria and the identification of impacts from the project.</p> <p>For example, Section 14.6.5.1 refers to daytime from 7am-10pm and night-time from 10pm-7am. At Section 14.6.5.2 it refers to daytime from 7am-6pm, evening from 6pm-10 pm and night-time from 10pm-7am.</p>	<p>The Draft EIS needs to be reviewed to ensure the following:</p> <ul style="list-style-type: none"> ▶ The terms day, evening and night and the hours of the day that they apply to have been correctly and consistently used. ▶ Noise and vibration assessment criteria are appropriate for the period of day. 	<p>Noted. Consistency in terminology of work periods has been noted Section 16.5 of Chapter 16: Noise and Vibration is correct and terminology of Day, Evening and Night has been updated to maintain consistency with work hours and the TMR Noise Code of Practice Vol 2 for work hours.</p>	<p>Chapter 16: Noise and Vibration</p> <p>Section 16.5</p>
218	218.0165	Local Government	Flora and Fauna	Operational rail noise	<p>Impacts to flora and fauna: Chapter 14 of the Draft EIS makes vague reference to fauna impacts from noise. It notes that during construction, impacts may be greatest in State forests but will only be temporary and no permanent impacts are expected. Operational noise is largely dismissed due to the presence of existing linear infrastructure in the area, including rail, and the assumption is made that fauna will adapt to the project as they are already exposed to transport noise. No consideration is given to the significant change to train types, length, speed, frequency of operations and how this may affect fauna. In short, the existing versus the proposed rail operations are not comparable. Notably, no reference is made at all to vibration impacts to fauna in Chapter 14.</p> <p>Chapter 10 largely repeats information supplied in Chapter 14 and makes no further assessment of noise impacts to fauna. It too relies on the assumption that fauna will adapt to the project as they are already exposed to transport noise. No consideration is given to the significant change to train types, length, speed, frequency of operations and how this may affect fauna.</p> <p>As noted earlier, noise emissions from the operations are expected to significantly impact many sensitive receptors from noise nuisance and sleep disturbance. It is reasonable to assume that noise and vibration emission will also affect wildlife however this is not adequately addressed by the Draft EIS. The Draft EIS does not meet TOR 11.95 as the impacts of noise and vibration on fauna have not been adequately assessed.</p>	<p>Impacts to flora and fauna: Chapter 14 of the Draft EIS makes vague reference to fauna impacts from noise. It notes that during construction, impacts may be greatest in State forests but will only be temporary and no permanent impacts are expected. Operational noise is largely dismissed due to the presence of existing linear infrastructure in the area, including rail, and the assumption is made that fauna will adapt to the project as they are already exposed to transport noise. No consideration is given to the significant change to train types, length, speed, frequency of operations and how this may affect fauna. In short, the existing versus the proposed rail operations are not comparable. Notably, no reference is made at all to vibration impacts to fauna in Chapter 14.</p> <p>Chapter 10 largely repeats information supplied in Chapter 14 and makes no further assessment of noise impacts to fauna. It too relies on the assumption that fauna will adapt to the project as they are already exposed to transport noise. No consideration is given to the significant change to train types, length, speed, frequency of operations and how this may affect fauna.</p> <p>As noted earlier, noise emissions from the operations are expected to significantly impact many sensitive receptors from noise nuisance and sleep disturbance. It is reasonable to assume that noise and vibration emission will also affect wildlife however this is not adequately addressed by the Draft EIS. The Draft EIS does not meet TOR 11.95 as the impacts of noise and vibration on fauna have not been adequately assessed.</p>	<p>The EIS has been revised to include an assessment of potential noise and vibration impacts to fauna (refer to Chapter 11: Flora and Fauna and Appendix L: Terrestrial and Aquatic Ecology Technical Report) and considers both construction and operational noise.</p> <p>The assessment of construction noise determines that noise associated with construction activities will be short-term in duration and it is likely that fauna will temporarily move out of areas that are subject to high levels of noise. Construction noise will be perceivable by fauna species within the area as the harmonic ranges produced by construction overlap with the hearing range and frequency of birdsong with species that occur in the area. This can potentially affect communication including calling to attract mates, territory defence, and warning of predators. The proposed mitigation measures for the Project in Chapter 11: Flora and Fauna includes a measure to stage works so that they avoid animal breeding periods (for species that breed within Australia) as much as possible within areas of habitat.</p> <p>Chapter 11: Flora and Fauna discusses further that operational noise may lead to some fauna species temporarily vacating/avoiding nearby habitat until the temporary noise (pulse) passes. The duration and frequency of the operational noise is unlikely to result in significant changes to species behaviour or avoidance of the area.</p> <p>The Project impacts from noise and vibration as well as the proposed mitigation measures are discussed in detail in the revised draft EIS, Chapter 16: Noise and Vibration, Appendix V: Noise and Vibration Assessment – Construction and Road Traffic Technical Report and Appendix W: Noise and Vibration Assessment – Railway Operations Technical Report.</p>	<p>Chapter 11: Flora and Fauna</p> <p>Sections 11.5 and 11.7</p> <p>Chapter 16: Noise and Vibration</p> <p>Appendix L: Terrestrial and Aquatic Ecology Technical Report</p> <p>Appendix V: Noise and Vibration Assessment - Construction and Road Traffic Technical Report</p> <p>Appendix W: Noise and Vibration Assessment - Railway Operations Technical Report</p>
218	218.0166	Local Government	Social Impact Assessment	Workforce accommodation village	<p>Accommodation shortages: The housing and accommodation market in the TRC area has changed significantly since the analysis conducted for the Draft EIS. Data published by The Chronicle on 20.1.21 shows a rental residential vacancy rate in January 2021 of 0.7% and anecdotal evidence and commentary in local media indicates that housing for sale in the TRC area is both reduced in availability and sale times are quite short.</p> <p>The Draft EIS states that free or subsidised accommodation will be provided to construction personnel within non-resident workforce accommodation where personnel live outside the safe daily driving distance. The Draft EIS assumes that sufficient vacant supply will exist at the northern end of the project to not require non-resident workforce accommodation (based on June 2018 vacancy rate data).</p> <p>The Draft EIS fails to acknowledge the current record-low vacancy rate that the TRC area (including Pittsworth and Southbrook) and proposes to use private accommodation in the northern Section of the proposed alignment, further exacerbating the accommodation issues that the TRC area is currently experiencing.</p> <p>Claims in the draft EIS that those who will be displaced will simply move to another area to accommodate a short-term workforce bought in from other areas is not considered to be an acceptable solution by TRC.</p>	<p>The Draft EIS's analysis of short-term accommodation and impacts on social infrastructure needs to be updated to address the current situation including, but not limited to, consideration of the:</p> <ul style="list-style-type: none"> ▶ Potential impact of workforce on residential accommodation (given current high demand and low rental vacancy rates). ▶ Potential problems created across the whole Region including in Toowoomba, Pittsworth, Millmerran and Southbrook through the proposed use of private accommodation rentals for the workforce. ▶ How the extreme lack of accommodation in the TRC area will be considered and managed in a way which ensures the local community won't be adversely impacted. <p>The Draft EIS should consider all accommodation options and how potential and real adverse impacts to accommodation in the TRC area as a result of the construction of the proposed project through committing to:</p> <ul style="list-style-type: none"> ▶ Prioritising a local workforce which does not require accommodation (as they already have it); and ▶ Encouraging any imported workforce to seek alternate accommodation which will not adversely affect the housing shortage currently being experienced by the local community; and ▶ Providing any imported workforce with separate, alternate accommodation and avoiding negative impacts to accommodation availability. <p>There has been a significant and substantial decrease in rental vacancy across the TRC region since June 2018. The Draft EIS requires update to consider current vacancy rates in the TRC area and provide for appropriate non-resident workforce accommodation in Toowoomba or nearby surrounding townships to satisfy any gap between acceptable supply levels and demand.</p>	<p>Revised draft EIS Appendix X: Social Impact Assessment, Section 5.5.2 includes updated housing data recognising the extremely tight rental housing market in the Toowoomba LGA. In providing sufficient capacity for all non-local workers, within the proposed accommodation facilities, ARTC expects that impacts will be largely mitigated, however the Accommodation Management Plan described in Section 8.4.4 of Appendix X: Social Impact Assessment has been revised to acknowledge the change in housing conditions, and provide more detailed and stringent management measures, e.g.,</p> <ul style="list-style-type: none"> ▶ Discouraging single status personnel from renting houses in local communities ▶ Avoiding use of rental housing in SIA study area postcodes where the rental vacancy rate is less than 2.5 per cent (which signifies a tight rental market) ▶ Use of local short-term accommodation, where appropriate in view of peak demands 	<p>Appendix X: Social Impact Assessment</p> <p>Section 5.5.2</p> <p>Section 8.4.4</p>

218	218.0167	Local Government	Social Impact Assessment		Local business: The Draft EIS states that the proposed project will be required to develop an Australian Industry Participation Plan.	nil.	<p>As per the submitter's comment, an Australian Industry Participation Plan (AIP Plan) will be prepared to support opportunities for businesses to supply the Project (Appendix X: Social Impact Assessment, Section 2.4).</p> <p>ARTC is committed to providing full, fair and reasonable opportunities for capable local businesses and Indigenous businesses to compete and participate in the Project's supply chain.</p> <p>Appendix X: Social Impact Assessment, Section 8.1 notes that to maximise the Project's benefits, ARTC has adopted a hierarchy for industry participation strategies which prioritise the Project footprint LGAs (Goondiwindi and Toowoomba).</p> <p>Inland Rail's tender assessment criteria includes local Indigenous participation as a key element of all construction tender assessments.</p> <p>Appendix X: Social Impact Assessment, Section 8.3.1 has been updated to provide examples of and commentary regarding minimum benchmarks and aspirational targets relevant to local and Indigenous procurement and workforce participation.</p> <p>Businesses which trade from a street address within the SIA study area or Region (as defined above) are considered "local". Appendix X: Social Impact Assessment, Section 8.6.3. has been updated in this regard. This is consistent with the reporting framework for other Inland Rail Projects and ARTC is unable to adopt additional Project-specific definitions.</p> <p>Appendix X: Social Impact Assessment, Section 8.6.5 describes the Project's reporting arrangements, including that the Project will report on supplier participation from the Project footprint LGAs. The Project will also report on supplier participation in the Project Region, being LGAs outside the Project footprint, but within 125 km radius of the Project.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 2.4</p> <p>Section 8.1</p> <p>Section 8.3.1</p> <p>Section 8.6.3</p> <p>Section 8.6.5</p>
218	218.0168	Local Government	Social Impact Assessment		Amenity of towns: The Draft EIS states that the amenity of Yelarbon, Brookstead, Millmerran and Pittsworth (and Gowrie Mtn) may be affected by rail noise and changes to scenic character and commits to engage with '...TRC to identify partnership opportunities to address impacts on local character and the amenity of these towns'	nil.	<p>The revised draft EIS details the measures designed to mitigate impacts amenity (e.g. noise and vibration mitigation measures and landscape treatments). Appendix X: Social Impact Assessment notes the value of partnerships in addressing impacts e.g. building on initiatives which Council has already planned or support for community projects to improve amenity (Section 8.1 of Appendix X: Social Impact Assessment).</p> <p>ARTC has engaged with TRC throughout 2022-2023 to identify initiatives to improve amenity and scenic character, to be detailed as part of the Community Wellbeing Plan (Appendix X: Social Impact Assessment, Section 8.5.6).</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 8.1</p> <p>Section 8.5.6</p>
218	218.0169	Local Government	Social Impact Assessment	Workforce accommodation village	<p>Workforce Accommodation: TRC services such as water and road maintenance may experience increased demand in the Millmerran, Inglewood and Yelarbon areas. The Draft EIS does not commit to consult with TRC to identify appropriate mitigation measures to reduce impacts from the proposed project on local government services.</p> <p>Millmerran already has strict water restrictions in place. Potential negative impacts to Millmerran's available water supply from proposed project activities has not been appropriately addressed.</p>	nil.	<p>Revised draft EIS Appendix X: Social Impact Assessment Section 8.4, 7.3 and 6.1 have been updated with additional information regarding the workforce accommodation facilities and the consultation process.</p> <p>ARTC has identified preferred sites for non-resident workforce accommodation facilities based on several criteria, identification of suitable land parcels, and agreement with the owners of those parcels to nominate the sites as preferred sites in the revised draft EIS, as described in Appendix X: Social Impact Assessment, Section 7.3.4.</p> <p>As the previously proposed site in the Turallin area proved unsuitable, the Contractor is currently undertaking due diligence to identify a workforce accommodation facility site in the Millmerran area, and will engage with TRC when preferred site/s are identified.</p> <p>Council's advice on water restrictions is noted. TRC's inputs as part of the draft EIS consultation process (described in Appendix X: Social Impact Assessment, Section 7.3.4) included that Council would assess proposed non-resident workforce accommodation facilities on a case-by-case basis, with site specific information needed to support assessment, that ARTC would need to consult further on water and sewerage infrastructure when proposed accommodation sites are selected, and waste management would need consideration.</p> <p>ARTC has noted that non-resident workforce accommodation facilities are likely to require self-sufficient provision of potable water and sewage treatment. Road maintenance costs will be discussed with road asset owners as part of the development application process for the accommodation facilities.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 8.4</p> <p>Section 7.3</p> <p>Section 7.3.4</p> <p>Section 6.1</p>
218	218.0171	Local Government	Social Impact Assessment	Workforce and employment	Loss of employment: The Draft EIS states that the current proposed alignment traverses land currently used by feedlots, a piggery and a poultry farm, with partial or full land acquisitions required. As a direct result, there may be potential for the loss of employment for agribusiness workers if operations are significantly disrupted or reduced.	nil.	<p>As a result of stakeholder feedback, ARTC has revised the Project's concept design to avoid the Doug Hall (Moyness) piggery and poultry farm. As such, the anticipated impacts noted by TRC have been reduced.</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 8.6.1 has been updated to note the re-alignment and reduction of impacts.</p> <p>The Project footprint avoids the Yarranbrook Feedlot's feeding system infrastructure, cattle handling infrastructure and associated facilities, but traverses through the Feedlot's pivot irrigation fields, where partial acquisition will be required. This may result in the need to relocate the pivot irrigation fields</p> <p>The permanent footprint traverses through land associated with D M Fletcher Feedlot at Bringallily. The footprint avoids the feed lot's infrastructure, but severs the land parcel. The permanent footprint traverses through the land parcel on which the R Sydney and KM Stevens Feedlot is located at Millwood, requiring partial or full acquisition, but avoids the feedlot's infrastructure.</p>	<p>Appendix X: Social Impact Assessment</p> <p>Section 8.6.1</p>
218	218.0172	Local Government	Editorial		Naming: The Draft EIS refers to Toowoomba Enterprise Hub. The major stakeholders of that precinct have a preference for it to be referred to as Toowoomba Trade Gateway.	The Draft EIS should be amended to correctly refer to the Toowoomba Enterprise Hub as the Toowoomba Trade Gateway.	Noted. Names and descriptions have been revised where occurrences occur such as Chapter 2: Project Rationale and Chapter 8: Land Use and Tenure.	<p>Chapter 2: Project Rationale</p> <p>Chapter 8: Land Use and Tenure</p>
218	218.0173	Local Government	Cultural Heritage		<p>Indigenous cultural heritage has been assessed by the proponent and the report identifies that Cultural Heritage Management Plans (CHMPs) have been developed. These have not been provided as part of the draft EIS, but a summary has been included of the issues as well as the proposed mitigation and management solutions.</p> <p>Based on the draft EIS, it is clear that the proposed alignment will cause disruption to some areas of Indigenous cultural heritage, and it is unclear if the CHMPs can achieve the TOR objective for cultural heritage (that the Project does not compromise the cultural heritage significance of a heritage place or heritage area).</p>	In relation to Indigenous cultural heritage, it is unclear whether the TOR has been achieved based on the information provided. The draft EIS requires revision to make clear whether or not the OCGs TOR for cultural heritage has been achieved.	Cultural Heritage Management Plan are confidential documents, and the management of Aboriginal heritage sites is a matter between the Aboriginal Party and the proponent. The Terms of Reference requires that a Cultural Heritage Management Plan be in place, and that the details of this Cultural Heritage Management Plan (or the steps taken to develop a Cultural Heritage Management Plan) be provided. A Cultural Heritage Management Plan has been developed between ARTC and Bigambul People, Western Wakka Wakka people and the Endorsed Aboriginal Parties for the unclaimed area in 2018. These plans ensure ARTC meets the Office of Coordinator-General TOR.	<p>Chapter 19: Cultural Heritage</p> <p>Table 19-8</p>
218	218.0174	Local Government	Cultural Heritage		<p>Existing railway: TOR 5.1 requires the EIS to ensure that all relevant environmental, social and economic impacts of the Project are identified and assessed, and to recommend mitigation measures to avoid or minimise adverse impacts. The EIS should demonstrate that the Project is based on sound environmental principles and practices.</p> <p>The draft EIS does not meet the requirements of TOR 5.1. Chapter 17 fails to clearly address the proposed and complete loss (through removal/burial) of the existing historic Millmerran Branch rail line, which runs east from Millmerran to Murlaggan and how this will be managed.</p>	It is in the public interest that the draft EIS be amended to meet the requirements of TOR 5.1 including, but not necessarily limited to, detail regarding how the new and old railway routes are to co-exist and what measures are in place to incorporate the preservation of the cultural heritage of the old rail line and station locations (Yandilla, Pampas, Cecilvale, Murlaggan) into the proposed Project. Opportunities for repurposing or reusing the old lines should be considered by the proponent.	<p>Site inspections and assessments were undertaken along the Millmerran line as outlined in Appendix Z: Non-Indigenous Cultural Heritage Survey Report, Section 6. While some early or original bridges remain intact, most station elements had been removed or relocated (including Yandilla, Pampas, Cecilvale, and Murlaggan), leaving little to be preserved. All sites were assessed against heritage criteria, and were generally found to be of no significance. Where sites were found to be significant, management recommendations were made, as outlined in Appendix Z: Non-Indigenous Cultural Heritage Survey Report, Section 9.</p> <p>Recommendations for a Heritage Interpretation Plan has also been added to Chapter 19: Cultural Heritage, Table 19-21 and Table 19-22, and Appendix Z: Non-Indigenous Cultural Heritage Survey Report, Tables 9.1 and 9.2.</p>	<p>Chapter 19: Cultural Heritage</p> <p>Table 19-21</p> <p>Table 19-22</p> <p>Appendix Z: Non-Indigenous Cultural Heritage Survey Report</p> <p>Section 6</p> <p>Section 9</p> <p>Table 9.1</p> <p>Table 9.2</p>
218	218.0175	Local Government	Editorial		<p>Transport: Section 18.3 identifies the transport planning frameworks, policies, plans and guidelines that are applicable to this assessment and are outlined in Table 18.2.</p> <p>There is no reference to the Darling Downs Regional Transport Plan (RTP) or the South East Queensland Regional Transport Plans in the table. The purpose of the RTP is to set out regional transport priorities and actions for developing the transport system in a way that supports regional goals for the community, economy and the environment.</p> <p>There is also no reference in the draft EIS to either the Queensland Walking Strategy 2019-2029 or the Queensland Cycling Strategy 2017-2027.</p>	<p>The draft EIS should be amended to give consideration to both the Darling Downs Regional Transport Plan and the South East Queensland Regional Transport Plans when undertaking the transport planning assessment component of the document as they both set out regional transport priorities and actions.</p> <p>Further, the draft EIS should also consider stock movements and their relationship with traffic.</p> <p>Consideration should also be given to the aims and objectives of the Queensland Walking Strategy 2019-2029 and the Queensland Cycling Strategy 2017-2027 when considering impacts during construction and operation</p>	<p>Chapter 20: Traffic, Transport and Access Section 20.2 now includes a reference and consideration of the South East Queensland Regional Transport Plan; Queensland Walking Strategy 2019-2029 and the Queensland Cycling Strategy 2017-2027.</p> <p>The Traffic and transport impact assessment has been undertaken in accordance with DTMR Guide to Traffic Impact Assessment for the construction works stage impacts to the road network. The assessment involved discussions and interactions with DTMR throughout the process. ARTC will continue to work with DTMR through future stages of the Project to ensure any road authority planning for the region is considered as part of the construction works stage.</p>	<p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.2</p>
218	218.0176	Local Government	Editorial		construction Transport Route Mapping routes on local roads to be clearly identified: The draft EIS states that the proposed primary construction routes are illustrated however Figures are not of an adequate scale to clearly define which TRC roads will be impacted. As a result, the draft EIS does not meet the requirements of TOR 10.3 (as local roads have not been mapped at a suitable scale).	The draft EIS should be amended to provide maps of the proposed primary construction routes at a suitable scale to define which TRC local roads will be impacted.	<p>As described within Appendix AA: Traffic Impact Assessment, Section 4 details the traffic generation, or "construction routes" resulting from the construction works stage of the Project. The construction activities accounted for in the TIA include:</p> <ul style="list-style-type: none"> Delivery of materials to the Project footprint Movement of workforce Transportation/collection of plant, equipment and other machinery Delivery of non-resident workforce accommodation facility cabins to site Rail-to-road diversions due to track closures. <p>These have been tabulated within Section 4 and are complimented by construction route mapping in Appendix U through to Appendix AF of Appendix AA: Traffic Impact Assessment. TRC are able to find impacted roads within both the tables and mapping available.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 4</p> <p>Appendix U-AF</p>
218	218.0177	Local Government	Editorial		<p>Short stacking - A triple design vehicle: The draft EIS states that TMR have requested storage lengths based on 42.5 m A-triple vehicles.</p> <p>The draft EIS states that A-triple vehicles do not (currently) use roads in proximity to the proposed Project alignment and has only adopted a 36.5 m Type 1 road train in its reference design.</p> <p>The draft EIS has failed to recognise that the road transport industry is increasingly using higher performance heavy vehicles for the more efficient movement of many commodities, and that A-triples are already in use elsewhere in the road network.</p> <p>The draft EIS has therefore not adequately ensured that its works are compatible with future transport corridors as required by TOR Transport Objective (c) and 11.116.</p>	The draft EIS requires updating to ensure its reference design meets the stated TMR requirement to accommodate 42.5 m A-triple vehicles wherever the proposed Project alignment is creating the potential for short stacking.	<p>The revised reference design has been developed to prevent short stacking issues with the Project's alignment. Short stacking occurs when a long vehicle does not have enough space to completely clear a rail crossing and stops while part of the vehicle is still within the rail corridor. Short stacking issues have been avoided through development of the revised reference design by maintaining a minimum separation distance between the outer rail of the Project alignment and the centreline of the nearest parallel road, in accordance with Section 5.4 of AS 1742.7:2016 and with the Manual of Uniform Traffic Control Devices Part 7: Railway Crossings (DTMR, 2019b).</p> <p>Through the greenfield sections of the Project the design caters for future provision of oversized vehicles such as the PBS2B (42 m) vehicle. All brownfield corridors have a minimum of 36.5 m short stacking for formed public roads (not including stock route road reserves).</p> <p>Where short stacking is not considered sufficient, the safety assessment in Section 5.2 of Appendix AA: Traffic Impact Assessment has recommended the designs be revisited during the detailed design stage. Design drawings showing available clearances can be provided to all road managers to demonstrate compliance with relevant standards, at the appropriate design review milestone.</p> <p>Further consultation with DTMR, GRC, TRC and the local community will confirm the location and preferred treatment for each road–rail interface. The consultation strategy for the Project is described in Appendix E: Consultation Report of the revised draft EIS.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2</p> <p>Appendix E: Consultation Report</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0178	Local Government	Traffic and Transport		<p>Transportation Task local roads not adequately addressed: The draft EIS describes 12 transport tasks (Table 18.28) impacting 61 TRC region local roads including 9 unconstructed local roads (Table 18.29).</p> <p>The draft EIS does not provide sufficient information as to the quantum of vehicle movements for each transport task, as these affect each local road.</p> <p>The draft EIS has therefore not provided sufficient information to allow an independent assessment of how existing transport infrastructure will be affected by Project transport at the local level, or prepared mitigation strategies in close consultation with relevant local governments (as required by TOR 11.113 and 11.116).</p>	Nil.	<p>Appendix AA: Traffic Impact Assessment has been updated in accordance with the GTIA to indicate performance thresholds for assessment of traffic impact were developed with reference to Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a), GTIA and DTMR Guidelines for Assessment of Road Impacts of Development (2017). This includes the 5% threshold provided from the GTIA and other acceptable LOS values provided in the Austroads Guide to Traffic Management Part 3: Traffic Studies and Analysis (2017a) and DTMR Guidelines for Assessment of Road Impacts of Development (2017).</p>	Appendix AA: Traffic Impact Assessment
218	218.0179	Local Government	Traffic and Transport		<p>Cycling and pedestrian access: The draft EIS notes that some of the proposed construction routes are aligned through areas/townships with moderate to high pedestrian activity and acknowledges that significant increases in heavy vehicle movements may adversely impact pedestrian movements. However, the document concludes that because these routes already facilitate a high proportion of heavy vehicle movements that any additional construction traffic to these routes is unlikely to result in a significant increase in risk to pedestrians. It is unclear how significant increases in heavy vehicle movements will not increase risk to people walking and cycling. Beyond the physical risk there is also the issue of deterring people from walking and cycling both now and in the future.</p>	<p>Serious consideration needs to be given to the Impacts on pedestrians and cyclists and the draft EIS needs to reflect the aims and intent of the Queensland Walking Strategy 2019-2029 and the Queensland Cycling Strategy 2017-2027. Further, the draft EIS should commit to a discussion with TMRs Cycling and Walking team to ensure people's ability to walk and cycling are not unduly impacted during either construction or operation of the proposed Project.</p>	<p>ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the Project alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards.</p> <p>Chapter 5: Project Description Section 5.4 of the revised draft EIS provides detail on reference design including the Project alignment and road/rail interfaces. This is further supported by the Appendix design drawings Part 1 and 2. Section 20.5.9 of the revised draft EIS Chapter 20: Traffic, Transport and Access identifies the existing walking and cycling networks impacted by the proposed Project alignment and construction routes.</p> <p>During construction, all road routes will be subject to a Road Use Management Plan and Traffic Management Plan, which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans will require regular assessment of road safety, road conditions and traffic composition including pedestrian and cyclist usage to ensure safety for all road users. Section 5.2.2 of the Appendix AA: Traffic Impact Assessment provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.</p> <p>Consultation will continue with local councils regarding pedestrian crossing options during detailed design. Once agreed, changes to active transport networks will be communicated to active transport users through regular Project channels.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.5.9</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p>
218	218.0180	Local Government	Hazard and Risk		<p>Asbestos: There are numerous references to asbestos through the chapter. It is not clear however if these comments are made on a precautionary basis or if there has been asbestos identified that needs to be managed.</p>	The revised draft EIS requires updating to provide clarification regarding asbestos.	<p>The potential for asbestos, including asbestos-containing materials, to be encountered within the Project footprint has been determined from the types of infrastructure that are located within the Project footprint and the age of such infrastructure. For example, Goondiwindi Regional Council has stated that sections of its potable water and sewerage pipeline network are known to be made from asbestos cement.</p> <p>A survey of infrastructure that will be removed or disturbed by the Project will be conducted prior to the commencement of construction to identify asbestos-containing materials.</p> <p>The occurrence of asbestos as a potential hazard is discussed in Section 21.5.2.3 of Chapter 21: Hazard and Risk. The commitment to undertake an asbestos survey of existing infrastructure pre-construction is made in Table 21-16 of Section 21.6.2 in Chapter 21: Hazard and Risk.</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.5.2.3</p> <p>Section 21.6.2</p> <p>Table 21-16</p>
218	218.0181	Local Government	Hazard and Risk		<p>Design interfaces with utilities: Table 19.12 outlines mitigation measures for interaction with utilities and issues arising as a result. However, the text fails to mention the policies and standards that the utilities themselves may have in place (e.g. TRC Policy numbers 2.04 and 2.03 which set standards/requirements for water and wastewater infrastructure.)</p>	The revised draft EIS requires update to include reference to any utility owner standards or policies in this section.	<p>Section 21.6.2 (Table 21-16) of Chapter 21: Hazard and Risk has been updated to state the following:</p> <p>"Designs for utility protection (modification, upgrade, diversion or realignment), will be subject to confirmation once the reference design is finalised and will be determined through further consultation with the affected utility owners and be in accordance with the following."</p>	<p>Chapter 21: Hazard and Risk</p> <p>Section 21.6.2</p> <p>Table 21-16</p>
218	218.0182	Local Government	Editorial		<p>Existing infrastructure and utilities: Second dot point re maintenance activities refers only to electricity and gas, what of other utilities i.e., telecom, water, sewerage etc.</p>	The draft EIS requires update to include reference to maintenance activities and consultation with all utility owners.	Chapter 21: Hazard and Risk, Table 21-16 has been updated to specify that the exact methodology for utility modification, upgrade, diversion or realignment will be subject to confirmation once the Project design is finalised and will be determined through further consultation with the affected utility owners.	Chapter 21: Hazard and Risk Table 21-16
218	218.0183	Local Government	Editorial		<p>Out of date legislation: The draft EIS cites the National Waste Policy 2009 and the Environmental Protection Policy 2008. Both of these regulatory policies have since been superseded.</p>	Table 20.1 requires update to reflect the most recent Policies are considered and that any amendments are fully captured in the draft EIS as appropriate.	Draft EIS Table 20.1 "Compliance against relevant sections of the ToR" is no longer within the revised draft EIS Chapter 22: Waste and Resource Management. This is now presented in Appendix A2: Terms of Reference Cross Reference Table. Appendix A2: Terms of Reference Cross Reference Table presents the Terms of Reference as issued by the Office of the Coordinator-General and therefore still cites the National Waste Policy 2009 and the Environmental Protection Policy 2008. The revised draft EIS has been updated to include the current policies, so Chapter 22: Waste and Resource Management does not reference the superseded policies.	<p>Chapter 22: Waste and Resource Management</p> <p>Appendix A2: Terms of Reference Cross Reference Table</p>
218	218.0184	Local Government	Waste and Resource Management		<p>Millmerran landfill: Table 2.3 lists Millmerran landfill as a waste management facility located in close proximity to the proposed Project. There is not enough landfill airspace available at Millmerran to receive Project waste. A waste transfer facility is planned for construction in 2021/22.</p>	Millmerran landfill is not a possible destination for Project waste and should not be considered as such. The draft EIS requires amendment to reflect this.	Chapter 22: Waste and Resource Management, Table 22-3 Waste Management Facilities in Proximity to the Project has been amended with the following for Millmerran Waste Facility 'Limited C&D waste recycling, Limited regulated waste disposal'. ARTC will confirm available airspace with Toowoomba Regional Council as the detailed design progresses, post-EIS'.	Chapter 22: Waste and Resource Management Table 22-3
218	218.0185	Local Government	Waste and Resource Management		<p>Project waste: Table 20.3 identifies Enwaste Toowoomba as a skip bin hire provider. Enwaste will likely bring waste to a TRC landfill.</p>	<p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to form an agreement between the proponent, Enwaste and TRC to identify which landfill sites skip bins may be taken to. The agreement is to be made in writing at least six months prior to the commencement of any construction activities.</p>	<p>Enwaste have been identified as an appropriate facility for skip bin hire in proximity to the Project, however the selected company for this service will be determined by the contractor prior to construction commencing.</p> <p>Details of selected waste facilities for the Project within Toowoomba Regional Council area will be outlined in the Construction Environmental Management Plan (CEMP) (see Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan
218	218.0186	Local Government	Waste and Resource Management		<p>Project waste: Table 20.3 identifies J. J. Richards as waste removal contractors. Some waste being transported by J. J. R. may be directed to a TRC landfill.</p>	<p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to form an agreement between the proponent, J. J. Richards and TRC to define which waste may be taken to TRC sites and which landfill site waste is to be taken to. The agreement is to be made in writing at least six months prior to the commencement of any construction activities.</p>	<p>J. J. Richards and Sons has been identified as an appropriate facility for acceptance and transfer of waste in proximity to the Project, however the selected company for this service will be determined by the contractor prior to construction commencing.</p> <p>Details of selected waste facilities for the Project within Toowoomba Regional Council area will be outlined in the Construction Environmental Management Plan (CEMP) (see Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan
218	218.0187	Local Government	Editorial		<p>Project waste: Beutel & Oughtred Sons have changed ownership and is now operating as Zilch.</p>	The draft EIS requires update to reflect the correct facility details.	ARTC acknowledges the ownership changes and has updated Chapter 22: Waste and Resource Management to reflect current ownership information.	Chapter 22: Waste and Resource Management
218	218.0188	Local Government	Waste and Resource Management		<p>Project waste: Section 20.6.3 Table 20.6 identifies timber sleepers as one of the largest construction waste sources and an assumption that all timber sleepers will be contaminated. It also classifies the timber sleepers as Regulated Waste (regarded as contaminated) even though no information is supplied to support this classification and treated timbers (other than sawdust or shavings) are not Regulated Waste under Sch 9 of the EP Regulation. Experience on similar Projects shows that a significant proportion of timber sleepers will not be contaminated and hence will be available for reuse.</p>	<p>The assumption that all timber sleepers will be contaminated is incorrect and no data is supplied in the draft EIS to support this claim.</p> <p>The opportunities for reuse of timber sleepers needs to be explored further in the draft EIS to remove this significant waste source from the waste stream.</p>	<p>The EIS has not characterised the chemical constituents of all materials that may arise from the Project. Chapter 22: Waste and Resource Management, Table 22-10 of the revised draft EIS outlines that opportunities for re-use will be considered, if compliant with the intent of the 'End of Waste Code: Chemically Treated Solid Timber [ENEW07503218]'. The regulatory definition of a regulated waste is "(1) Regulated waste is waste that"</p> <p>(a) is commercial waste or industrial waste; and</p> <p>(b) is of a type, or contains a constituent of a type, mentioned in schedule 9, part 1, column 1.</p> <p>While schedule 9 Part 3 Division 1 of the Environmental Protection Regulation exempts treated timber as a regulated waste, this does not wholly apply to railway sleepers. Part b of the definition above includes OC/ OP pesticides, petroleum hydrocarbons and PAHs which are all commonly deposited on and can be absorbed by timber railway sleepers during operation and maintenance of the rail corridor.</p>	Chapter 22: Waste and Resource Management Table 22-10
218	218.0189	Local Government	Waste and Resource Management		<p>construction waste quantities: Table 20.6 quotes a general waste (from offices and accommodation) of 141 tonne over the construction duration of the proposed Project.</p>	<p>The draft EIS should be updated to commit to:</p> <ul style="list-style-type: none"> The appropriate management of general waste and source separation of recyclables from the general waste stream. Providing source separation bins and receptacles in the laydown areas (which already incorporate areas for Project waste). Include educational/ induction material for workers to inform and drive source separation. 	<p>As per Chapter 22: Waste and Resource Management, Section 22.6, mitigation measures pertaining to waste management have been developed for the Project in accordance with relevant legislative requirements, aligning with the 2018 National Waste Policy and the <i>Waste Reduction and Recycling Act 2011</i> (Qld) hierarchy.</p> <p>As noted in Chapter 22: Waste and Resource Management, general waste has been assessed as immaterial in volume and will be managed using standard waste management practices.</p> <p>As outlined in Chapter 24: Draft Outline Environmental Management Plan, the Contractor will prepare and implement a Construction Environmental Management Plan (CEMP), which will include waste management strategies, including:</p> <ul style="list-style-type: none"> Requirements for waste isolation, e.g. green waste, commercial and industrial (C&I) waste, construction and demolition (C&D) waste, general waste, regulated waste and recyclables, in accordance with the Environmental Protection Regulation 2008 Requirements for training, inspections, audits, corrective actions, notification and classification of environmental incidents. 	<p>Chapter 22: Waste and Resource Management</p> <p>Section 22.6</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
218	218.0190	Local Government	Waste and Resource Management		<p>Regulated waste disposal: (Ballast, soil (contaminated), paint and solvents, oil and chemicals).</p> <p>A detailed plan needs to be developed and agreed for isolating, storing, and transporting regulated waste, and an agreed and pre-determined destination established.</p> <p>The plan should include worker skills/ qualifications (e.g. asbestos handling), receptacles, bins etc for storage, cover if required, record keeping, notification process. TRC may accept such materials but further information on types and quantities is required.</p>	<p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to develop a regulated waste disposal plan and provide to TRC for approval at least six months prior to the commencement of any construction activities.</p>	<p>Chapter 24: Draft Outline Environmental Management Plan, Proposed Mitigation Measures - Waste Management, outlines that the Contractor will prepare and implement a Waste Management Plan as part of the Construction Environmental Management Plan (CEMP), which will include:</p> <ul style="list-style-type: none"> Requirements for waste isolation, e.g. green waste, commercial and industrial (C&I) waste, construction and demolition (C&D) waste, general waste, regulated waste and recyclables, in accordance with the Environmental Protection Regulation 2008 Requirements for training, inspections, audits, corrective actions, notification and classification of environmental incidents. Requirements and procedures for wastes and contaminated soils or other materials to be transported and disposed in accordance with the <i>Environmental Protection Act 1994</i> (Qld). <p>A Waste Management plan will be developed as part of the Construction Environmental Management Plan (CEMP) and include measures as outlined above.</p>	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0191	Local Government	Waste and Resource Management		<p>Spoil management: While in some areas, the draft EIS states that there will be no surplus of soil, in other parts it infers that there may be between 149,000 m³ to 300,000 m³ of material classed as unsuitable fill that may be sent to a waste facility. The potential quantity is significant, equivalent to 5 hectares, between 3 m to 6 m deep.</p> <p>Goondiwindi has reportedly undertaken to receive some of this material as clean fill for day cover. However, there would be a limit to how much material can be used this way.</p> <p>TRC would not be able to receive such a large quantity at Hermitage Road (the Toowoomba Waste Management Centre (TWMC)). Other uses for the material may possibly be found in programs of rehabilitation works for retired landfills in the area. Strict soil quality assessment protocols would be required to avoid contaminated soils and a timeframe for planning and design to implement deployment of the material. Further discussion with TRC is required should this be considered a possibility.</p>	<p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to reach written agreement with TRC regarding the disposal of unsuitable fill at least six months prior to the commencement of any construction activities.</p>	<p>The Project's anticipated spoil management is outlined in Chapter 22: Waste and Resource Management, Section 22.5.2. Where practicable, spoil will be reused within the Project footprint through treatment, amelioration or drying or for offsite reuse subject to compliance with relevant legislation and policy framework, demonstration of the material as clean and written agreement with the receiver. Material that cannot be treated for appropriate reuse may be disposed offsite; however, offsite disposal to landfill will only occur as a last resort, if the material is considered unsuitable for other uses (e.g. due to geotechnical or contamination reasons).</p> <p>As above, offsite disposal is not foreseen at this stage of Project planning, however if deemed necessary, ARTC will engage with Toowoomba Regional Council to discuss further.</p>	Chapter 22: Waste and Resource Management Section 22.5.2
218	218.0192	Local Government	Waste and Resource Management		<p>Waste concrete (concrete culverts, in-situ and precast waste): The quantities Projected are 2% x (20,721 m³+ 91,076 m³ + 24,125 m³) = 2718 m³ or 6540 tonnes. Spread over the 5-year Project, approximately 1300 tonnes p.a.</p> <p>TRC is limited in the amount of concrete waste that can be practically accepted with current operations.</p>	<p>The draft EIS requires updating to provide clarity on where the proponent intends to send concrete waste and to commit to the development of a plan with confirmed agreements to receive Projected tonnages for processing (and to potentially buy back the processed material).</p> <p>The draft EIS should consider a mobile crushing plant and suitable lay-down areas for processing concrete waste without long transport involvement may be suitable.</p>	<p>ARTC acknowledges Toowoomba Regional Council's comment regarding capacity to accept concrete waste. The management of concrete waste is to be further determined as part of detailed waste management planning as outlined in Chapter 22: Waste and Resource Management, Section 22.6 Mitigation Measures.</p> <p>As the selection of the waste facility will be determined by the contractor, the Project is unable to provide further information on destinations or processes that will be adopted by the contractor, who is yet to be appointed.</p>	Chapter 22: Waste and Resource Management Section 22.6
218	218.0193	Local Government	Editorial		<p>Cumulative impact: Issues raised in relation to cumulative impacts have been provided in the technical comments above, given that detailed information relating to cumulative impact has been provided in the technical chapters. The information provided in these chapters relating to cumulative impact is overly detailed and repetitive and provides little value to the reader.</p> <p>As a result, Chapter 21 of the draft EIS provides little value in its current form given it is a compilation of the information provided in previous technical chapters. As such, cumulative impacts are not considered to be appropriately addressed, as required by TOR 7.3.</p>	<p>The draft EIS requires update to provide summary information and detail relating directly to the mitigation of cumulative impact in technical chapters. Chapter 21 should provide value and relevance regarding cumulative impacts.</p>	<p>ARTC acknowledges the issues with Chapter 23: Cumulative Impacts and how cumulative impacts is discussed throughout the EIS. Chapter 23: Cumulative Impacts and the cumulative impacts assessments have been updated in the revised draft EIS.</p>	Chapter 23: Cumulative Impacts
218	218.0194	Local Government	Outline EMP		<p>Lighting and visual amenity: TOR 11.87 requires that the draft EIS describe any proposed measures to avoid, minimise or mitigate potential impacts on landscape character and visual amenity.</p> <p>Similarly, TOR 11.96 requires that the draft EIS describe any proposed measures to avoid, minimise or mitigate potential impacts on natural values, and enhance these values, in particular, address measures to protect or preserve any threatened or near-threatened species.</p> <p>The draft EIS does not meet 11.87 or 11.96, specifically relating to description of measures to avoid, minimise or mitigate potential impacts of light at night on visual amenity and wildlife.</p> <p>Chapter 22 lacks information on key lighting issues in the following subplans:</p> <ul style="list-style-type: none"> Visual Amenity (22.11.3) does not contain definitive mitigation measures with reference to relevant standards for obtrusive lighting and guidelines for skyglow. Flora and Fauna (22.11.4) does not contain definitive mitigation measures with reference to relevant guidelines for light pollution in relation to wildlife. Hazard and Risk (22.11.12) does not contain definitive mitigation measures with reference to relevant standards for outdoor work environments at night. 	<p>Chapter 22 of the draft EIS requires updating to meet the requirements of the OCGs TOR including specifying mitigation measures related to lighting impacts on visual amenity, flora and fauna and hazard and risk.</p> <p>TRC request that the OCG impose the following condition:</p> <p>The proponent is required to ensure all lighting impacts on visual amenity, flora and fauna and hazard and risk are appropriately assessed, managed and mitigated in accordance with industry best practice to minimise risks to community and landscape amenity and ecological communities and receptors.</p>	<p>Based on consultation undertaken by ARTC with the Mt Kent Observatory, it is understood that there are no concerns regarding lighting impacts associated with the Project due to the distance of the observatory from proposed infrastructure. Lighting proposed is all essential for safety and the mitigation measures already include the minimum required standards. The consultation outcomes are detailed in Appendix E: Consultation Report.</p> <p>Impacts of lighting on wildlife, as well as livestock and poultry, are not part of the Landscape and Visual Impact Assessment. Lighting impacts to native fauna are addressed separately within the Projects Flora and Fauna assessment (Chapter 11: Flora and Fauna). There will be limited lighting associated with the construction works (i.e. flashing beacons and temporary spot lights in support of short-duration night works, if required) and operations (i.e. head lamp on rollingstock and safety lighting at road-rail interfaces) stage of the Project. All lighting associated with the construction works stage will be short term in nature and for the operations stage, will exist as pulses of short duration (for rollingstock).</p> <p>Measuring light to assess its effect on fauna is challenging and an emerging area of research and development. There is currently no globally recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species visual system.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, includes as part of proposed mitigations, detailed design will incorporate lighting to the minimal level required to meet operational road and rail safety requirements for the Project.</p>	<p>Chapter 11: Flora and Fauna Sections 11.5 and 11.7</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p> <p>Appendix E: Consultation Report</p>
218	218.0195	Local Government	Outline EMP		<p>Revegetation: Revegetation of the proposed railway corridor should not be based solely on the existing landscape context but on ecological grounds to reinstate native trees in an otherwise cleared landscape. For the draft EIS to not commit to revegetate in areas of previously disturbed agricultural land as a response to a treeless plain is a missed opportunity for the proponent to create a lasting green legacy for this proposed Project.</p> <p>Open agricultural land (treeless plain) should not be a cue for a minimal revegetation response from the proponent but rather be a blank canvas for significant landscape rehabilitation to occur.</p>	<p>The draft EIS should consider the extent of the proposed Project footprint as a quantifiable measure of revegetation based on the original tree species for that location. This will be particularly relevant to deep cut and fill embankments (up to 20 m) which disturb significant areas of landscape covering widths (up to 65-70 m wide) for the rail corridor alone (based on batters 1:1.5 grade). The draft EIS should include a commitment to considering revegetation in all areas affected by the proposed Project including, but not necessarily limited to, rail track service roads and access points</p>	<p>A Rehabilitation and Landscaping Management Plan will be developed as a component of the Construction Environmental Management Plan (CEMP) and will be further refined throughout each stage of the Project, where required.</p> <p>This plan includes location specific rehabilitation objectives, indicators, and success criteria, including native flora species (Chapter 24: Draft Environmental Management Plan). Revegetation of areas affected by the Project will include, but is not limited to, rail track service roads and access points particularly cut and fill embankments (up to 20 m in height or depth).</p> <p>It should be noted that a green corridor of the kind referred to in the submission will also serve as a wildlife corridor, leading to potential increases in wildlife strikes and fatalities.</p> <p>The landscape and visual impact strategy is focused primarily on assisting the Project sit within the existing rural landscape, while having regard for viewpoints including highways and lookouts. It is neither reasonable nor relevant to impose a rural landscape recovery task onto the Project.</p>	Chapter 24: Draft Environmental Management Plan
218	218.0196	Local Government	Outline EMP		<p>Rehabilitation opportunities: The draft EIS does not commit to on-site chipping of felled native vegetation to stockpile and reuse as a mulch/ compost blanket for areas requiring revegetation. Given this, it is not considered that the requirements of TOR 11.162 (assess the proposed management measures against the preferred waste management hierarchy, namely: avoid waste generation; cleaner production; reduce; recycle; reuse) have been appropriately met.</p>	<p>The draft EIS requires amendment to meet the requirements of TOR 11.162 and include on-site chipping of cleared vegetation as a sustainable reuse of the material and to also provide a seed bank for native trees (in some cases). The chipped vegetation should be stockpiled in low mounds to avoid overheating and the subsequent loss of viable seed.</p>	<p>The Draft Soil Management Plan, Soil Management Plan and Rehabilitation and Landscaping Management Plan will include suitable clearing and rehabilitation procedures during detailed design. Such procedures will be developed on a case-by-case basis and may consider mulching, site chipping, recovery of hollow logs, tree trunks and other potential fauna shelters, and seed collection, as well as reuse of excess material for works within the permanent footprint (i.e. additional landscaping). See Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
218	218.0197	Local Government	Outline EMP		<p>Rehabilitation and landscaping: The draft EIS proposes that the rail corridor will be maintained free of woody vegetation as part of the rehabilitation and landscaping activities.</p> <p>It is suggested that this should exclude a suitable buffer of revegetation to be installed in areas where the fill batters are high (3 m) and space is limited beyond the toe of the batter e.g. beside a road alignment or private property.</p>	<p>The draft EIS should be updated to qualify this statement and to allow woody vegetation (trees and tall shrubs) within the rail corridors where fill embankments are high (3 m+) and planted in the lower Section of the bank only (e.g. one-third of batter length). Depending on final batter slope, a 10 m high embankment with a 67% slope (1:1.5) will be at least 33 m wide on the ground footprint. There will be sufficient space to plant out the lower sections of these batters with trees (woody vegetation) as well. This will be in areas which are not considered to pose a bushfire risk (i.e., Whetstone and Bringally State Forests).</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to progressively rehabilitate, and landscape all impacted areas from construction activities in an appropriate manner.</p>	<p>Noted. As stated, Chapter 24: Draft Outline Environmental Management Plan, the rail corridor will be maintained, free of woody vegetation.</p> <p>Reinstatement, stabilisation, rehabilitation and landscaping of disturbed areas will be undertaken progressively as work fronts are completed. The Draft Soil Management Plan, Soil Management Plan and Rehabilitation and Landscaping Management Plan will include suitable clearing and rehabilitation procedures during detailed design. Such procedures will be developed on a case-by-case basis and will be developed in consultation with local councils and affected communities, including Traditional Owners.</p> <p>The landscaping strategy will be developed in the detailed design stage, having regard to operational requirements of the Project, as well as impact management requirements such as erosion control, overland flow and water quality management, bushfire hazards, and fauna connectivity.</p>	Chapter 24: Draft Outline Environmental Management Plan
218	218.0198	Local Government	Editorial		<p>Incomplete information: Table 22.12 is incomplete. TRC has infrastructure that will be impacted by the proposed Project (such as switchboards and pump stations) which have not been included in this Table.</p>	<p>The draft EIS should be amended to rectify Table 22.12 and to either discuss rectification works to be undertaken (e.g. physically increase infrastructure height) or include under commercial/ industrial Access to these sites should also be discussed and managed in a way as to not be adversely impacted.</p>	<p>The flood-impact objectives that have been adopted for the Project are presented in Chapter 24: Draft Outline Environmental Management Plan. These objectives address the requirements of the Terms of Reference, the additional information request issued by the Office of the Coordinator-General and the recommendations issued by the International Panel of Experts for Flood Studies. The flood-impact objectives have been used to guide the development and refinement of the reference design.</p> <p>Chapter 24: Draft Outline Environmental Management Plan, includes Existing habitable and/or commercial and industrial buildings/ premises (e.g. dwellings, schools, hospitals, shops) and sensitive infrastructure. The chapter states that sensitive infrastructure means infrastructure that is an essential service required to operate during emergency events, including water treatment facilities, telecommunications substations and electrical substations.</p>	Chapter 24: Draft Outline Environmental Management Plan

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0199	Local Government	Outline EMP		<p>Groundwater impacts: TRC would like to see some commitment to assessing cause. The draft EIS should specifically mention cause for Groundwater.</p> <p>In regard to the difference in water levels from predicted to modelled (whether good or bad), it would be appropriate for the draft EIS to include a commitment for determining the reason behind the variation and propose possible rectification works. These works should be scheduled early in the construction process in order to ensure water levels do not get worse over the short and long term.</p> <p>Further, water quality is not adequately addressed. The draft EIS does not include a commitment to improving post-construction water quality back to its original condition.</p>	<p>The draft EIS should be amended to address groundwater levels and quality and propose appropriate mitigation measures to ensure risks to levels and quality are managed to ensure that there is no significant residual impact as a result of the proposed Project.</p>	<p>Groundwater level and quality monitoring will occur as part of the Groundwater Management and Monitoring Program (GMMP). The GMMP will be assessed and updated before commencement of each Project stage (Project approvals and corridor acquisition, detailed design, construction works, operations). This program will identify impacts from the Project.</p> <p>All groundwater monitoring data will be assessed on a quarterly basis, initially, to identify trends and compare to trigger levels (baseline and pre-construction). This will also enable the Baseline GMMP to be revised, if required. Monitoring will be targeted in areas where construction activities have potential to impact on groundwater quality and/or levels.</p> <p>Where a groundwater bore is expected to be decommissioned or have access or usage impaired as result of the Project, 'make-good' measures will be agreed in consultation with the affected landowners during detailed design (Chapter 24: Draft Outline Environmental Management Plan).</p>	Chapter 24: Draft Outline Environmental Management Plan
218	218.0200	Local Government	Outline EMP		<p>Design Interfaces with utilities: Table 22.23 outlines mitigation measures for interaction with utilities and the subsequent issues arising from this interaction. The Table lists various regulatory requirements however does not include mention of the policies and standards that the utilities themselves may have in place (e.g. TRC Policy 2.03 and 2.04 for TRC which set standards/rules for water and wastewater infrastructure.)</p>	<p>The draft EIS requires update to include a reference to any standards, policies (or other) which utility owners have in place.</p>	<p>Utilities within the Project footprint will be surveyed and marked prior to the commencement of construction. Protection or relocation of utilities will be conducted in accordance with relevant legislation, Australian standards and guidelines. Designs for utility protection, where necessary, will be developed in consultation with the relevant utility owner and be in accordance with the listed Acts, regulations, guidelines, codes of practice in Chapter 24: Draft Outline Environmental Management Plan.</p>	Chapter 24: Draft Outline Environmental Management Plan
218	218.0201	Local Government	Stakeholder engagement		<p>Stakeholder engagement: Section 4.1.1 provides a brief two paragraph discussion of consultation relating to the Condamine Floodplain, the management of which is a major concern for TRC and the community, with Table 4.2 providing a summary of engagement and issues raised. In comparison, Section 4.1.2 (which discusses the McIntyre Floodplain) provides extensive detail of community consultation measures and actions taken.</p> <p>Appendix C has a very heavy focus on NSW engagement, having committed Sections 5.3 and 5.4 to an in-depth discussion of stakeholder management in relation to NSW local government and community engagement, yet failing to provide the same level of detail for Queensland (Section 5.2.3 provides a brief summary of State Government consultation).</p> <p>Section 2.2 Table 2.3 (B2G Project Key Stakeholders NSW) relates to NSW consultation and is irrelevant to the proposed Project.</p> <p>Further, it is noted that the only information provided relating to the in-depth consultation with TRC is the recording of dates, times and topics. Appendix C, Section 2 'methodology' 2.1 'aims and objectives' states that the aim of the engagement program was to 'inform stakeholders, including the broader community about the Project and the EIS process, seek stakeholder involvement in the development of the design and EIS, and report on how this input was considered.' Given the lack of discussion regarding TRC engagement and the Condamine Floodplain crossings, the proponent is not meeting its own aim (note Section 2.1 only discusses the aim of the engagement program, no objectives are provided).</p> <p>Section 3.1.5.4 (Key findings) states that 'local governments and regional businesses have talked about the strong regional development potential and enhanced connectivity that Inland Rail will bring.' It would be assumed that providing specific detail regarding LGA consultation would be provided here to support this statement.</p>	<p>The lack of information relating to consultation for the TRC area, and in particular, the Condamine Floodplain, indicates that the requirements of the TOR 7.8 to 'describe the consultation that has taken place and how the responses from the community and agencies have been incorporated into the design and outcomes of the Project' has not been achieved. This is also true for TOR 7.9, which requires the inclusion of a public consultation report (as an appendix) 'detailing how the public consultation plan was implemented and the results of the implementation' as Appendix C fails to provide any detail regarding consultation in Queensland.</p> <p>If the lack of information provided in Section 4.1.1 is a direct result of the appointment of the Flood Panel, the draft EIS should discuss this, rather than remaining silent on the issue and leaving the reader to wonder.</p> <p>The lack of information relating to the level of LGA Stakeholder Engagement, reference to the Condamine Floodplain Crossing and Inland Flood Study/ Group, and the inclusion of information relating to NSW, where the Project is NOT located in Appendix C is concerning.</p> <p>The draft EIS should be amended to include discussions with the Queensland local councils which the proposed Project traverses, including detail relating directly to how the proponent intends to address LGA concerns about community impacts, and referencing the sections of the draft EIS which provide the assessments of these impacts.</p> <p>TRC requests to have input into the review and ongoing engagement and consultation plan including the program of consultation.</p>	<p>The revised draft EIS, Chapter 6: Stakeholder Engagement and Appendix E: Consultation Report detail the community engagement undertaken to inform the Condamine River flood model and the floodplain crossing design. This included more than 50 one-on-one and small group meetings with landowners, as well as discussions at broad-scale community engagement events, to capture community knowledge about flood levels to inform the development of hydrologic and hydraulic models and provide validation of the models and to consider in the development of the reference design. In addition, 50 historic flood markers on private property were surveyed.</p> <p>The flood modelling conducted for the Project was reviewed by the Independent International Expert Panel for Flood Studies, appointed by the Australian Government to provide assurance to the public that the flood models and reference design developed by ARTC meet national guidelines and industry best practice. Community safety and the potential impact of Inland Rail on flood behaviour are key concerns of stakeholders along the Inland Rail alignment and the Independent Flood Panel's assessments will assure communities that ARTC flood modelling follows best practice design of waterway structures in a floodplain environment.</p> <p>In addition, the Independent Flood Panel discussed within their Final Report that the current Flood Impact Objectives (FIOs) should be reviewed to be more consistent with those adopted along the Narrabri to North Star alignment. As part of additional assessment and studies conducted for the revised draft EIS, ARTC has assessed all local catchments against the new Flood Impact Objectives (FIOs), which determine the acceptable parameters within which the Project can change or increase the existing flood conditions, including afflux, time of inundation, velocity, hazard and flow directions. In October 2022, ARTC undertook consultation with all landowners that were shown to have the highest exceedances to the FIOs, in order to discuss these potential impacts and allow ARTC to develop mitigations specific to each area or property.</p> <p>Community engagement has influenced the development of the reference design. The Condamine floodplain crossing design has been updated to incorporate community feedback and has been reviewed following recent major flood events.</p> <p>Community feedback, along with input from the Independent International Panel of Experts for Flood Studies has resulting in the following key changes:</p> <ul style="list-style-type: none"> extending the proposed bridge over the North Branch by approximately 250 m north moving the proposed Yandilla rail bridge further south and combining with the proposed Grasstree Creek bridge increasing the number of proposed culverts near Yandilla grain silos to ensure the drainage channel to the south of the silos has sufficient culverts to convey flood water. <p>ARTC will continue to engage with impacted landowners in regard to the results of local catchment modelling through finalisation of the EIS and development of the detailed design. The purpose of this consultation will be to ensure that impacts to property-scale water balance features, such as irrigation channels and dams, are appropriately considered.</p> <p>Consultation with impacted stakeholders will continue through detailed design of the Project to ensure that alterations to the design and its impacts are communicated back to landowners. Impacts are to be determined at all drainage structures and waterways affected by construction works. The change in flood levels and impacts on infrastructure and properties outside the rail corridor must be justified for a range of events up to and including the 1% AEP event, in line with recommendations from the Independent International Panel of Experts for Flood Studies.</p>	<p>Chapter 6: Stakeholder Engagement</p> <p>Appendix E: Consultation Report</p> <p>Section 5.3</p>
218	218.0202	Local Government	Landscape and Visual Amenity		<p>Visual impact: TOR 11.85 requires that the draft EIS 'Describe and illustrate the visual impact of the construction and operation of the Project and 'views should be representative of public and private viewpoints, including places of residence, work and recreation.</p> <p>The draft EIS does not meet the requirements of 11.85. Appendix I fails to adequately discuss key matters (as per Chapter 9) and reference appropriate and latest standards/ guidelines. See previous comments above regarding:</p> <ul style="list-style-type: none"> Sky glow Communities at night (obtrusive light) Outdoor work environments. 	<p>Appendix I should be modified as required to meet TOR 11.85.</p>	<p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. The Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Private dwellings have not been directly assessed within the LVIA (i.e. they are considered with reference to nearby public viewpoints) since isolated private views are typically afforded lower significance in LVIA. However, it is considered that an adequate number of viewpoints have been included to assess representative impacts suitable for EIS stage. As part of the Project's mitigation measures and controls, ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p> <p>Several additional viewpoints have been included in the revised draft EIS. This includes an additional viewpoint assessment and visualisation (Viewpoint 4) assessing potential impacts within Yelarbon with regards to the GrainCorp silo artwork viewing area and the potential provision of noise walls in this location. In addition, an artist's impression showing the potential for mitigation measures in this location to reduce the visual impact/improve visual amenity has been prepared, noting that this is indicative only and the delivery of mitigation measures are subject to detailed design and liaison with relevant landowners and managers. An assessment of each of the proposed construction facilities and miscellaneous site facilities has also been included in the Appendix K: Landscape and Visual Impact Assessment Section 8.2 and 9.1.</p> <p>A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment). This assesses potentially affected sensitive receptors, and discusses potential impacts associated with train headlights and active level crossings.</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. In particular, the revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment for further details.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 6</p> <p>Section 8.2</p> <p>Section 9</p> <p>Section 9.1</p> <p>Section 9.2</p> <p>Section 11</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p>
218	218.0203	Local Government	Flooding		<p>Flooding: The draft EIS makes no acknowledgement of potential impacts to infrastructure other than surface infrastructure as a result of flooding events (either resulting from natural inundation, or as a result of the proposed rail alignment crossing the Condamine Floodplain).</p>	<p>The draft EIS requires amendment to consider flooding impacts to buried assets that could become exposed and damaged by changes to overland flow. TRC request that the OCG impose the following condition:</p> <p>All recommendations from the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland review are to be addressed and implemented into the proponents commitments for the proposed Project.</p>	<p>Noted. ARTC has no objection to the proposed condition however acknowledge that it is the discretion of regulators to determine this.</p> <p>The Flood Sensitive Receptor database has been reviewed to include additional public utility assets such as STPs, Electric Substations etc. as part of the revised draft EIS. If TRC are concerned about any other specific TRC assets not reported on please let us know so we can include those assets.</p> <p>The flood modelling methodology that has been followed is consistent with Australian guidelines and industry standard practice, and is outlined in Section 2 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS. In addition, the flood modelling conducted for the Project has been reviewed by the Independent International Expert Flood Panel, appointed by the Australian Government to provide assurance to the public that the flood models and Reference Design developed by ARTC meet national guidelines and industry best practice as outlined in Section 1.4 of Appendix T1: Hydrology and Flooding Technical Report - Volume 1.</p> <p>The Queensland and Australian governments have accepted the Expert Flood Panel's final report findings that state the flood models and reference designs developed by ARTC accord with the relevant national and state guidelines and industry best practices; adequately identify and mitigate flood risks; and are fit-for-purpose to be taken forward as the basis for the development of detailed designs subject to ARTC implementing the Panel's recommendations.</p> <p>ARTC has actioned Expert Flood Panel recommendations by addressing critical matters prior to finalising the revised draft EIS to further strengthen the flood models for detailed design. Any outstanding modelling issues raised by the Expert Flood Panel, and agreed to be addressed in detailed design, have been identified in the "Additional modelling items to be considered in detailed design" Section of each catchment (Sections 5 to 17) of Appendix T1: Hydrology and Flooding Technical Report - Volume 1 of the revised draft EIS.</p>	<p>Appendix T1: Hydrology and Flooding Technical Report - Volume 1</p> <p>Section 1.4</p> <p>Section 2</p> <p>Section 5 - 17</p>
218	218.0204	Local Government	Groundwater		<p>General comment: Appendix R does not include an assessment of the impact of work camps and depots on groundwater. For example, the assessment fails to mention the location of water supply, stormwater, wastewater disposal (including washdowns).</p>	<p>Appendix R requires update to include an assessment of the impacts of work camps and depots on groundwater.</p>	<p>As part of ARTCs construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing see Chapter 5: Project Description, Section 5.6.24. Currently the hierarchy of water supply source preferences prioritises non-potable sources for construction water (i.e. dust suppression) to minimise impacts to communities and water users. Further, the use of groundwater for construction water is not a preferred water source for the Project. If groundwater is to be sourced for construction water, trading or purchasing of existing allocated entitlements will be pursued in the first instance through a qualified water broker (Chapter 5: Project Description Section 5.6.24). The extracted groundwater volumes shall therefore be within the existing licencing limits that are calculated by the State to protect groundwater resources. Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements.</p> <p>Preliminary consideration of non-resident workforce accommodation facilities has been included in revised draft EIS Chapter 5: Project Description Section 5.6.4. However, the detailed design and assessment of non-residence workforce accommodation will be completed as part of the detailed design stage. Stormwater and wastewater management and disposal will be subject to relevant state and local requirements and impact assessment (including impacts to groundwater) must be completed as part of the approvals process. Table 7.1 of Appendix U: Groundwater Technical Report presents the water quality requirements for the Project including non-resident workforce accommodation.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.6.4</p> <p>Section 5.6.24</p> <p>Appendix B5: Construction Water Requirements</p> <p>Appendix U: Groundwater Technical Report</p> <p>Table 7.1</p>
218	218.0205	Local Government	Editorial		<p>Mapping colour scheme: The mapping legend requires modification to make it easy for the reader to identify between National Parks and State Forest.</p>	<p>The draft EIS requires update to make it easy for the reader to interpret maps.</p>	<p>The colour scheme of Figure 1-1 in Appendix U: Groundwater Technical Report has been amended to improve clarity.</p>	Appendix U: Groundwater Technical Report Figure 1-1
218	218.0206	Local Government	Editorial		<p>Crossing loops: Proposed crossing loops not detailed.</p>	<p>The draft EIS requires update to provide the location of crossing loops (including illustrating on maps as appropriate) and to analyse any additional impacts as a result of proposed crossing loops.</p>	<p>Chapter 5: Project Description, Section 5.4.3 includes the five proposed crossing loops including a diagram of a typical layout of a crossing loop as well as the location of each crossing loop (by chainage). Crossing loops are also illustrated on the maps within Appendix B1: Design Drawings.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4.3</p> <p>Appendix B1: Design Drawings</p>

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0207	Local Government	Groundwater		Lack of modelling: The impacts of bridge structures on groundwater has not been modelled. By this point in the draft EIS there has been nothing to state the depth of the piling works and whether there will be an impact to groundwater. The depths would be used to determine if further assessment is required and to demonstrate that further assessment is or is not required.	The draft EIS requires amendment to appropriately model and discuss the potential impact of bridge structures on groundwater as a result of proposed Project activities.	Consideration of impacts to groundwater resulting from the bridge structures is presented in Section 8.1 of Appendix U: Groundwater Technical Report, including estimates of groundwater extraction as part of the piling process. Bridge and piling groundwater impact information has been brought into the main body of the revised draft EIS Chapter 15: Groundwater Section 15.6 and Table 15-17 and 15-18, as well as Appendix U: Groundwater Technical Report, Section 7.1.1 and 7.2.1.	Chapter 15: Groundwater Section 15.6 Table 15-17 Table 15-18 Appendix U: Groundwater Technical Report Section 7.1.1 Section 7.2.1
218	218.0208	Local Government	Editorial		Summary of springs: Some of the springs would be expected to have a higher than "low" potential GDE. This information is not clearly illustrated on mapping.	The draft EIS requires amendment to include mapping which shows the location of these springs.	The summary of springs in the revised draft EIS can be found in Appendix U: Groundwater Technical Report, Table 4.18. These springs are not seen on Figure 4-27 as they are outside the extent viewable on the figures.	Appendix U: Groundwater Technical Report Table 4.18 Figure 4-27
218	218.0209	Local Government	Editorial		Incongruency between text and figures: Section 4.5 states a maximum elevation of 595 m (near Southbrook) but Figures 4.1a through 4.1d do not indicate this. Figures 4.1d (which covers the Southbrook area) has a high point contour of 400 m.	The draft EIS requires amendment to include the contours which appear to be missing and that would show the higher elevations as stated in Section 4.5.	Figure 4.1a-d in Appendix U: Groundwater Technical Report only labels contours up to 400 m due to the extent that is used to display the Figure and the density of contours above this height, which are displayed, however are not labelled. Figure 4: Landform and hydrological context in Appendix K: Landscape and Visual Impact Assessment Technical Report displays the landform in the digital elevation method and shows the elevation up to 750 m AHD.	Appendix K: Landscape and Visual Impact Assessment Technical Report Figure 4 Appendix U: Groundwater Technical Report Figure 4.1a-d
218	218.0210	Local Government	Editorial		Regional salinity: Areas of high and moderate salinity risk have been identified as present within the proposed Project footprint. However, this risk has not been addressed in Appendix R.	The draft EIS requires update to appropriately discuss and address salinity risk.	Regional salinity in the existing environment has been discussed (see Appendix U: Groundwater Technical Report, Section 4.7.3). As mentioned in Section 8.1 (Table 8.1), groundwater sampling was conducted at the 37 monitoring bores installed for the collection of baseline water quality and assessment of the salinity parameters is ongoing. The data will be used to establish baseline conditions and water quality objectives for the Project.	Appendix U: Groundwater Tech Report Section 4.7.3 Section 8.1 Table 8.1
218	218.0211	Local Government	Groundwater		Section 8 general comments: Section 8 of Appendix R does not meet the requirements of TOR 5.1 as: <ul style="list-style-type: none"> Proposed mitigation measures for impacts to existing bore water supplies are in general terms and do not appropriately address specific issues. Table 8.1 provides total volume of construction water for the proposed Project. Construction water usage may have been better represented in order to accurately evaluate water requirements for the construction of the proposed Project. Without providing specific details regarding existing groundwater allocations versus the ability to use those allocations, Section 8 remains vague. Mitigation measures for impacts to existing drinking water supplies are not appropriately addressed. 	The draft EIS requires update accordingly and in order to meet the requirements of TOR 5.1.	Groundwater predictive modelling conducted for the revised draft EIS indicates drawdown will be localised around the vicinity of the deep cuts where no registered bores have been identified. No regional groundwater drawdown is anticipated. ARTC has undertaken a bore survey to identify any unregistered bores that may be impacted from the Project (Chapter 15: Groundwater, Section 15.6.2). ARTC will continue to engage with groundwater users/ landholders to determine an appropriate make-good mitigation strategy for impacted bores on a case-by-case basis (Chapter 15: Groundwater, Section 15.7.4). As part of ARTC's construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing (Chapter 5: Project Description, Section 5.6.24). Currently the hierarchy of water supply source preferences prioritises non-potable sources for construction water (i.e. dust suppression) to minimise impacts to communities and water users (Chapter 5: Project Description, Section 5.6.24). Further, the use of groundwater for construction water is not a preferred water source for the Project. Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements Report. The revised draft EIS has been updated with information as applicable, including how and when specific issues will be addressed.	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Section 15.7.4 Table 15-20 Appendix B5: Construction Water Requirements Report
218	218.0212	Local Government	Groundwater		Impacts to groundwater: Section 1.7 of Appendix R states that the impact assessment area has been established to delineate the spatial extent for the groundwater assessment generally defined as the area within a one-kilometre (1 km) distance from the centreline of the proposed Project alignment. The 1 km distance from the centreline is considered to be an inadequate distance to appropriately assess groundwater characteristics and identify impacts to groundwater from the proposed Project. Groundwater impacts may surface a substantial time after the construction of the proposed Project, and the draft EIS should acknowledge this. Further, mitigation measures are not addressed well enough. Comments like makes good do not identify the specific groundwater impacts as a result of the proposed Project or identify the specific and appropriate mitigation measures to be adopted. Section 8 does not provide any specific detail regarding impacts from the proposed Project to the water supply at regional township TRC bores/drinking water infrastructure e.g. the Millmerran water supply is not sufficient to provide the town with water and construction water for the proposed Project. As a result, the draft EIS does not meet the requirements of TOR 5.1.	In regional townships (such as Millmerran and Brookstead), TRC water supplies are 100% depends on the groundwater bores located adjacent to the proposed Project alignment. There seems to be no specific assessment provided in the draft EIS which directly addresses impacts on these community drinking water bore supplies. Mitigation measures to maintain drinking water supply should be identified and described prior to the community experiencing adverse impacts to groundwater supply as a result of proposed Project activities (such as cuts/ fills). The draft EIS requires amendment to appropriately assess and model impacts to groundwater with more specific references and proposed commit to appropriate mitigation measures to overcome any impacts to community water supplies as a result of the Project activities, including the consideration of alternate construction water supplies. As impacts to groundwater could be experienced by the community a substantial time after the construction of the proposed Project, TRC requests that the OCG impose the following condition: The proponent is required to commit to appropriately addressing groundwater impacts to regional townships resulting from proposed Project activities and to adequately reflect the time scale during which these adverse impacts may be experienced and to provide appropriate mitigation measures to ensure these impacts are managed to ensure that there is no significant residual impact to groundwater from the proposed Project.	As part of ARTC's construction water planning process, construction water procurement studies have been undertaken and further investigation is ongoing (Chapter 5: Project Description, Section 5.6.24). Currently the hierarchy of water supply source preferences prioritises non-potable sources for construction water (i.e. dust suppression) to minimise impacts to communities and water users (Chapter 5: Project Description, Section 5.6.24). Further, the use of groundwater for construction water is not a preferred water source for the Project. Should the Project access groundwater, it would be secured through private agreement, the licenced capacity of existing bores will not be exceeded. Flow and volume monitoring during extraction will be required for each bore, with extraction logs maintained (Chapter 15: Groundwater, Table 15-20). Detailed discussion of ARTCs approach to construction water is outlined in Appendix B5: Construction Water Requirements Report. Groundwater predictive modelling conducted for the revised draft EIS indicates drawdown will be localised around the vicinity of the deep cuts and limited to the construction works stage. No regional groundwater drawdown is anticipated. The inputs and results of the numerical predicative groundwater modelling has been reviewed as part of the revised draft EIS (Chapter 15: Groundwater, Section 15.6.2). The model has been revised to reflect the design changes and to include additional data collected. The mitigation measures detailed in Chapter 15: Groundwater, Section 15.7 have been reviewed and revised to reflect the current understanding of potential impacts to groundwater relating to the Project.	Chapter 5: Project Description Section 5.6.24 Chapter 15: Groundwater Section 15.6.2 Section 15.7 Table 15-20 Appendix B5: Construction Water Requirements Report
218	218.0213	Local Government	Editorial		Crossing loops: The draft EIS does not detail proposed crossing loops.	The draft EIS should be amended to provide locations and maps of crossing loops and to analyse any additional impact in relation to these.	Chapter 5: Project Description, Section 5.4.3 includes the five proposed crossing loops including a diagram of a typical layout of a crossing loop as well as the location of each crossing loop (by chainage). Crossing loops are also illustrated on the maps within Appendix B1: Design Drawings.	Chapter 5: Project Description Section 5.4.3 Appendix B1: Design Drawings
218	218.0214	Local Government	Editorial		Topography: The maximum elevation is stated as being 595 m near Southbrook, however Figures 4.1a-d does not indicate this. Figures 4.1d (which covers the Southbrook area) has a high point contour of 400 m. There appears to be contours missing that would show the higher elevations as stated in Section 4.5.	The draft EIS requires amendment to include the missing contours.	Figure 4.1a-d in Appendix U: Groundwater Technical Report only labels contours up to 400 m due to the extent that is used to display the Figure and the density of contours above this height, which are displayed, however are not labelled. Figure 4: Landform and hydrological context in Appendix K: Landscape and Visual Impact Assessment Technical Report displays the landform in the digital elevation method and shows the elevation up to 750 m AHD.	Appendix K: Landscape and Visual Impact Assessment Technical Report Figure 4 Appendix U: Groundwater Technical Report Figure 4.1a-d
218	218.0215	Local Government	Groundwater		Impacts of work camps on groundwater: Appendix R does not include an assessment of the impact proposed work camps and depots will have on groundwater. For example; water supply, stormwater, wastewater disposal (including washdown) and locations should all be considered.	Appendix R requires updating to consider and appropriately mitigate these impacts.	As described in Section 5.6.3 of Chapter 5: Project Description of the revised draft EIS, ARTC has undertaken an initial assessment of workforce demand and has identified the potential need for two non-resident workforce accommodation facilities to accommodate the forecast construction workforce. Locations for these facilities that will meet the Project's safe commutable distances requirements are likely to be in proximity to the townships of Yelarbon, Inglewood, and Millmerran. The selection criteria for the location of the non-resident workforce accommodation facilities included: <ul style="list-style-type: none"> The proximity of the accommodation facilities to likely construction sites for fatigue management purposes (maximum desirable commute of 30 mins) Land tenure, ownership, road access, and area of the site Proximity to supporting infrastructure and services, such as water and electricity Likelihood of social, environmental and heritage related impacts Potential for planned future developments. Based on these criteria, two properties have been identified as suitable for the establishment of non-resident workforce accommodation facilities. While possible locations for three non-resident workforce accommodation facilities have been identified, not all locations may be required or nominated by the appointed Contractor. The location, capacity and layout of the accommodations are required will be confirmed and finalised by the Contractor during the detailed design stage of the Project. As mentioned in Section 3.4.5 of Chapter 3: Legislation and Project Approval Process, non-resident workforce accommodation secondary approvals will be sought separately to the approvals sought through the revised draft EIS and will be obtained prior to accommodation establishment works commencing. Table 7.1 of Appendix U: Groundwater Technical Report presents the water quality requirements for the Project including non-resident workforce accommodation.	Chapter 5: Project Description Section 5.6.3 Appendix U: Groundwater Technical Report Table 7.1
218	218.0216	Local Government	Waste and Resource Management		Toowoomba Waste Management Centre listed: It is correct that the TWMC is able to accept materials however where there are likely to be significant quantities disposed, prior discussions with TRC are required in order to ensure that the site is capable of managing the material.	The draft EIS requires update to include provisions for prior discussions with the waste facility owner/ operator where there are significant quantities to be disposed in order to confirm that materials can be accepted.	ARTC acknowledges Toowoomba Regional Council's request for further discussions regarding waste management and designated facilities. Preliminary discussions have been undertaken between ARTC and potential receivers of materials arising from the Project. These consultations will be ongoing and will inform more detailed planning for the Project as it progresses through detailed engineering and execution stages.	N/A
218	218.0217	Local Government	Waste and Resource Management		Waste Levy: The draft EIS indicates that unsuitable spoil may be exempt from the waste levy and be acceptable as clean fill for day cover at the landfill.	The proponent should note that the application of the waste levy on materials is required by the Waste Reduction and Recycling Act 2011 (and Regulation). It cannot necessarily be assumed that all spoil will be exempt, particularly when working near previously disturbed lands. Normal published gate fees at waste facilities will apply at the time of disposal.	Chapter 22: Waste and Resource Management, Section 22.2, Table 22-1 states that under new laws provided for Queensland, levy zones and non-levy zones are stipulated. Under the new laws, waste disposal from the Project will be subject to a fee, as the Project is located within a levy zone. It is anticipated that some waste types will be automatically exempt from the levy under Section 26 of the <i>Waste Reduction and Recycling (Waste Levy) Amendment Act 2019</i> [Qld], including clean earth.	Chapter 22: Waste and Resource Management Section 22.2 Table 22-1

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
218	218.0218	Local Government	Editorial		Robust commitments required from proponent: in accordance with changes to the draft EIS proposed above, Appendix Z will require update accordingly.	Appendix Z requires update to include the relevant and robust commitments provided by the comments above.	Chapter 24: Draft Outline Environmental Management Plan have been updated as part of the revised draft EIS and contain all the mitigations measures, monitoring and reporting requirements, management plans, and commitments proposed throughout the EIS.	Chapter 24: Draft Outline Environmental Management Plan
218	218.0219	Local Government	Landscape and Visual Amenity		<p>Lighting commitments: TOR 11.87 requires that the draft EIS "describe any proposed measures to avoid, minimise or mitigate potential impacts on landscape character and visual amenity.</p> <p>Similarly, TOR 11.96 requires that the draft EIS "describe any proposed measures to avoid, minimise or mitigate potential impacts on natural values, and enhance these values" in particular, address measures to protect or preserve any threatened or near-threatened species.</p> <p>The draft EIS does not meet TOR 11.87 or 11.96 as a proponent commitment that would recognise the need for measures to avoid, minimise or mitigate potential impacts of light at night on visual amenity and wildlife has not been provided.</p> <p>Appendix Z does not include any lighting commitments under the specific Project matters of:</p> <ul style="list-style-type: none">Visual amenityFlora and faunaHazard and risk.	<p>Appendix Z should be updated to include specification of commitments related to minimising negative impacts arising from lighting in these sections: Visual Amenity, Flora and Fauna, Hazard and Risk.</p> <p>The Landscape and Visual Impact Assessment (LVIA) has been conducted in line with the methodology outlined in Section 4.0 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment and has assessed impacts associated with the proposed route from a variety of publicly accessible representative viewpoint locations considered to communicate the potential of impacts on landscape and visual values associated with the Project. A broad range of representative viewpoints has been selected across the LVIA study area to represent a range of impacts. An assessment of each of the proposed construction facilities and miscellaneous site facilities has also been included in the Appendix K: Landscape and Visual Impact Assessment Section 8.2.</p> <p>Potential impacts associated with the Project, including Project lighting, are identified in Section 6 of Appendix K: Landscape and Visual Impact Assessment. A qualitative lighting assessment has been undertaken as part of the LVIA as outlined in Section 4.10 of Appendix K: Landscape and Visual Impact Assessment. The qualitative lighting impact assessment within the LVIA report has been updated to include reference of potential impacts associated with transient lighting due to train headlights (refer Section 9: Lighting Impact Assessment of Appendix K: Landscape and Visual Impact Assessment). The reference to AS 4282 has also been updated.</p> <p>In addition, an Obtrusive Lighting Assessment (OLA), a quantitative assessment, has been prepared by a lighting engineer to support the LVIA (refer Section 9.2 and Appendix 3: Obtrusive Lighting Assessment of Appendix K: Landscape and Visual Impact Assessment).</p> <p>With regards to lighting impacts on visual receptors, the qualitative desktop assessment of potential Project lighting impacts concluded that the proposed Project and associated infrastructure are unlikely to create any measurable impacts associated with obtrusive lighting into the external environment as a result of the likely construction activities or permanent Project lighting on representative viewpoint locations.</p> <p>Section 11 of the revised draft EIS Appendix K: Landscape and Visual Impact Assessment provides discussion of mitigation measures and controls that have been incorporated into the revised reference design development process, as appropriate and where possible, as well as those measures that are proposed to be adopted for future stages of Project delivery. In particular, the revised draft EIS contains several recommendations regarding mitigating the visual impact of lighting for consideration during detailed design. Please refer to Section 11.23 and Appendix 3: Obtrusive Lighting Assessment for further details of Appendix K: Landscape and Visual Impact Assessment.</p> <p>Impacts of lighting on wildlife, as well as livestock and poultry, are not part of the Landscape and Visual Impact Assessment. Lighting impacts to native fauna are addressed separately within the Border to Gowrie Flora and Fauna assessment as detailed in Chapter 11: Flora and Fauna, which summarises there will be limited lighting associated with the construction (i.e. flashing beacons and temporary spot lights in support of short-duration night works, if required) and operation (i.e. head lamp on rollingstock and safety lighting at road-rail interfaces) of the Project. All lighting associated with the construction works stage will be short term in nature and for the operations stage, will exist as pulses of short duration (for rollingstock).</p> <p>Measuring light to assess its effect on fauna is challenging and an emerging area of research and development. There is currently no globally recognised standard method for monitoring light for wildlife. Artificial lighting may have a range of impacts across different groups of taxa and between species within these groups, which is ultimately dependent upon a species visual system.</p> <p>Negative impacts arising from Project lighting will be minimised by the mitigation measures outlined in Appendix K: Landscape and Visual Impact Assessment. In particular, the following commitment in relation to visual amenity has been stated: "while ensuring the construction and operational safety is not compromised, Australian Rail Track Corporation (ARTC) would seek to minimise light emissions from the Project (during construction and operation) by select placement, configuration and direction of lighting to reduce potential impacts to the surrounding environment, where practicable, in accordance with Australian Standards. " In addition, ongoing consultation with affected private landowners will be undertaken to determine appropriate opportunities for at-property mitigation measures and treatments.</p>	<p>Appendix K: Landscape and Visual Impact Assessment</p> <p>Section 4.0</p> <p>Section 4.10</p> <p>Section 6</p> <p>Section 8.2</p> <p>Section 9</p> <p>Section 9.2</p> <p>Section 11</p> <p>Section 11.2</p> <p>Appendix 3: Obtrusive Lighting Assessment</p> <p>Chapter 11: Flora and Fauna</p>	
218	218.0220	Local Government	Flora and Fauna	Survey effort/ field investigation data	<p>It is in the public interest that the draft EIS be updated to acknowledge the local and environmental importance of patches of remnant vegetation and commit to providing an appropriate mechanism to allow their retention and protection from direct impact by the proposed Project and should specifically commit to the protection of the areas mentioned in this comment.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>"The proponent is required to acknowledge and protect patches of remnant vegetation and provide an appropriate mechanism to allow their retention and protection from adverse impacts relating to proposed Project activities."</p>	<p>Remnant vegetation: Scrutiny of the design drawings for the proposed Project identifies likely impacts to remnant vegetation worthy of retention for ecological and cultural importance. This includes vegetation within road and rail reserves as well as patches of remnant vegetation. These are generally smaller isolated areas which are not currently mapped but should be identified through site survey, and includes:</p> <ul style="list-style-type: none">Gore Highway – remnant roadside trees;Southbrook west of Geitz Road - Koala habitat trees;Murlaggan – remnant patches in heavily cleared areas;Brookstead – Ware Road trees along railway;Condamine River – significant remnant vegetation at both crossings;Grasstree Creek remnant riparian vegetation;Owen's Scrub Road;Back Creek - remnant riparian vegetation;Bringally Creek – remnant riparian vegetation; andNative Dog Creek – remnant riparian vegetation. <p>As a result, the draft EIS fails to meet the requirements of TOR 5.1.</p>	<p>Where impacts cannot be avoided (e.g. clearing of remnant vegetation or habitat for a threatened species), mitigation and management measures will be implemented (Chapter 11: Flora and Fauna). ARTC will minimise clearance of remnant vegetation to that necessary for construction, and ensure all necessary permits and approvals are in place prior to the commencement of construction.</p> <p>As per revised draft EIS Chapter 11: Flora and Fauna, Greenfield components of the Project have been aligned to minimise the extent of impact to remnant vegetation, and the number of watercourses traversed by the Project. Clearing of remnant vegetation will be restricted to the minimum required to enable the safe construction, operation and maintenance of the rail corridor, including minimising the disturbance of sensitive areas such as:</p> <ul style="list-style-type: none">Habitat for 'critically endangered', 'endangered' and 'vulnerable' flora and fauna speciesEndangered' and 'of concern' REs and HVRRiparian vegetationSteep slopesAlong riverbanks. <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The three key considerations in investigating the proposed rail corridor options and selecting the preferred rail corridor were:</p> <ul style="list-style-type: none">Ability to enhance the Inland Rail service offeringconstruction and operating costsMulti-criteria analysis (MCA). <p>As described in Section 2.8 and Section 2.9 of Chapter 2: Project Rationale, a comprehensive review and assessment of potential alignment options was undertaken. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in EIS, Appendix E: Consultation Report), and the findings of environmental and engineering investigations.</p> <p>Since the draft EIS was released for public notification, a number of alignment changes have been made in response to direct engagement with various State and Commonwealth agencies, public submissions on the draft EIS, and engagement with key stakeholders and community groups. This engagement has been recorded in Appendix E: Consultation Report. Refer to Appendix B3: Changes to reference design since draft EIS to reflect the alignment maturity.</p>	<p>Chapter 2: Project Rationale</p> <p>Section 2.8</p> <p>Section 2.9</p> <p>Appendix B3: Changes to Reference Design since draft EIS</p> <p>Appendix E: Consultation Report</p> <p>Section 5.1</p> <p>Section 5.10</p>
218	218.0250	Local Government	Traffic and Transport	operational traffic	<p>Project access roads TRC approval required for access to local roads: The draft EIS identifies 11 locations within the TRC region where Project access roads are proposed to be constructed from local roads to facilitate access to laydowns and construction sites, with most of these being retained for future rail maintenance access.</p> <p>The draft EIS acknowledges that the Department of Transport and Main Roads (TMR) approval will be required for access roads from State roads but it fails to recognise local government approval is also required for Project access from local roads.</p> <p>As a road authority, TRC has statutory powers to manage works on roads and to impose reasonable and relevant conditions in relation to those works.</p> <p>Further to this, the mitigation strategies provided were not prepared in close consultation with relevant local governments (TRC) (as required by TOR 11.116).</p>	<p>The draft EIS should be updated to acknowledge that local government approval is required for Project access from local roads, provide detail regarding appropriate mitigation measures for Project access from local roads, and describe how these mitigation measures were developed in consultation with TRC.</p> <p>The proponent should work towards reaching agreement with TRC no less than six months prior to the commencement of construction.</p> <p>TRC requests that the OCG impose the following condition:</p> <p>The proponent is required to consult with TRC regarding all aspects of the construction and location of Project access roads and to reach written agreement with TRC in relation to this access at least six months prior to the commencement of any construction activities.</p> <p>Further to this, the proponent must also develop suitable plans for Council's consideration which addresses, without limitation, matters such as:</p> <ul style="list-style-type: none">Prior approval for use of local roads for any and all parts of the ProjectRelevant road impact assessments and safety auditsCondition and operational assessments before, during and post-constructionDemonstrating how safety of all other road users (including travelling public and pedestrians) will be maintained/ managed on public roads during constructionHow local roads will be adequately maintained during construction to a safe and reasonable standard for all activities being undertaken (at no cost to Council) <p>All roads and road-related infrastructure used for any part of the Project, will only be accepted as returned to Council if it is in a condition at least the same as, or better than, the condition the road or road-related infrastructure was in prior to the commencement of any part of the Project.</p>	<p>Once the construction routes have been confirmed at the next stage of the Project, relevant road authorities would be consulted and any alternate construction routes agreed on prior to finalising the Traffic Management Plan. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority.</p> <p>Revised draft EIS Appendix AA: Traffic Impact Assessment, Section 6.2 contains a summary of commitments made by ARTC and the Contractor within Appendix AA: Traffic Impact Assessment. Key relevant commitments include:</p> <ul style="list-style-type: none">ARTC will draft and finalise a Road use Management Plan for construction activities. The RUMP will be developed in consultation with the relevant department officers prior to construction commencing.Ensure confirmed road alterations and resulting diverted traffic is accommodated sufficiently and the operations of existing Intersection s and road links are not worsened.ARTC will consult, discuss and agree on approach with road authorities where assessments flag existing issues to determine appropriate mitigation measures provided by the Project. <p>The agreed arrangements to deal with impacted pavements as a result of construction will exist between the Road Manager and ARTC.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 6.2</p>
218	218.1500	Local Government	Groundwater		Lack of consideration for localised risk: The magnitude of significance appears to be focused on the overall proposed Project and does not consider localised risk.	The draft EIS should be amended to appropriately consider the localised risk for the large cuttings, as this risk would be higher than that currently reported.	<p>The impact assessment methodology in Appendix U: Groundwater Technical Report, Section 3.2 defines the impact magnitude, durations/timeframes, and sensitivity that inform the significance assessment. Table 3.2 in Appendix U: Groundwater Technical Report details the magnitude of impact classifications adopted and are based on the size/distribution of the impact (e.g. extremely localised to widespread impacts).</p> <p>Predicative groundwater modelling was conducted for deep cuts likely to intersect groundwater and indicated only localised drawdown around the vicinity of select deep cuts which intersect groundwater (see Appendix U: Groundwater Technical Report, Section 6.3.5). This modelling focused on localised risk.</p>	Appendix U: Groundwater Technical Report Section 3.2 Section 6.3.5 Table 3.2
219	219.0001	Private	Traffic and Transport	Infrastructure crossings/ interaction	Concern that the passing loops for 1.8 km long trains are located within 1 km of Owns Scrub Road and that the passing loops for 3.6 km long trains will extend across Owens Scrub Road in the future	Ensure the location of the passing loops meets the Design specifications in Section 5.2.1 to ensure a) no level crossings across loops and b) sufficient road vehicle sighting distance from the loops	<p>As part of the revised reference design, Owen Scrub Road is now proposed as a road over rail grade separation (310-38-P-3b) with surround road upgrades. This replaces the previously proposed active level crossing within the draft EIS. The new crossing loop location is approximately 2.5 km east of Owen Scrub Road, which is now a grade separated road-rail interface. The new crossing loop location is approximately 2.5 km east of Owen Scrub Rd and meets all performance specifications as outlined in Table 5-4 in Chapter 5: Project Description of the revised draft EIS. Therefore no delay for road traffic at this location is anticipated.</p> <p>The revised draft EIS Chapter 5: Project Description, Section 5.2 describes the operation of the double-stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains is not part of the proposal for which approval is being sought.</p>	Chapter 5: Project Description Table 5-4 Section 5.2
219	219.0002	Private	Traffic and Transport	Level crossing	The EIS is contradictory and describes the treatment for Owens Scrub Road to be active in Appendix T, Section 2.4 and passive in Section 5.2.7.1	Clarify the level crossing treatment for Owens Scrub Road	As part of the revised reference design, Owen Scrub Road is now proposed as a road over rail grade separation (310-38-P-3b) with surround road upgrades Appendix AA: Traffic Impact Assessment. This replaces the previously proposed active level crossing within the draft EIS.	Appendix AA: Traffic Impact Assessment
219	219.0003	Private	Traffic and Transport	Level crossing	The close proximity of the Yandilla passing loop to Owens Scrub Road will result in trains decelerating over Owens Scrub Road and increase level crossing delays for road traffic from 3 minutes to up to 5 minutes.	ARTC needs to be challenged about the construction, operation and future extension of this crossing loop and they need to acknowledge these design implication and deficiencies and demonstrate what mitigation measures - if any are possible - they will undertake to address this major issue.	<p>As part of the revised reference design, Owen Scrub Road is now proposed as a road over rail grade separation (310-38-P-3b) with surround road upgrades. This replaces the previously proposed active level crossing within the draft EIS. The new crossing loop location is approximately 2.5 km east of Owen Scrub Road, which is now a grade separated road-rail interface. The new crossing loop location is approximately 2.5 km east of Owen Scrub Rd and meets all performance specifications as outlined in Table 5-4 in Chapter 5: Project Description of the revised draft EIS. Therefore no delay for road traffic at this location is anticipated.</p> <p>The revised draft EIS Chapter 5: Project Description, Section 5.2 describes the operation of the double stacked rollingstock up to 1,800 m long. Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
219	219.0004	Private	Traffic and Transport	Level crossing	Owens Scrub Road is very important to local and regional people and it is unacceptable to contemplate that emergency service vehicle could be delayed by a slow moving train across the level crossing.	ARTC needs to be challenged about the construction, operation and future extension of this crossing loop and they need to acknowledge these design implication and deficiencies and demonstrate what mitigation measures - if any are possible - they will undertake to address this major issue.	As part of the revised reference design, Owen Scrub Road is now proposed as a road over rail grade separation (310-38-P-3b) with surround road upgrades, Appendix AA: Traffic Impact Assessment. This replaces the previously proposed active level crossing within the draft EIS. The new crossing loop location is approximately 2.5 km east of Owen Scrub Rd and meets all performance specifications as outlined in Table 5-4 in Chapter 5: Project Description of the revised draft EIS. Therefore no delay for road traffic at this location is anticipated. The revised draft EIS Chapter 5: Project Description, Section 5.2 describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains is not part of the proposal for which approval is being sought.	Chapter 5: Project Description Section 5.2 Table 5-4 Appendix AA: Traffic Impact Assessment
219	219.0005	Private	Traffic and Transport	Level crossing	Concerns that the Yandilla Passing loop could extend over Owens Scrub Road and result in up to 5 hours of road closure per day	ARTC needs to be challenged about the construction, operation and future extension of this crossing loop and they need to acknowledge these design implication and deficiencies and demonstrate what mitigation measures - if any are possible - they will undertake to address this major issue.	As part of the revised reference design, Owen Scrub Road is now proposed as a road over rail grade separation (310-38-P-3b) with surround road upgrades, Appendix AA: Traffic Impact Assessment. This replaces the previously proposed active level crossing within the draft EIS. The new crossing loop location is approximately 2.5 km east of Owen Scrub Road, which is now a grade separated road-rail interface. The new crossing loop location is approximately 2.5 km east of Owen Scrub Rd and meets all performance specifications as outlined in Table 5-4 in Chapter 5: Project Description of the revised draft EIS. Therefore no delay for road traffic at this location is anticipated. The revised draft EIS Chapter 5: Project Description, Section 5.2 describes the operation of the double stacked rollingstock up to 1,800 m long. The planning approval for Inland Rail will only allow for development consistent with that Project description and does not include longer trains. ARTC note that as part of the rail network, trains of various lengths and configurations up to 1,800 m will use different parts of the system. It is important to note that 3,600 m trains is not part of the proposal for which approval is being sought.	Chapter 5: Project Description Section 5.2 Table 5-4 Appendix AA: Traffic Impact Assessment
220	220.0001	Private - Brookstead	Social Impact Assessment	Modelling	<ul style="list-style-type: none"> The stakeholder engagement activity surveying landowners, community members, business owners and community organisations in the Toowoomba and Goondwindi LGAs, had a very few residents from the impacted communities participate as it was poorly advertised and promoted by ARTC within the region. The SIA survey does not represent views of the community members who may be impacted by the Project. 	The submitter raised concerns that the EIS doesn't meet the objectives of the land Section of the TOR: Development should be designed and operated to:(a) improve environmental outcomes(b) contribute to community wellbeing(c) contribute to social, economic and environmental sustainability(d) mitigate impacts to the natural landscape and visual amenity.	<p>This survey's purpose was to inform the initial scoping process for the Social Impact Assessment (SIA), to identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2).</p> <p>Revised draft EIS Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did not a statistically valid result in context with the SIA study area's population, but provided insights on local values and views to assist development of the SIA scope.</p> <p>Appendix X: Social Impact Assessment has been determined as meeting the Terms of Reference by the Coordinator-General. The survey is only one of a several stakeholder engagement processes which informed the scope of the Social Impact Assessment. As such, repetition is not necessary.</p> <p>ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert and Calvert to Kagaru Projects are located. The first survey in the SIA study area was conducted in May 2022, and repeated in May 2023. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2).</p>	Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2
220	220.0002	Private - Brookstead	Social Impact Assessment	Mitigation measures	No detail is provided about how the social impacts identified will be minimised or mitigated and as such, the draft EIS is incomplete according to TOR condition 11.140.	The submitter raised concerns that the future views don't consider the noise barriers.	<p>Measures outlined in Chapter 24: Draft Outline Environmental Management Plan of the revised draft EIS are designed to avoid or mitigate environmental impacts such as noise, vibration, dust and changes to visual amenity which could otherwise affect quality of life or community wellbeing. Notwithstanding, whilst construction activities are occurring, the Project could impact on community values that support wellbeing.</p> <p>Section 8 of revised draft EIS Appendix X: Social Impact Assessment provides a comprehensive Social Impact Management Plan addressing identified impacts across the following categories: community and stakeholder engagement, workforce management, housing and accommodation, community wellbeing and local business and industry.</p> <p>The timing for development of the Community Wellbeing Plan (during detailed design stage), as outlined in Appendix X: Social Impact Assessment, Section 8.5.6, acknowledges that a process of deliberation with key stakeholders is required to develop the plan, including the respective responsibilities of stakeholders for delivery of specific initiatives. Both ARTC and the Contractor, along with Councils, Government agencies and community organisations, will have a role in plan implementation, with a consultation process required to confirm stakeholder involvement.</p> <p>ARTC has continued engagement with Councils regarding initiatives to be articulated in the Community Wellbeing Plan during the EIS display and post display period. The results of this consultation have been added to Appendix X: Social Impact Assessment, Section 8.5.6.</p>	Chapter 24: Draft Outline Environmental Management Plan Appendix X: Social Impact Assessment Section 8 Section 8.5.6
220	220.0004	Private - Brookstead	Noise and Vibration	operational rail noise	ARTC has not provided sufficient information to the communities of details surrounding the impacts of the train noise and vibration and have not considered feasible alternatives for noise and vibration solutions to move the rail further from the residences in the communities. This is in direct violation of Section 6.7 of the TOR.	The incomplete nature of the draft EIS as indicated in Table 23.5. The true noise and vibration impact on the communities from B2G cannot be determined until the details of the Project footprint, level crossing design, utilities, signalling and communication, vertical alignment of the railway, bridge structure design, and fencing strategy have been completed. As with all prior interactions with the proponent, the detail is scant and is 'not yet available'.	<p>The operational railway noise and vibration modelling has been undertaken in accordance with the Department of Transport and Main Roads' Interim Guideline – Operational Railway Noise and Vibration (March 2019). The assessment methodology for noise and vibration from railway operations is comprehensively explained in Appendix W: Noise and Vibration Assessment - Railway Operations, Section 4. As part of the assessment, a detailed noise prediction model was developed for the calculation of airborne railway noise levels from rollingstock operations and associated sources of noise, including idling trains at crossing loops, and level crossings (assessed separately).</p> <p>Operational noise mitigation measures are recommended in Section 16.10 of Chapter 16: Noise and Vibration and Section 17 of Appendix W: Noise and Vibration Assessment – Railway operations. There will be engineering and vibration acoustic assessment works (including noise modelling) undertaken during the detailed design and construction works stages of the Project. However, concept noise barriers have been presented in Appendix W: Noise and Vibration Assessment - Railway Operations (Section 17.4).</p> <p>The preferred location for the proposed rail corridor (as presented in the revised draft EIS Chapter 2: Project Rationale, Section 2.8 and 2.9) was identified based on an analysis of multiple corridor options, with the preferred alignment presenting the strongest benefits for industry, environment and the community. The design development process used a combination of technical assessments and the ARTC multi-criteria analysis tool, which is used across Inland Rail's program of works. The option selection and design process considered the issues raised during consultation with relevant stakeholders (as described in Appendix E: Consultation Report of the revised draft EIS), and the findings of environmental and engineering investigations including community impacts: (including property impacts, Aboriginal and non-Aboriginal heritage, land use and economic impacts).</p> <p>ARTC is committed to working directly with impacted landowners and the local community to develop a solution that minimises impacts where possible. Further consultation with key stakeholders and the community will continue into the detailed design stage to minimise disruption in the construction works stage and through to operations.</p>	Chapter 2: Project Rationale Section 2.8 Section 2.9 Chapter 16: Noise and Vibration Section 16.10 Appendix E: Consultation Report Appendix W: Noise and Vibration Assessment - Railway Operations Section 4 Section 17 Section 17.4
220	220.0006	Private - Brookstead	Stakeholder engagement		<p>ARTC has failed to build trust, credibility and visibility due to the preferred communication process approach with key stakeholders being 'divide and conquer', resulting in negative social impacts on the community.</p> <p>ARTC has failed to build trust due to the informal communication style with residents, a lack of documentation of meetings held, a lack of follow up on action items and information provided as well as a deliberate power ratio between ARTC representatives to landholders.</p> <p>The EIS provides a lot of documentation around 'the process' but little if any evidence on the effectiveness of engagement or how community concerns have been taken on board.</p> <p>ARTC has failed to build credibility with the community of the Condamine floodplain, due to significant delays in responding to community concerns (about the inaccuracies in the flood modelling, subsequent design shortcomings, potential impacts due to increased risk of severe flooding) as well as discounting historic flood records.</p> <p>ARTC has failed to build visibility in the community as the majority of affected landholders did not receive prior notice of the first meeting held in Millmerran, the Social Impact Survey failed to attract sufficient response for a valid representation of community views and impacts as well as a lack of follow through on an improved communication approach.</p> <p>The lack of outcome measurements not only means there is no data on how effective the stakeholder engagement process has been, but more importantly that there is no accountability on the behalf of ARTC to evaluate their effectiveness.</p>	<ul style="list-style-type: none"> Community consultation process to be undertaken again with an independent facilitator to oversee the consultation process to ensure a fair process where community concerns are 'heard, acknowledged, considered' and that the community is truly empowered in influencing the best possible outcome in their region of influence, in line with the TOR for communication. Consultation for the B2G region needs to revisit decisions around rail and bridge design, road access changes and the impact on residences and local businesses. The SIA survey must be undertaken again as well as a Stakeholder satisfaction survey must be presented as part of the EIS process to provide credible feedback and evidence on ARTC's stakeholder engagement process. draft EIS should be rejected on the incomplete and inconclusive nature of information needed to effectively comment on environmental and social impact. 	<p>The consultation approach for the Project is guided by the International Association of Public Participation (IAP2) principles. These principles underpin ARTC's core values for engagement, which define the expectations of the community consultation process, in accordance with different levels on the public participation spectrum. The level of stakeholder participation for the Project depends on the stakeholder group and technical constraints. Further information on ARTC's approach to consultation is outlined in Appendix E: Consultation Report, Section 2.</p> <p>ARTC expects a high standard of professional conduct and ethics in our business. ARTC's process for recording and responding to stakeholder concerns is documented in Chapter 6: Stakeholder Engagement, Section 6.2.4 and 6.2.5. All stakeholder interactions are recorded, categorised, and responded to within set timeframes as outlined in Section 6.2.4. Issues and themes are analysed internally by the stakeholder team to continually improve ARTC's consultation and communication processes.</p> <p>Since the draft EIS and this submission, ARTC has undertaken a body of work to inform the revised draft EIS, including additional consultation, assessments and technical investigations. This process was supported by a comprehensive stakeholder engagement program, which is detailed further in Appendix E: Consultation Report, Section 4.</p> <p>A number of consultation methods have been used in the development of the revised draft EIS, allowing stakeholders to provide feedback to the reference design. Where appropriate, design changes and/or mitigation measures have been made in response to stakeholder feedback. This is documented in the revised draft EIS in Chapter 6: Stakeholder Engagement, Section 6.6 and Table 6.11.</p> <p>Responses to the concerns raised in this submission are outlined below.</p> <p>The first meeting in Millmerran:</p> <ul style="list-style-type: none"> ARTC notes that this submission refers to the first community engagement event in Millmerran, held in June 2016. At this time, the community engagement associated with the corridor selection process and development of the Yelarbon to Gowrie Corridor Options Report (DIRD 2016) and was managed by the Federal Department of Infrastructure and Regional Development. ARTC's engagement program is designed to provide multiple opportunities for targeted stakeholders and the wider community to participate in the Project. ARTC has undertaken significant work to engage with all stakeholders, particularly those directly impacted by the Project. It should be noted that, in some instances, stakeholders have declined to engage directly with ARTC despite numerous attempts. A combination of digital and traditional engagement methods was used for the greatest reach. Digital tools include website, interactive map, social media, maps, videos, a Project flythrough, graphics, and e-newsletters. Further details and examples are listed in Section 6.4 and Appendix E: Consultation Report, Section 6. Traditional tools included information sessions, letterbox drops, fact sheets, maps, graphics, newsletters, meetings (group and individual), workshops, forums, phone calls, letters, newspaper advertising, television advertising, attending community events and shows. <p>Condamine floodplain:</p> <ul style="list-style-type: none"> Significant additional hydrology assessments, modelling and consultation has been undertaken to further inform the Condamine floodplain crossing since the draft EIS. In June 2020, the Australian and Queensland governments established the Independent International Panel of Experts for Flood Studies to provide assurance that the flood models and reference design meet national guidelines and industry best practice. Following the release of the Independent International Panel of Experts for Flood Studies of Inland Rail in Queensland Report in July 2021 (draft) and October 2022 (final), Inland Rail carried out additional consultation and technical investigations to refine the flood model. Community sessions and one-on-one landowner meetings allowed ARTC to collect data and local knowledge about historical flooding along the alignment in 2021 and 2022. ARTC has been working with global engineering consultancies, local councils, landowners and government agencies to ensure the Project design is safe and reliable and incorporates knowledge from historical flood events. ARTC will continue to seek feedback from landowners and councils along the alignment during detailed design. The outcomes of hydrology and flood consultation are outlined in Appendix E: Consultation Report, Section 5.3. <p>Social Impact survey:</p> <ul style="list-style-type: none"> A range of targeted engagement tools were used to inform the Social Impact Assessment, including the social impact survey. This survey's purpose was to inform the SIA scoping process and identify community values to be considered in the assessment. The survey was not designed to define the breadth or significance of social impacts, but rather to identify initial concerns, prior to implementation of the range of engagement strategies that informed the assessment of impacts and development of mitigations (as detailed in Appendix X: Social Impact Assessment, Section 6.2). Appendix X: Social Impact Assessment, Section 4.3 notes that the survey did produce not a statistically valid result for the SIA study area's population but provided insights on local values and views to assist development of the SIA scope. ARTC has sponsored an independent survey of community wellbeing, quality of life and community values and priorities for enhanced liveability in the Project region and adjacent LGAs to the north where Inland Rail's Gowrie to Helidon, Helidon to Calvert, and Calvert to Kagaru Projects are located. The first survey in the Project region was conducted in May 2022. Surveys will be conducted annually to enable monitoring of key values (Appendix X: Social Impact Assessment, Section 6.2.2). <p>Future consultation:</p> <ul style="list-style-type: none"> As noted in Chapter 24: Draft Outline Environmental Management Plan, ARTC will work with individual landowners to accommodate the continuation of current property management activities and access across properties, where possible, in the detailed design and construction works methodology. Individual property treatments will be developed in consultation with landowners' occupants, with respect to the management of construction on, or immediately adjacent to, private properties. The treatments will detail any required adjustments to fencing, access, farm infrastructure or relation of impacted structures, as required. Chapter 24: Draft Outline Environmental Management Plan, also notes that an independent Community Relations Monitor will be appointed to attend meetings between ARTC and directly affected stakeholders on construction issues and potential mitigation measures and provide support to stakeholders and communities that are facing change due to Inland Rail, as well as other relevant tasks. <p>Brookstead and Pampas road and rail consultation:</p> <p>As detailed in Chapter 6: Stakeholder Engagement, Section 6.6, since this submission, ARTC has undertaken further consultation with the Brookstead and Pampas communities regarding road and rail design as outlined below:</p> <ul style="list-style-type: none"> ARTC hosted a community information session to discuss proposed changes to the Brookstead road network design, which was developed in conjunction with DTMR and TRC. The outcome of this engagement was not to progress with the closure of Madeleine Street East Intersection with the Gore Highway, as this was viewed as a main access road into Brookstead. ARTC hosted a community information session to discuss proposed changes to the Pampas road network design, to address road safety and technical constraints. Additional consultation also included four one-on-one meetings with stakeholders who could not attend the session. A detailed brochure was produced and distributed to the Pampas community, which resulted in phone calls and email enquiries from stakeholders. Reference design outcomes included changes to Fysh Road, Harris Road and the Gore Highway Intersection, which involved road realignments and a more optimal location of the proposed level crossing. 	Chapter 6: Stakeholder Engagement Section 6 Section 6.2.4 Section 6.2.5 Section 6.4 Section 6.5 Section 6.6 Chapter 24: Draft Outline Environmental Management Plan Appendix E: Consultation Report Section 2.1 Section 4.1 Section 5.3 Appendix X: Social Impact Assessment Section 4.3 Section 6.2 Section 6.2.2

Sub No.	Issue No.	Submitter Type	Submission Category - QLD	Sub-Category	Summary of Issue	Submitter Proposed Solution	Response to draft EIS Submissions	References in revised draft EIS
221	221.0002	Private	Air Quality		The submitter is concerned about dust pollution from preparing, construction, and operational use and maintenance of the rail.	Relocate rail to densely populated area. Building the alignment between Melbourne and Gladstone will make the Inland Rail a great success.	<p>The landholder's dwelling has been considered in the air quality assessment for the Project. In the dispersion model developed for the assessment of the operations stage in Appendix F of Appendix R: Air Quality Technical Report, the landholder's dwelling has been represented by sensitive receptor R825. The landholder's dwelling is located less than 50 metres from the edge of the permanent footprint for the Project.</p> <p>The construction and operation of the Project will result in emissions to air. However, the assessment of the construction works and operations stages has determined that the impact of air emissions to sensitive receptors, as a result of air emissions will not be significant with the inclusion of recommended mitigation measures.</p> <p>Construction dust emissions have been assessed for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust). The assessment of construction has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors (households) (Chapter 12: Air Quality, Section 12.5.1). The assessment has also recommended mitigation measures including for preparation and maintenance activities to reduce construction dust emissions and minimise the potential for significant impacts (Section 12.6 of Chapter 12: Air Quality). With the inclusion of the recommended mitigation measures, it is expected that the significance of construction dust impacts for impacts to health and nuisance/amenity will be low or negligible.</p> <p>Based on the results of the air quality assessment, the proposed alignment will not result in significant air quality impacts to sensitive receptors, and an alternate alignment is not required on the basis of air quality reasons. Further information on the results of the assessment of the construction works and operations stage assessments on impacts to air quality is presented in Section 12.6 of Chapter 12: Air Quality. Section 12.6 of Chapter 12: Air Quality presents the mitigation measures which have been recommended for the construction works and operations stages of the Project. These mitigation measures will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan, and, when implemented, impacts to sensitive receptors are not expected to be significant. The recommended mitigation measures are considered appropriate for the Project, and a shade line is further mitigation which is not required. It is also noted that shade lines are difficult to maintain, and are less practical for the mitigation of construction dust. The scope of the revised draft EIS is to assess the route selected by the Australian Government is detailed in Chapter 2: Project Rationale.</p>	<p>Chapter 2: Project Rationale</p> <p>Chapter 12: Air Quality</p> <p>Section 12.5.1</p> <p>Section 12.6</p> <p>Section 12.8</p> <p>Appendix R: Air Quality Technical Report</p> <p>Appendix F</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
222	222.0001	Private	Traffic and Transport		The ambulance, police and vet would be delayed with the rail service line.	Overhead bridge on road pass.	<p>Revised draft EIS Appendix AA: Traffic Impact Assessment Section 5.10.1 and 6.1.9 address the traffic impacts on emergency services. As noted in the submission, as part of the on-going process, ARTC is working with the relevant emergency service agencies (e.g. QFES, QAS and QPS) to develop protocols and joint working arrangements to address potential impacts on emergency services and service response times during construction and operation, and ensuring that access is retained as required. QPS (submitter) and QFES have acknowledged the potential impact to their services during construction and operations and are supportive of the Projects proposed approach. The QFES, QAS and QPS (submitter) will all be consulted to identify suitable emergency access points to the rail corridor in response to emergencies along the rail track.</p> <p>Consultation with the community and relevant government agencies (including emergency services) will continue through the detailed design and construction works stages to ensure that safety concerns and issues are addressed.</p> <p>The construction Traffic Management Plan will identify and include secondary/ alternative construction routes which can be used by construction traffic in the event that a primary construction route is blocked by an accident or emergency situation. Where a suitable secondary route is not identified, the movement of construction vehicles will stop until suitable alternative routes are identified and agreed with the relevant road authority. In all of these cases, the QFES, QAS and QPS will be updated and informed of changes by the Contractor.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.10.1</p> <p>Section 6.1.9</p>
222	222.0002	Private	Air Quality		School children and elderly will be impacted with dust and noise issues.	Work shorter hours	<p>Construction dust emissions have been assessed for the potential to impact human health (airborne dust which can be inhaled) and cause nuisance or amenity impacts (deposited dust).</p> <p>The assessment of the construction works stage of the Project has considered the type of emission sources which will be present during construction, the magnitude of the dust emissions expected, and the location of sensitive receptors. The definition of sensitive receptors as defined by the Queensland Government's Department of Environment and Science (DES) Guideline Application requirements for activities with impacts to air (DES, 2017) includes residences, temporary accommodation, schools and educational facilities.</p> <p>A qualitative assessment of the construction works stage was undertaken, as discussed in Section 12.5.1 of Chapter 12: Air Quality. Residential dwellings and schools located within the air quality study area (within 1 kilometre of the alignment) have been considered in the assessment of the construction works stage, and therefore impacts to these receptor types (schools, dwellings, etc) have been considered.</p> <p>The construction works stage assessment was undertaken considering the air quality goal for PM10 (particulate matter less than 10 microns in diameter), which is set for the protection of human health as prescribed by the Environmental Protection (Air) Policy (DES, 2019). The assessment also considered impacts to aesthetic amenity (nuisance dust) via assessment of dust deposition.</p> <p>The assessment determined that with the effective implementation of the proposed mitigation measures, the impacts to air quality at sensitive receptors (including schools and residential dwellings) with respect to dust deposition and human health will not be significant (Chapter 12: Air Quality, Section 12.8). It is noted that construction activity will be transient along the length of the Project, and therefore construction dust will not be generated along the entire alignment for the duration of the construction program. It is expected that dust emissions would be generated intermittently, subject to the activity being undertaken, and that any potential dust impacts would be short-term and temporary.</p> <p>It is also noted that the shortest averaging period for air quality goals set for particulate matter (dust) are 24-hour averages. The school day is shorter than 24 hours, and therefore the exposure duration for children at schools is shorter than the averaging period for air quality goals set for particulate matter. Further information on the results of the assessment for the construction works stage is presented in Section 12.5.1 of Chapter 12: Air Quality.</p> <p>Mitigation measures for the construction works stage were identified considering the emission sources anticipated and the magnitude of emissions expected. Section 12.6 of Chapter 12: Air Quality presents the mitigation measures which have been recommended for the construction works stage of the Project. These mitigation measures will be included in the Construction Environmental Management Plan (CEMP) for the Project as described in Chapter 24: Draft Outline Environmental Management Plan. Based on the results of the assessment, and with the implementation of the recommended mitigation measures, reduced construction hours are not expected to be required.</p>	<p>Chapter 12: Air Quality</p> <p>Section 12.5.1</p> <p>Section 12.6</p> <p>Section 12.8</p> <p>Chapter 24: Draft Outline Environmental Management Plan</p>
223	223.0001	Private	Traffic and Transport		The submitter is worried about the Inland Rail Crossing the floodplain between Millmerran and Toowoomba. He raises existing issues about heavy traffic which is stopped by roadworks. A rail line would further add to this, and have a very high maintenance requirement that might threaten business case and service of the Inland Rail.	Consult with main roads about the maintenance of this stretch of road before approving further infrastructure along this route.	<p>As part of the consultation process outline in Appendix E: Consultation Report, DTMR have been and will continue to be part of ongoing consultation regarding the Project and specifically regarding Millmerran Inglewood Road. The results of this consultation at the EIS stage are included in the revised draft EIS Appendix AA: Traffic Impact Assessment Further, once a construction contractor is appointed, consultation between the construction contractor, ARTC, local councils and DTMR regarding the provision of road impact assessments and road safety audits for all impacted LGRs and SCR will be required.</p>	<p>Appendix AA: Traffic Impact Assessment</p> <p>Appendix E: Consultation Report</p>
224	224.0001	Private	Traffic and Transport	Road safety	The construction and operation of longitudinal transport infrastructure (in particular heavy rail) and subsequent rationalisation of intersecting roads/streets and bicycle/ pedestrian access ways can make a significant adverse impact on the permeability/connectivity of walking and bicycling networks of the adjacent communities and towns.	Ensure that the accessibility and permeability/ connectivity of walking and bicycling networks are not worsened and, in support of strategic intents (i.e., the Queensland Walking Strategy, Qld Cycling Strategy, Toowoomba Regional Sustainable Transport Strategy) are improved to enable more sustainable and healthy transport activities for impacted nearby communities and towns.	<p>ARTC recognises the impact on the community, in particular on pedestrian and cycling infrastructure, by designing the Project alignment and construction routes in accordance with the relevant guidelines and standards including Austroads and DTMR road infrastructure guidelines and standards.</p> <p>Chapter 5: Project Description Section 5.4 of the revised draft EIS provides detail on reference design including the Project alignment and road/ rail interfaces. This is further supported by the Appendix design drawings Part 1 and 2. Section 20.5.9 of Chapter 20: Traffic, Transport and Access identifies the existing walking and cycling networks impacted by the proposed Project alignment and construction routes.</p> <p>During construction, all road routes will be subject to a Road Use Management Plan and Traffic Management Plan, which must be prepared in accordance with DTMR and TRC guidelines and standards. These plans will require regular assessment of road safety, road conditions and traffic composition including pedestrian and cyclist usage to ensure safety for all road users. Section 5.2.2 of the Appendix AA: Traffic Impact Assessment provides further detail of mitigation measures for the whole Project that will be implemented during subsequent Project stages.</p> <p>ARTC has committed to maintaining connectivity of existing on and off-road pedestrian/ shared user facilities, and consultation will continue with local councils regarding pedestrian crossing options during detailed design.</p>	<p>Chapter 5: Project Description</p> <p>Section 5.4</p> <p>Chapter 20: Traffic, Transport and Access</p> <p>Section 20.5.9</p> <p>Appendix AA: Traffic Impact Assessment</p> <p>Section 5.2.2</p>
