## Appendix T DPI Fish Survey Data

This fisheries survey data is from unpublished records provided by Malcolm Dunning of DPI Queensland Fisheries Service. This data is not to be published outside this Supplementary EIS without further reference to Malcolm Dunning, DPI Queensland Fisheries Service.

From 1991 to 1994, a series of stake nets, beam and otter trawl samples were taken in Repulse Bay near the Laguna Quays Resort site situated 70 kilometres north of Mackay (Fig. 1). Repulse Bay is characterised for the most part by a harsh, rocky shoreline with a very broad intertidal zone. Due to the large tidal regime of the area (maximum tidal range about 6 metres), mangrove areas only flood on spring tides. Wet and dry season sampling was undertaken in four areas described as follows:

- ❑ Mangrove Foreshore: A closed *Rhizophora stylosa* mangrove area in a protected bay south east of the Laguna Quays Resort. This site substrate consisted mainly of muddy sand sediments.
- ❑ Covering Creek: A small tidal creek on the northern boundary of the development site. It is the only creek near the sampling area that opens directly into Repulse Bay. The creek is fringed by well developed *Rhizophora stylosa* mangroves. This site substrate consisted mainly of muddy sand sediments.
- ❑ Intertidal Flat: This intertidal area south east of Laguna Quays Resort stretches about one kilometre between the mangrove edge and low water mark. The intertidal flat was vegetated with relatively sparse *Zostera capricorni*, *Halophila ovalis* and *Halodule pinifolia* seagrass. The sediment consisted of muddy sand in the upper intertidal zone immediately adjacent to the mangroves to silt encrusted stone and rock in the lower intertidal area.
- ❑ Offshore: The offshore sampling area consisted of two transects between five and ten kilometres offshore from the Laguna Quays Resort. The inner transect was about seven metres deep at high tide and the outer transect was ten metres deep at high tide.

Sampling was carried out over three years, with the time periods sampled and the methods used for each area given in Table 1. Sampling was discontinued in Covering Creek after November 1992 due to flood rains in January 1993 (Fig 3). High runoff in the creek caused major sediment erosion, with the creek base changing from muddy sand substrates to bare rock.

■ **Table 1. Sampling period and method used for the four areas.**

Sites	Sampling Period	Sampling Method
Mangrove site	May 1991 - Mar 1994	stake net
Covering Creek	May 1991 - Nov 1992	stake net
Intertidal Flat	Mar 1993 - Mar 1994	beam trawl
Offshore	May 1991 - Dec 1993	otter trawl

■ Table 4a. Crab species recorded from the four different habitat types in Repulse Bay.
